This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

The ecosystem is fragile and interconnected as is stated in this article: "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creates/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3\\_6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3_6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

#### HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH

Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..."  
<https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life."  
<https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks  
<https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources  
<https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

It's Been Proven an Increase in Human Population Destroys Coral Reefs

if a Bungalow Resort is allowed to be built in Keauhou Bay, it will bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed.  
<https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability."  
<https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%2C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study%20said.>

By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct  
<https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram

data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management."

[https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=vsakgQNhauhJAnWwAq453RgN0AjWeli9nR3ZoTv0PyGzA5lc\\_H0O1zcHNIP3AShncgKRy6\\_vkLPw49dbmBYoXSg3Y1MgQIGBZsapidGUH7O1SLbu9x5P3xED4Kx4T0s.lvgQ1a7ZRR3rUbraxpodJd2AoNiSmWsuXb7JJEDdpJgOGJpx71TJWdCfXvFKJZYeNdcJj3Sw\\_dnaUg5IZhcfPBDImmaH15yqT5Q%3D&tracking\\_referer=abcnews-go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=vsakgQNhauhJAnWwAq453RgN0AjWeli9nR3ZoTv0PyGzA5lc_H0O1zcHNIP3AShncgKRy6_vkLPw49dbmBYoXSg3Y1MgQIGBZsapidGUH7O1SLbu9x5P3xED4Kx4T0s.lvgQ1a7ZRR3rUbraxpodJd2AoNiSmWsuXb7JJEDdpJgOGJpx71TJWdCfXvFKJZYeNdcJj3Sw_dnaUg5IZhcfPBDImmaH15yqT5Q%3D&tracking_referer=abcnews-go.com)

### INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS

Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. Worldwide, hotels produce almost 300,000 tonnes of waste each year."  
<https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Keauhou Bay. On Hawaii Island, we are already struggling to meet the increasing need for resources and infrastructure.

Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

A County commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill

By Megan Moseley September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and

glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

Time's Up For Landfills

'Gentle' demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

Drought Conditions On Hawai'i Island Prompt Water Supply Message

by Big Island Video News

on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information from the U.S. Drought Monitor. There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

U.S.

Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to significant droughts, and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the world's largest surfing wave pool opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe."

"We are in a water crisis, that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

UPDATE: HELCO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power->

Big power supply problems continue to plague Hawaii Island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES

A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawaii'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems.

<https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added."

<https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island.

<https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: All of these roads only have two lanes!

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution."

[https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr.  
<https://www.youtube.com/watch?v=-FQSSnPDjI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

**MORE ARTICLES HIGHLIGHTING INFRASTRUCTURE AND RESOURCE DEFICITS, INCLUDING WATER, TRASH, ELECTRIC and WASTEWATER:**

1) **Hawaii Deals with Burgeoning Waste Management Problem**

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled."  
<https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawaii Sanitary Landfill reaching capacity.

The West Hawaii Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years."

16) US Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "We're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) News Hawaii'i County issues mandatory 25% water restriction for North Kona August 7, 2023 - 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

18) Hawaii'i Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News  
on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawaii, the Hawaii'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-ca-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem.  
<https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

19) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large\\_generators/](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large_generators/)

20) "Hawaiian Electric asking Big Island customers to conserve power due to down generators

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new

development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

#### HISTORICAL AND CULTURAL SIGNIFICANCE:

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii. After being added back in 1978, the law is part of Hawaii's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina.

The Law of the Splintered Paddle is also on Kamehameha Schools website. The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads.

<https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-20-0-years-after-k>

Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.

#### IN CONCLUSION

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Ecosystem in Keauhou Bay and "The Endangered Species Act of 1973 (ESA or "The Act"; 16 U.S.C. § 1531 et seq.) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from extinction as a "consequence of economic growth and development untempered by adequate concern and conservation", the ESA was signed into law by President Richard Nixon on December 28, 1973. The Supreme Court of the United States described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation". [1]" [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land MUST be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawaii Island is already having serious infrastructure and resource issues that have yet to be solved. These issues MUST be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly

Lillian Ah Nee

protects the marine life and environment from further damage. The location is NOT suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

Mahalo,

Lillian Ah Nee

**Subject:** Kamehameha Schools EIS Draft For Keaouhou Bay WILL HAVE NEGATIVE IMPACT  
**Attachments:** Keaouhou Bay Research Letter.pdf  
**Categories:** Yellow Category

Please find attached below my letter of opposition to the Keaouhou Bay development.

Mahalo for your time and attention,  
Lillian Ah Nee  
[REDACTED]

To Whom it May Concern,

Please **REJECT** Kamehameha Schools Environment Impact Statement (EIS) for Keaouhou Bay to become a Bungalow Resort.

Please acknowledge that a Bungalow Resort WILL have a **SERIOUS NEGATIVE IMPACT** on Keaouhou Bay as stated in all the different researched articles below.

Please, DO NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is scientifically proven that developments pollute nearby waters both during and after development.

I am in full agreement with the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have ALWAYS polluted the water in EVERY coastal development area.

#### ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.

The Green Sea Turtle swims in Keaouhou Bay weekly and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list.

Endangered Species Act

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from  
<https://www.fisheries.noaa.gov/national/angered-species-conservation/angered-species-ac>

#### FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED

The green sea turtle is federally protected and can be seen in Keauhou Bay weekly.

The following article that states: "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from  
<https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

**Allowing this development WILL POLLUTE Keauhou Bay.** The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!), states this fact clearly. Keauhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen because developments have been shown to ALWAYS pollute the water is that is nearby.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawaii are protected by the Endangered Species Act (ESA) and additionally protected by Hawaii Revised Statutes Chapter 195D (HRS) and Hawaii Administrative Rules (HAR) 13-124." This information was taken from this site  
<https://dlnr.hawaii.gov/species/sea-turtles/>

#### THE ENDANGERED MONK SEAL WILL BE AFFECTED

Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring more people down to Keauhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful.

Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keauhou Bay will likely be changed forever.

This information is from a NOAA Scientist: "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought."  
<https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawaii Revised Statutes (HRS) Chapter 195D and Hawaii Administrative Rules (HAR) 13-124." This was taken from  
<https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

Keauhou Bay is the monk seal and the green sea turtle's habitat. Allowing a bungalow resort to be developed in Keauhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to protect the land around Keauhou Bay from developments that destroy the habitat of these endangered species with pollution and runoff.

Does this EIS have any reports on the endangered species that frequent Keauhou Bay? This is their habitat and it needs to be "conserved".

Under the Conservation Program there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems."

[https://www.capitol.hawaii.gov/hrscurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species."

[https://www.capitol.hawaii.gov/hrscurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keauhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keauhou Bay and the surrounding area during the building phase of this enormous project.

**GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS**

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use."

<https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keauhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable!

Most drains have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping system.

The pavement from this development will cause pollution to runoff into Keauhou Bay because this treed land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keauhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at:

<https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> where the Hawaii government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keauhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.

These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keauhou Bay and for these endangered species habitat.

Under Section 2 (b) of the Endangered Species Act - Keauhou Bay MUST BECOME A CONSERVATION AREA for these endangered species. It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keauhou Bay.

**ALGAE BLOOMS KILL CORAL AND MARINE LIFE**

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer.

When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course developments. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution. . . ."

<https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAUHOU BAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..."

<https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

FURTHERMORE: "If there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location."  
<https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

## ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN

Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keauhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

The article below is from NOAA regarding motor vehicle engines and pollution to the sea.

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant.>

Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects

News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a new report from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%20Nearly%2085%20percent,pipeline%20spills%2C%20says%20a%20new>

The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershepherds.org.au/blog/the-impact-of-stormwater-car-emissions/>

NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE

Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keauhou Bay during development?

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that

underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

What is ocean noise?

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

#### LEARN FROM OTHERS: RUN-OFF FROM DEVELOPMENT KILLS

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments. Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed. Keauhou Bay is a much smaller ecosystem.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow...

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and

its waters. And much of it starts right in the urban and suburban neighborhoods where we live."

<https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay due to its size and fragility.

#### MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN

Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays. Manta rays are in Keauhou Bay every night to eat zooplankton, and are often seen here during the day as well.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is NO WAY to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments.

Please read the Scientific articles below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii". Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide...

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-off)."

<https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event>

sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival"  
[https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

it's Been Proven Resort Developments KILL Marine Life

This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon. The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment."

<https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

The ecosystem is fragile and interconnected as is stated in this article: "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO.  
<https://www.marinebio.org/creates/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

#### HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH

Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..."  
<https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life."

<https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks  
<https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources  
<https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed.  
<https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment – especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability."

<https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=9630885&#:~:text=The%20less%20people%20at%20a,there%20are%2C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study%20said.>

By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shoes, that more people cause more damage. The area simply cannot afford or support this development.

"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct  
<https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram

data from tourists and high-resolution live coral cover maps in Hawaii, we find that regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management.”  
[https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhaJhJAnWAq453RgN0jAWei9jR3ZoTv0PyGzA5ic\\_H0O1zcHNIP3ASnhcgKRy6\\_vKLPw49dbmBYoXSg3Y1MgQIGBZsapsdGUHi7O1SLbu9x5Pr3xED4Kx4T0s.lvgQ1a7ZRR3rUbraxpodJd2AoNISmWsuX87JJEDdpj8OGJpx71TJWdCfXvFKJZYeNdcJ3Sw\\_dnaUg5IZhcjPBDImmaH15yqT5Q%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhaJhJAnWAq453RgN0jAWei9jR3ZoTv0PyGzA5ic_H0O1zcHNIP3ASnhcgKRy6_vKLPw49dbmBYoXSg3Y1MgQIGBZsapsdGUHi7O1SLbu9x5Pr3xED4Kx4T0s.lvgQ1a7ZRR3rUbraxpodJd2AoNISmWsuX87JJEDdpj8OGJpx71TJWdCfXvFKJZYeNdcJ3Sw_dnaUg5IZhcjPBDImmaH15yqT5Q%3D&tracking_referrer=abcnews.go.com)

#### INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS

Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. Worldwide, hotels produce almost 300,000 tonnes of waste each year."  
<https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Kealahou Bay. On Hawaii'i Island, we are already struggling to meet the increasing need for resources and infrastructure.

Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawaii'i landfill

The West Hawaii'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawaii'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

A County commission drafts ordinance aiming to ban recyclables at West Hawaii'i landfill

By Megan Moseley September 6, 2023

Hawaii'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawaii'i County Director of Environmental Management, told commissioners the West Hawaii'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson George Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Kaahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and

glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste.”

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

Time's Up For Landfills

'Gentle' demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawaii's government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

<https://buildingindustryhawaii.com/2024/04/times-up-for-landfills/>

Drought Conditions On Hawaii's Island Prompt Water Supply Message

by Big Island Video News  
on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawaii's island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawaii's island is under "Moderate Drought" conditions, according to the latest information from the U.S. Drought Monitor. There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawaii's County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawaii%CA%BB-i-island-prompt-water-supply-message/>

U.S.

Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to significant droughts, and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the world's largest surfing wave pool opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe."

"We are in a water crisis, that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawaii, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

UPDATE: HELCO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity use is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power->

Big power supply problems continue to plague Hawaii Island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urg-ed-to-reduce-electricity-use-through-april>

FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES

A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawaii'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems.

<https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added."

<https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island.

<https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: All of these roads only have two lanes!

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution."  
[https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr.  
<https://www.youtube.com/watch?v=FQSSnPDjI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawai'i Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

MORE ARTICLES HIGHLIGHTING INFRASTRUCTURE AND RESOURCE DEFICITS, INCLUDING WATER, TRASH, ELECTRIC and WASTEWATER:

1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled."  
<https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity.

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years."

16) US Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "We're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) News Hawaii County issues mandatory 25% water restriction for North Kona August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokohau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

18) Hawaii Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News  
on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawaii, the Hawaii County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem.

<https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

19) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large/)

20) "Hawaiian Electric asking Big Island customers to conserve power due to down generators

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new

development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

#### HISTORICAL AND CULTURAL SIGNIFICANCE:

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii. After being added back in 1978, the law is part of Hawaii's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

-Caring for and serving one's people

-Knowing and doing what is pono (right)

-Standing for the principle that leadership privilege is earned

-Taking kuleana (responsibility) for those we serve

-Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

The Law of the Splintered Paddle is also on Kamehameha Schools website. The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads.  
<https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-20-0-years-after-k>

Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.

#### IN CONCLUSION

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Ecosystem in Keauhou Bay and "The Endangered Species Act of 1973 (ESA or "The Act"; 16 U.S.C. § 1531 et seq.) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from extinction as a "consequence of economic growth and development untempered by adequate concern and conservation", the ESA was signed into law by President Richard Nixon on December 28, 1973. The Supreme Court of the United States described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation".[1]"  
[https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land MUST be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawai'i Island is already having serious infrastructure and resource issues that have yet to be solved. These issues MUST be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly

protects the marine life and environment from further damage. The location is NOT suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

Mahalo,

Lillian Ah Nee

Aloha,

My name is Loke Aloua and I am submitting comments in **opposition** to the proposed development for Kamehameha Schools, Keaouhou Bay Management Plan Draft: Environmental Impact Statement

Tax Map Keys (3) 7-8-012:098; (3) 7-8-012:101; (3) 7-8-012:048; (3) 7-8-010:044; (3) 7-8-012:027; (3) 7-8-012:004; (3) 7-8-012:013; (3) 7-8-012:014; (3) 7-8-012:054; (3) 7-8-012:065; (3) 7-8-012:007; (3) 7-8-010:049; (3) 7-8-012:103  
Keaouhou, Island of Hawaii, Hawai'i and support the **No Action Alternative**.

This is not an appropriate development for this area. While the area should be cared for to bring to life the cultural significance of the area, this development does the opposite. This kind of project can be done by the people no need this fancy project that kills the spirit of this place. Why bring more tourists who will wreckreate in this space? Why not put kánaka back on 'āina to put back what was forcibly removed? Even KS has a history of evictions and wrongful treatment of Native tenants? Why not use your folks resources for be one example, put Hawaiians on the land, bring back the native species? No bring the natives back just for decorate your resort development. Pau dat kine already, nuff. Testimonies received during previous consultations have shown that the community does not support this development. Kamehameha Schools has not listened to the community and instead is plowing forward with their plans for a development for financial revenue. The health of the place is the priority, simple. Does this project enhance or deteriorate the health of the place?

My kūpuna are from this area. All the mo'olelo I have been told get erased by this proposed development. So much has changed already the space is unrecognizable. Why bring more of this erasure when there's the potential to actually serve the land and water? Bring back the birds, limu, fish, plants to its optimal health. Everytime, money, money, money. Go plant kalo. Go eat from the land. Live more simply. Stop developing for make money. We will lose everything with this kind mindset. No matter anymore Hawaiian, not Hawaiian all these developments like money. If I never read KS label this could be one foreigner coming in with one nada master plan for erase Hawaiians.

I support the No Action Alternative. I read through the plan and it's incomplete. I have the following comments and questions listed below.

**Proposed project lacks necessary water credits**

The DEIS states that the proposed project will require 146,199.2 GPD as its max daily demand, 487,330.8 GPD for total peak hour demand, and 97,466.2 GPD total average daily demand (5-10, Table 5.2). Yet, the average water demand is assumed to be 86,385 GPD which is equivalent to 240 water credits which is significantly less. All of the three

water projections for max daily demand, total average daily demand, and total peak hour demand are well beyond the equivalent water credits.

Each water credit is equivalent to 400 GPD. The total peak hour demand requires 1,218 water credits, total peak hour, 365 water credits for max daily demand, and 243 water credits for the total average daily demand. Comments submitted by the DWS in Table 7.2 clarify that, "Please be informed that the applicant has assigned **101 units of water** to TMK 7-8-010-044 through an executed Water Agreement with the Water Board, dated April 4, 2012. Additional water could be made available subject to the Water Board's approval." **Thus, the proposed project does not have necessary water credits for the project to proceed.**

How can this project proceed when it does not have the necessary water credits that it is estimated to use? Repeatedly, the DEIS states that KS will work with DWS when the necessary water credits are not confirmed available for this proposed project. The project should be denied until such credits are obtained by DWS and necessary impacts to ecosystems and cultural practices analyzed with full consultations. Kona has major water issues. This is the dryside of the island and everyone is developing like freshwater is infinite. KS claims this project has been scaled back but really it is still too big even for the amount of water that is available for this parcel. 101 credits translates to approximately 40,400 GPD. Where is the development for this type of allotted water use?

I have the following questions:

- How many water credits does KS have in possession for this proposed development?
- How will KS acquire additional water credits?
- Are additional water credits available?
- Where will the well for the project be supplying the development with water be located?
- What are the environmental impacts of withdrawal on groundwater dependent species, near and deep shore fisheries?
- What are the impacts of water use on traditional and customary practices?
- What ahupua'a will be supplying this proposed project with its potable water?

#### **Wastewater facility capacity needs updated capacity for 2024 and the improvement analysis is incomplete.**

The DEIS states, "He'eia WWRF will have capacity to accommodate the increase in wastewater flows based on the information from 2016. Further study will be needed to find out if any capital improvements of the WWRF and facilities leading up to it will need improvements with this increase in flow" (7-12). The DEIS should provide updated pumpage capacity for the He'eia WWRF. Pumpage estimates used for this project are almost a decade old. Furthermore, wastewater analysis should assess whether or not capital improvements are needed before the project plans are accepted, if the project

requires capital improvements then those plans should be provided in this DEIS for public review. Capital improvements are major projects that have the potential to cause adverse impact or require further funds that should not be of the taxpayers.

I have the following questions:

- What is the He'eia WWRF pumping capacity as of 2024?
- Considering current data for the He'eia WWRF can this facility receive the wastewater produced from this site?
- What are the capital improvement projects needed to ensure that the wastewater can be received by the He'eia WWRF?
- Can the current sewage line system receive the waste and transfer it to the He'eia WWRF?

#### **Traffic Analysis fails to account for tsunami and emergency evacuations.**

Keaouhou Bay is frequented by a wide array of users (e.g., fishers, divers, swimmers, boat operators, paddlers) including 'ohana with keiki and elderly. The entirety of the proposed project sits within a tsunami evacuation zone. With existing traffic the roads are already congested. Yet, the Traffic Analysis fails analysis shows little impact and too fails to assess how additional vehicles and populations will impact traffic during emergency evacuations. Public safety and evacuations during an emergency situation should be prioritized and assessed to provide realistic projections of traffic and added population impacts. This is mandatory, not optional. How you going bring all this added traffic and users then not assess emergency evacuation scenario? What happens when people die cause they cannot get out with gridlocked systems? Why not prevent this kind catastrophe? The DEIS should provide this analysis to ensure that public safety is considered and current and proposed roads can indeed ensure safe evacuations.

I have the following questions:

- How will added vehicular and pedestrian traffic impact emergency evacuations?
- What is the traffic assessment for emergency evacuation scenarios?

#### **Current and added capacity of the proposed development on existing medical facilities unassessed**

The DEIS provides a list of medical facilities near this proposed development, yet fails to provide any substantive analysis of how population increases will impact existing medical facilities. Kona is in dire need of a second hospital and upgrades to the existing facility. Identifying them as a medical facility is not an assessment. Identifying additional facilities that the existing community relies on like Urgent Care and West Hawaii

Community Health Center is also inadequate. These are primary care facilities for our 'ohana on the west side. The DEIS fails to assess how added population will add stress to these existing facilities. It is so careless to assume that there will be no impact and that listing them is enough; it is not. 'Ohana already wait hours if not days to get into these overloaded facilities. Have some decency and get it together. Provide a thorough analysis. Listing medical facilities by name is not an analysis, it's a list.

I have the following questions:

What is the current capacity of medical facilities listed in the DEIS?

How will the proposed project impact the carrying capacities of the medical facilities listed as available?

What is the assessment of impacts of population on the West Hawai'i medical facilities?

#### **Impacts to Keauhou Bay from increased users unassessed**

This proposed project will be increasing user density of the area. The impacts of this increased user density on Keauhou Bay should be assessed. It is ridiculous to propose this development which is directly seaside without having any safety measures in place for the biodiversity of the bay. This includes consideration for endangered and non-endangered species both terrestrial and marine. This project is premised by the assumption that this development will improve the area, yet it fails to actually consider the ecosystem of the Keauhou Bay, how ridiculous. It is so shameful to bring this type of project in and not actually consider the impacts to the bay and the marine life. How shame. More than 400 pages written with fancy graphs, pictures, and headings then no analysis on the impacts to the bay. KS will be responsible for bringing hundreds to thousands more people to Keauhou Bay. Where is the accountability for the health of the place? The impacts are beyond those of the project site. This old school all I gotta do is look at the boundaries of the land I like develop is pau. There are impacts beyond that need to be assessed.

I have the following questions:

What exactly are the impacts of these populations on the marine ecosystem?

What are these impacts to traditional and customary users of this space?

Where is the Ka Pa akai Analysis to assess these impacts and mitigation?

How will the proposed development and added users impact marine species?

What is the cumulative impact of the development on Keauhou Bay?

There are at least 12 individuals who received Land Commission Awards for land within the proposed project area. These 'ohana who have royal patents to the lands within this proposed development. 'Ohana are still in Kona.

I have the following questions:

Where is the chain of title to show proof of sale for RP 3888, RP 6391, RP6842, RP 4437, RP 6367, RP 7891, RP 8023, RP 4579, and RP Haluapo (Table 4-1)?

Have the descendants of these LCA awardees been notified of this development?

Have the descendants of these LCA awardees and those whose 'ohana frequented? Keauhou been consulted regarding the significance of archaeological remains?

I will standby to receive a detailed response. Please, no just stick all my comments in one table summarizing with one, "Mahalo for your comments."

Ke aloha 'āina,

Loke Aloua

**Clear title to lands within the project area**

Bill and Cindy Armer

**To:** Alex.Roy@hawaiicounty.gov; 221053-01 KS Keauhou Entitlements  
**Subject:** Comments on Keauhou & Kailiinehe proposed EIS project

**Categories:** Yellow Category

We are Bill and Cindy Armer, 20+ year outrigger canoe paddlers and 5 times weekly users of the Keauhou Bay area. We have been off-island or distracted with medical issues for the past three months and have returned to discover this massive document about this Hawaiian treasure. We appreciate many of the elements outlined in sections of this draft EIS especially the history sections. We did not have the time to raise more questions or create a more thorough response.

We take issue with the conclusion that the project developer felt they met the standard stated in the early pages of the document: "*HRS Section 343-5(e), enacted by Act 172 (2012), allows an applicant to prepare an EIS rather than an environmental assessment if the approving agency determines, through its judgment and experience, that an EIS is the acceptable level of environmental review.*" Kamehameha Schools stewards approximately 54 acres at Keauhou Bay, a relatively small area that is utilized in a variety of ways by tourists and residents alike. Historically, the significant demand and utilization of this area can and often creates congestion which leads to user conflicts along the bayfront. This unique and culturally significant area demands more time and consideration of factors than just more increase of profitability of the Kamehameha Schools investment of over \$100 million dollars.

A brief review of opponent postings in the Keauhou Bay area states that the project will result in 900 additional people daily in the immediate area and more than 150 homes. We were disappointed to find no direct discussion or defense about these allegations in the document. We certainly also challenge the lack of common sense and logic by the consultants, Fehr & Peers, who assert in this report that "The Draft Environmental Impact Statement (DEIS) provides an analysis of potential traffic impacts in Section 4.11. A Mobility Analysis Report (MAR) was prepared by Fehr & Peers to identify and assess existing and future mobility options as well as potential traffic impacts generated by the Project (Appendix E). The MAR found that the implementation of the Project would not result in significant traffic impacts." The issues of population density, emergency vehicles and daily traffic congestion demand a more complete and responsible conclusion. This is an area served by two lane road access and is frequently stopped for extensive waiting periods now--due to the explosion of residents, vehicles, and the impacts on the environment and the Bay. We have been through multiple evacuations of the tsunami corridor in Keauhou. We conducted numerous water quality studies for years in Keauhou Bay which revealed the extensive, ongoing degradation of the bay environment in the last 25 years. The bottom of the Kamehameha III cut-de-sac continuously floods and pollutes the dry well for the roadway for days after every rainstorm. The fish and crustaceans have declined, the ocean mammals do not visit as often, and frequent human swimmers are blessed with staph and even more serious infections.

We encourage you to complete a proper and full environmental assessment of this project. This area is too historical, too valuable, and too cultural to give the developer this easy pass with an EIS. Do the full environmental assessment of this project. Mahalo for your consideration of our request.

## Leiola Augustine

It is with a heavy heart that I write my response to the EIS below.

I was fortunate enough to be born as the granddaughter to a very special wahine, Tutu or aunty Lily Kong who was the last person to be born and raised in Keaouhou Bay. She dedicated her life to the preservation of the bay and through her I learned about our cultural heritage as Hawaiians and the rich history and culture of Keaouhou Bay.

There is no place that still exists like Keaouhou Bay. Having been the birth site and home site to many of our ali'i signifies its importance to Hawaiian culture and indigenous people. Its ability to self-sustain its population and those of neighboring ahupua'a through recent history makes this a very special place that could be lost if KS chose to develop the property to its full capacity of 700+ units vs the 150 units it proposes.

Contrary to what some people have recently said of my grandmother, she was not against development. She was against certain developments and development in ways that did not properly care for the land, preserve cultural and historical sites and displaced indigenous people. She knew, with no modern industry other than tourism, that development was inevitable in Kona. Without development such as all the condos, hotels and vacation rentals that surround Keaouhou Bay where would people who wanted to vacation here stay? Where would people who wanted to move here live? Without the economic contributions of those people how would future generations live in this modern, technological society?

She knew that in order for the following generations to thrive in a modern world that new skills through education would be required, but how are indigenous keiki going to be educated? How would they obtain the skills and resources to make a life among outsiders who had more economic and educational resources than we had here? Our princess Pauahi, through her schools and education programs are one of the few ways keiki would be able to learn those skills. She understood, and I currently live, the complex and complicated dichotomy of preserving our 'aina and culture while living in a modern world.

I'd like to make it clear that my preference is to see no further development in the bay and to actually remove certain features such as the seawalls that cover the beach and the restroom at Kaiilimehe that covers the spring and stop all commercial activity in the bay so the bay can return to its natural state. However, I also know that some of this is not realistic and therefore appreciate a private landowner who is willing to work with the community to ensure the property is developed with community involvement and with as much integrity as possible.

Volume I section 6.1 states: "Without comprehensive improvements, the Kamehameha Schools-owned properties would remain underutilized and underperforming financially". It might be helpful for those who oppose this development to understand that KS and the trustees are bound by the trust to financially increase the endowment for our Iahui. I welcome those opposed to this development and KS to think outside the box and offer another avenue for these lands that will achieve the desired financial benchmark other than a commercial and resort development. Those opposed, please understand that without meeting this financial benchmark or offering some other source of educational or financial support, you are continuing to displace indigenous

Hawaiians and taking away from our Iahui.

Regarding the "underutilized" portion of the above statement I do feel as though we should leave some of these areas as just that. Not utilized at all. I do believe and appreciate that our cultural sites are to be preserved with this new plan, but want to ensure that KS recognizes and understands that there is increasing sensitivity amongst indigenous Hawaiians as to not market our culture for financial gain or for our culture to be on display as a novelty. As a suggestion, let the families or those organizations that bear the responsibility of maintaining those sites or take ownership of the cultural significance of those sites, the freedom to choose who, how and if those sites, customs and history shall be shared.

Pollution - My tutu always spoke about the pollution and overuse of the bay. I do see that there is a plan to connect current and future facilities to the He'eia sewer system. Also, implementing water runoff solutions to eliminate further pollution of the bay will be imperative.

Commercial & Recreational Tenant Selection - I would like to see more clarity on the criteria for use and tenant selection in commercial and recreational spaces. Priority should be given to tenants who have a low impact on the bay and are inclusive of indigenous customers/participants, rather than those with a high impact and culturally exclusive practices. The same low impact and culturally inclusive criteria should be applied to recreational tenants, favoring those who are sensitive to cultural considerations over those who are high impact and exclusive.

Volume I section 3.1.5 paragraph 4 talks of the Kau cemetery, which was where my great grandfather and other family members along with other families that inhabited the bay were laid to rest. Also, volume II page 112 and 113 notes that Ilina (burial sites) and Iwi (bones) should be left in place. I appreciated Malay and Malay's recommendation to follow my kupuna's wishes to leave any Ilina and Iwi in place. However, even though my family's Ilina located mauka of the current volleyball court and mauka of the old Kona road has since been bulldozed by Mr. Post from Texas to build his golf course and our ohana's Iwi has since, without our approval, been relocated. My immediate ohana and I wish that the Ilina Kau to no longer be used as a golf course and to be further left alone. It does seem that figure 3-34 and figure 3-35 honors those wishes and that no further development would take place in that area.

In case I was not clear before, the restrooms/comfort station at Kaiilimehe beach must be relocated to allow for the spring can flow.

Furthermore, to any party who is using my ohana's mo'olele for commercial or monetary advancement or to further advance your position we ask you to stop. My tutu willingly and freely shared her mo'olele and mana'o so it would not be lost, but that does not mean that permission was granted to be used in connection with individual gain. Her mo'olele and her mana'o live through us, her living descendants.

I'd like to commend KS on its willingness to listen to and include community and kupu'aina involvement as this is only the second time (that I am aware of) a landowner in the bay has sought out the opinion of those with interests in the bay. We mahalo you for including us and ask that our ohana continue to be consulted as the progress of this project.

## M. Kekoa Aukai-Richardson

I oppose the proposed developments in Kaula Bay. The proposal ignores a key fact: our environment is in a delicate state, which means we should be protecting more lands and not developing any lands that we do not have to. The public concerns in Hawaii are also being ignored with this proposal of more development. The public continues to voice opposition to over-tourism, over-fishing, over-development, and pollution, as these are issues that are causing people and animals in Hawaii to have a reduced quality of life. This development will negatively impact a sacred place, residents, current business owners, and the magnificent marine life in the area. It is especially concerning that this proposal is coming from a Native Hawaiian organization that should by all logic and reason have every interest in seeing this area remain as undeveloped as possible. More parking spaces and shops will only lead to more people coming to the area, which the area cannot sustain. For anyone curious as to what that may look like, visit Hanauma Bay. Even though it isn't developed, far too many people are allowed to visit, and locals can see the results. It's a depressing place if you love marine life and nature. If you were to snorkel there you will see dead coral and very few fish or na honu. During COVID restrictions, when Hanauma Bay was closed, the marine life there started to bounce back. The evidence is clear: the more people in an area, the worse the environment will be. This is especially true in Hawaii because, unlike in some other places, the state and counties do very little to enforce laws on the books regarding marine life, and are not acting fast enough to create more laws and regulations to protect vulnerable places. What kind of credibility can Native Hawaiian organizations have when they are placing more importance on monetary gain than on preserving a sacred place that holds value far beyond any dollar amount to Native Hawaiians themselves? Why should anyone listen to Native Hawaiians who say the cost of living here is too high, there's too much development and over-tourism when this is how one of our most well-known Hawaiian institutions is making decisions that betray those concerns, and in a sacred place nonetheless. I stand with Kupuna Kumu Lily Kong, a descendant of the area. Her wisdom and heritage should be honored by not moving forward with this plan. Mahalo.

## Candi Baker

We need to protect our island. We don't need more concrete or vacation places. We need to save our corals, and sea life. Not make it a Disneyland for the rich. You are suppose to have the people's welfare not your paycheck as a factor. Do the environmental research!!!

**Subject:** Attention Keauhou Bay #15 Comment Letter

To whom it may concern,

In a time of severe climate change, building another hotel on Keauhou Bay is a huge mistake. The Outrigger doesn't even have enough guests to keep it functional. Hotels do not ensure revenue.

Please, read the scientific proof below and state in your report that this Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keauhou Bay as stated in all the different reported articles below.

Please see the following article that states "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES

Why does Hawaii have a runoff problem?  
Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from

Even with storm drains if you allow this development it WILL POLLUTE Keauhou Bay because as the above article (that was written in 2014 because runoff water from developments were polluting the ocean even then) states, and this is bay holds many sea creatures such as sea turtles, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals that have rested on the dock before and...

Keauhou Bay is a DOCUMENTED RESTING AREA for the ENDANGERED MONK SEAL, and if a resort is allowed to be built, that will bring a lot more people down to Keauhou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE.

This information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media.

There's a seal on the beach! Let's go get a 'sealfie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species. In , NOAA scientists used social media to monitor human activities around endangered . They discovered that human disturbance is more common than they thought."

Has there been a detailed traffic study for the increase in cars that will be added to this already severely traffic area?

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks

If you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years and, "Noise Pollution

Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behaviour of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

Please, Do NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project, because it is scientifically proven that developments will ALWAYS have rain runoff that will pollute nearby waters constantly during development and after.

Please, read the Scientific articles below written by NOAA, National Oceanic and Atmospheric Administration and other professional organizations, that prove that developments have ALWAYS polluted the water in every coastal development area.

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all Aquatic Life there, and even the Manta Rays that go there to eat zooplankton from the Manta Ray tours at night, and they eat it during the day in that area as well because they need to eat 5 times their body weight in zooplankton daily. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates

If you allow this bay to be development you will be allowing all types of marine life to die and there is NO WAY to stop this from happening because polluted runoff rain water

from developments can't be fully stopped. It is what has happened in ALL coastal developments.

Please read the Scientific proof below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide...

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-off)."

This article is by the Coral Reef Alliance here in Hawaii. "An ecosystem under threat: Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive."

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development."

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban run-off, may be exacerbated under high thermal

stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii".

The Chesapeake Bay has a foundation that is trying to save it due to runoff pollution that was caused by developments, and the Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed because this bay is very small.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow...

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and it's rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live."

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay because it is so much smaller than the Chesapeake Bay.

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species."

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide."

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral."

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival"

It's Been Proven Resort Developments KILL Marine Life

The manta rays go to Keauhou Bay every night to eat zooplankton and if you allow this development that WILL have runoff water, you WILL be causing zooplankton to be seriously affected because as this article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in . As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that proves runoff from development in this area will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the

terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." htt

"Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain". This information is in article by MarineBIO.

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton. There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this could cause the manta ray food source to disappear and that will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on the manta ray tour for their income.

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will force bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed.

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of every year are wreaking havoc on its natural -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in "

If you allow this resort to be developed, you will be destroying the coral reefs in the bay because this bay is extremely small and used by a lot of locals already for fishing, canoeing, swimming, snorkeling, paddle boarding, surfing, boating...it can't afford more use by many thousands more people yearly.

If you allow Keauhou Bay to be developed there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that, "Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with metapopulation theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii. Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management."

A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads

The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island can not handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawaii! News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Please watch their video on their link below because it is a professional report on Big Island traffic problems.

With more tourists comes more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state, This time last year Hawaii island was at five traffic deaths, as of April 1, 2024, they're at 14. Seven of which happened in the last two weeks...

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added."

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example, "On the Big Island, the mayor had to issue shutting down Waipio Valley Road due to overuse and poor prior maintenance."

Please, watch the NEWS video from the link below on aerial footage in Hilo because the footage shown is the same thing that is happening on Aalii Drive and Queen K HWY, and for the same reasons.

There are 2 developments already on Aalii Dr. being built as of today, and more are scheduled for this road in the near future, and Aalii Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow already.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening in Kona on the roads Kamehameha Schools wants to develop their resort, "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution."

There was a crash on Aalii Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direction traffic. and that adds even more traffic to this already seriously congested road, and Kamehameha Schools wants to add a resort on this road, and that will increase the traffic even more.

No new hotel on Keahou Bay.

Please, save Keahou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools because all of these articles prove it would be extremely damaging to the waters at Keahou Bay.

Thank you,

Sincerely,

Jennifer Ball

## Joyce Barbarich

Keauhou Bay receives an inordinate amount of pollution from runoff, especially after rain. Clearing land and paving more roads will remove the natural filter that cleans some of the water. This and increasing human and vehicle traffic above the bay will further damage the marine life in and near the bay. Adding upscale tourist accommodations to a small area of great historical and cultural importance, the birthplace of King Kamehameha III, is a shocking affront, disrespectful to Hawaiians, and a blatant grab for yet more money at the expense of the environment, local residents, and those who sincerely care about history. Setting up an educational feature on the birthplace site is warranted but bringing hundreds more tourists and vehicles to the area will be catastrophic. Please deny permission for this new resort development.

**From:** Danica Ann Barretto  
**Sent:** Tuesday, July 23, 2024 8:56 AM  
**To:** 221053-01 KS Keauhou Entitlements  
**Subject:** Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT!

**Categories:** Green Category

To whom it may concern,

Please reject Kamehameha Schools EIS for Keauhou Bay to become a Bungalow Resort. This is a VERY small bay and the added footprint of a 105 room Resort, that will include excess traffic, will have a **serious negative impact** in Keauhou Bay.

Please, Do NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near coastal development area. An article entitled, "*What is the biggest source of pollution in the ocean?*" by NOAA, *National Oceanic and Atmospheric Administration*, states, "*When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides.*" It also states, "*Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called, nonpoint source pollution, which occurs as a result of runoff.*"

The trees you want to take down keep the runoff pollution from the golf course from going into the Bay. According to the National Library of Medicine, in their article, "*Putting the Earth in Play: Environmental Awareness and Sports*," shares that the golf industry uses **approximately 50 pesticide active ingredients**, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are **being held off** from running into the Bay by the very trees you want to take down.

Let's not forget the marine life that will be threatened by excess pollution and traffic. Keauhou Bay is the monk seals and the green sea turtle's habitat. More pollution and people will endanger these species.

This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced.

Kind Regards,  
Danica Ann Barretto

Mark Barville

Please leave the area alone. Keep it natural. Plant native species, create natural paths with benches, remove unnecessary concrete and asphalt. What would Hawaiians of 1800 have wanted?

COMMENTS REGARDING:

Draft Environmental Impact Statement (DEIS)  
for the Kamehameha Schools Keauhou Bay Management Plan  
Keauhou, Hawai'i Island, Hawai'i

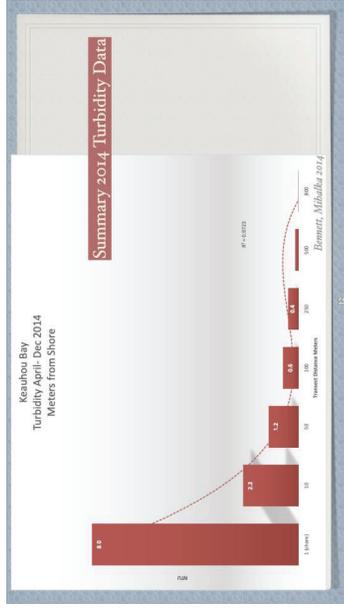

Richard H. Bennett MS, PhD  
Applied Life Sciences LLC

The following comments pertain specifically to water quality issues affecting Keauhou Bay. The draft EIS does not address these nor accounts for the fact that the State and the EPA list Keauhou Bay as an Impaired Water Body under section 303 D of the Clean Water Act (CWA). That law requires that impacts to the Bay be mitigated and that further impairment does not occur. This requirement under the law has not been met. Any development in the watershed needs to be conducted by a careful evaluation of this fact. Under the law, remediation begins by conducting a Total, Maximum Daily Loading study known as a TMDL. The Bay is listed as impaired for exceeding the limits for turbidity. Turbidity has several causes in near-shore waters, such as runoff water with fine sediments and phytoplankton. Our research shows that turbidity is a problem in Keauhou Bay in the absence of surf events. The turbidity is also due to the overgrowth of marine phytoplankton. Our studies show that turbidity declines along a line moving offshore. The inner Bay has very poor circulation and is where most sediments and other factors causing turbidity arise. Phytoplankton grow in response to increased temperature and nutrient loading in the Bay. The lack of adequate circulation amplifies the problem.

The photo was taken in the summer of 2007 in response to concerns about the greening of Keauhou Bay. The brand name on the canoe paddle is not legible. (photo credit Bennett).

Figure 1. Nine-month summary of turbidity data for the Bay.

(Bennett 2002)

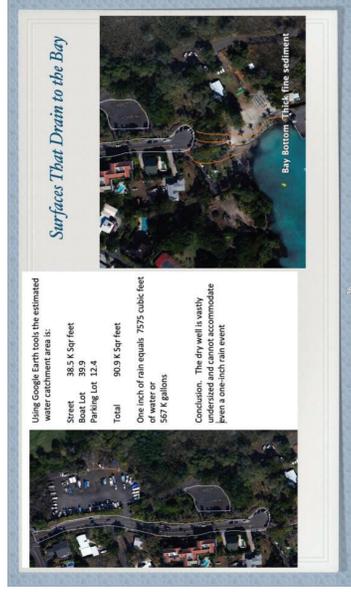

The nine-month summary chart above shows that turbidity is worse at the shoreline and decreases non-linearly in waters offshore. The slight rise in turbidity at 250 meters may be more of a phytoplankton effect than sediment.

The DEIS makes the following statement regarding groundwater.

*Due to the low frequency of substantial rainfall and high permeability of the soils throughout the Project in this area, surface runoff generally does not occur in the typical rainfall occurrence. Runoff either percolates into the underlying groundwater or evaporates into the atmosphere. There are no drainage reports or calculations on file with the County of Hawai'i or DOT for the adjacent public roadways or surrounding developed properties. However, existing stormwater runoff peak flow estimates for the three (3) drainage basins within the Project Area are presented in Table 4-4.*

The draft EIS fails to account for surface water runoff from Kamehameha III Road. At the Bayside terminus of the road is a dry well. It is typically loaded with sediment and unable to handle the storm flows that come down the length of the road. Thereafter, water overflows the curb and goes down the driveways and the slope into the Bay. As it does, it picks up considerable sediment and delivers it to the near-shore waters, increasing the turbidity problem (Fig 3).

Figure 2. Rain catchment area and water volume estimate.

(Bennett 2002)

As calculated above, a one-inch rain can produce over five hundred thousand gallons of water, with most of the flow eroding fine sediments as it enters the Bay (Figure 3). The County of Hawai'i was made aware of this dry well failure four years ago. Some of this water comes off of Kamehameha Schools land.

The DEIS statement that rainwater percolates to groundwater suggests groundwater is the terminus and the water does not flow to the sea. For at least 25 years, it was the position of the State that groundwater under the land does not communicate with the sea. Considerable research, such as Kneee (2010), Dulai (2020), Peterson (2009), and others, shows that the State's policy is specious and not science-based. The State's anchialine system is a subterranean estuary (Bishop 2015). Consequently, the DEIS must reconsider the implication that the local groundwater is an inconsequential endpoint for fresh and waste water flows. A recent US Supreme Court decision held that wastewater disposal to the nearshore groundwater without the necessary permit was a violation of the CWA (see footnote page 7).

Figure 3. Stormwater and sediment flow into the Bay.

The photos suggest considerable sediment erosion into the Bay.

Nutrient Degradation and Impairment of the Bay.

The draft EIS does not account for the elevated levels of nutrients in the Bay. Again, our research shows that nitrogen and phosphorus exceed state standards. Unlike other locations, it is unfortunate that the Hawai'i Department of Health fails to measure these nutrients in the Bay. Thus, conducting a nutrient analysis of the Bay waters was necessary. That analysis is provided below.

Table 1. Nutrient analysis along transects over three quarters of 2019

Location	Date	SI	SI	NH <sub>4</sub> <sup>+</sup> NO <sub>3</sub> <sup>-</sup>	NH <sub>4</sub> <sup>+</sup>	NO <sub>3</sub> <sup>-</sup>	Salinity	HPO <sub>4</sub> (State)		Keaouhu State		Hawaii (EIS) (State)

Note: The NELHA Lab has multiple certifications, including the State Department of Health

None of the nutrient values for water collected as shown above met state standards. The elevated nutrients in the Keaouhu Bay watershed come from various sources. A common misconception is that fertilizers applied to private properties and the local golf course are the significant sources. However, research shows that nutrient leaching from the Mauna Kea and Keaouhu golf courses is minor compared to the nearby homes on Puako Drive (Dialer 2011). The likely source is the myriad cesspools in the watershed. Some homes on the North peninsula of the Bay are connected to sewers, but most homes are not.

The elevated levels of ammonia suggest a water connection to fresh sources of animal and human waste. Ammonia in marine water is quickly converted to nitrate. Our data also shows the nitrogen and phosphorus levels exceed state standards for the Bay. Had the State collected this data, the EPA would declare water impairment from these nutrients. These elevated nutrients can cause the seasonal "greening" of the marine waters (Smith 2020).

The draft EIS makes no mention of nutrient pollution issues and implies that all new developments will be connected to the sewer line that transmits raw sewage to the Heeia wastewater treatment plant. The treated wastewater containing most of the nutrients in human waste is conveyed to the golf course to irrigate the golf course. It is not known the extent to which those nutrients leech into the groundwater and the Bay. It is also not known how much more water the golf course will utilize in the future.

Several residences and perhaps some commercial facilities in the proposed development area use cesspools or septic systems for human waste management. The impact on the Bay is significant and needs to be described and mitigated. However, this problem is not mentioned in

the DEIS. It is more than advisable that the Project connect all waste systems to the regional sewer.

It is well established that sewer lines leak, which is a function of many factors such as piping class and age (Rutch 2006). In the project area, some sewer lines are quite old. One such line on the East shore of the Bay broke during a significant tidal event. The DEIS does not account for sewer line leakage or the risk from extreme tidal events. This problem needs to be evaluated, and where sewer lines are at risk and need to be replaced by resilient lines such as High-Density Polyethylene (HDPE).

Figure 4. Nitrogen (delta N 15) signatures along the Keauhou Region shoreline

Figure 1 Q (Dallier 2011)

#### Nitrogen Signatures in the Keauhou Area

The magnitude of the delta N 15 value indicates the greater contribution of human (animal) waste nitrogen. Raw sewage water is currently conveyed from the hotel at the Bay to the Heeia Wastewater Treatment Plant (HWWTP). The Secondary treated wastewater (WW) is provided to the local golf course for irrigation. How much water the golf course needs or could utilize is unknown. Casual observation of the course suggests that it is under-irrigated. Nutrients in the WW are not removed but beneficial to the grass. Delta N 15 data indicates that the golf course contributes negligible human (animal) nitrogen to the near-shore waters.

In contrast, the Delta N 15 values are higher in the Bay proper. The source is likely human waste from cesspools in the immediate region. Less than half of the homes are connected to sewer. It is imperative that the DEIS account for these sources and provide sewer design criteria for all new developments to be connected to the HWWTP.

Figure 5. Non-permitted wastewater discharge to the Bay

Some years ago, federal funds were provided to upgrade the Bay boat launch facilities. Before the upgrade, boat wash water flowed over the surface and into the Bay. A dry well was installed, and it drained to surface water only a few feet below the drain. Boat wash water is potable water. The wash water contains fish liquids, blood, and particulate fish waste. This wastewater may be a source of ammonia in the Bay. Washed bilge water often contains oil products. The data in Figure 5 is from the wash water surface drain at Honokohau Harbor.

Since it is obvious this wash water flows into the Bay in the groundwater, the State should have applied for an NPDES permit. Such a permit is required for any ocean discharge of wastewater, especially in waters known to be Impaired under the CWA. This requirement has been affirmed by the Supreme Court<sup>1</sup>.

#### Conclusions

The surface water and groundwater flows from the proposed development and those in the upper watershed need to be considered to ensure that further degradation of this impaired water body does not occur. This is referred to herein as a TMDL. Given the environmental ethics of Kamehameha Schools and the legal history of the Public Trust Doctrine of the State Constitution<sup>2</sup>, we suggest that these environmental impacts described above be studied for the project design and mitigated.

<sup>1</sup> County of Maui, Hawaii v. Hawaii Wildlife Fund, 140 S. Ct. 1462, 590 U.S. 165, 206 L. Ed. 2d 640 (2020).

<sup>2</sup> Kelly v. 1250 Oceanside Partners, 140 P.3d 985, 111 Haw. 205 (2006).

Keauhou Bay is a small bay inlet on Hawai'i Island and, as such, is subject to much more degradation than the open shore area of West Hawai'i. As such, the Bay requires special protections.

Sincerely,

/s/ R.H. Bennett MS, PhD, President

**Subject:** Keaouhou Bay EIS - Oppose This Development!

**Categories:** Green Category

To whom it may concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools EIS for Keaouhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keaouhou Bay as stated in all the different researched articles below.

Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project, because it is scientifically proven that developments pollute nearby waters constantly during development and after.

Please read these Scientific articles written by NOAA, National Oceanic and Atmospheric Administration and many other professional organizations, that have studied and proved that developments has ALWAYS polluted the water in every near coastal developed area.

**First, does this EIS have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development and golf course runoff because Keaouhou Bay is their habitat and this development WILL be CHANGING an Entire Ecosystem.**

**In the Endangered Species Act of 1973 Under Section 2 (b), "to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.**

The Green Sea Turtle swims in Keaouhou Bay weekly and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

"Hawaiian monk seals are protected federally by the ESA and the [Marine Mammal Protection Act \(MMPA\)](#), as well as locally by Hawai'i Revised Statutes (HRS) [Chapter 195D](#) and Hawai'i

Administrative Rules (HAR) [13-124](#)." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

[ENDANGERED SPECIES CONSERVATION](#)

Endangered Species Act

"**Section 2. Findings, Purposes, and Policy**

**(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—**

**(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section." This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-act>**

Keaouhou Bay IS the monk seals and the green sea turtle's habitat and to allow a bungalow resort to be developed in Keaouhou Bay, that is these endangered species habitat, is to threaten these endangered species habit with golf course runoff pollution, as well as development pollution and hence, threaten their habitat, hence their lives, and goes completely against the Endangered Species Act of 1973.

The words in the Endangered Species Act states, "to conserve" and conserving the endangered species that enter into Keaouhou Bay would be to NOT DEVELOP A BUNGALOW RESORT because this would cause serious pollution runoff that would pollute the bay and endanger these already endangered species, the green sea turtle and the monk seal.

**Does this EIS have any reports on the endangered species that frequent Keaouhou Bay because this is their habitat.**

**Under the Conservation Program there should be research done on endangered species and their associated ecosystems, which is Keaouhou Bay. Because this bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.**

**"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hrscurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)**

**Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species."** [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please see that developing Kamehameha Schools Bungalow Resort in Keaouhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would happen a lot more often due to taking out the natural pollution filter, that is the trees and the land that is there now.

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keaouhou Bay more severely because of the bungalow resort development's pavement. As of right now the trees and land that this development wants to clear and develop into a bungalow resort is a Natural Pollution Filter.

Please read from **Wikipedia**, "**Most drains have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean.** Other than catchbasins, typically there are no treatment facilities in the piping system." [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20dry%20wells)

It's the pavement that this development wants to put in that will cause a lot of pollution to runoff into Keaouhou Bay because this top land that is directly below the golf course (that they want to clear) soaks in the golf course pesticides, fertilizer, weed killer... and is the BEST AND ONLY PROTECTION POLLUTION FILTER Keaouhou Bay has from the golf course pollution.

Please see this site at <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> because on page 2 it states from the Hawaii's government that **Natural Ground Cover has 10% runoff, where has development has 55% runoff.**

**These trees and land** are saving monk seals and green sea turtles habitat from the golf course pollution and this land **MUST BE PRESERVED and CONSERVED** as the natural protector for Keaouhou Bay hence, **for these endangered species habitat.**

**Under Section 2 (b) of the Endangered Species Act** - Keaouhou Bay MUST BECOME a CONSERVATION AREA for these endangered species because it is their habitat as of today, and to allow a resort development to be built above this bay would threaten the very lives of these endangered species because it will allow golf course toxic pollution and development pollution to run into these species natural habitat, which is Keaouhou Bay.

Keaouhou Bay has trees and land just under the golf course (that Kamehameha Schools wants to clear for their bungalow resort) that protects Keaouhou Bay from a lot of algae blooms because it soaks up pollution that is runoff from fertilizer, weed killer... in the golf course, and unfortunately when there is a severely heavy rain storm the land up on top of the bay has a greater runoff than normal from the golf course pollution, and pollution foam and algae blooms happen because of it.

If you clear this land, this kind of algae bloom will happen a lot more often and end up killing a lot of coral and marine life as stated in the many articles that will follow.

One of these articles is in the Global Coral Reef Alliance. They researched the reef before and after a golf course development, and even though this development is not a golf course development, it is still a development and it will also be located just under a golf course and this will allow the pollution from the golf course to come down to the bay a lot more often because the natural land that soaks up this pollution will be gone.

**Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?**

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development.. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution.. "<https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keaouhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING KEAOUHOU BAY'S ECOSYSTEM because the golf course runoff won't have the best protection which is the natural trees and land that can soak up the polluted water most of the year and polluted foam algae blooms will happen a lot more often.

Here is another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef

...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

### **Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?**

This needs to be fully known because you will be changing an entire ecosystem to build a bungalow resort. Because it rains in Keauhou Bay many nights out of the year and the land they want to clear absorbs the golf course toxins so this bay is not as severely polluted as it will be with pavement and development, and when serious storms come Keauhou Bay won't stand a chance because the land can't keep ALL golf course pollutions out during this time and pavement won't even come close.

"If there are [toxic algal blooms](#), like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

### **Federally Protected Green Sea Turtle Swim in Keauhou Bay Often**

The green sea turtle that is federally protected and can be seen in Keauhou Bay weekly. Please see the following article that states "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES

### **Why does Hawaii have a runoff problem?**

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste....

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

If you allow this development it WILL POLLUTE Keauhou Bay as the above article (that was written in 2014 because runoff water from developments were polluting the ocean even then) states, and this bay holds many sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals that have rested on the dock before and..that will ALL be harmed by the more sever pollution runoff that WILL happen because developments can't help but pollute the water nearby.

Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL, and if a resort is allowed to be built, that will bring a lot more people down to Keauhou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE.

### **Has the EIS done any research on what a high population would do in such a small area, and what will happen to the endangered species that live there because it's their habitat and a high population will change this bay forever?**

This information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media.

There's a seal on the beach! Let's go get a 'sealfie'!" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species. In [a recent study](#), NOAA scientists used social media to monitor human activities around endangered [Hawaiian monk seals](#). They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-ery-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

### **Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?**

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, in Hilo, Puna, and there are Ocean View and Volcano housing construction projects as well. The entire Big Island has construction projects all over.

### **Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?**

Because, "Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises.

Worldwide, hotels produce almost [300,000 tonnes of waste each year](https://www.homebiogas.com/blog/hotels-waste-management/)." <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means these resources and infrastructures will be taxed even more in the near future.

Please read the below articles that prove that Big Island doesn't have the resources or infrastructure for a Bungalow Resort Development because it will increase the need for resources and infrastructure that the island doesn't have as of today.

### **Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill**

September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years. (File photo)

Of the 900 total votes in our most recent poll, which asked people to weigh in on the best way to extend the life of the Big Island's [only remaining landfill](#), all of the above was the most popular answer, garnering 274 votes, or 30%.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

#### **A county commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill**

By [Megan Moseley](#) September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

#### **Time's Up For Landfills**

##### **'Gentle' demolition strategies can help preserve resources**

**PAULA BENDER April 2, 2024**

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

#### **Drought Conditions On Hawai'i Island Prompt Water Supply Message**

by **Big Island Video News**  
on Oct 5, 2023 at 3:59 pm

**(BIVN)** – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information [from the U.S. Drought Monitor](#). There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawai%CA%BBi-island-prompt-water-supply-message/>

[U.S.](#)

**Hawaii is "on the verge of a greater catastrophic," locals say, as water crisis continues**

By [Li Cohen](#)

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to [significant droughts](#), and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the [world's largest surfing wave pool](#) opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe."

"We are in a [water crisis](#), that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, **"We may come to a point where we have to decide ... who gets water and who doesn't."**

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island parts need to be shipped and the power plant has generators that are not working and because of this, and other reasons, the Big Island needs to seriously conserve power so that everyone will have power, and if this problem of shipping parts can happen once it can happen again.

UTILITIES

UPDATE: HECO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HECO credited conservation efforts,

particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power->

**Big power supply problems continue to plague Hawaii island**

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

**Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.**

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

### What You Need To Know

**-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity**

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

**Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keaouhou Bay?**

**Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keaouhou Bay, what traffic and increased population studies have they done? Because they will have employees with cars, guests with cars, visitors with cars and this would range at times at least over 200 cars or more, parking above Keaouhou Bay causing serious car population because of all these added cars right next to the bay.**

Article below is from NOAA.

**What is the biggest source of pollution in the ocean?**

**Most ocean pollution begins on land.**

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or **construction sites can run off** into waterways, harming fish and wildlife

habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirty%20ocean%20is%20a%20pollutant>

Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects

### News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a **new report** from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%2D%20Nearly%2085%20percent,pipeline%20spills%20C%20says%20a%20new>

### The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershepherds.org.au/blog/the-impact-of-stormwater-car-emissions/>

**Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keaouhou Bay during development?**

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behaviour of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

### OCEANS POLLUTION

How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawai'i's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

#### **What is ocean noise?**

"Ocean noise refers to sounds made by human activities that can **interfere with or obscure** the ability of marine animals to **hear natural sounds in the ocean**."

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

**The Chesapeake Bay has a foundation that is trying to save it due to runoff pollution that was caused by developments, and the Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed because this bay is very small.**

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...**runoff is a significant source of harmful nitrogen pollution that continues to grow...**

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

**Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.**

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live."

<https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20places%20in%20ceparady.>

**If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay because it is so much smaller than the Chesapeake Bay.**

**Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?**

**Because the studies below show developments kill coral, marine life and zooplankton are kill and negatively affected as well, and zooplankton is the manta ray food. Manta rays are in this bay every night to eat zooplankton and sometimes they are in this bay during the day time too.**

If you allow this bay to be development you will be allowing all types of marine life to die and there is NO WAY to stop this from happening because polluted runoff rain water from developments can't be fully stopped. It is what has happened in ALL coastal developments.

Please read the Scientific proof below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawai'i. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide..."

This was the third major bleaching episode in Hawai'i over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban runoff). <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,ha%20catastrophic%20impacts%20state%2Dwide.>

This article is by the Coral Reef Alliance here in Hawai'i. "An ecosystem under threat Hawai'i's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/w/here-we-work/hawaiian-islands/#:~:text=Hawaii%20reefs%20face%20major%20global,info%20Hawaii%20CBBIs%20waterways%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA. "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. **Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban run-off, may be exacerbated under high thermal stress.** In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawai'i". <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The coral all over Hawai'i has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all Aquatic Life there, and even the Manta Rays that go there to eat zooplankton from the Manta Ray tours at night, and they eat it during the day in that area as well because they need to eat 5 times their body weight in zooplankton daily. Please see the cited information below.

**"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.**

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

**"Impacts are known to be highly negatively impacted by developments because, coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species."** <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,service%20that%20coral%20reefs%20provide.>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development... This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,info%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,info%20the%20atmosphere%20within%20days.)

It's Been Proven Resort Developments KILL Marine Life

The manta rays go to Keauhou Bay every night to eat zooplankton and if you allow this development that WILL have runoff water, you WILL be causing zooplankton to be seriously affected because as this article by MarineBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that proves runoff from development in this area will hurt and kill plankton, by **Frontiers in Marine Science**, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon. The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl- $\alpha$  concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

"Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO.

<https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "**Toxic Effects of Pollutants on Plankton** There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation." [https://scope.dge.camegie-science.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.camegie-science.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this could cause the manta ray food source to disappear and that will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on the manta ray tour for their income.

**Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?**

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, **there likely be more than 6,300 people descending on Kona..**" <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life." <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

**Where are the EIS reports on human density because this resort will increase this area in population by hundreds. Below are reports that human population destroy coral reefs.**

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the **destruction of sensitive marine habitats** such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of **sediments** into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development/#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously

increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will forsore bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20population%20and%20greater, to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%20C%20the%20research%20found,&text=The%20millions%20of%20tourists%20who,world%20C%20a%20new%20study%20said.>

If you allow this resort to be developed, you will be destroying the coral reefs in the bay because this bay is extremely small and used by a lot of locals already for fishing, canoeing, swimming, snorkeling, paddle boarding, surfing, boating...it can't afford more use by many thousands more people yearly.

If you allow Keauhou Bay to be development there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that, "Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations

inland will lead to more runoff and siltation. Effects of human perturbations can be explored with metapopulation theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aqua culture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhahJhAnWAq453tRgN0JA1WcInR3ZoTv0PvGzA5lc\\_H00Lz4fNIP3ASnhgKRY6\\_vKLPw49dbmBYoXSg3YIMgOIGBZsandGUH7O1SLh9x5Pr3xED4KxL4T0sJlvGQ1a7ZrZr3rUbraxpodJd2AoNlSmWStx7JjEDdJpJ8OGJpx71TJWdCfXvFKJZYeNdeJ3Sw\\_dnaUg51ZlhcjPBDImmaH1.5vqT5Q%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhahJhAnWAq453tRgN0JA1WcInR3ZoTv0PvGzA5lc_H00Lz4fNIP3ASnhgKRY6_vKLPw49dbmBYoXSg3YIMgOIGBZsandGUH7O1SLh9x5Pr3xED4KxL4T0sJlvGQ1a7ZrZr3rUbraxpodJd2AoNlSmWStx7JjEDdJpJ8OGJpx71TJWdCfXvFKJZYeNdeJ3Sw_dnaUg51ZlhcjPBDImmaH1.5vqT5Q%3D&tracking_referrer=abcnews.go.com)

**A Resort Development WILL Increase Traffic on Already Severely Trafficed Roads. Where are the traffic study reports for this EIS because with 150 rooms comes over 150 cars because you must include employee cars, as well as visitors for the people staying in the resort, and what if the guests have more than one car?**

The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island can't handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawaii's News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Please watch their video on their link below because it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists comes more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state, This time last year Hawaii island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks...

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

“We don’t have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn’t exist here,” he added. <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example, “On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance.” This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

Please, watch the NEWS video below on aerial footage in Hilo because the footage shown is the same thing that is happening on Alii Drive and Queen K HWY, and for the same reasons, all of these roads only have 2 lanes.

There are 2 developments already on Alii Dr. being built as of today, and more are scheduled for this road in the near future, and Alii Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems, traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening in Kona on the roads Kamehameha Schools wants to develop their resort, “Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution.” [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313e78e4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313e78e4c19.html).

There was a crash on Alii Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direct traffic. and that adds even more traffic to this already

seriously congestion road, and Kamehameha Schools wants to add a resort on this road that will increase the traffic by 100’s of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=FQ5snPjii8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Please read this Path article, HAWAII COUNTY’S VISION ZERO INITIATIVE

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

“That’s just Big Island traffic,” is a common sentiment. But what if we didn’t have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?”

This was taken from Path as well as The Law of the Splintered Paddle below <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

### **The Law of the Splintered Paddle**

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing

them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law, "[ʻĀkūʻnʻʻĀwāi Mʻmalahoe](#)", or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless (especially kʻpuna and keiki) across Hawaiʻi be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaiʻi. After being added back in 1978, the law is part of Hawaiʻi's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

-Caring for and serving one's people

-Knowing and doing what is pono (right)

-Standing for the principle that leadership privilege is earned

-Taking kuleana (responsibility) for those we serve

-Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

**The Law of the Splintered Paddle is also on Kamehameha Schools website**, so they should want to help make Big Island roads become safer and not add to the traffic and possible traffic death toll problem. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

**Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious Resource and Infrastructure issues. Please read the articles below.**

**The Big Island Doesn't Have the Resources and Infrastructure for Another Resort**

Please see the articles below because the Big Island doesn't have the resources or infrastructure to safely add another resort development on island and these other NEWS and Research articles prove this point.

1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem/>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity.

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste Hawai'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the east side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

4)"What happens to Hawaii Island's trash and recyclables? BY MICHELLE BRODER VANDYKE HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder Vandyke Hawaii Island PUBLISHED 11:30 AM ET Dec. 17 The future of the landfill

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community support." <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables-->

5) "The overwhelming plastic waste Hawaii visitors leave behind By Nataasha Bourlin/Aug 24, 2023

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/plastic-waste-hawaii-visitors-leave-behind-18286076.php>

6) "A county commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill By Megan Moseley September 6, 2023 · 1:00 AM HST  
\* Updated September 6, 2023 · 2:02 PM

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill." <https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

7) "Hawai'i County issues mandatory 25% water restriction for North Kona August 7, 2023 · 5:21 PM HST

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend." <https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

8) "Hawai'i Water Supply Closely Monitored As Severe Drought Continues by Big Island Video Newson Nov 6, 2023 at 3:28 pm STORY SUMMARY

HAWAII COUNTY - Officials say a special focus will be placed on the South Kohala Water System, which is more susceptible to drought conditions." <https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-ca-%BBi-inder-severe-drought/>

9) "Big Island Concerns About Water Quality Prompt A Lawsuit Over A Kona Sewage Plant Kealakehe sewage plant discharges more than 1 million gallons of wastewater into a lava pit near the ocean. By Paula Dobbyn / February 6, 2024

Settlement talks are scheduled in an environmental lawsuit involving a county-operated Big Island sewage plant in Kona." <https://www.civilbeat.org/2024/02/concerns-about-water-quality-prompt-a-lawsuit-over-a-kona-sewage-plant/>

10) "Researchers find sewage from an oceanfront Big Island community reaches nearshore waters Hawai'i Public Radio | By Russell Subiono, Sophia McCullough Published December 20, 2021 at 5:56 PM HST

There are nearly 50,000 cesspools on the Big Island, with tens of thousands posing a risk to water resources, according to the Hawai'i Department of Health." <https://www.hawaiiipublicradio.org/the-conversation/2021-12-20/researchers-find-sewage-from-an-oceanfront-big-island-community-reaches-nearshore-waters>

11) "Kona coast faces stark wastewater tradeoffs Current situation

There are approximately 88,000 cesspools across the state, releasing more than 200,000 cubic meters of wastewater per day to the environment. <https://www.hawaii.edu/news/2021/09/10/kona-stark-wastewater-tradeoffs/>

We ask that you start figuring out how this can never happen again? These are the kind of issues that need to be resolved before you approve more development.

12) "BIG ISLAND NEWS HECO restores power after initiating emergency outages on Big Island by: Elizabeth 'Ufi' Posted: Jan 30, 2024 / 09:43 AM HST Updated: Jan 30, 2024 / 04:15 PM HST

An unexpected loss of several large Hawaii Electric generators left some residents on Big Island without power for parts of the morning on Tuesday, Jan. 30." <https://www.khon2.com/big-island-news/heco-initiates-30-min-rolling-outages-after-loss-of-generators/>

13) Hawai'i State News Update: Hawaiian Electric initiates rolling outages throughout Big Island February 13, 2024 · 5:23 PM HST  
\* Updated February 14, 2024 · 4:21 PM

The emergency outages are being initiated in various areas around the entire island to prevent loss of power to an even greater number of customers. The timing and extent of the outages will depend on the amount of demand on the system and the availability of generators." <https://bigislandnow.com/2024/02/13/hawaii-island-customers-asked-to-reduce-electricity-use/>

14) "LOCAL NEWS

HECO issues rolling power outages around Big Island by: Emily Cervantes Posted: Feb 13, 2024 / 05:11 PM HST Updated: Feb 13, 2024 / 09:12 PM HST Hawaiian Electric initiated rolling outages for Big Island after several large generators became unavailable and reduced output Tuesday night." <https://www.khon2.com/local-news/heco-releases-conservation-alert-for-big-island/>

15) "Here's how power outages can have repercussions for Hawai'i's water supply Hawai'i Public Radio | By Savannah Harriman-Pote Published February 13, 2024 at 10:59 AM HST

Water departments on O'ahu and Hawai'i Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply?

It is impossible to separate Hawai'i's power system from its water system, said Kawika Uyebara, deputy director of Hawai'i County's Department of Water Supply." <https://www.hawaiiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-conserve-water-amid-power-outages>

16) U.S. Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues  
By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "we're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) NewsHawai'i County issues mandatory 25% water restriction for North Kona  
August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

18) Hawai'i Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News  
on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawai%CA%BBi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

20) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnur3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/BigIsland/comments/1bnur3/hawaiian_electric_is_reporting_that_several_large/?rdt=52660)

21) "NewsHawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will damage Keauhou Bay coral and marine life and, Big Island resources and infrastructure are currently being negatively affected from the development that is on island already, and there are years of new development that have already been approved, before having safe resources and infrastructures for new developments.

With these scientifically proven articles by some of the most professional scientists in the world, they say the a serious population increase, as well as development and resort runoff that happens because of parking lots, and... with all coastal developments, it will be dangerous for Keauhou Bay to be development because it will damage the marine ecosystems in the area.

Please, save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools because all of these articles prove it would be extremely damaging to the waters at Keauhou Bay.

Thank you,

Sincerely,

Robert Berger

**Sent:** Monday, July 15, 2024 4:40 PM  
**To:** 221053-01 KS Keauhou Entitlements  
**Subject:** Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT!

**Categories:** Yellow Category

To whom it may concern,

Please, read the scientific proof below and state in your report that this Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keauhou Bay as stated in all the different reported articles below.

The Green Sea Turtle swims in Keauhou Bay weekly and the monk seal as also been seen in Keauhou Bay.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>.

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawai'i Revised Statutes (HRS) Chapter 195D and Hawai'i Administrative Rules (HAR) 13-124." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

#### ENDANGERED SPECIES CONSERVATION

#### Endangered Species Act

#### "Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section." This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-act>

The word in the very Endangered Species Act states, "to conserve" and conserving the endangered species that enter into Keauhou Bay would be to NOT DEVELOP A BUNGALOW RESORT because this would cause serious runoff that would pollute the bay and endanger these already endangered species the green sea turtle and the monk seal.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall

utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." This was taken from [https://www.capitol.hawaii.gov/hrcurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrcurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm).

Please, see that developing Kamehameha Schools Bungalow Resort in Keauhou Bay would threaten endangered species due to the unavoidable pollution runoff that would happen a lot more often due to taking out the natural pollution filter, that is the trees and the land.

Keauhou Bay has the trees and land just under the golf course (that Kamehameha Schools wants to clear for their bungalow resort) that protects Keauhou Bay from a lot of algae blooms because it soaks up pollution that is runoff from fertilizer, weed killer... in the golf course, and unfortunately when there is a severely heavy rain storm the land up on top of the bay has a greater runoff than normal from the golf course and an algae bloom happens.

If you clear this land, this kind of algae bloom will happen a lot more often and end up killing a lot of coral and marine life as stated in the two Global Coral Reef Alliance articles below because this is what happened in the Bahamas when they researched the reef before and after a golf course development, and even though this development is not a golf course development, it will be just under one and this will allow the pollution from the golf course to come down to the bay a lot more often.

This information was taken from Global Coral Reef Alliance titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution."  
<https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come because the golf course runoff won't have the best protection which is the natural trees and land that can soak up the polluted water most of the year and this kind of harmful algae bloom will happen more often.

Here is another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef

...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

Heavy storms can come in and serious toxins from the golf course are able to run into Keauhou Bay causing Algae Blooms and Sea Foam even with the best filter which is the trees and land because at times tropical storms are more than any land can absorb. .

This doesn't happen that often but if you allow this Bungalow Resort development in Keauhou bay, algae blooms and sea foam will happen more often because fertilizer, pesticides, waste...will be allowed to runoff into the bay because the natural pollution filter, the trees and land will be gone and pavement can't hold as much runoff as the natural trees and land.

"If there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

Algae Bloom photos taken in Keauhou Bay Feb. 14, 2024. Sea Foam in Keauhou Bay Dec. 2020.

#### Federally Protected Green Sea Turtle Swim in Keauhou Bay Often

The green sea turtle that is federally protected and can be seen in Keuhou Bay weekly. Please see the following article that states "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Even with storm drains if you allow this development it WILL POLLUTE Keauhou Bay as the above article (that was written in 2014 because runoff water from developments were polluting the ocean even then) states, and this bay holds many sea creatures such as the protected green sea turtle, spotted eagle rays,

manta rays, octopus, dolphins, fish, coral, monk seals that have rested on the dock before and...that will ALL be harmed by the more severe pollution runoff that WILL happen because developments can't help but pollute the water nearby.

Keauhou Bay is a DOCUMENTED RESTING AREA for the ENDANGERED MONK SEAL, and if a resort is allowed to be built, that will bring a lot more people down to Keauhou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE.

This information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media.

There's a seal on the beach! Let's go get a 'selfie'!" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species. In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

Has there been a detailed traffic study for the increase in cars that will be added to this already severely traffic area?

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs>.

If you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years and, "Noise Pollution

Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behaviour of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawai'i's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations.

Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations>.

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL, seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

Please, Do NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project, because it is scientifically proven that developments will ALWAYS have rain runoff that will pollute nearby waters constantly during development and after.

Please, read the Scientific articles below written by NOAA, National Oceanic and Atmospheric Administration and other professional organizations, that prove that developments have ALWAYS polluted the water in every coastal developed area.

The coral all over Hawai'i has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all Aquatic Life there, and even the Manta Rays that go there to eat zooplankton from the Manta Ray tours at night, and they eat it during the day in that area as well because they need to eat 5 times their body weight in zooplankton daily. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

If you allow this bay to be developed you will be allowing all types of marine life to die and there is NO WAY to stop this from happening because polluted runoff rain water from developments can't be fully stopped. It is what has happened in ALL coastal developments.

Please read the Scientific proof below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawai'i. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts statewide..."

This was the third major bleaching episode in Hawai'i over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers

of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban runoff). " <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event>

<https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event>

This article is by the Coral Reef Alliance here in Hawai'i. "An ecosystem under threat Hawai'i's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff.."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaii/>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status-report/docs/Hawaii\\_status\\_report\\_forw\\_b.pdf](https://www.coris.noaa.gov/monitoring/status-report/docs/Hawaii_status_report_forw_b.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019.."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban runoff, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawai'i." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The Chesapeake Bay has a foundation that is trying to save it due to runoff pollution that was caused by developments, and the Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed because this bay is very small.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, " ...runoff is a significant source of harmful nitrogen pollution that continues to grow ..."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to

100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and it's rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#~:text=Besides%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay because it is so much smaller than the Chesapeake Bay.

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#~:text=Impacts%20from%20land%20based%20sources,and%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide.>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_coral/coral09\\_humanthreats.html#~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humanthreats.html#~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_coral/coral09\\_humanthreats.html#~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humanthreats.html#~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

It's Been Proven Resort Developments KILL Marine Life

The manta rays go to Keauhou Bay every night to eat zooplankton and if you allow this development that WILL have runoff water, you WILL be causing zooplankton to be seriously affected because as this article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton — a

change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem...

Here is another article that proves runoff from development in this area will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon. The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of chl-*a* concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

"Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20als%20sensitive%20to%20light%20and%20increases%20in%20predation.>

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton. There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation." [https://scope.doe.carmegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_57-274.pdf](https://scope.doe.carmegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_57-274.pdf)

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this could cause the manta ray food source to disappear and that will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on the manta ray tour for their income.

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will for sure bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by

humankind's continued numerical increase." This is in the article by National Library of Medicine National Center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-20research/story?id=96308858#:~:text=The%20less%20people%20at%20a%20site%20are%20the%20research%20found.&text=The%20millions%20of%20tourists%20who%20visit%20a%20new%20study%20said.>

If you allow this resort to be developed, you will be destroying the coral reefs in the bay because this bay is extremely small and used by a lot of locals already for fishing, canoeing, swimming, snorkeling, paddle boarding, surfing, boating...it can't afford more use by many thousands more people yearly.

If you allow Keauhou Bay to be developed there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that, "Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with metapopulation theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii: Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgONhahhIAnWAq453trRgN0jAIWv9mR3ZoTv0PyGzA5lc\\_H001zeHNIP3ASnhcgKrv6\\_vkLjPw49dbmBYoXSg3YlMgOIGBZsapdGUH701SLbu9x5P:3xED4Kx4t0sllvg01a72ZRt3rUbraXp0dl2AoNSmWSuxB7jEDdpI8OGIpx71TIWdCfXvFKIzYeNdcj3SwdnaUg5IzHcIFBDImmaH15vqT5Q%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgONhahhIAnWAq453trRgN0jAIWv9mR3ZoTv0PyGzA5lc_H001zeHNIP3ASnhcgKrv6_vkLjPw49dbmBYoXSg3YlMgOIGBZsapdGUH701SLbu9x5P:3xED4Kx4t0sllvg01a72ZRt3rUbraXp0dl2AoNSmWSuxB7jEDdpI8OGIpx71TIWdCfXvFKIzYeNdcj3SwdnaUg5IzHcIFBDImmaH15vqT5Q%3D&tracking_referrer=abcnews.go.com)

A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads

The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island can not handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawai'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Please watch their video on their link below because it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists comes more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state, This time last year: Hawaii island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks...

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

Please, watch the NEWS video from the link below on aerial footage in Hilo because the footage shown is the same thing that is happening on Alii Drive and Queen K HWY, and for the same reasons.

There are 2 developments already on Alii Dr. being built as of today, and more are scheduled for this road in the near future, and Alii Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow already.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening in Kona on the roads Kamehameha Schools wants to develop their resort, "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The

State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash on Alii Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direction traffic, and that adds even more traffic to this already seriously congested road, and Kamehameha Schools wants to add a resort on this road, and that will increase the traffic even more.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=FOSsnPDii8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Please read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii Island.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path as well as The Law of the Splintered Paddle below <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law, "Kūnūwai Mōmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless (especially kūpuna and keiki) across Hawaii be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii. After being added back in 1978, the law is part of Hawaii's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve

-Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

The Law of the Splintered Paddle is also on Kamehameha Schools website, so they should want to help make Big Island roads become safer and not add to the traffic and possible traffic death toll problem. <https://www.khsbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-true-200-years-after-k>

Besides a resort development in Keauhou Bay causing runoffs that will severely pollute the bay as the above research and science articles have shown above causing marine life to die, it will also increase in the bay's population that will seriously add to damaging even more coral, plankton and all marine life as well, and the island has severe traffic issues already with increased death tolls rising, and a resort development in Keauhou Bay will totally increase even more traffic in these already severely congested traffic areas.

The Big Island Doesn't Have the Resources and Infrastructure for Another Resort

Please see the articles below because the Big Island doesn't have the resources or infrastructure to safely add another resort development on island and these other NEWS and Research articles prove this point.

1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled," <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity.

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste  
Hawai'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the east side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

4) "What happens to Hawaii Island's trash and recyclables?" BY MICHELLE BRODER VANDYKE HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder Vandyke Hawaii Island PUBLISHED 11:30 AM ET Dec. 17 The future of the landfill

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community support." <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables-->

5) "The overwhelming plastic waste Hawaii visitors leave behind  
By Natasha Bourin/Aug 24, 2023

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/plastic-waste-hawaii-visitors-leave-behind-18286076.php>

21) "NewsHawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island.

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will damage Keauhou Bay coral and marine life and, Big Island resources and infrastructure are currently being negatively affected from the development that is on island already, and there are years of new development that have already been approved, before having safe resources and infrastructures for new developments.

With these scientifically proven articles by some of the most professional scientists in the world, they say the a serious population increase, as well as development and resort runoff that happens because of parking lots, and... with all coastal developments, it will be dangerous for Keauhou Bay to be development because it will damage the marine ecosystems in the area.

Please, save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools because all of these articles prove it would be extremely damaging to the waters at Keauhou Bay.

Thank you,

Sincerely,

Maebrie Bettinardi

**Kelli Blincoe**

Please stop and think what r u doing we dont need more development we need the structure that are here redone and remodeled. Give the wildlife their water and land not more Humans .

Aloha e Tyson,

Thank you for your comments concerning the Keaouhou Bay Management Plan, Draft Environmental Impact Statement. Your comments have been received and administratively recorded.

Comments received during the 45-day public comment period will be reproduced in the Final Environmental Impact Statement, and substantive comments addressed.

Since you also provided a copy to the County of Hawai'i and our planning consultant, G70, we will not be forwarding them a duplicate copy.

We appreciate your involvement and contribution to the environmental review process. Your input is invaluable in helping us develop a management plan that reflects the needs and concerns of our community.

Thank you once again for your engagement and commitment to the future of Keaouhou Bay.

Mahalo,

The Keaouhou Bay Project Team

---

**CAUTION: This email is from an outside sender. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

Protect the 'Aina

To Whom It May Concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools Environment Impact Statement (EIS) for Keaouhou Bay to become a Bungalaw Resort.

Please state in your report that a Bungalaw Resort WILL have a SERIOUS NEGATIVE IMPACT on Keaouhou Bay as stated in all the different researched articles below.

Please, DO NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalaw resort project. It is **scientifically proven** that developments pollute nearby waters both **during and after development**.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have **ALWAYS** polluted the water in **EVERY** coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keaouhou Bay is their habitat and this development **WILL be CHANGING an Entire Ecosystem**.

#### **ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT**

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.

The Green Sea Turtle swims in Keaouhou Bay weekly and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list.

#### **Endangered Species Act**

"Section 2. Findings, Purposes, and Policy

(4) The United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/endorangered-species-conservation/endorangered-species-ac>

#### **FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED**

The green sea turtle is federally protected and can be seen in Keaouhou Bay weekly.

The following article that states: **"POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"**  
**Why does Hawaii have a runoff problem?**

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

**Allowing this development WILL POLLUTE Keaouhou Bay.** The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!) states this fact clearly. Keaouhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen **because developments have been shown to ALWAYS pollute the water is that is nearby.**

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawaii are protected by the Endangered Species Act (ESA) and additionally protected by [Hawaii Revised Statutes Chapter 195D \(HRS\)](#) and [Hawaii Administrative Rules \(HAR\) 13-124](#)." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>.

#### **THE ENDANGERED MONK SEAL WILL BE AFFECTED**

Keaouhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keaouhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

**Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keaouhou Bay will likely be changed forever.**

This information is from a NOAA Scientist; "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered [Hawaiian monk seals](#). They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the [Marine Mammal Protection Act \(MMPA\)](#), as well as locally by Hawaii's Revised Statutes (HRS) [Chapter 195D](#) and Hawaii's Administrative Rules (HAR) [13-124](#)." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

**Keaouhou Bay is the monk seals and the green sea turtle's habitat.** Allowing a bungalow resort to be developed in Keaouhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. **By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.** The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to **protect the land around Keaouhou Bay** from developments that destroy the habitat of these endangered species with pollution and runoff.

**Does this EIS have any reports on the endangered species that frequent Keaouhou Bay? This is their habitat and it needs to be "conserved".**

Under the **Conservation Program** there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall

utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hiscurrent/Vol003\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hiscurrent/Vol003_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hiscurrent/Vol003\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hiscurrent/Vol003_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keaouhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keaouhou Bay and the surrounding area during the building phase of this enormous project.

#### **GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS**

"The golf industry uses [approximately 50 pesticide active ingredients](#), including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keaouhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable! Please read from Wikipedia, "

Most drains have a single large exit at their point of discharge (often covered by a [grating](#)) into a canal, river, lake, [reservoir](#), sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping

system." [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single%20exit,https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single%20exit](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single%20exit,https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single%20exit)

The pavement from this development will cause pollution to runoff into Keaouhou Bay because this trend land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keaouhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEE-7.15.14.pdf>

where **the Hawaii'i government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keaouhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.**

**These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keaouhou Bay and for these endangered species habitat.**

Under Section 2 (b) of the Endangered Species Act - **Keaouhou Bay MUST BECOME A CONSERVATION AREA for these endangered species.** It is currently their habitat, and to allow a large resort

development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keaouhou Bay.

#### **ALGAE BLOOMS KILL CORAL AND MARINE LIFE**

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer. When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

**Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.**

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course developments. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

**Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?**

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution..

" <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAUHOU BAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

**Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?**

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

**FURTHERMORE:** "If there are **toxic algal blooms**, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

**ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN**

**Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?**

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars

(likely more), coming in and out of, and parking above Keauhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

**The article below is from NOAA regarding motor vehicle engines and pollution to the sea.**

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife

habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines.Dirt%20can%20be%20a%20pollutant.>

**Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects**

News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a [new report](#) from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2022/09/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%2D%20Nearly%2085%20percent.pipeline%20spills%2C%20sea%20%20a%20new>

**The Impact Of Stormwater – Car Emissions**

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatersheds.org.au/blog/the-impact-of-stormwater-car-emissions/>

**NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE**

**Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keauhou Bay during development?**

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation

Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

**How Does Noise Pollution Harm Marine Species?**

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often

overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>  
If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

#### **What is ocean noise?**

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.  
Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.  
These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

#### **LEARN FROM OTHERS:**

##### **RUN-OFF FROM DEVELOPMENT KILLS**

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments. Chesapeake Bay is a **lot bigger** than Keaouhou Bay. If it's being drastically hurt by runoff water from developments, Keaouhou Bay waters won't stand a chance if development above the bay is allowed. Keaouhou Bay is a much smaller ecosystem.

**This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states,** "...runoff is a significant source of harmful nitrogen pollution that continues to grow..."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keaouhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban

and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carraying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keaouhou Bay due to its size and fragility.

#### **MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN**

##### **Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?**

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays. Manta rays are in Keaouhou Bay every night to eat zooplankton, and are often seen here during the day as well.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is **NO WAY** to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments. Please read the Scientific articles below.

##### **It's Been Proven Developments Severely Pollute Nearby Waters**

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawai'i. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts statewide..."

This was the third major bleaching episode in Hawai'i over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban runoff)." <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,bad%20catastrophic%20impacts%20statewide.>

**This article is by the Coral Reef Alliance here in Hawaii.** "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawai%CA%BBi%20reefs%20face%20major%20global,into%20Hawai%CA%BBi%20waterways%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and

development." [https://www.cofis.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forwe\\_b.pdf](https://www.cofis.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forwe_b.pdf)  
This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "**Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019...**

**We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors,**

such as tourism and urban run-off, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

**"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.**

This is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

**Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development,...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species."** <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=impacts%20from%20land%2Dbased%20sources.and%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, **"Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide."** <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead.services%20that%20coral%20reefs%20provide.>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. **Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.**

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments.organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments.organisms%20that%20can%20smother%20corals.)

Another article by NOAA, **"Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project)**

**Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival"** [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

**It's Been Proven Resort Developments Kill Marine Life**

This article by MarinBio states, **"Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change.** Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem...."

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. **This occurred in a relatively short time considering that the experiment lasted less than three weeks.** The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-*a* concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

**The ecosystem is fragile and interconnected as is stated in this article:** "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by

MarineBio. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to.light%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, **"Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage.** Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray/tour for their income.

#### **HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH**

**Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?**

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: **The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life.**" <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

**Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.**

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development/#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keaou Bay. **Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it.** Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

**It's Been Proven an Increase in Human Population Destroys Coral Reefs**  
If a Bungalow Resort is allowed to be built in Keaou Bay, it will bring a serious increase in human traffic. **"Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs.** Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS. **"This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found.** The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96380858#:~:text=The%20less%20people%20at%20a,there%20are%20the%20the%20>

[researchgate.net/publication/350065281](https://www.researchgate.net/publication/350065281) found. **text=The%20millions%20of%20tourists%20who,world%20a%20new%20stud**

By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

**"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction.** Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquacultur,e%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, **"Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity.** By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, **coral reefs both attract and suffer from coastal tourism.** Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhaHjAnWAq453tRgN0AJW6l9inR3Z0Tl0PvGzA5c\\_H001zcHNIP3ASnhcgKRy6\\_XkLPw49dbmBx0Xsg3YIMgQIG8ZsapidGUH7Z01SLbu9sP3xED4Kl4T0slvgQIa7Z2RR3Ubraxpod42A0NlSmWSuX87JEDdpj8OCjpx71IWDGfXFKZVeNdcj3Sw\\_dnaUg5ZlncjPBDlmmaH15yqI5Q%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhaHjAnWAq453tRgN0AJW6l9inR3Z0Tl0PvGzA5c_H001zcHNIP3ASnhcgKRy6_XkLPw49dbmBx0Xsg3YIMgQIG8ZsapidGUH7Z01SLbu9sP3xED4Kl4T0slvgQIa7Z2RR3Ubraxpod42A0NlSmWSuX87JEDdpj8OCjpx71IWDGfXFKZVeNdcj3Sw_dnaUg5ZlncjPBDlmmaH15yqI5Q%3D&tracking_referrer=abcnews.go.com)

**INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS**  
**Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?**

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

**Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?**

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. **Worldwide, hotels produce almost 300,000 tonnes of waste each year.**" <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Keaou Bay. On Hawaii's Island, we are already struggling to meet the increasing need for resources and infrastructure.

**Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill**  
September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill>

**A County commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill**

By [Meghan Moseley](#), September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of

Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump.

Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill>

**Time's Up For Landfills**

'Gentle' demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

<https://buildingindustryhawaii.com/2024/04/times-up-for-landfills/>

**Drought Conditions On Hawai'i Island Prompt Water Supply Message**

by Big Island Video News

on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information from the [U.S. Drought Monitor](#). There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

**From a Water Supply news release:**

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawaii%CA%BBi-island-prompt-water-supply-message/>

**Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues**

By [Li Cohen](#)

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to [significant droughts](#), and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the [world's largest surfing wave pool](#) opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe."

**"We are in a water crisis, that has to be made very clear,"** Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

**UPDATE: HELCO asks for continued energy conservation**

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

**Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.**

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/the-co-customers-on-hawaii-island-asked-to-conserve-power->

**Big power supply problems continue to plague Hawaii Island**

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

**The company explained that it faces an "extremely tight" supply of power at peak use periods,** especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

**Hawaii Island customers urged to reduce electricity use through April**

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

**-if there is not enough electricity to meet demand,** Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

**FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES**

15

**A Resort Development Will Increase Traffic on Already Severely Traffic-kicked Roads. Are there traffic study reports for this EIS?**

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawaii News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "**Hawaii Island has most traffic fatalities in state.** This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

**"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here,"** he added." <https://www.khon2.com/local-news/z-fatalities-for-hawaii-island-in-march/>

**The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.** Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/langly-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: **All of these roads only have two lanes!**

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a

16

solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html). There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=FQSSmPjij8>  
**Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.**

**Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:**  
A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii's Island...

- 28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees
  - 13% of pedestrians hit at 20 mph actually suffer fatality
  - 73% of pedestrians hit at 40 mph suffer fatality
  - 25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!
  - 56% of fatal crashes were the result of alcohol or drugs
  - 41% of fatal crashes occurred in light trucks and vans
  - 49% of crashes occur during the day, outside of peak traffic hours
  - Of all the crash fatalities, most were males between 20 to 24-years old.
- "That's just Big Island traffic,"** is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"  
This was taken from Path <https://hathhawaii.org/hawaii-countys-vision-zero-initiative/>

## 18) Hawai'i Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News  
on Nov 6, 2023 at 3:28 pm  
(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.  
<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawai%CA%BB%I-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

19) **"Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."**

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large\\_generators\\_are\\_experiencing\\_a\\_range\\_of\\_issues\\_and\\_may\\_lead\\_to\\_the\\_need\\_for\\_rolling\\_outages\\_if\\_supply\\_does\\_not\\_meet\\_demand/](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large_generators_are_experiencing_a_range_of_issues_and_may_lead_to_the_need_for_rolling_outages_if_supply_does_not_meet_demand/)

20) **"Hawaiian Electric asking Big Island customers to conserve power due to down generators March 25, 2024 · 11:49 AM HST**

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues. The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

## HISTORICAL AND CULTURAL SIGNIFICANCE:

### The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially Kupuna and Keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai'i. After being added back in 1978, **the law is part of Hawai'i's State Constitution today.**

It is symbolic of servant leadership, reinforcing the importance of:

-Caring for and serving one's people

11) **"Kona coast faces stark wastewater tradeoffs, Current situation**  
There are approximately 88,000 cesspools across the state, releasing more than 200,000 cubic meters of wastewater per day to the environment. <https://www.hawaii.edu/news/2021/09/10/kona-stark-wastewater-tradeoffs/>

We ask that you start figuring out how this can never happen again? These are the kind of issues that need to be resolved before you approve more development.

- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking Kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

**“We take that to mean that anyone who uses our roadways should be able to do so without fear of harm,” explains Tina.”**

**The Law of the Splintered Paddle is also on Kamehameha Schools website.** The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-rmg-true-200-years-after-k>

**Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.**

#### IN CONCLUSION

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Eco-system in Keauhou Bay and "The Endangered Species Act of 1973 (ESA or "The Act"; 16 U.S.C. § 1531 *et seq.*) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from extinction as a "consequence of economic growth and development untempered by adequate concern and conservation", the ESA was signed into law by President Richard Nixon on December 28, 1973. The Supreme Court of the United States described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation". [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land MUST be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawai'i Island is already having serious infrastructure and resource issues that have yet to be solved. These issues MUST be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly protects the marine life and environment from further damage. The location is NOT suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

Please reject this EIS because Kamehameha Schools has NOT ACKNOWLEDGED OR ASKED thousands of Hawaiians, or Hawaiian Descendants from Keauhou Bay how they feel about developing this land, Keauhou Bay.

They have asked ONLY a few families on an island that has thousands of Hawaiian people and here is video testimony from Kupuna Kumu Lily Kong who is a Keauhou Bay descendants and her and her mother OPPOSE DEVELOPMENT: <https://vimeo.com/994680462>

Kupuna Kumu Lily Kong who was born in Keauhou Bay and she states that she is against development. She also states that her mother was against development as well. Please listen to her words in her testimonial video about Keauhou Bay on this link and know that this proves that descendant directly from Keauhou Bay OPPOSE THIS DEVELOPMENT <https://vimeo.com/994680462> and it is CULTURAL LAW THEY MUST BE HEARD AND ACKNOWLEDGED!

These laws were created, "After these legal victories, the Kohanaiki 'Ohana worked to create a new law in the state of Hawaii to require Cultural Impact Statements along with Environmental Impact Statements for all future large-scale development. Act 50, the Cultural Impact Statement Law was adopted in 2000." <https://kohanaikiokhana.org/legal-victories>

Kupuna Kumu Lily Kong also states that there are burial grounds on the land that Kamehameha Schools wants to clear and it is told that Kamehameha Schools has bulldozed sacred land in the past and Keauhou Bay's burial grounds MUST BE RESPECTED AND NOT DISTURBED!

Hawaiians locals have said that there were bones in the small cave that is at the base of Keauhou Bay. These burials need to take priority over a Bungalow Resort Development.

There are over 6,219 signatures as of Aug. 5th (these signatures grow daily) and these signatures are Hawaiians, locals and tourist and some of these Hawaiians have left comments on why they are opposing this development.

ALL OF THESE PEOPLE HAVE A RIGHT TO BE ACKNOWLEDGED AND THEIR VOICES HAVE VALUE TO BE HEARD, THESE PEOPLE MATTER AND IT IS CULTURAL LAW THEY MUST BE ACKNOWLEDGED!

Here is the petition link with thousands of Hawaiian signatures and comments opposing Kamehameha Schools Bungalow Resort Development. Please read these signatures and comments! [https://www.change.org/p/save-keauhou-bay-from-becoming-a-big-crowded-resort?utm\\_source=share\\_petition&utm\\_medium=custom\\_url&recruited\\_by\\_id=92a53560-1e91-11e5-b4ef-b94e90cedb0d](https://www.change.org/p/save-keauhou-bay-from-becoming-a-big-crowded-resort?utm_source=share_petition&utm_medium=custom_url&recruited_by_id=92a53560-1e91-11e5-b4ef-b94e90cedb0d)

Please reject this EIS because under Princess Bernice Pauahi Bishop's Will it states Kamehameha Schools are her trustees and they have a "fiduciary duty" to do what is best for THEIR BENEFICIARIES (the Hawaiian people's) and a Bungalow Resort is BEST FOR TOURISTS NOT THE HAWAIIAN PEOPLE BECAUSE THOUSANDS OF HAWAIIAN PEOPLE SINGED THE ABOVE PETITION OPPOSING KAMEHAMEHA SCHOOLS BUNGALOW RESORT.

Please reject this EIS because the Big Island DOES NOT HAVE THE RESOURCES TO PROVIDE FOR ANOTHER BIG RESORT ON ISLAND and there are 445 signatures with many comments that agree with this fact because of the factual reported articles in the Help Prioritize Big Island Developments to Keep Island's Resources Safe for ALL petition. Please read this petition, all the signatures and comments <https://www.change.org/p/help-prioritize-big-island-developments-to-keep-island-resources-safe-for-all>

## Lewis Brentano

there is no indication of ADA compliant access to the building. The rendering only shows a stair entry and no indication of a ramp or lift.

My name is Lewis Brentano and I'm a Hawaii resident and I reside at [REDACTED]

The following comments on the Kamehameha Schools - Keauhou Bay Management Plan DEIS

The general area of concern is that of ADA compliant access for persons with disabilities for all elements of the proposed management plan.

It is apparent that the most recent plan does address some of the accessibility issues that I and others raised in the initial comments. And for that, those both with disabilities are grateful. However, there are at least five other areas that appear inadequately addressed or not addressed at all in terms of ADA compliant access in the plan.

1. ADA compliant access from the north side of the KOA to the south side - A first area of concern is the access for disabled people from the north side of Keauhou Bay to the south provide access to all the facilities on the southside. Today, anyone in a wheelchair or with mobility challenges has to go to Ali'i Drive and walk all the way to the Outrigger hotel to get to the south side of bay - a distance of over mile and a half on a busy road.

It appears from the renderings of the improvements to Old Kona Road that there will be a multi-use pathway parallel to the road itself that would go from north side of the bay to the south side, but it still appears to be a long distance compared to providing ADA compliant access from the Kamehameha III road cul-de-sac, directly across the area above the beach on the bay, to the South side. I do not see in the plan any indication of pedestrian access from the cul-de-sac to the other side of the bay where the heritage center would be.

2. ADA compliant access to the lobby of the lodging area. There is no evidence or statement about making the lodging lobby accessible—all the rendering drawings and comments show two different sets of steps to go from street level to the lobby entrance. If such accessibility is intended, it needs to be stated directly in obviously in your plan.

3. ADA Compliant access to lodging units. The third area would be the lodging units themselves as depicted at best 1/3 of the units would be accessible in terms of entry, and there is no mention of building accessible, bathrooms, bedrooms, etc., in the actual units. This seems to be an issue that must be addressed early on in the design phase.  
Excuse me it's time for breakfast my part

4. Too few ADA complaint Handicapped Parking places The area of accessibility is related to number accessible. Parking places stated in the document and in the plans — you know that you will build 126 parking places for the retail area, but only five handicap places this is too small, a percentage of spaces, especially given likelihood that a good number of visitors and tourists would most likely be senior citizens. I'm sure there are ADA guidelines on percentages of handicap parking places, but would it seem 15 to 20% of spaces should be a minimum out of the 126 total.

5. ADA compliant access to Heritage Center. In the rendering and description of the heritage center

## Jan Brinkman

Thank you for your personal meeting September 22, 2022 addressing the Keaouhou Management Project. Sadly we are faced with a choice today, we have the power to consume everything and we have for centuries-but for the 1st time in our history we are faced with the repercussions of that behavior. We have so little left to replenish and we need to ensure sustainability for future generations. I am here to ask for more, encouraging KS to over see the stewardship of proper management reform. I am asking KS to get ahead of the imprint of construction and development to off set, guard against {Kahu} and prepare ahead for hazards to replenish unknown damages and lead as an example. KS has exceptional leadership and resources with the ability to pool resources with the state, federal government and scientists for ocean policies. I'm here to ask for more. > The topics I covered with KS in the amount of short time I was allowed, I'm taking the liberty to go a bit more in depth with my concerns: > Traditionally, the Ahupua'a runs from the mountain and continues from the shoreline to the outer edges of our coral reefs. This organized distribution of resources established sustainability of the population. This last century we have fallen short of any bond of developing our oceans with our lands. The responsibility to replant, renature, reseed and protect our forests {Kahu} needs to be diversified back to our oceans as our land is managed. I am asking for more, trial programs of increasing coral into the Keaouhou Bay by 30% with replantment, replanting and reseeded to reforest our coral reefs. Hawaii has 410,000 acres of coral, the majority of this states coral reefs have died including 25% of the fish and critters. High tech mapping (ReFugia) using coral response to illumination has shown 50% loss of reef and fish due to beaching, pollution, development and fishing activities. NOAA estimates total economics value of Hawaiian coral reefs at 33.57 billion dollars. Our reef protect our shorelines and provide recreation and livelihood to the tourist industry. I am sadly humbled at the sight of tourists excitement to see nothing but empty skeletons of these coral animals. The Hawaiian Chants of Kumu Lipo clarifies that life began with the emergence of a coral polyp, it became more complex and developed into a community. Science also supports coral polyps were the first of life. Our coral reefs and reefs through out the world are threatened with extinction by 2050. Hawaii has 80% of the coral reefs in the USA. Causing further accelerated coral loss is elevated by carbon dioxide levels on this planet. Reef ecosystem destruction result with 25% of all marine species being at risk, while the assisted economic loss will expose people to decreased food resources and security of sustainability. > The number one problem at Keaouhou Bay has always been the sewage system. I find it alarming that the state does not address our sewage pipe problems that run into our oceans and easily passes that off to development companies. To remain triple AAA waters without periodic alerts of high bacteria counts not only in Kona but all islands. I also beg the state to apply for the 'Infrastructure Act' to ensure all islands can renew a safe transition to a modern healthy sewage pipe systems. > I want more intricate details of protection for water run-off. Working in the evening at he bay it was very common to have sudden heavy rains. Keaouhou rain belt is 35" a year. The first phase of the project with the sewage system and trailer parking remains a big threat to our bay with coral kill from silt and sediment. The Red Hill 1250 project was very destructive and damaging to our ocean and marine livelihood. Robert Kim directed me as a witness in court against Bud Quitiquit and four mainland lawyers. I remained giving my testimony for over an hour. The court gave me a copy of the testimony that I did daily trips to Red Hill and my underwater experience of damaging changes that I observed. If anyone would like to read what I witnessed during that construction time and the lawyers questions please contact me to review the unnecessary stress and permanent damage that affected the Red Hill area. A reminder one inch of

rain per acre 27,154 gallons with a weight of 113 tons, not including the grade or slope, no containment walls, water guides or barriers can contain this situation. Plans should be made for construction during dry season along with the daily burden of removing any disrupted soil to another location. Tested soils on all acres are crucial to foresee areas that need extra care and replanting. The 2 primary soils are Waiaha cobble medial silt loam and Waiaha medial silt loam. > Also mentioned was Blue Carbon, which is on the financial market to sustain projects of restoration. I mentioned to KS with all their coastal access through their land holdings Blue Carbon could make these types of projects feasible using their school to educate with restoration projects along our coastal waters using carbon credits. 83% recycle of carbon is in our oceans. Other examples I touched on were Maui aquarium which has the seeding ability for Keaouhou Bay and Waikiki aquarium has also pioneered efforts to cultivate coral and have shipped over 5,000 corals grown in Hawaii. We just recently welcomed a new coral restoration project at Otec. NOAA and volunteers have projects in Kane'oh'e Bay, Mauna Loa Bay and South shore waters. Besides NOAA and many other state and federal programs to pool resources with KS, I know this can be done. Puerto Rico collected 10,000 pieces of broken coral and replanted with a 90% success rate after their 2017 hurricane. > Having a 100 ton Master Coast Guard Captain License for over 40 years I was blessed with over a dozen years Captaining out of Keaouhou Bay. I also had the pleasure of logging over 10,000 scuba dives along the Kona Coast and also exploring Palau and New Zealand. In the 90's we had a Keaouhou Bay clean-up, being active with this project I had my daughter and many other school students that were eagerly efficient. In the 70's our storms caused damage to our corals and we, the dive company would replace and replant coral of many species even if it was the gesture was turning them upright so the polyps could feed. January 80 storm was devastating and we took the 'build and they will come' hold true to marine life. Even though displacement occurred the fish would move to the coral heads, egg cases continued to be laid, protection was contained for molting crabs and lobsters, eels, shells and nudibranch could also take shelter. The most important was the coral polyp could survive and there circle of replenishment continued through displacement. We also placed fragile pieces of coral into lobe coral for support and actually they gave great support and seemed to fuse around the bases. Through hurricane Iwa and Iniki our ecosystem was already stressed as we went through great development along the Kona coast with construction, pollution, population and more water activity stress. The ocean acidification with warmer waters have left us in dire need. It is my vision and dream to have Senator Dr. Tim Richards present a bill to the floor to aid and assist our oceans with any coastal development making replenishment and restoring critical habitat mandatory. We must ask more from all coastal resorts to be participants in ocean projects and reform including tourist attractions participation. > I am here to ask everyone for 'more' in this critical time for our coral reefs and oceans. Our obligation to our future generation is that they are equally entitled to our natural resources. Keaouhou Bay and the surrounding land could also be embraced for our future generations to decide what is best for their future generation.

Sadly we are faced with a choice today, we have the power to consume everything and we have for centuries-but for the 1st time in our history we are faced with the repercussions of that behavior. We have so little left to replenish and we need to ensure sustainability for future generations. I am here to ask for more, encouraging KS to over see the stewardship of proper management reform. I am asking KS to get ahead of the imprint of construction and development to off set, guard against (Kahu) and prepare ahead for hazards to replenish unknown damages and lead as an example. KS has exceptional leadership and resources with the ability to pool resources with the state, federal government and scientists for ocean policies. I'm here to ask for more.

> > The topics I covered with KS in the amount of short time I was allowed, I'm taking the liberty to go a bit more in depth with my concerns:

> > Traditionally, the Ahupua'a runs from the mountain and continues from the shoreline to the outer edges of our coral reefs. This organized distribution of resources established sustainability of the population. This last century we have fallen short of any bond of developing our oceans with our lands. The responsibility to replant, renature, reseed and protect our forests (Kahu) needs to be diversified back to our oceans as our land is managed. I am asking for more, trial programs of increasing coral into the Keaouhou Bay by 30% with replenishment, replanting and reseeded to reforest our coral reefs. Hawaii has 410,000 acres of coral, the majority of this states coral reefs have died including 25% of the fish and critters. High tech mapping (Refugia) using coral response to illumination has shown 50% loss of reef and fish due to beaching, pollution, development and fishing activities. NOAA estimates total economics value of Hawaiian coral reefs at 33.57 billion dollars. Our reef protect our shorelines and provide recreation and livelihood to the tourist industry. ## Justin Broderick

This project will have a negative impact on the wildlife of Keaunohou bay, and the surrounding areas. I oppose this plan and would like to see the bay stay the way it is. The infrastructure in Kona is already out of date and cannot support more people. The life of the land is perpetuated in righteousness.

## Shantee Brown

Please do not develop more unnecessary luxury building around Keaunohou Bay. I support the needed upgrades for public use and cultural preservation + education. The current hotel and other lodgings are more than adequate. We do not have enough drinking water for more tourists in Kona and I cannot imagine hundreds more people in Keaunohou + He'eia Bay. Also, run off from the development will contaminate the bay.

## Marjorie Bryant

I own a condo a 5-min walk from Keaouhou Bay and spend as much time as I can there each year. I do not rent it out. I intend to reside there full time once my house in CA sells. I received your notice in the mail a couple years ago re the Keaouhou Bay Draft EIS.

I am concerned about three things. First, I am concerned about the nēnē who hang out on the golf course, in an area adjacent to this proposed development (the first/ ninth fairway and the far end of the driving range on Kona Country Club). I am attaching pictures, which I also sent to nānē.org a while back. I and my neighbors first observed the nēnē there in fall 2023. They seem to hang out there every day. Fall through Spring. How will you ensure that the nēnē do not get disturbed during your years of construction activities? I don't know what to suggest to mitigate this. All I know is nēnē need all the help they can get to expand their range.

My second concern relates to increased traffic. How will you mitigate the extra noise and air pollution from construction truck traffic along Ali'i Dr and Kaleiopapa St by my condo (Keaouhou Akahi 78-7030 Ali'i Dr)? And also to/from your resort and commercial area once built? My unit is within 20 feet of the Ali'i Dr roadway, and this extra noise and pollution will greatly impact me. I suggest creating permanent sound barriers along Ali'i and Kaleiopapa St by our condo complex for the noise, and limiting construction activities to weekdays and conventional work hours. I don't know what to suggest for the air pollution, but I hope your bright minds can come up with something. Also, our driveway is just past a blind corner on Ali'i Dr where the speed limit of 35 mph is glibly ignored by drivers, most of whom speed by at 45+ mph. How will you mitigate the increased danger turning left (or right) out of my condo onto Ali'i Dr as a consequence of your increased traffic? Also, how will you ensure pedestrian safety in this area with your increased traffic? It's a popular walking, running and biking route. I use it regularly. I suggest lowering the speed limit to 25 mph on Ali'i in our area and installing speed bumps on Ali'i in our area to mitigate both these factors. But drivers regularly drive around the speed bumps on Kaleiopapa St, so this won't be enough. For the latter reason, I also suggest an actual physical barrier - like a low white curb or posts along the white line that denotes the shoulder - be installed on both Ali'i Dr in our area and Kaleiopapa St to protect pedestrians. I wouldn't want your organization to be exposed to a lawsuit should anyone get hurt or die in this area.

My third concern is the increased heat and lowered precipitation in my local climate that will be caused by your proposed development, because you will be razing a majority of 29 acres of trees and vegetation and replacing it with black pavement and other hardscape. The science behind this concern is well documented. From <https://www.epa.gov/heatislands>: "Conventional paving materials can reach peak summertime temperatures of 120–150°F (48–67°C), transferring excess heat to the air above them and heating stormwater as it runs off the pavement into local waterways." Trees make rain, and razing forests decreases rain (supporting science for this sentence is listed at end of this letter and marked by \*). Our area has been in a drought for years. It is not a good idea to decrease precipitation in an area of drought. And of course we all know mature trees provide cooling shade.

Increased heat from your proposed development will radiate up to my condo, which is right across the golf course above the project site. This will affect my health, and that of my neighbors, most of whom are kupuna like me - not only when we're at home, but when we go out for our daily walks down to Keaouhou Bay. Further, it is a documented scientific fact that our climate and oceans are warming increasingly rapidly. Your development will exacerbate this locally. It's going to heat not only the air but the water in the bay.

I do not believe this impact - the extra heat and what it will do to our health and the health of the bay and the health of our local ecosystem - can be successfully mitigated. That said, here are some suggestions. I suggest using alternate paving materials that do not generate heat. I also suggest leaving mature shade trees on site in place - and intact. And I suggest planting shade trees (at a maximum distance of 30 ft apart) in your parking lots - and all over your property, including the commercial/retail areas on Ehukai St and Kaleiopapa St. And I suggest planting greenscape on the roofs of your buildings - all buildings, including the commercial/retail areas on Ehukai St and Kaleiopapa St.

Please also address for me: how will you ensure dedicated public access to the shoreline during construction? And how do you aim to preserve the peaceful and shady nature of the shoreline on site, both during construction and after, so local people like myself can continue to enjoy it? Because it is not true that local folks are uncomfortable there. Lots of local folks (both Hawaiian and non-Hawaiian) go daily, to fish and cool in the water and paddle and picnic and play volleyball. And on the weekends it's crowded with local folk. I see this with my own eyes. Everyone parks on the north side of the bay on Kamehameha III Rd, where there is plenty of parking, always.

And a final note. I do not understand why this project is necessary. Why permanently adversely alter the local environment around this sacred site when: (1) your organization owns an existing mall a half mile away. Keaouhou Shopping Center with plenty of space to accommodate the many tour operators you wish to relocate off Kaleiopapa St; (2) a 350-room hotel already exists on Keaouhou Bay (The Outrigger) and it never gets full, and restaurants in it have struggled and closed over the years; and (3) we have a labor shortage on island - Aloha Gas and other businesses at Keaouhou Shopping Center like Kenichi Pacific restaurant and KTA grocery and Longs Drugs can't even find enough employees (they are all short-staffed) and have cut operating hours and have had constant help wanted signs out for years now and even offer hiring buses) - so there isn't anyone to fill the jobs you will create? Are parking lots and new buildings and roads really a fitting way to honor Kamehameha III's birth site?

This latter question is a genuine question, not meant to be provocative. It seems to me that there are three problems at Keaouhou Bay that your organization is trying to solve, and frankly they aren't all your responsibility to solve. But they all have simpler, less costly and less environmentally detrimental solutions.

One problem is: street-based mauia tour operators on Kaleiopapa St operate illegally with no overhead and thus have an unfair competitive advantage over legitimate mauia tour operators like Sea Quest who are based in bayside buildings on your property. I'd like to make the point that it is the County of Hawaii whose responsibility it is to solve this problem. Doing business on the side of the road has always been prohibited by Hawaii state law, but in the past, it was not commonly enforced. The State of Hawaii, however, now has an explicit law on the books and has begun to expect enforcement: Hawaii Revised Statute 264-101 (2023). The County of Hawaii should be sending enforcement folks down to Kaleiopapa St each night to enforce this law, until the problem goes away.

The second problem at Keaunohu Bay it seems you are trying to solve: the volume of cars parked on Kaleiopapa St (going on snorkel tours during the day and mauia tours at night) cause that busy street (which is gateway to the state boat ramp and The Outrigger Resort) to be unsafe for pedestrians. This safety problem also has a simple solution: the County of Hawaii should make Kaleiopapa St a no parking zone. Keaunohu Bay business patrons could then be directed to park in the large grassy area at the corner of Ehaikai St and Kaleiopapa St, which your organization owns and characterizes as a parking area. And patrons could also be directed to park on Kamahaemaha III Rd in one of the several dirt parking lots your organization owns over there on the north side of the bay, where many folks already do park, and to park on Kamahaemaha III Rd itself, which has sidewalks for pedestrians. It seems to me that your organization could charge for these parking privileges in its existing lots and make money.

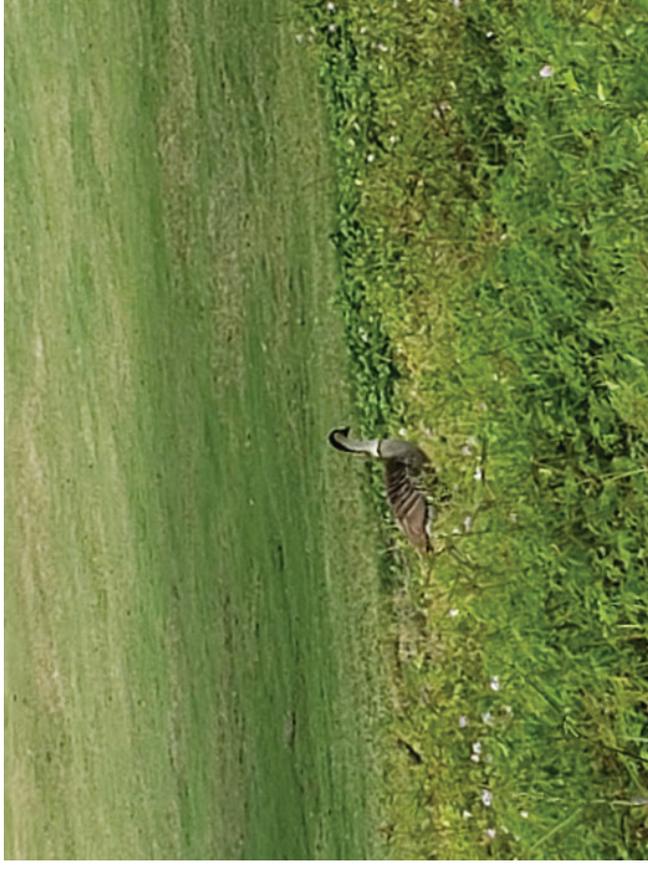

Third problem it seems you are trying to solve is: the buildings you own by the bay (where Sea Quest operates) regularly flood during storms, and king tides with high surf. Perhaps all that is necessary to solve this problem is to build a reinforced wall around the structures, to keep the sea out, rather than build brand new structures elsewhere. There may be other problems at the bay you are trying to solve too, and whatever they are, I suggest finding a less environmentally destructive way to solve them, because no one wins when we destroy the one thing we rely on for life: our environment, our land and sea.

In any case, it seems to me that these three solutions I suggest are much more cost effective - and less environmentally destructive - than your current proposal. Razing forests and building more parking lots and buildings seems the least cost effective and most destructive and detrimental to everyone's future.

Thank you.

**Categories:** Yellow Category

Mr. Roy  
Please find attached a comment letter in response to the Keaouhou Bay Management Plan (KBMP) (the "Project"), Draft Environmental Impact Statement (DEIS) publication. My comments are submitted as a private citizen with more than 30 years of experience in marine and aquatic environmental assessment. I have visited the project site personally and had the opportunity to engage the cultural resources and enjoy recreational opportunities that Keaouhou Bay offers.

The focus of my comments is the substantial lack of the necessary foundational studies along the shoreline and within the bay to assess impacts of additional hardscape in an area already impacted by development. Without such context, an appropriate assessment of the Project impacts and appropriate mitigation measures cannot be determined. My fear is that the project will exacerbate existing documented impacts to Hawaii's cultural heritage at the site and further endanger the public and natural resources unique to Keaouhou Bay.

Thank you for the opportunity to comment on this matter,  
Best regards,  
Nick

Re: Comments on Kamehameha Schools, Keaouhou Bay Management Plan, Draft Environmental Impact Statement, Volumes I and II (Prepared by G70, June 2024)

Mr. Roy,  
I am submitting these comments in response to the Kamehameha School, Keaouhou Bay Management Plan (KBMP) (the "Project"), Draft Environmental Impact Statement (DEIS) publication. As an initial matter, I have degrees in biology and marine biology, as well as a professional career of over 30 years with a wide breadth of experience in assessing environmental impacts, including impacts of contaminants and sedimentation on biological resources in aquatic and marine systems. I have a deep appreciation of Hawaiian culture and the natural resources which bless Keaouhou Bay in particular. I have visited the project site and had the opportunity to engage the cultural resources and enjoy recreational opportunities Keaouhou Bay offers. My comments include technical aspects of the DEIS, and are informed by personal observations. The focus of my comments is the substantial lack of the necessary foundational studies upon which to base an assessment of the Project impacts and appropriate mitigation measures. My comments follow.

#### A. Background Expertise

My curriculum vitae is attached. Note that my experience, though focused in California, includes an extensive risk assessment program at Pearl Harbor, Oahu, which assessed sediment quality and effects of runoff on biological resources, as well as work at Midway Atoll involving contaminant impact assessments.

#### B. DEIR Review and Comments

My personal experience at Keaouhou Bay was one of enjoyment, but also disappointment at the state of the "beach" shoreline and marine biological resources thereby. On a cursory level, these appear degraded. Based on my visual observations, conditions dramatically improved toward the mouth of the Bay as one would expect with increasing water circulation, but the pattern also suggests that existing developments adjacent to Ka'iiliinehe Beach impact the quality of marine biological resources. As noted above, my overall conclusion is that the DEIS lacks key basic foundational studies of existing conditions within the bay necessary to assess the potential impacts of the project, and the KBMP therefore also fails to assess potential mitigation measures appropriately. Finally, the KBMP makes statements regarding sustainability, but is clearly focused on commercial development and an expanded footprint of development. While the Project might generally improve the human experience of cultural resources in particular (which I applaud), other sustainability elements of the KBMP are lacking, especially considering that the shoreline has already been highly modified by development and, in my opinion, has been in a state of degradation for decades.

**NICK BUHBE, M.S.**  
**CEO & PRINCIPAL SCIENTIST**

Development is, in my experience, a one-way path which cannot easily be undone. Keauhou Bay is an important and unique resource on many levels. Managing shoreline development needs to be undertaken with great care now to ensure that resources are better protected for future generations, and not degraded further.

Thank you for the opportunity to comment on the DEIS.

Best Regards,

Nicholas Buhbe

Mr. Buhbe is a senior scientist with 30 years of experience specializing in aquatic biological resources, sediment testing, assessment of water quality, ecological risk assessments, preparation of environmental planning compliance documents, and wetland-related project work. His portfolio includes biological, chemical, and physical evaluations of water and sediments in bays, estuaries, and riparian settings.

Mr. Buhbe has conducted surveys of a wide range of biological habitats including southern California kelp forests, coastal reefs, eelgrass beds, and sediment infauna. He is familiar a wide range of sampling techniques and protocols, including toxicological evaluations and experimental design. Mr. Buhbe is currently working on several projects in San Diego Bay. He is also actively focused on project work assessing watershed impacts to downstream receiving waters under the Clean Water Act and analogous state laws, working to resolve conflicts between competing beneficial and/or land uses, and has managed a multi-year programmatic assessment under Regional Board oversight.

Mr. Buhbe brings three decades of experience incorporating toxicological evaluations into multidisciplinary studies. Over the past several years, his work has focused on multiple projects with legal aspects, often evaluating water and sediment quality against ecological benchmarks, and navigating projects through complex permitting, compliance and legal issues. As such his technical work is focused on the project or program manager level. Mr. Buhbe founded Mission Environmental in 2017 and fills the CEO role at the company. Between technical and company roles, he is familiar with managing staffing resources, budgets, and schedules throughout a project's arc, including evaluating feasibility of project scopes of work, estimating costs, preparing proposals, reviewing contract language, performing work, interacting with project stakeholders, preparing documents, completing and filing regulatory applications and reports, performing technical reviews, and invoicing. His role at Mission Environmental includes not only preparation of project cost estimates, but also implementing projects within budget and schedule constraints.

Mr. Buhbe's expertise also extends to participation on the Pacific Chapter and hemispheric programs of the Western Dredging Association (WEDA), part of a worldwide organization focused on the dredging aspects of coastal development. He is currently participating on WEDA's Environmental Commission. Mr. Buhbe is a Past President of the WEDA Pacific Chapter and has contributed several presentations at annual meetings over the years.

Descriptions of select recent project experience is included below, followed by a list of additional project experience.

**EXPERTISE**  
Environmental Monitoring  
Water Resources  
Dredging & Sediment Evaluations  
Ecotoxicology  
Ecological Risk Assessment  
Natural Resource Management  
Aquatic & Wildlife Biology/Ecology

**EDUCATION**  
M.S. in Biology, San Diego State University, 1997  
B.A. in Marine Biology, University of California, Santa Cruz, 1992

**CERTIFICATIONS**  
NAUI Open Water II SCUBA Diver, 1989; Research Diver  
NOAA Caulerpa Surveyor  
Transportation Worker  
Identification Credential (TWIC)  
OSHA 40-Hour HazWOPER (Section 1910.120), Initial: 17 Feb. 1995; updated annually  
OSHA DOT Training

**PROFESSIONAL AFFILIATIONS**  
Western Association of Dredging, Pacific Chapter Past President;  
National Environmental Commission Member  
Society of Environmental Chemistry and Toxicology (SETAC), So. Cal. Chapter – Past Member  
California Estuarine Research Society – Past Member

## SELECT PUBLICATIONS

Mr. Buhbe has prepared numerous technical notes, monitoring and informational reports, comment responses, and permit applications which both synthesize information and support defensible technical conclusions. In addition, Mr. Buhbe has participated in several professional or technical groups charged with developing industry- and site-specific recommendations. Publications arising out of those groups include but are not limited to:

Lake San Marcos Joint Parties. 2021. Phosphorus Inactivation VI Interim Report [June 2021] Alum Application, Upper San Marcos Creek Watershed and Lake San Marcos Nutrient Management Program. [Lead Author]. December. Available at: [https://documents.geotracker.waterboards.ca.gov/esi/uploads/geo\\_report/1633670270/110000003261.PDF](https://documents.geotracker.waterboards.ca.gov/esi/uploads/geo_report/1633670270/110000003261.PDF)

Central Dredging Association. 2019. Sustainable Management of the Beneficial Use of Sediments.

Information Paper. [Contributing Author] [online] Available at:

Prepared for Southwestern Wetland Interpretive Association in collaboration with Border Field State Park, Tijuana River National Estuarine Research Reserve, and California Coastal Conservancy. [Lead Author].

## SELECT PROJECT EXPERIENCE

**LAKE SAN MARCOS INVESTIGATIONS & RESTORATION STRATEGIES, San Marcos, CA**

Nick is currently program manager for biological and hydrological investigations of Lake San Marcos, a 303(d)-listed nutrient-impaired water-body in Southern California, in fulfillment of Regional Water Quality Control Board (RW) Investigative Order. No. R9-2011-0033 and in support of ongoing implementation of a legal settlement. Mr. Buhbe was the senior managing scientist for both compliance and mediation settlement aspects, and developed investigation Work Plans, Sampling and Analysis Plans (SAP), Quality Assurance Program Plans (QAPP), and Health and Safety Plan (HASP) associated with the Order (approved by the RW in 2012) and subsequent work. Under Nick's leadership, the consultant team has completed activities required for the RI/FS, including development of a comprehensive dataset comprising lake water quality, bathymetry, sediment-water nutrient interactions, and various other ecological conditions. The RI/FS was approved by the RW in 2017, and pilot studies evaluating lake and watershed phosphorus inactivation, aeration of deep lake waters susceptible to anoxia, and watershed actions are now underway. Nick has supervised and/or directly conducted monthly lake monitoring since 2012, prepared quarterly monitoring reports, formulated technical workplans and reports assessing lake remediation pilot studies, and is responsible for forecasting work, preparing budget estimates, and invoicing. He has prepared and delivered presentations to the general public (at community workshops) and to the RW (both regulatory status updates to staff and at Board hearings). The project is transitioning

from an investigation and remedial action pilot study phase under legal mediation to an implementation phase under a trusteeship, in part due to his long history with the project and deep understanding of the project objectives, Nick anticipates continued involvement to monitor compliance and attaining remedial action objectives.

**AUSTAL USA DRY DOCK PERMITTING, San Diego Bay, San Diego, CA**

Nick served as the Project Manager for a site-wide sediment quality assessment and dredge permitting effort for a dry dock deployment. The project is a collaborative effort of the client and the U.S. Navy, and involves input of multiple technical stakeholders. The sediment assessment revealed the need for significant upland disposal, and permitting incorporated modification of the initial dredge footprint, revised placement/disposal strategy, marine resource mitigation, site engineering, and other elements. Nick prepared a project scope and budget, managed the sampling, analysis, and reporting components of this program, and interfaced directly with the client advising of the implications of sediment quality, engineering constraints, and marine biological resource impacts. Nick was the project proponent/agent working with the Regional Water Quality Control Board, U.S. Army Corps of Engineers, and U.S. Navy for in-water permitting and project certification. Permits and certifications were received and project construction began in 2023.

**MARINE BIOLOGICAL ASSESSMENT OF AMPLIFY ENERGY PIPELINE OIL SPILL, San Pedro Channel, CA**

Nick was selected as a potential expert witness concerning a natural resource damage assessment and/or spill liability case brought by Amplify Energy against the owners of the MSC Donit. His work included review of U.S. Coast Guard/Federal Bureau of Investigation survey documentation; development of and participation in a field survey using divers and remotely operated vehicles; and review of expert witness reports, video survey results, and photographic documentation. From a technical perspective, his role was to evaluate pipeline biota conditions and evaluate successional patterns of marine habitat; his review informed several theories regarding the cause of the oil spill.

**POND 20 RESTORATION PROJECT, San Diego Bay, CA**

Pond 20 is a historical salt production pond in south San Diego Bay that the San Diego Unified Port District is seeking to convert low-function salt panne habitat to a highly productive and functional salt marsh and intertidal habitat. Conversion of habitat typology relies on significant excavation of materials. Nick designed and implemented a sediment characterization plan to evaluate the feasibility of placement options for the soils & sediments at the site. In addition, his knowledge of southern California estuaries and bay habitats informed the ecological design, the restoration plant palette, and project strategy. As task lead, Nick was responsible for developing and adhering to a budget for the sediment feasibility study effort. Subsequent work consisted of working with an engineering firm to independently assess the feasibility of the broader project objectives.

**SAN DIEGUITO RIVER ESTUARY SOL 2 RESTORATION PROJECT, Del Mar, CA**

The 22<sup>nd</sup> Agricultural District (operator of the Del Mar Race Track) was responsible for the restoration of several acres of upland to functional saltmarsh as mitigation directed by the California Coastal Commission. The Phase 2 site was challenging due to extremely high soil salinity levels at the design grade which threatened the survival of restoration plantings (observed at Phase 1). Mr. Buhbe was the project manager for the project and reported to the project Restoration Ecologist, ensuring that implementation of the plan was fulfilled appropriately and that necessary measures were undertaken to ensure mitigation success. During his tenure on the project, Nick worked closely with the construction team, irrigation and planting contractor, landscape architect, and Commission staff to ensure that milestones were met and the project remained on budget.

#### **R.E. STAITE ENGINEERING MARINE SEDIMENT QUALITY ASSESSMENT, Southern CA**

Nick served as the Project Manager for the pre-dredging feasibility study and a site-wide sediment quality assessment for a waterfront development site. The site is currently the subject of several broad investigative orders due to heavy metals, pesticide, and PCB contamination at the leasehold, which is included in the "BAE Systems and SDG&E Northern Sediment Delineation Investigation" program. Chemistry data was compared against ecological effect guideline values commonly used in the permitting and regulatory processes for dredge material disposal suitability analyses. Nick prepared a project scope and budget, managed the sampling, analysis, reporting components of this program, and interfaced directly with the client advising of sediment quality implications. Contaminant concentrations were assessed across the site (laterally) and vertically in the sediment column to evaluate potential avenues to achieve development objectives while minimizing constraints presented by the contamination. Data is also informing the Regional Water Quality Control Board-lead cleanup process.

#### **WATERFRONT CONTAMINATION SOURCE, TRANSPORT, AND FATE EVALUATION, San Diego, CA**

The industrialized waterfront of east-central San Diego Bay is the subject of several cleanup and abatement and/or investigation orders due to sediment contamination. Nick was responsible for evaluating data pertaining to the Northern Investigation Area, which is known to be contaminated with organic and metal pollutants. On behalf of R.E. Staite Engineering, Nick has been project manager for field investigations and forensic evaluations pertaining to the extent and magnitude of contamination, possible sources, and contaminant transport mechanisms at the site. Responsibilities have included preparing scope and budget documents, implementing scopes of work, drafting data reports and technical memoranda, and interfacing with regulators including the San Diego Regional Water Quality Control Board.

#### **REYNOLDS DEMINERALIZATION PLANT DISCHARGE MONITORING & EXPANSION PLANNING PROJECT, National City, CA**

The Reynolds Plant discharges concentrated brine from a reverse osmosis process into the Sweetwater River, a tributary to San Diego Bay. As part of a NPDES permit renewal process and a planned expansion of the plant, Mr. Bubbe was responsible for preparing the initial (2007) and final (2012) 5-year monitoring plans, liaising with the RB with respect to the monitoring program design, and providing guidance as to relative impacts of brine disposal alternatives. As part of the project impact assessment, the team modeled how brackish discharges affected salinity in the Sweetwater River Estuary. In addition, Mr. Bubbe was responsible for monitoring of estuarine vegetation, benthic macroinvertebrates, water quality, and macroalgae to assess the potential impact of the discharge in a highly sensitive environment. The project is now fully operational.

#### **TIJUANA ESTUARY SEDIMENT FATE AND TRANSPORT PROJECTS, San Diego, CA**

Several State agencies sponsored an evaluation of the effects of beach replenishment with materials containing less than 80 percent sand. The project used before-after-control-impact (BACI) statistical tools to evaluate shorebird foraging behavior and beach marine invertebrate abundance, and demonstrated that pre- and post-construction conditions at impact sites were indistinguishable from pre- and post-project conditions (for birds) and from naturally occurring populations at nearby unimpacted sites (for beach invertebrates). Demonstration of a lack of biological resources impacts, along with the coastal process research conducted in parallel by a team of USGS researchers, indicate that use of materials containing less than 80 percent sand for beach replenishment may be a viable tool for shoreline management in California.

#### **WOODBRIDGE WATERFRONT PARK RESTORATION & ECOLOGICAL RISK ASSESSMENT, Woodbridge, NJ**

As part of a larger remediation project at the Woodbridge, New Jersey site, the NJDEP identified West Lake sediments as a source of potential ecological risk in need of additional assessment due to elevated levels of contaminants of potential ecological concern. Mr. Bubbe was responsible for overseeing the implementation of a toxicological survey which tested sediment contaminant loads and related them to acute and chronic toxicity testing results. Mr. Bubbe was also responsible for evaluating the data from statistical and ecological risk perspectives and identified specific thresholds which may function as the basis of ongoing remediation. In addition, Mr. Bubbe prepared sections of a report corresponding to the toxicological evaluation, and functioned as a key quality assurance reviewer for the entire supplemental ecological risk report, including trophic/food web modeling.

#### **LOS ANGELES REFINERY MARINE TERMINAL SURFICIAL SEDIMENT CHARACTERIZATION, Los Angeles, CA**

ConocoPhillips was required to delineate the extent of possible effects of an upland NAPL plume upon the nearshore area of the LAMT leasehold. Mr. Bubbe managed marine field sampling, toxicological analyses, and benthic macroinvertebrate community evaluation under strict Health and Safety and Quality Assurance regimens. In addition, Mr. Bubbe drafted the project-specific Sampling and Analysis Plan, coordinated and led field efforts, and supervised report preparation to evaluate the potential causes of varying degrees of impact. The delineation effort included the use of multiple lines of evidence (LOE) in the assessment, including chemistry, biology, and toxicology, to assess surficial sediments according to the California Sediment Quality Objectives (SQO) protocol. The project was completed on schedule and under budget.

#### **CONFIDENTIAL CLIENT, Pacific Northwest**

Nick was responsible for a detailed evaluation of sources and components of total polycyclic aromatic hydrocarbons with respect to their propensity for toxic effects, likelihood of mobility, and environmental persistence. The evaluation included data quality review and assessment of PAH ratios to evaluate sources and potential lines of evidence to support liability allocations.

#### **POWER PLANT SEDIMENT INVESTIGATION, San Francisco, CA**

The confidential Power Plant site is known to exhibit soil and sediment contamination related to historical manufactured gas plant operations. Mr. Bubbe participated on a team conducting a comprehensive ecological evaluation of sediment contamination in the nearshore area along San Francisco Bay. Tasks included participation in the sampling effort planning and implementation phases, including mobilization of personnel to assist with field work. Mr. Bubbe was also tasked with preparing the Emergency Response Plan (ERP) for the field effort, installing a protective boom as a provision of the ERP (through a subcontractor), and coordinating and contracting analytical laboratory services, data validation services, drilling contractors, a sampling vessel, marine taxonomists, and specialized seafloor sampling equipment. Mr. Bubbe served as project manager through several phases of the project, liaised directly with the clients on matters related to project strategy, and interacted with a team of third-party field observers representing interests of a local jurisdiction. Mr. Bubbe oversaw a survey of the benthic macroinvertebrate community, which utilized the California SQO (sediment quality objectives) approach to assess the level of ecological disturbance across the site, and a separate field effort associated with collecting bioaccumulation and toxicity information specific to the site.

## ADDITIONAL PROJECT EXPERIENCE

Listed in approximate reverse chronological order.

Molina Center Mercury Discharge Evaluation, Long Beach, CA  
 Alta Road Site Cleanup and Geotechnical Investigations, San Diego, CA  
 Marina Infrastructure Permitting Support, San Diego, CA  
 Shipyard Sediment Quality Investigation Reporting, San Diego, CA  
 Waterfront Contamination Fate and Transport Assessment, San Diego, CA  
 Waterfront Development Contamination and Best Management Practices Review, San Diego, CA  
 Pfister Chemical Facility Waterfront Sediment Risk Assessment, Ridgefield, NJ  
 Riparian Mitigation Site Evaluation and Planning, San Diego, CA  
 Browne Park Pond Restoration Project, Queens, NY  
 Tijuana Estuary River Valley Parcel Erosion Control Plan, San Diego, CA  
 Passaic River Estuary Discharge Impact Assessment, Confidential Client, NJ  
 Upland Biological Resources Survey, Maui, HI  
 Coastal Mitigation Strategy Consulting, Confidential Client, US Gulf Coast  
 Camp Pendleton Base-wide Utility Infrastructure EIR, NAFAC, Camp Pendleton, CA  
 Southern California Harbor Sediment Baseline Assessment, Confidential Client, CA  
 Southern California Bioassessment Working Group, CA  
 Santa Margarita River Watershed & Estuary Monitoring, USMC Camp Pendleton, CA  
 Upper Santa Margarita River Watershed Monitoring, Riverside, CA  
 Navy Fuel Pier 180 Replacement Dredge Material Characterization, San Diego, CA  
 Richmond Inner and Outer Harbor Sediment Characterization, Richmond, CA  
 U.S. EPA National Coastal Condition Assessment Laboratory Audits, Nationwide  
 Marine Group Sediment Testing, WSSI Inc., San Diego Bay, CA  
 EIR for the Recommissioning of Lease PRC 421, Goleta, CA  
 Port of Long Beach Pier G Sediment Characterization, Long Beach, CA  
 Western Anchorage Sediment Storage Site Characterization Project, Long Beach, CA  
 On-Call Environmental Projects for the Port of Los Angeles, Los Angeles, CA  
 NAS North Island Carrier Quaywall Stabilization Project Sediment Characterization, Naval Facilities Engineering Command, U.S. Navy, Coronado, CA  
 Southwest Marine Buildings Demolition Project EIR, Los Angeles, CA  
 Spring Canyon Riparian Mitigation Site Construction and Monitoring, San Diego, CA  
 Watershed Pollutograph Chemistry-Dominguez Watershed Site, San Pedro, CA  
 Koehler Kraft Boatyard Redevelopment, Koehler Kraft Company, San Diego, CA  
 Escondido Creek Bioassessment Monitoring Program, City of Escondido, CA  
 Port of LA Channel Deepening Project Water Quality Monitoring, Los Angeles CA  
 IR Site 10 Intertidal Marine Resources Survey (San Diego Bay), NAS North Island, CA  
 Spartina Mitigation Site Identification, Caltrans District 11, San Diego, CA  
 Back Channel Navigation Safety Improvements Sediment Characterization, Long Beach, CA  
 Beach Replenishment Biological Resource Surveys, Aircraft Carrier Homeporting Project, U.S. Navy Southwest Division & San Diego Association of Governments, CA  
 San Onofre Nuclear Generating Station Marine Biological Monitoring Studies, Southern California Edison, San Onofre, CA  
 Coronado Bridge Eelgrass Construction Monitoring Surveys, Caltrans, Coronado, CA  
 National City Marine Terminal Wharf Extension Sediment Characterization, San Diego, CA  
 Aircraft Carrier Homeporting Project (CVN U.S.S. Stennis), LA-5 Ocean Dredged Material Disposal Site

Long-Term Ecological Monitoring, U.S. Navy, NAS North Island, CA  
 Deep-Draft Power-Intensive Pier Replacement Project Sediment Characterizations (P-327, Phases I, II, and III), U.S. Navy, San Diego, CA  
 Midway Atoll Ecological Risk Assessment Project (Navy CLEAN CTO 136), USN Pacific Division, Midway Island NAS, HI  
 Port of Los Angeles Pier 400 Phase II Water Quality Monitoring Project, Los Angeles, CA  
 Aircraft Carrier Homeporting/Main Channel Deepening Water Quality Monitoring, San Diego, CA  
 NASSCO and Southwest Marine Sediment Characterization Studies, San Diego, CA  
 Long Beach Naval Complex Environmental Impact Report/Environmental Impact Statement, (Marine Biology and Biological Resources sections), Long Beach, CA  
 Chollas Creek Dredging Water Quality Monitoring Project, San Diego, CA  
 Newport Dunes Dredging Water Quality Monitoring Project, Newport Beach, CA  
 Convair Lagoon Water Quality Monitoring, San Diego, CA  
 Pearl Harbor Naval Complex Ecological and Human Health Risk Assessment (CTO 206) Field Sampling, Navy CLEAN, USN Pacific Division, Pearl Harbor, HI  
 Convair Lagoon Eelgrass Surveys, San Diego, CA  
 San Onofre Nuclear Generating Station (SONGS) Radiological and Marine Resources Monitoring, San Onofre, CA  
 Midway Atoll Baseline Benthic Macroinvertebrate Analysis, USN Pacific Division, Midway Island NAS, HI  
 Richmond Harbor Benthic Macroinvertebrate Survey, Richmond, CA  
 San Onofre Mitigation Reef Studies, San Onofre, CA

## Rob Bussell

Upon my thorough review and analysis of the Draft EIS and supporting documents, a very well informative and complete document covering (no doubt) a wide variety of 'sensitive' // 'concerning' areas of interest. Clearly, the documents demonstrate a high level of awareness and mitigation measures, that realistically reassures the public that KS has a great development in the best interest for Kona. Therefore, it's my opinion that this is a worthy project endeavor that has my full support and endorsement.

## Lindsey Caldwell

I am emailing to voice my opposition to the planned resort by Kamehameha schools at Keaunohou Bay. I am tired of seeing our coastlines be used for the rich and for tourists. I am tired of seeing the minimal recourses and the limited infrastructure being prioritized for the rich and tourists. The worst part is most of these lands are either apart of the Hawaiian homes system, bishop estate, Kamehameha schools or Liliuokalani trust, or once were. Sold to the highest bidder or used for the benefit of people who only bring further gentrification. The kids currently graduating from Kamehameha schools may never get to live and thrive in their ancestral lands because of them no more than 17\$ an hour which couldn't even find their rent let alone a future mortgage. And the unfortunate who couldn't afford Kamehameha or pass the requirements for admittance get an even shorter stick in all of this. Where's the development for the Hawaiian people? I don't even need to read the environmental impact because it's the big picture I'm looking at. That once again Hawaiians are selling out, that money is more important than the people. That tourism is more important than reconnecting with Hawaiian roots. Why not turn this area into a place that benefits people, feeds people, heals people, instead of a place that only heightens tensions, limits resources further and pushes Hawaii and it's people further from its heart. Save Keaunohou Bay, don't gentrify it!!! Perpetuate what Kamehameha schools and all these other Hawaiian organizations were really meant to be, instead of using them to deepen pockets of people who do nothing for Hawaiians. No More Resorts!!!!

## Noelani Campbell

Aloha e Alaka'ina no Keaouhou Bay Project,

I am a Native Hawaiian and also a member of Keaouhou Canoe Club. As a Nā Ho'okama a Pauahi and a Nā Poki'i Scholarship recipient, my awardee kuleana has spanned over forty-five years. The Trust had only asked of me one thing in return for six years of tertiary education; to give back to Pauahi's children. This request has been an important part of the fabric woven throughout my life abroad, on the Mainland, and maka'āina Hawai'i.

As a kumu of Hawaiian Studies for the DOE (grades K-5), as a former kumu for Kamehameha Schools Kilohana Program, and in the education of keiki, 'ōpio, and the general membership at Keaouhou Canoe Club, I have continued to serve the Princess's legacy in the preservation of Hawaiian culture and values intended to empower her children. I express the following with much aloha for all that I have been given.

In the Keaouhou Bay Management Plan EIS Draft, I would like to make two clarifications:

1. Keaouhou Canoe Club is a non-profit 501c3. We are not a commercial operator.
  2. The "hostile and hostile atmosphere" (Sec. 3.2.3 paragraph 3) is indeed a daily occurrence however Ka'ili'ilimehe Park which has managed access is not the only locale of managed practices and stewardship.
- Having been a lessee of Kamehameha Schools (formerly Bishop Estate) for forty years, KCC has always been a Hawaiian racing club. The canoe club has promoted Hawaiian canoe koa racing, Hawaiian culture, and the preservation of the koa canoe. Traditional practices and education thrive with concentrated focus on local area children ages 7-18.
- Supporting that kuleana, are numerous mālama kōkua; individuals who preserve and uphold tenets of 'ohana wa'a with particular care of the koa canoe. Adornments of offering and protection are prepared by highly skilled lei makers (KCC members) where cultural propriety is applied in the harvest, preparation, and integrity of the lei produced. Kanaka Maoli are at the helm of cultural rearing and coaching of our youth and supported in all ways Hawaiian by member kōkua. Piko and pule are at the center of 'ohana wa'a which is conducted at practices, races, and relevant gatherings. By the start of the first regatta, with guidance, piko is led entirely by nā poki'i for the leadership, coaches, parents, and the entire racing program (keiki, 'ōpio, kāne, wāhine).

The statement "Keaouhou Bay offers a unique opportunity to infuse culture and education" (Sec. 3.2.3 paragraph 6) speaks to a potential that has already been realized and is ongoing at KCC. Education (historical, wahi pana, ali'i, nā mea wa'a, mo'olelo) and mālama 'Āina Pauahi are at the forefront of the canoe club's kuleana; steward the children, steward the land.

The recreational paddling program is a component of KCC's endeavors. We do not conduct any

for-profit activities as do the other recreational entities operating at Keaouhou Bay. There is no signing up for tours; only pre-planned educational/outreach opportunities for the community and the community at large. This component provides an opportunity to further create reverence and respect for those who are not familiar with Keaouhou's historical significance.

Our pa'a Culture Committee has worked diligently in providing these avenues of learning. Various resource specialists are invited to present aspects of Hawaiian ancestral knowledge, history, social/economic organization, resource management/sustainability, and the implications of rights and privileges viewed through a Hawaiian lens (kuleana).

'Āina Pauahi has provided me the physical, spiritual, and cultural connections necessary to be a worthy keeper of nā mea Hawai'i and the ha'i mo'olelo kūpuna a me nā ali'i o Keaouhou. As Kamehameha Schools reimagines this corridor for the future, seeds have long been planted and sprouted with profound yield especially in our strong youth racing program. Our keiki and 'ōpio are ma'a to traditional koa canoe practices of care, adornments, and protocols as well as all aspects of 'ohana wa'a.

As we prepare for the coming months/years, we remain, committed to Pauahi's legacy established in our Mission Statement and terms of our lease agreement.

I feel a great sense of responsibility to those who came before me, who gave me the inheritance of place and connection, and all the sacrifices they made for me to be here. It is for this reason, I remain accountable to the children who will inherit all that is Keaouhou.

'Owau nō me ka ha'a ha'a,  
Noelani Campbell

Aloha e Alaka'ina no Keauhou Bay Project,

I am a Native Hawaiian and also a member of Keauhou Canoe Club. As a Nā Ho'okama a Pauahi and a Nā Poki'i Scholarship recipient, my award kuleana has spanned over forty-five years. The Trust had only asked of me one thing in return for six years of tertiary education; to give back to Pauahi's children. This request has been an important part of the fabric woven throughout my life abroad, on the Mainland, and maka'āina Hawai'i.

As a kumu of Hawaiian Studies for the DOE (grades K-5), as a former kumu for Kamehameha Schools Kilohana Program, and in the education of keiki, 'ōpio, and the general membership at Keauhou Canoe Club, I have continued to serve the Princess's legacy in the preservation of Hawaiian culture and values intended to empower her children. I express the following with much aloha for all that I have been given.

In the Keauhou Bay Management Plan EIS Draft, I would like to make two clarifications:

1. Keauhou Canoe Club is a non-profit 501c3. We are not a commercial operator.
2. The "hustle and bustle atmosphere" (Sec. 3.2.3 paragraph 3) is indeed a daily occurrence however Ka'ilii'ilinehe Park which has managed access is not the only locale of managed practices and stewardship.

Having been a lessee of Kamehameha Schools (formerly Bishop Estate) for forty years, KCC has always been a **Hawaiian racing club**. The canoe club has promoted Hawaiian canoe koa racing, Hawaiian culture, and the

preservation of the koa canoe. Traditional practices and education thrive with concentrated focus on local area children ages 7-18.

Supporting that kuleana, are numerous mālama kōkua; individuals who preserve and uphold tenets of 'ohana wa'a with particular care of the koa canoe. Adornments of offering and protection are prepared by highly skilled lei makers (KCC members) where cultural propriety is applied in the harvest, preparation, and integrity of the lei produced. Kanaka Maoli are at the helm of cultural rearing and coaching of our youth and supported in all ways Hawaiian by member kōkua. Piko and pule are at the center of 'ohana wa'a which is conducted at practices, races, and relevant gatherings. By the start of the first regatta, with guidance, piko is led entirely by nā poki'i for the leadership, coaches, parents, and the entire racing program (keiki, 'ōpio, kāne, wāhine).

The statement "Keauhou Bay offers a unique opportunity to infuse culture and education" (Sec. 3.2.3 paragraph 6) speaks to a potential that has already been realized and is ongoing at KCC. Education (historical, wahi pana, ali'i, nā mea wa'a, mo'olelo) and mālama 'Āina Pauahi are at the forefront of the canoe club's kuleana; steward the children, steward the land.

The recreational paddling program is a component of KCC's endeavors. We do not conduct any for-profit activities as do the other recreational entities operating at Keauhou Bay. There is no signing up for tours; only pre-planned educational/outreach opportunities for the community and the community at large. **This component provides an opportunity to further create reverence and respect for those who are not familiar with Keauhou's historical significance.**

Our pa'a Culture Committee has worked diligently in providing these avenues of learning. Various resource specialists are invited to present aspects of Hawaiian ancestral knowledge, history, social/economic

organization, resource management/sustainability, and the implications of rights and privileges viewed through a Hawaiian lens (kuleana).

‘Āina Pauahi has provided me the physical, spiritual, and cultural connections necessary to be a worthy keeper of nā mea Hawai‘i and the ha‘i mo‘olelo kūpuna a me nā ali‘i o Keauhou. As Kamehameha Schools reimagines this corridor for the future, seeds have long been planted and sprouted with profound yield especially in our strong youth racing program. Our keiki and ‘ōpio are ma‘a to traditional koa canoe practices of care, adornments, and protocols as well as all aspects of ‘ohana wa‘a.

As we prepare for the coming months/years, we remain, committed to Pauahi’s legacy established in our Mission Statement and terms of our lease agreement.

I feel a great sense of responsibility to those who came before me, who gave me the inheritance of place and connection, and all the sacrifices they made for me to be here. It is for this reason, I remain accountable to the children who will inherit all that is Keauhou.

‘Owau nō me ka ha‘a ha‘a,

Noelani Campbell

## Mary Kealoha Campbell-Droze

A boutique hotel would wipe out what is currently a lush, verdant green space leading down to the Bay, which is acting as a buffer for run-off and other pollutants. There is already enough development in the area; we need to preserve whatever green we can.

## Shelley Carey

I support Kamehameha Schools (KS) comprehensive plan to improve Keauhou Bay. This sacred and historical place has been sorely neglected for too many years. Too many Hawaiian historic and sacred lands have vanished due to poor management and limited forethought. KS's Keauhou plan is almost a decade in the making and hasn't been without community and stakeholder input. For those that have read the plan will understand this project is meticulously detailed to honor the legacy of Kauikeouli and the future of the Kānaka 'Ōiwi.

The plan itself is based in stewardship and education. The plan highlights Kauikeouli's birth site and utilizing current commercial buildings to increase cultural education. The restoration of Ho'okūkū Pond, Mo'ikeha Cave, and removal of invasive plants and reseeding only native plants should be commended by all. Additionally, rerouting and relocating commercial activities away from sensitive cultural sites will create a more harmonious and balanced use of the area.

Due to current limited infrastructure, there are limited community and recreational opportunities, the new plan will increase use of the shoreline, improve parking, and route vehicle traffic to the old Kona Rd. Additionally, an increase of revenue from low impact lodging and commercial center will further increase the KS educational mission. The KS Keauhou Bay Plan should be approved without reservation.

This was taken from <https://www.fisheries.noaa.gov/national/ENDANGERED-species-conservation/ENDANGERED-species-act>

**FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED**

The green sea turtle is federally protected and can be seen in Keauhou Bay weekly.

The following article that states: "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.clemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Allowing this development WILL POLLUTE Keauhou Bay. The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!) states this fact clearly. Keauhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen because developments have been shown to ALWAYS pollute the water is that is nearby.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawaii's are protected by the [Endangered Species Act \(ESA\)](#) and additionally protected by [Hawaii Revised Statutes Chapter 195D \(HRS\)](#) and [Hawaii Administrative Rules \(HAR\) 13-124](#)." This information was taken from this site <https://dlmr.hawaii.gov/dar/species/sea-turtles/>

**THE ENDANGERED MONK SEAL WILL BE AFFECTED**

Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keauhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keauhou Bay will likely be changed forever.

This information is from a NOAA Scientist; "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!' That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species."

**To:** 221053-01 KS Keauhou Entitlements; Alex.Roy@hawaicounty.gov; Planning@hawaicounty.gov; Keauhoubay@ksbe.edu  
**Subject:** Save Keauhou bay  
**Categories:** Yellow Category

To Whom It May Concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools Environment Impact Statement (EIS) for Keauhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT on Keauhou Bay as stated in all the different researched articles below.

Please, DO NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is scientifically proven that developments pollute nearby waters both during and after development.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have ALWAYS polluted the water in EVERY coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keauhou Bay is their habitat and this development WILL be CHANGING an Entire Ecosystem.

**ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT**

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keauhou Bay.

The Green Sea Turtle swims in Keauhou Bay weekly and the monk seal has also been seen swimming and resting in Keauhou Bay. Both of these marine animals are on the endangered species list.  
Endangered Species Act

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought. <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-sealife>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawai'i Revised Statutes (HRS) Chapter 195D and Hawai'i Administrative Rules (HAR) 13-124." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

Keaouhou Bay is the monk seals and the green sea turtle's habitat. Allowing a bungalow resort to be developed in Keaouhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to protect the land around Keaouhou Bay from developments that destroy the habitat of these endangered species with pollution and runoff.

Does this EIS have any reports on the endangered species that frequent Keaouhou Bay? This is their habitat and it needs to be "conserved".

Under the Conservation Program there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keaouhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keaouhou Bay and the surrounding area during the building phase of this enormous project.

#### GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keaouhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable!

Please read from Wikipedia, "Most drains have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping system." [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dr%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dr%20wells)

The pavement from this development will cause pollution to runoff into Keaouhou Bay because this treed land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keaouhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> where the Hawai'i government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keaouhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.

These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keaouhou Bay and for these endangered species habitat.

Under Section 2 (b) of the Endangered Species Act - Keaouhou Bay MUST BECOME A CONSERVATION AREA for these endangered species. It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keaouhou Bay.

#### ALGAE BLOOMS KILL CORAL AND MARINE LIFE

The trees that are slated to be cleared for the development further protect Keaouhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer.

When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course developments. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development.. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution... " <https://www.globacoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cav-abaco-bahamas/>

If you allow a Bungalow Development in Keaouhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAOUHOU BAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globacoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keaouhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

FURTHERMORE: "If there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

#### ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN

Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keaouhou Bay?

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keaouhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keaouhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

The article below is from NOAA regarding motor vehicle engines and pollution to the sea.

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant.>

Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects

News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a new report from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%20Nearly%2085%20percent,pipeline%20pills%2C%20says%20a%20new>

The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershedrds.org.au/blog/the-impact-of-stormwater-car-emissions/>

#### NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE

Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keaouhou Bay during development?

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation->

[districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.](#)

What is ocean noise?

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

#### LEARN FROM OTHERS: RUN-OFF FROM DEVELOPMENT KILLS

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments. Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed. Keauhou Bay is a much smaller ecosystem.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow..

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20open,parly.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay due to its size and fragility.

#### MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN

Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays. Manta rays are in Keauhou Bay every night to eat zooplankton, and are often seen here during the day.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is NO WAY to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments.

Please read the Scientific articles below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide..."

This was the third major bleaching episode in Hawai'i over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-off). <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,head%20catastrophic%20impacts%20state%20wide.>

This article is by the Coral Reef Alliance here in Hawaii. "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawaii%20reefs%20face%20major%20global,into%20Hawaii%20CA%20BBi's%20waterways%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status-report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status-report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban run-off, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269058>

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantaradvocates.com/how-much-plankton-do-mantas-eat/>

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development,...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide.>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

It's Been Proven Resort Developments KILL Marine Life

This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem...

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This

occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-*a* concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

The ecosystem is fragile and interconnected as is stated in this article: "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE.12/SCOPE.12\\_3.6.chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE.12/SCOPE.12_3.6.chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

#### HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH

Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life." <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20pop,od%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denier%20coastal%20populations%20and%20greater,fo%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in *Nature Sustainability*." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,ther%20are%2C%20the%20research,th%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study%20said.>

By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manita night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so

fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S00652988120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNha,hj,AnWAq453RgN0jA,W9E9jnR3zoTv0P,CzA5tc,H00JzcHNIP3AShngcKRy6\\_vkLPw49dbmBYoXSg3Y1MgOIGBBZsnpdGUH7O1SLbn9x5P3xEPD4Kx4T0sJNgQla7ZZR1GfUbraxpoddJd2AonISmWSukB7JEDdpJjSOGJpx7JTJWdCfXvFKJIZYcNdGj3Sw\\_dnaUg5ZlhcjPBDlmmah15xqt50%3D&text=king,referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNha,hj,AnWAq453RgN0jA,W9E9jnR3zoTv0P,CzA5tc,H00JzcHNIP3AShngcKRy6_vkLPw49dbmBYoXSg3Y1MgOIGBBZsnpdGUH7O1SLbn9x5P3xEPD4Kx4T0sJNgQla7ZZR1GfUbraxpoddJd2AonISmWSukB7JEDdpJjSOGJpx7JTJWdCfXvFKJIZYcNdGj3Sw_dnaUg5ZlhcjPBDlmmah15xqt50%3D&text=king,referrer=abcnews.go.com)

#### INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS

Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. Worldwide, hotels produce almost [300,000 tonnes of waste](https://www.homebiogas.com/blog/hotels-waste-management/) each year." <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Keauhou Bay. On Hawaii's Island, we are already struggling to meet the increasing need for resources and infrastructure.

Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawaii's landfill September 17, 2023

The West Hawaii's Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawaii landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

A County commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill

By [Megan Moseley](#) September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Kaahumanu Highway in Waikoloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

Time's Up For Landfills

Gentle' demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

Drought Conditions On Hawai'i Island Prompt Water Supply Message

13

by Big Island Video News  
on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely. Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information [from the U.S. Drought Monitor](#). There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

[U.S.](#)

Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By [Li Cohen](#)

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to [significant droughts](#), and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the [world's largest surfing wave pool](#) opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe."

"We are in a [water crisis](#), that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

UPDATE: HELCO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

14

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/hcco-customers-on-hawaii-island-asked-to-conserve-power>

Big power supply problems continue to plague Hawaii Island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

Hawaii Island customers urged to reduce electricity use through April

15

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES

A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawaii News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

16

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added. <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example. "On the Big Island, the mayor had to issue an [emergency order](#), shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: All of these roads only have two lanes!

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8423-8313ed8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8423-8313ed8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=-FQSmFDjiI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

**MORE ARTICLES HIGHLIGHTING INFRASTRUCTURE AND RESOURCE DEFICITS, INCLUDING WATER, TRASH, ELECTRIC and WASTEWATER:**

1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Wastc360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.wastc360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawaii's Sanitary Landfill reaching capacity.

The West Hawaii's Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

20) "Hawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

#### HISTORICAL AND CULTURAL SIGNIFICANCE:

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai'i. After being added back in 1978, the law is part of Hawai'i's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

The Law of the Splintered Paddle is also on Kamehameha Schools website. The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.kisbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-true-200-years-after-k>

Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.

#### IN CONCLUSION

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Eco-system in Keauhou Bay and "The Endangered Species Act of 1973 (ESA or "The Act"; 16 U.S.C. § 1531 et seq.) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from extinction as a "consequence of economic growth and development untempered by adequate concern and conservation", the ESA was signed into law by President [Richard Nixon](#) on December 28, 1973. The [Supreme Court of the United States](#) described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation".<sup>[1]</sup>" [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land MUST be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawai'i Island is already having serious infrastructure and resource issues that have yet to be solved. These issues MUST be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly protects the marine life and environment from further damage. The location is NOT suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

Mahalo,

Dorothy S Case

**Ocean planet Images**

**[www.oceanplanetimages.com](http://www.oceanplanetimages.com)**

I am responding to the Kamehameha Schools EIS for Keauhou Bay as a regular user of the Bay and as a member of the Keauhou Canoe Club.

My concern with the EIS is related to Section 4.5. I swim in the bay each week. We enter at the "beach" which is on the North side of the end of the rock wall, and at the end of Kamehameha III Rd. If there is a heavy rain, which is common for Keauhou, the water there becomes cloudy from the runoff from the water flowing down this road and bringing the dirt and debris. The drainage opening at the end of Kam III in the circular turnaround area becomes backed up and floods the whole end of the road. Mitigating this runoff problem must be in the future plans.

The other issue I am very concerned about is how the wastewater is going to be taken care of. Sewage has always leaked into the Bay. For many years one of the members of the Keauhou canoe club, Dennis McHatta, collected samples of the water in the bay very scientifically. There was an OC 16 TV program made about this showing how after a rain, the water becomes turbid. He proved that sewage was leaked as well. My understanding is that there are very old pipes for sewage, water, electric, and telecommunications lines running along the shoreline that are at risk or are already compromised. The first thing that **MUST** be done before any construction or development is done, is to relocate these lines to a safer place. We already are experiencing higher tides and king tides that tell us the seas are rising. This is an opportunity to correct these issues of water lines, sewer lines, communication lines, to protect the fragile waters of the bay.

The proper authorities must be involved to correct these issues.

When we first moved to Keauhou in 2011, I remember snorkeling in this bay and seeing beautiful coral of all colors. There were 50-60 manta rays on the night tours. Yellow tang were everywhere. And now when we swim, we do not see any tropical fish or any beautiful coral. And after a rain, the water is cloudy and sometimes smelly.

I implore you to take care of the basic needs of the bay first, before going forward on any new development.

Mahalo for your attention to this matter. Signed: *Dorothy S Case*

Re: Kamehameha Schools, Keauhou Bay Management Plan Draft Environmental Impact Statement

Dear County of Hawaii, Planning Department,

I am submitting these comments to the Kamehameha School, Keauhou Bay Management Plan Draft Environmental Impact Statement. As an initial matter, I have over 30 years experience in the preparation of environmental impact reports and statements and after my initial review of the subject report it appears to be the most incomplete and deficient report that I have ever reviewed. However, before getting in to substantive comments I'll introduce myself.

**A. Background Expertise**

I graduated from UC Santa Barbara with a degree in environmental studies and from law school from the University of the Pacific, McGeorge School of Law. During undergraduate studies I worked at the Institute of Crustal Studies Vadose Monitoring Laboratory conducting cutting edge research in the movement of pollutants within the vadose zone (defined as the zone of soil between the surface of the earth and groundwater.) Prior to becoming an environmental attorney, I worked for several years as an environmental consultant. I also previously clerked for the United States Department of Interior, Regional Solicitors' Office and the California Department of Fish and Game, Legal Advisors' office. For the past 31 years my legal practice has been in environmental law where I have litigated dozens of cases on behalf of and against public entities related to Environmental Impact Reports and Environmental

Impact Statements. I also have assisted in the preparation of many environmental impact assessments, including providing substantive comments and review on behalf of multiple public entities and a number of cities. Part of my expertise includes analyzing traffic impacts, runoff issues, noise impacts, air impacts and toxic/nutrient loading impacts from projects. I have spent literally thousands of hours over the last 30 plus years analyzing such impacts. To date, I have never lost of single case involving litigation over the sufficiency of an Environmental Impact Report or Statement. I have been considered by several courts to be an expert in environmental impact reports and litigation. In one of the last cases I handled involving the failure to prepare an appropriate EIR, the Court awarded over \$400,000 in attorneys' fees and costs to my client as the prevailing party. That amount could have been avoided had Los Angeles County simply listened to the comments that we provided. Accordingly, we urge you to similarly listen to our comments as the failure to do so may result in a large and expensive piece of litigation. The environmental impact report and statement litigations have involved a number of subjects including impacts to the local coastal zone and waters. Additionally, I have litigated dozens of cases involving toxic substances, including damages caused to water bodies from excess nutrients and toxic substances. I am on the editorial board of the Environmental Forensics Journal. I am routinely invited to lecture both nationally and internationally on issues involving the detection and impact of toxic substances and nutrients on the environment, including coastal waters. For example, I was asked to speak at the International Environmental Forensics Conference in China where I spoke on the admissibility of expert opinions in environmental forensic cases related to toxic pollutants. I also have been published in a number of books, publications and have been interviewed numerous times as an environmental expert by local and national media. I also have been a frequent user of Keauhou Bay for over 20 years such that a number of my comments are based on my personal observations over the course of several thousand hours over the last 20+ years. For the past two years I have spent over 200 hours observing usage of the bay, including public usage, the boat ramp and commercial/tourist usage of the bay particularly related to some of the initial scoping documents to see if there was any veracity in the claims presented by the Project proponent.

**B. Substantive Comments**

As discussed supra, the subject EIS is facially deficient and must be rejected in its entirety. Under existing law, the EIS conclusions and analysis must be supported by substantial evidence to support the analysis and conclusions. It is the burden of the party preparing the EIS to provide support for the document. The failure to provide the required supporting evidence for the statements and conclusions requires that the document be rejected by the reviewing public agencies. For the most part, the EIS appears to be a series of unsupported statements and conclusions and written to appear more as an advertising document for the project intended to "sell" the project to both the public and regulatory agencies rather than providing any substantive research and/or analysis. The comments listed below are not necessarily all inclusive but highlight the many deficiencies. It is our understanding that a number of other experts will also be submitting comments highlighting the deficiencies in the EIS and those comments are referenced, adopted and should be considered to be included herein.

**1. The Project Provides No Support Of How It Will Alleviate "Congestion" Conflicts Use**

First, the EIS creates a straw man argument that Keauhou Bay suffers from "congestion" and conflicts with incompatible uses. There is no supporting study analyzing the existing number of users on a daily, weekly, monthly and/or annual basis nor the type and timing of the usage. Without such an analysis, the statement that there is a problem with "congestion" and/or "incompatible uses" is simply unsupported

by any evidence. There are one or two photographs depicting people standing around the publicly owned dock area, which as people are congregating in publicly owned spaces the report fails to explain how the Project will prevent the public from congregating on publicly owned land. There is also Figure 3-13 which depicts a picture of the bay with ZERO people present, which directly contradicts any claim of congestion. Other than reducing access to publicly owned space, the project provides **no analysis** of how it will reduce the existing number of users nor the purported "incompatible" uses. Without underlying research, study and analysis the statements that the project would reduce "congestion" and/or use conflicts is unsupported and the EIS must be rejected on this basis alone. In fact, it would be reasonable to conclude that the project would substantially increase congestion and use conflicts at Keauhou Bay. For example, with the construction of 43 housing structures containing 150 housing units, which will each likely have 2 cars, with a minimum average of 4 car trips per vehicle per day, the housing units alone will likely add OVER 600 vehicles trips per day. (Based on my observations, the housing units alone will more than likely, on their own, double or triple the amount of traffic in the area.) Plus, you are adding hundreds of new visitors staying in the new housing on the bay, which presumably those new visitors will visit and use the bay. With the proposed cultural center, commercial center, commercial kiosks and employees/workers at the new proposed resort, there obviously will be a substantial increase in the number of additional vehicle trips per day. I'd note that the nearby Pu'uhonua o Hōnaunau National Historical Park ("City of Refuge") reports over 300,000 visitors per year to the site and cultural center (Volcanoes National Park attracts over a million visitors per year.) Will the new proposed cultural center (located substantially closer to the City of Kailua-Kona so it will be much easier for visitors to access) attract a comparable number of visitors per year to the City of Refuge? The EIS provides no projections based on increased numbers from the cultural center. Even assuming the new cultural center only attracts 100,000 visitors per year (which is less than 33% the number that visit the City of Refuge), that equates to nearly 30,000 additional vehicles trips alone per year. (Note: the City of Refuge Parking lot has 75 parking spots plus there are usually 20 plus cars parked outside the gate, meaning that with staff there are 100 plus parking spots associated with the City of Refuge that are frequently full. The Project proponent has ZERO parking spots in the EIS for the "cultural center" beyond the existing parking.) The kiosks at Alii Marketplace have approximately 40 parking spots that are largely full most of the time. Accordingly, one would anticipate the "kiosks" at the Project will require comparable parking (if not more because kayak and SUP rentals are likely going to stay longer than visitors to Alii Marketplace.) Accordingly, it may be reasonable to conclude that the Project will add a demand for upwards of 140 parking spots to the existing parking demands. There is no study of the existing parking requirements not assessment of the future parking requirements should the project be implemented. Plus, the EIS identifies the launch ramp area as the area of purported greatest congestion and yet the project proposes to ADD substantial numbers of visitors and vehicles to the area of alleged greatest congestion. The launch ramp cue (i.e. Vehicles/trailers waiting to launch and/or pull-out boats) is noted as an area of greatest congestion. The cultural center is proposed to be built in the area of greatest congestion. The Project fails to explain how adding thousands (if not tens of thousands) of more people and vehicles to the area identified as having the greatest congestion will be reduced by the Project. Particularly, the EIS fails to contain projections as to the increase in number of visitors and vehicles to the area and the extent to which the Project will impact those levels. (Note: With 43 houses and 150 units being built on the bay likely housing 250+ tourists each day plus commercial kiosks with kayak and SUP rentals, the bay daily usage will also likely substantially increase and yet there is no estimate of that impact.) There is NO analysis of the impact on local flora and fauna from the likely increase usage of the bay arising from the project. Moreover, with the addition of SUP and kayak rentals on the bay, the Project is likely to increase conflicts with the existing boating usage of the bay for ingress and egress to the loading ramp and dock area. There is no analysis of the future impacts on existing uses

of the bay with the addition of rental kayaks and SUP to the bay. For the foregoing reasons, the EIS must be rejected for failing to provide supporting evidence and documentation.

## 2. The Report Fails To Analyze Traffic Impacts

As discussed supra, the Project proposes to build a resort with 43 housing structures with 150 housing units (Note: the term "bungalow" seems to be an attempt to mislead the public in to believing that what is being proposed are not in fact large multi-bedroom homes), commercial kiosks, cultural center and commercial/retail center. It also proposes to build a new road connecting the north and south ends of the bay. As discussed supra, the Project will likely result in a minimum of hundreds, if not thousands, of additional vehicle trips per day. There is no study of the what the current number of vehicle trips per day are on the surrounding public roads, the level of impact of the existing stop lights nor the number of vehicles that travel from the south-north and/or north-south on the existing roadways that would conceivably use the new road. Accordingly, there is no evidence of what, if any, the amount of reduction on the existing roadways would be by the construction of a new road. Moreover, there is no analysis of the additional vehicle trips that would be created by the Project and what those impacts would be on existing traffic conditions nor existing parking. (Note: the impact of toxics on the bay from the Project will be discussed separately.) Moreover, the EIS fails to address how the Project proposes to mitigate the increased traffic impacts. Finally, the EIS asserts that the Project will reduce traffic impacts, without the citation to any evidence and/or study supporting that conclusion. The Project also proposes to relocate the existing commercial snorkel boat vendors to the other side of the launch ramp, which means the snorkelers will have to walk across the purportedly congested boat ramp to get to the dock area and load on the snorkel boats. (Note: With the current buildings next to the dock, the snorkel visitors don't have to walk across the busy double-lane boat launch ramp. (One can just imagine how many people will get run over by people either trying to launch and/or pull boats from the water during the day and at night.) On this basis alone, the EIS must be rejected and further studies conducted.

## 3. The EIS Fails To Address Noise Impacts From The Project

The Project purports to build a large resort, commercial center, cultural center and commercial kiosks. The majority of the project will tear out historically forested areas for which the only noise being generated is by natural flora and fauna and replace it with a resort and new road. There is NO study of the existing noise levels in the area. There is NO analysis of what increased noise impacts to the area will be from the Project other than conclusory statements that are without supporting evidence and/or study. Obviously, the Project will materially change existing conditions related to noise through a substantial increase in activity around the bay. (Potentially adding thousands of new visitors and vehicle noise to the bay area on a daily basis.) An noise study must be conducted to analyze existing noise levels and potential future noise levels.

## 4. The EIS Fails To Address Air Impacts From The Project

The Project proposes to build a large resort, commercial center, cultural center and commercial kiosks. In building the project roughly 20+ acres of existing native forest will be destroyed to build the resort. As discussed supra, potentially thousands of additional vehicle trips will be added to the area without any analysis as to what the existing air quality conditions are nor the impact of the additional vehicular and project features are to the local air quality. For example, even if the cultural center only has a fraction of the visitation as the 300,000 plus visitors that visit the City of Refuge, that could generate tens of thousands of additional vehicle trips to the bay area on a yearly basis and have potential

consequences to the local air quality. (Note: The area is generally not served by any public transportation, which necessitates vehicular travel.) A study needs to be conducted as to existing air quality and future projected air quality impacts from the project, including destruction of forest.

**5. The Report Fails To Address Historical Runoff Issues**

Currently, Kamehameha III Drive experiences flooding after even an average rainstorm. (Personal observations over the last 20 years.) Portions of the flooding appears to originate from Project lands and nothing in the EIS addresses how the Project will address existing flooding on Kamehameha III Drive caused by Project lands. The EIS also fails to address the fact that historically there were two sand volleyball courts. The 2<sup>nd</sup> court was situated in the publicly owned land between the seawall and the existing volleyball court. When the project proponent cleared lands (it appears illegally and without an EIS and/or other permit) to construct the existing parking lot and boat storage area the drainage was substantially effected and the rather than have vegetation slow the water flow, the surface flow rate dramatically increased and the 2<sup>nd</sup> sand volleyball court was washed out along with portions of the remaining volleyball court. (Personal observation.) Note: The EIS fails to address the permit status of the existing boat storage and parking lots on the northern side of Keaouhou Bay and I could not find any permit with the County for the construction nor corresponding environmental documentation. Accordingly, it appears that the boat parking lot and other parking lot may be unpermitted. The Project proponent failed to make repairs to the 2<sup>nd</sup> sand volleyball court located on public lands and existing sand volleyball court that its apparently illegal development destroyed. The EIS fails to address the apparent illegal development of the current northern parking lot and boat storage lot nor the environmental impacts therefrom. Notably, the EIS fails to also address that to the North of the sand volleyball court is a historical catchment area that helped capture runoff from the northern area where the new parking lots and boat storage were added. (Personal observation and interview of locals.) The Project proponent has failed to maintain the catchment, which has contributed to excess runoff from the area that has damaged publicly owned property. In interview of locals, in the past there have been attempts by the locals to keep the catchment clear so as to reduce flooding from the upper areas. The EIS must address the permit status (or lack thereof) of the apparently illegally constructed parking and boat parking lots including the lack of environmental review thereof, the historical runoff issues from the Project proponent lands that have caused damage to publicly owned property and how the project will mitigate existing issues. For this basis alone, the EIS must be rejected and further studies and assessments conducted.

**6. The Project Fails To Address Additional Runoff Impacts From Increased Hardscape**

The project proposes to take existing native vegetation areas and tear them out in favor of building the resort, commercial kiosks and commercial/retail. Based on the review of project maps, it appears that roughly 15-20 acres of native vegetation will be removed and replaced with mostly hardscape. There is NO analysis of the existing runoff from the "as is" condition of the properties and project area. There is also no study/analysis and/or projection of the increase flow and rate of runoff from the increased hardscape. The potential increased flow has the potential to alter the fresh/saltwater balance within the eastern end of the bay, which could impact fish and coral. This is a requirement of the EIS. The failure to include such an analysis mandates that the EIS be rejected and further studies of historical, existing and potential future conditions analyzed with appropriate mitigation measures.

**7. The Project Fails To Study, Analyze And/Or Provide Projection As To Increased Toxicity And Eutrophication Impacts To Keaouhou Bay**

As discussed supra, the Project proposes to add potentially thousands of new vehicle trips to the area surrounding Keaouhou Bay every day. Also, the Project proposes to add a new road closer to the Bay that would carry the additional traffic along with re-routing existing traffic that is currently roughly more than a ½ mile away and that currently drains to an existing golf course and forest area. Roadways are well known for the ability to accumulate and disperse toxic pollutants during rainfall events. Thus, by positioning the roadway closer to the bay there is the potential for an increase in toxic pollutants entering the bay and impacting existing flora and fauna. There is NO study and/or analysis of the existing toxicity of runoff to the bay from nearby roadways. Additionally, there is NO analysis or projection of the concentration and ecological impact of the project and additional roadway on future runoff to the bay arising from the Project. Not only do roadways accumulate toxicants that runoff the roadways during rainfall events, but projects such as resorts with houses, pools, lawns etc... also have increased runoff of nitrates and phosphates. Nitrates and phosphates, among similar chemicals, are well known to cause eutrophication to water bodies. Golf courses also have the potential to release substantial amounts of nitrates and phosphates through runoff. Currently, the golf course to the east of the bay drains into the forest area, which the Project proposes to remove. The forest area likely acts as buffer that absorbs nitrates and phosphates that are captured by the existing forest area. At times, after heavy rainfall, the end of the bay closest to Project proponent's property can appear slightly green and with surface scum, which suggests that under current conditions there may be nutrient issues with the current runoff. Not only does the EIS fail to analyze existing conditions but also the impact of the removal of the forest, construction of the road and construction of the resort on the future release of eutrophic chemicals to the bay. On this basis alone, the EIS must be rejected and further study conducted.

**8. The EIS Fails To Take In To Consideration The Historical Failure Of Proponent To Maintain Existing Facilities**

The EIS fails to analyze the long history of the failure of the Project proponent to provide maintenance to the existing properties. The EIS vaguely references the long-term maintenance issues related to Project proponent's properties and then suggests that the maintenance failure is due to the lack of income from the properties and that in the future the maintenance will improve. Such a suggestion by Project proponent is misleading at best and verges on being an outright fraudulent misrepresentation. Project proponent is a \$14.6 billion dollar entity according to its website. (See <https://investments.ksbe.edu/endorsement#:~:text=As%20of%20lume%203%20C%202023,Real%20Estimate%20of%20%244.7%20billion.>) Thus, the suggestion that the lack of maintenance was due to the lack of funding available in which to conduct maintenance. Moreover, Project proponent has historically received funding from the Keaouhou properties through the boat yard rental, parking, canoe club and building rentals such that the failure to conduct maintenance is inexcusable. For example, the existing seawall owned by Project proponent has been in serious disrepair for over a decade, with the wall having large pieces falling off into the ocean and no repairs have been made. Similarly, after Project proponent's construction of the apparently unpermitted northern parking lots occurred and the sand volleyball court built on public lands was washed away, Project proponent failed to attempt to any repair. Project proponent failed to maintain existing drainage structures to the north of the existing volleyball court. Moreover, the cultural heritage corridor (which they supposedly they care about) has been allowed to fail into disrepair, with broken benches for sitting, peeling paint, overgrown plants and trash that have largely gone unrepaired and neglected for the last decade or more. (Personal observation.) Thus, there is ZERO evidence to support that if the Project is approved that the Project proponent will suddenly and magically start to actually do maintenance on its' properties. As a result,

the EIS MUST consider that the Project proponent will act EXACTLY as it has in the past and continue to fail to maintain its' properties and what the implications will be on the future for the Project based on the last many decades of neglect by the Project proponent. Moreover, the EIS fails to disclose and discuss the long history of scandal and abuse associated with Project proponents organization and what transparency will exist to ensure that the Project will do what it is supposed to do. (See e.g. <https://www.kamoi.net/media/2020/03/12/an-investigative-report-into-the-past-trustees-of-kamehameha-schools/>) The EIS mentions nothing of other "projects" such as the cultural center and botanical gardens along Alii Drive that Project proponent has abandoned and failed to maintain in the past and currently. There is NOTHING in the EIS that provides any checks and balances to ensure that the Project will actually be maintained and based on history on the Project properties and nearby failed projects by the Project proponent, it is unlikely that the Project will meet its' promises. Moreover, the EIS, based on the poor maintenance history by the Project proponent on these and other nearby properties needs to consider the impacts of the Project proponent continuing to conduct basic maintenance on the Project properties as it has done for decades. In other words, the EIS needs to address not only the lack of historical maintenance, other failed nearby projects, and the impact of the failure to maintain the Project in the future. (Typically, a Project such as this will have a detailed maintenance and upkeep schedule of the Project and mitigation measures that then can be adopted as conditions of the Project approval and be enforceable by regulatory agencies.)

#### **9. The Project Blocks Public Access Across Publicly Owned Property**

Based on the maps attached to the EIS, there is publicly owned property extending from the end of Kamehameha III Drive to the boat dock area. Currently, there is a path that extends from the end of Kamehameha III Drive to the boat dock area that allows access to the boat dock area. (personal observation and use.) However, the project proposal maps appear to block to existing publicly owned path from the end of Kamehameha III Drive to the dock area. Project proponent misleading fails to identify the existing path and access across publicly owned property. Nevertheless, the Project proponent proposes to block access to the public across publicly owned property, which is illegal. As a result, the EIS must be rejected and the current public access preserved in future versions should be Project wish to move forward.

#### **10. Destruction Of The Sand Volleyball Courts Violates Proponents Charter As Well As Access To Publicly Owned Property**

Historically, there were two sand volleyball courts located on the east end of Keauhou Bay. One of the sand volleyball courts was located at the western edge of Project proponents' property, which is the existing volleyball court. According to locals, the existing volleyball court has been in continuous use by the public, including locals and in particular local kids for at least 35+ years. Dozens of comments have been submitted stressing the importance of the sand volleyball courts to the local community. With the limited number of sand volleyball courts available locally, this is the primary sand volleyball court used by local kids who want to learn how to play sand volleyball. As women's sand volleyball is now a collegiate sport and men's sand volleyball is also poised to become a men's collegiate sport, the existing volleyball court is a critical resource for local kids hoping to not only learn how to play volleyball, but also pursue potential college scholarship opportunities. Notably, sand volleyball is one of the sports that most represented by local Hawaiians in the Olympics. Up until Project proponent cleared land to create the northern parking lot and boat parking, there was second sand volleyball court that was similarly used by locals. Project proponent proposes to eliminate BOTH volleyball courts and instead grass in the area as "open space." There is no analysis as to the impact of eliminating the existing volleyball court nor the

impact on the local community and uses. Currently, there is roughly 10-20+ adults and kids that utilize the existing volleyball court on a daily basis. Accordingly, Project proponent should be required to analyze the impact of eliminating the existing volleyball court. There is nothing in the Project that would replace the 2<sup>nd</sup> court that was damaged by the excess runoff caused by land prior land clearing activities. At a minimum, the Project should be required to replace the 2<sup>nd</sup> volleyball court that was damaged by Project proponent's activities and to ensure that future runoff is controlled so it does not impact the sand volleyball court. Notably, historical photographs (See attached historical photograph from 1990) show that the East end of Keauhou Bay was a sandy beach ALL of the way up to the base of the hill to the East of the existing volleyball court. The seawall appears to be a late addition built within the existing high tide area. (See historical nautical chart dated 1949, which does not note the presence of any seawall.) Based on the 1949 chart, the seawall itself appears to have been constructed below the mean high tide line, which appears to be publicly owned land. Thus, a large grassy area constructed on Project proponents' property and on the publicly owned lands is incompatible with both historical and current uses. There is no analysis of the impact of the removal on historic cultural uses and current uses. To be consistent with historical uses on both the public lands and lands within the historical mean high tide, Project proponent should be required to replace the sand that has been lost and to ensure that it cannot be washed away by excess runoff. Due to the failure to analyze the impacts of the sand volleyball court removal, proposed construction on publicly owned lands and within the mean high tide and the failure to consider future impacts, the EIS should be rejected. (Not to mention the failure to address seawall that is falling down.) Moreover, if Project proponent should consider moving forward in the future, the sand volleyball courts should both be replaced, the drainage fixed and maintained by Project proponent. All of the above should be supported by adequate usage and projection studies.

#### **11. The EIS Fails To Address Congestion Caused Elsewhere By The Removal Of The Sand Volleyball Courts**

It is my understanding that literally dozens of comments have been received outlining the usage of the volleyball court and negative impact from its removal. The remaining court is utilized on a daily basis by the public and local kids. It is a long-standing tradition that family's barbecue locally and play on the volleyball courts every weekend. With the removal of the remaining court, the usage will be transferred to already congested sand courts at Magic Sands Beach and Coconut Grove creating both congestion and usage conflicts elsewhere. The EIS fails to analyze existing usage nor where the existing usage would be relocated. It fails to address potential congestion caused at the other locations by the court removal. A study needs to be conducted of existing usage and the impact of shifting that usage to the 2 remaining sand volleyball courts in the area.

#### **12. Existing And Future Impacts On The Coral In The Bay Are Ignored**

The USEPA considers sedimentation, pollutants and nutrients to be some of the primary threats to coral communities. (<https://www.epa.gov/coral-reefs/threats-coral-reefs#:~:text=Metals%20such%20as%20mercury%20and,%2C%20feeding%2C%20and%20defense%20responses.>) A healthy coral community is key to maintain a healthy aquatic environment. The status of the health of the coral reefs within Keauhou Bay and the impact of existing sedimentation, toxics and nutrients has not been assessed. Current impacts from Project proponent's properties to the health of the coral reefs has not been studied nor assessed. The EIS fails to quantify the potential amount of sediment, pollutants and nutrients that may be generated from its construction activities nor from the Project. The EIS analyzes no potential mitigation measures that may be adopted to address past and current impacts to the bay from Project proponent's properties nor future impacts to the bay

from the Project. As a result, the EIS is facially deficient and rejected so that the appropriate studies of the baseline conditions of the bay are studied and future project impacts are assessed and appropriate mitigation measures adopted to ensure the health of Keauhou Bay.

### 13. The EIS Fails To Consider Tsunami Impacts On The Cultural Center

Presumably, the proposed "Cultural Center" would contain hawaiian artifacts etc.... However, the buildings that Project proponent proposes to utilize as a "Cultural Center" were badly damaged during the last tsunami (which was a relatively small tsunami.) If the Culture Center had been in operation during the last tsunami, precious artifacts would have been lost and/or destroyed. Instead, as the buildings housed snorkel tour businesses, all that was damaged was the buildings and their easy to replace contents. It is inconceivable that any entity that purports to be charged with a duty to protect cultural heritage would place a Culture Center at one of the highest at risk locations on the islands. (Due to Keauhou Bay's triangular shape and rapidly rising depths, a tsunami wave from a westerly direction is channeled, funneled and magnified by the shape of the bay.) This makes Keauhou Bay one of the locations on the western side of the island most likely to experience the largest tsunami impacts. The report fails to mention that entire buildings adjacent to the proposed Culture Center were destroyed by the last tsunami nor are any mitigation measures proposed. Without any information in the EIS it is unclear what if any protection would exist for the Cultural Center and any artifacts inside.

#### Threats to Coral Reefs | US EPA

Coral reefs are among the most biologically diverse and valuable ecosystems on Earth. This web site describes the importance of coral reefs, threats to them, and ongoing efforts to protect them.

[www.epa.gov](http://www.epa.gov)

### 14. The EIS Report Fails To Address Adequate Project Alternatives

The EIS and the Project proponent infer that there is a "need" for greater economic development and use of the property. However, the EIS fails to disclose the current income levels from the current uses of the properties. Moreover, the EIS fails to address any "smaller" project alternatives. As everyone is aware, Project proponent has spent over a decade in construction of the Kahalu'u Ma Kai Project located on 22 acres nearby. (The hotel closed in 2012.) As that project historically operated a resort and was fully developed, logic would dictate that if Project proponent was concerned about income that property would an ideal location for a resort. Currently, there is apparently no economic use being made of the Kahalu'u Ma Kai property and very little use for educational purposes. According to the locals, the primary use appears to be for private barbeques and events for select locals connected to Project proponent. (Notably, there seems to be very little to anything "cultural" about 22 acres of non-native mowed bermuda grass, which is a post-european contact non-native species.) Accordingly, if the income from the Keauhou properties is such a great concern, where they are currently making money, and Kahalu'u Ma Kai is making zero income, shouldn't the project be built on Kahalu'u Ma Kai and a more limited project build at Keauhou? The EIS does NOT explore that alternative. Moreover, across the street from Kahalu'u Ma Kai is, from my

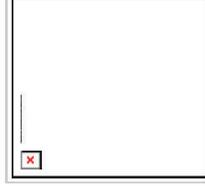

understanding, a former "cultural center" and botanical garden that was closed by Project proponent and appears to generate zero income. The EIS fails to analyze a situation where the resort would be constructed on that property and a smaller project constructed on the Keauhou properties. Again, the EIS should consider reasonable alternatives where Project proponents use underutilized properties near the Keauhou properties, and a smaller project be built on the Keauhou properties.

### Conclusion

It would be hard to find a more defective and deficient EIS. In the last 30+ years I've yet to see a more facially defective and deficient EIS. The EIS reads like an advertising brochure with a bunch of unsupported claims and conclusory statements. The EIS appears to be written with the goal of misleading the public and regulatory agencies rather than informing them of potential impacts and setting out appropriate mitigation measures. There were virtually no studies conducted of the existing environmental conditions at, near and/or inside Keauhou Bay. Most of the summary conclusory statements have zero evidentiary support. In fact, most statements related to project impacts appear by use of simply common sense to be likely untrue, misleading and false. The Project proponent has the burden to conduct adequate studies of existing conditions and provide an assessment of future conditions, which is has failed to even remotely attempt to do so. The EIS should also assess mitigation measures to reduce the project impacts, which can then be adopted as conditions to the Project approval. Thus, if the mitigation measures and maintenance requirements be adopted as conditions of approval, they become enforceable by the County. The County of Hawaii legally cannot "weigh" expert opinion in deciding whether to approve an EIS. As there are no studies to support the conclusions in the report and multiple expert opinions pointing out the deficiencies in the lack of appropriate studies, projections and mitigation measures the County cannot legally approve of the EIS as drafted.

Very truly yours,

Jeffery L. Caufield

#### An Investigative Report into The Past Trustees of Kamehameha Schools

In the period of 1992-2001, the trustees of Kamehameha Schools committed acts of abuse of power that would entail months of investigations and news reports. The

I am available to call in to radio shows, give newspaper interviews etc... But am not currently on island. I'll be in Europe from July 25-August 12<sup>th</sup> so after July 25<sup>th</sup> my availability will be limited. A brief synopsis of my background:

I graduated from UC Santa Barbara with a degree in environmental studies and from law school from the University of the Pacific, McGeorge School of Law. Prior to becoming an environmental attorney I worked for several years as an environmental consultant. For the past 31 years my legal practice has been in environmental law where I have litigated dozens of cases on behalf of and against public entities related to Environmental Impact Reports and Environmental Impact Statements. To date, I have never lost a single case involving litigation over the sufficiency of an Environmental Impact Report or Statement. I have been considered by several courts to be an expert in environmental impact reports and litigation. The environmental impact report and statement litigation have involved a number of subjects including impacts to the local coastal zone and waters. Additionally, I have litigated dozens of cases involving toxic substances, including damages caused to water bodies from excess nutrients and toxic substances. I am on the editorial board of the Environmental Forensics Journal. I am routinely invited to lecture both nationally and internationally on issues involving the detection and impact of toxic substances and nutrients on the environment, including coastal waters.

## Aaron Chang

Aloha, and thank you for this opportunity to comment on the Kamehameha Schools' Keaouhou Bay Management Plan Draft EIS of June 23, 2024.

I appreciate Kamehameha Schools (KS) for maintaining its awareness of what makes Keaouhou Bay and the surrounding lands and coastal resources so special in all the world, and commend KS for its willingness to envision a development of lower-density than it could build (e.g., a 700-room hotel or resort). But the current plan is still too much, and will alter the environment, the community, and the character of this place with such significance that we are assured of losing it to becoming another over-used tourist destination, populated mostly by people from outside Hawai'i, with locals once again priced out of the area.

What KS calls "low-impact" is only low-impact" compared to what it could do in this resort zoned area, but when you look at the proposal the impact will actually be quite high, and much more significant than the public is being told.

For this small area, to build 150 bedrooms in bungalow-style lodgings, along with commercial buildings, vendor kiosks, restaurants, ocean sports rentals, etc., will result in substantial increases in congestion of both vehicles and people, all trying to utilize this small geographic area.

Currently Keaouhou Bay is a relatively quiet, relaxing place, a remnant of what Hawai'i Island used to be, a reminder of what Hawai'i Island has lost so much of, an experience which is so rare, unique, and special in all the world, that people come from all over the planet to visit it.

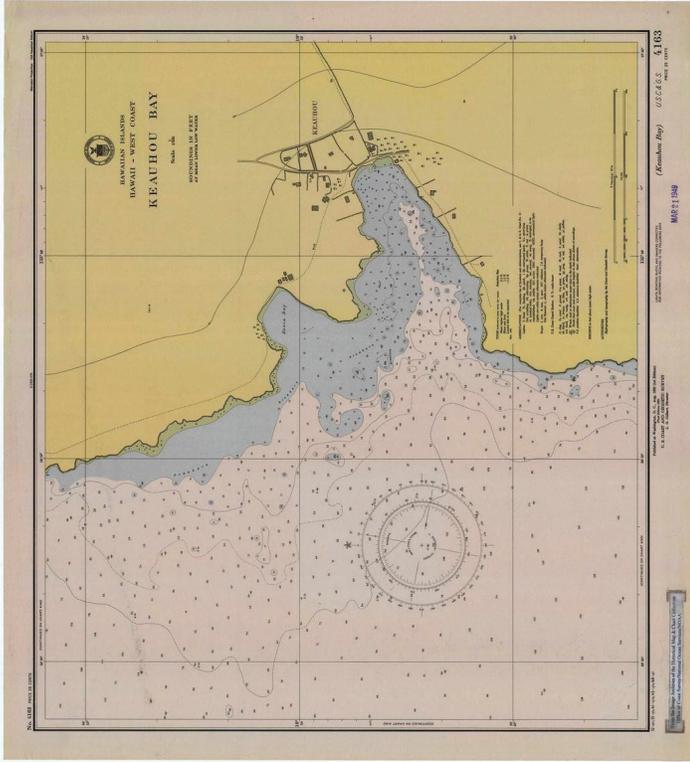

There are deficiencies in the Draft EIS which prevent the community and government from truly and reasonably understanding the impacts they are being asked to approve.

Why are there no substantial studies of current traffic compared to what the additional traffic will be under the proposal? With increases in congestion around the bay, polluted runoff is unavoidable, which will harm marine life.

The community deserves a better study on how vehicle and foot traffic will be moving through this area together, and how many more people and vehicles are likely to impact the area over many years.

Destroying the many acres of forest above the bay and replacing that with urban development, buildings, homes, streets, and parking lots may not be an impact like a nuclear waste dump, but it is a significant alteration of the environment, introducing numerous sources of non-point source pollution affecting not just the bay but the larger coastal environment. This includes toxic pollutants from roads, homes, yards, and businesses.

The forest which soaks up much of the heavy rains will be gone, the landscape will be hardened with 248 new parking spaces for the resort and new restaurant, as well as commercial and retail activities adjacent to the resort. This assures significant increases in polluted runoff, and much the wildlife that currently lives there and has nowhere else to move thanks to the significant loss of

large tracts of undisturbed natural habitat will likely die, or be forced to outcompete other wildlife in the areas where migration occurs.

Tourists will inevitably want to swim in the bay, which will create dangerous conflicts with boats that use the small bay year-round.

Any new development should include a maintenance plan to protect the bay environment and maintain nice facilities for the community.

To preserve the character and cultural significance of Keauhou Bay and overall region, the community would deeply appreciate KS withdrawing this plan, and returning with one that is more limited in scope, and truly takes into account the needs of our residents.

Today, we live on an increasingly crowded island, and what is done in one area significantly burdens all surrounding areas. The public has cherished this place for many years. Please don't destroy what is so unique and special about this place. Please don't take that from our community.

If anything, what we need more of in the Keauhou area is workforce housing that is truly affordable. Using the land for any resort or commercial purpose prevents any such housing from being possible there.

Mahalo nui loa for your thoughtful and serious consideration of these concerns.

Aaron Chang

## Donna. Cherrier

Keauhou Bay is at capacity you at the present! The water often is brown after a rain and doesn't allow use by local citizens

July 5, 2024

To whom it may concern,

Please, read the scientific proof below and state in your report that this Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keaouhou Bay as stated in all the different reported articles below.

Keaouhou Bay is a DOCUMENTED RESTING AREA for the ENDANGERED MONK SEAL, and if a resort is allowed to be built, that will bring a lot more people down to Keaouhou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE.

This information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media.

There's a seal on the beach! Let's go get a 'selfie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species. In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/engangered-hawaiian-monk-seals-cri-foul-over-selfies>

Has there been a detailed traffic study for the increase in cars that will be added to this already severely traffic area?

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the **destruction of sensitive marine habitats** such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of **sediments** into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracts <https://oceantracts.org/libray/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

If you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years and, "Noise Pollution

Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behaviour of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keaouhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project, because it is scientifically proven that developments will ALWAYS have rain runoff that will pollute nearby waters constantly during development and after.

Please, read the Scientific articles below written by NOAA, National Oceanic and Atmospheric Administration and other professional organizations, that prove that developments have ALWAYS polluted the water in every coastal developed area.

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all Aquatic Life there, and even the Manta Rays that go there to eat zooplankton from the Manta Ray tours at night, and they eat it during the day in that area as well because they need to eat 5 times their body weight in zooplankton daily. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

If you allow this bay to be developed you will be allowing all types of marine life to die and there is NO WAY to stop this from happening because polluted runoff rain water from developments can't be fully stopped. It is what has happened in ALL coastal developments.

Please read the Scientific proof below.

Reason #1 It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide..."

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-

off). " <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-hawaii#:~:text=Coral%20Bleaching%20is%20Occurring%20more,had%20catalytic%20impacts%20state%20wide.>

This article is by the Coral Reef Alliance here in Hawaii: "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawaii%20reefs%20face%20major%20global,into%20Hawaii%20waterways%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban run-off, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The Chesapeake Bay has a foundation that is trying to save it due to runoff pollution that was caused by developments, and the Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed because this bay is very small.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow...

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy>.

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay because it is so much smaller than the Chesapeake Bay.

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species>.

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide>.

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_coral/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organism%20that%20can%20smother%20corals](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organism%20that%20can%20smother%20corals).

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_coral/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days).

Reason #2 It's Been Proven Resort Developments KILL Marine Life

The manta rays go to Keauhou Bay every night to eat zooplankton and if you allow this development that WILL have runoff water, you WILL be causing zooplankton to be seriously affected because as this article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that proves runoff from development in this area will hurt and kill plankton, by **Frontiers in Marine Science**, "**Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon**" The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the

natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl- $\alpha$  concentration and phytoplankton abundance over the entire experiment."

<https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

"Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation." [https://scopes.dge.carnegiescience.edu/SCOPE\\_12/S\\_COPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scopes.dge.carnegiescience.edu/SCOPE_12/S_COPE_12_3.6_chapter12_257-274.pdf)

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this could cause the manta ray food source to disappear and that will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on the manta ray tour for their income.

Reason #3 It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will forsure bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20silting.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%2C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study,%20said.>

If you allow this resort to be developed, you will be destroying the coral reefs in the bay because this bay is extremely small and used by a lot of locals already for fishing, canoeing, swimming, snorkeling, paddle boarding, surfing, boating...it can't afford more use by many thousands more people yearly.

if you allow Keauhou Bay to be development there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that, "Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with metapopulation theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science

Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300>

[328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20situation.](#)

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhaJhJAnWAq453tRgNOAJWl9inR3ZoTvOPyGzA5ic\\_H00JzcHNIP3ASnhcgKRv6\\_vKLPw49dbmBYoXSg3YIMgQIGBZsabdGUiH7OISLbu9x5Pr3xED4kxI4TosJlvqQIa7ZzRT3r,UbraxpodJd2AoNISmWSuxB7jJEDdpJ8OGJpx7ITJWdCFxvFKJIZYeNdcjJ3sw\\_dnaUg5IZlhcjPBDImmahI5yqT5O%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhaJhJAnWAq453tRgNOAJWl9inR3ZoTvOPyGzA5ic_H00JzcHNIP3ASnhcgKRv6_vKLPw49dbmBYoXSg3YIMgQIGBZsabdGUiH7OISLbu9x5Pr3xED4kxI4TosJlvqQIa7ZzRT3r,UbraxpodJd2AoNISmWSuxB7jJEDdpJ8OGJpx7ITJWdCFxvFKJIZYeNdcjJ3sw_dnaUg5IZlhcjPBDImmahI5yqT5O%3D&tracking_referrer=abcnews.go.com)

Reason #4 a Resort Development WILL Increase Traffic on Already Severly Trafficed Roads

The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island can not handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawaii News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Please watch their video on their link below because it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists comes more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most

traffic fatalities in state. This time last year Hawaii island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks...

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

Please, watch the NEWS video from the link below on aerial footage in Hilo because the footage shown is the same thing that is happening on Alii Drive and Queen K HWY, and for the same reasons.

There are 2 developments already on Alii Dr. being built as of today, and more are scheduled for this road in the near future, and Alii Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow already.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening

in Kona on the roads Kamehameha Schools wants to develop their resort, "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash on Alii Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direct traffic. and that adds even more traffic to this already seriously congested road, and Kamehameha Schools wants to add a resort on this road, and that will increase the traffic even more.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=EQSsnPDjI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Please read this Path article, HAWAII! COUNTY'S VISION ZERO INITIATIVE

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii! Island.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path as well as The Law of the Splintered Paddle below <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

### **The Law of the Splintered Paddle**

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law, "K?n?wai M?malahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law

proclaimed that the defenseless (especially k?puna and keiki) across Hawaii! be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii!. After being added back in 1978, the law is part of Hawaii's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

**The Law of the Splintered Paddle** is also on Kamehameha Schools website, so they should want to help make Big Island roads become safer and not add to the traffic and possible traffic death toll problem. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

Besides a resort development in Keauhou Bay causing runoffs that will severely pollute the bay as the above research and science articles have shown above causing marine life to die, it will also increase in the bay's population that will seriously add to damaging even more coral, plankton and all marine life as well, and the island has severe traffic issues already with increased death tolls rising, and a resort development in Keauhou Bay will totally increase even more traffic in these already severely congested traffic areas.

Reason #5 The Big Island Doesn't Have the Resources and Infrastructure for Another Resort

Please see the articles below because the Big Island doesn't have the resources or infrastructure to safely add another resort development on island and these other NEWS and Research articles prove this point.

- 1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity.

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste Hawai'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the east side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

4) "What happens to Hawaii Island's trash and recyclables? BY MICHELLE BRODER VANDYKE HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder Vandyke Hawaii Island PUBLISHED 11:30 AM ET Dec. 17 The future of the landfill

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent

regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community

support." <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables-->

5) "The overwhelming plastic waste Hawaii visitors leave behind By Natasha Bourlin Aug 24, 2023

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/plastic-waste-hawaii-visitors-leave-behind-18286076.php>

6) "A county commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill By Megan Moseley September 6, 2023 · 1:00 AM HST \* Updated September 6, 2023 · 2:02 PM

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill." <https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

7) "Hawai'i County issues mandatory 25% water restriction for North Kona August 7, 2023 · 5:21 PM HST

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend." <https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

8) "Hawai'i Water Supply Closely Monitored As Severe Drought Continues by Big Island Video Newson Nov 6, 2023 at 3:28 pm STORY SUMMARY

HAWAII COUNTY - Officials say a special focus will be placed on the South Kohala Water System, which is more susceptible to drought conditions." <https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-ca%BBi-under-severe-drought/>

9) "Big Island Concerns About Water Quality Prompt A Lawsuit Over A Kona Sewage Plant Kealahehe sewage plant discharges more than 1 million gallons

of wastewater into a lava pit near the ocean. By Paula Dobbyn / February 6, 2024

Settlement talks are scheduled in an environmental lawsuit involving a county-operated Big Island sewage plant in Kona." <https://www.civilbeat.org/2024/02/concerns-about-water-quality-prompt-a-lawsuit-over-a-kona-sewage-plant/>

10) "Researchers find sewage from an oceanfront Big Island community reaches nearshore waters Hawaii' Public Radio | By Russell Subiono, Sophia McCullough Published December 20, 2021 at 5:56 PM HST

There are nearly 50,000 cesspools on the Big Island, with tens of thousands posing a risk to water resources, according to the Hawaii' Department of Health." <https://www.hawaiipublicradio.org/the-conversation/2021-12-20/researchers-find-sewage-from-an-oceanfront-big-island-community-reaches-nearshore-waters>

11) "Kona coast faces stark wastewater tradeoffs Current situation

There are approximately 88,000 cesspools across the state, releasing more than 200,000 cubic meters of wastewater per day to the environment. <https://www.hawaii.edu/news/2021/09/10/kona-stark-wastewater-tradeoffs/>

We ask that you start figuring out how this can never happen again? These are the kind of issues that need to be resolved before you approve more development.

12) "BIG ISLAND NEWS HECO restores power after initiating emergency outages on Big Island by: Elizabeth 'Ufi Posted: Jan 30, 2024 / 09:43 AM HST Updated: Jan 30, 2024 / 04:15 PM HST

An unexpected loss of several large Hawaii Electric generators left some residents on Big Island without power for parts of the morning on Tuesday, Jan. 30." <https://www.khon2.com/big-island-news/heco-initiates-30-min-rolling-outages-after-loss-of-generators/>

13) Hawaii' State News Update: Hawaiian Electric initiates rolling outages throughout Big Island February 13, 2024 · 5:23 PM HST

\* Updated February 14, 2024 · 4:21 PM

The emergency outages are being initiated in various areas around the entire island to prevent loss of power to an even greater number of customers. The timing and extent of the outages will depend on the amount of demand on the system and the availability of generators." <https://bigislandnow.com/2024/02/13/hawaii-island-customers-asked-to-reduce-electricity-use/>

14) "LOCAL NEWS

HECO issues rolling power outages around Big Island by: Emily Cervantes Posted: Feb 13, 2024 / 05:11 PM HST Updated: Feb 13, 2024 / 09:12 PM HST Hawaiian Electric initiated rolling outages for Big Island after several large generators became unavailable and reduced output Tuesday night." <https://www.khon2.com/local-news/heco-releases-conservation-alert-for-big-island/>

15) "Here's how power outages can have repercussions for Hawai'is water supply Hawaii' Public Radio | By Savannah Harriman-Pote Published February 13, 2024 at 10:59 AM HST

Water departments on O'ahu and Hawai' Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply?

It is impossible to separate Hawai'is power system from its water system, said Kawika Uyehara, deputy director of Hawai' County's Department of Water Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-conserve-water-amid-power-outages>

16) U.S. Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues  
By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is ola i ka wai, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and it isn't addressed soon, one community member says, "we're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) NewsHawaii'i County issues mandatory 25% water restriction for North Kona  
August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

18) Hawaii'i Water Supply Closely Monitored As Severe Drought Continues  
by Big Island Video News  
on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawaii, the Hawaii'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-CA-BB-i-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

20) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/Bigisland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reportng\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/Bigisland/comments/1bnuar3/hawaiian_electric_is_reportng_that_several_large/?rdt=52660)

21) "NewsHawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will damage Keauhou Bay coral and marine life and, Big Island resources and infrastructure are currently being negatively affected from the development that is on island already, and there are years of new development that have already been approved, before having safe resources and infrastructures for new developments.

With these scientifically proven articles by some of the most professional scientists in the world, they say the a serious population increase, as well as development and resort runoff that happens because of parking lots, and... with all coastal developments, it will be dangerous for Keauhou Bay to be development because it will damage the marine ecosystems in the area.

Please, save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools because all of these articles prove it would be extremely damaging to the waters at Keauhou Bay.

Thank you,

Sincerely,

**Donna Cherrier**

**Keauhou Punahele Resident**

Donna Cherrier

July 5, 2024

Hello Please see attached my comment letter for the Keauhou Bay EIS process. Thank you

To whom it may concern,

Please, read the scientific proof below and state in your report that this Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keauhou Bay as stated in all the different reported articles below.

Keauhou Bay is a DOCUMENTED RESTING AREA for the ENDANGERED MONK SEAL, and if a resort is allowed to be built, that will bring a lot more people down to Keauhou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE.

This information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media.

There's a seal on the beach! Let's go get a 'selfie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species. In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

Has there been a detailed traffic study for the increase in cars that will be added to this already severely traffic area?

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the **destruction of sensitive marine habitats** such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of **sediments** into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/libray/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

If you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years and, "Noise Pollution

Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behaviour of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keaouhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project, because it is scientifically proven that developments will ALWAYS have rain runoff that will pollute nearby waters constantly during development and after.

Please, read the Scientific articles below written by NOAA, National Oceanic and Atmospheric Administration and other professional organizations, that prove that developments have ALWAYS polluted the water in every coastal development area.

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keaouhou Bay will be devastating to the coral, reef fish, and all Aquatic Life there, and even the Manta Rays that go there to eat zooplankton from the Manta Ray tours at night, and they eat it during the day in that area as well because they need to eat 5 times their body weight in zooplankton daily. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

If you allow this bay to be developed you will be allowing all types of marine life to die and there is NO WAY to stop this from happening because polluted runoff rain water from developments can't be fully stopped. It is what has happened in ALL coastal developments.

Please read the Scientific proof below.

Reason #1 It's Been Proven Developments Severely Pollute Nearby Waters Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide..."

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development... This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris."

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_coral/09\\_humantreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_coral/09_humantreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_coral/coral09\\_humantreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humantreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

Reason #2 It's Been Proven Resort Developments KILL Marine Life

The manta rays go to Keauhou Bay every night to eat zooplankton and if you allow this development that WILL have runoff water, you WILL be causing zooplankton to be seriously affected because as this article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that proves runoff from development in this area will hurt and kill plankton, by **Frontiers in Marine Science**, "**Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon**" The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the

natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-*a* concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

"Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation." [https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this could cause the manta ray food source to disappear and that will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on the manta ray tour for their income.

### Reason #3 It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will force a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study%20said.>

If you allow this resort to be developed, you will be destroying the coral reefs in the bay because this bay is extremely small and used by a lot of locals already for fishing, canoeing, swimming, snorkeling, paddle boarding, surfing, boating...it can't afford more use by many thousands more people yearly.

If you allow Keauhou Bay to be developed there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that, "Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with metapopulation theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300>

### 328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii. Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wskgQNhaJhJAnWwAq453tRgNOjAWeI9inR3ZoTvOPyGzA5ic\\_H00JzcHNIP3ASnhcgKRy6\\_VKLPw49qbmBYoXSg3YIMgQjGBzsbpdGUH701SLbu9x5Pr3xED4KxI4T0sJlvqQ1a7ZRT3rUbraxpodJd2AonISmWSuxB7JjEDpJj8OGJpx7TjTWdCfXvFKJZjYeNdcj3Sw\\_dnaUg5IzhcJpBDImmaH15yqT5Q%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wskgQNhaJhJAnWwAq453tRgNOjAWeI9inR3ZoTvOPyGzA5ic_H00JzcHNIP3ASnhcgKRy6_VKLPw49qbmBYoXSg3YIMgQjGBzsbpdGUH701SLbu9x5Pr3xED4KxI4T0sJlvqQ1a7ZRT3rUbraxpodJd2AonISmWSuxB7JjEDpJj8OGJpx7TjTWdCfXvFKJZjYeNdcj3Sw_dnaUg5IzhcJpBDImmaH15yqT5Q%3D&tracking_referrer=abcnews.go.com)

### Reason #4 a Resort Development WILL Increase Traffic on Already Severely Trafficed Roads

The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island can not handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawaii'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%. " Please watch their video on their link below because it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists comes more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most

traffic fatalities in state. This time last year Hawaii island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks...

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example. "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

Please, watch the NEWS video from the link below on aerial footage in Hilo because the footage shown is the same thing that is happening on Alii Drive and Queen K HWY, and for the same reasons.

There are 2 developments already on Alii Dr. being built as of today, and more are scheduled for this road in the near future, and Alii Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow already.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening

in Kona on the roads Kamehameha Schools wants to develop their resort, "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash on Alii Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direction traffic. and that adds even more traffic to this already seriously congestion road, and Kamehameha Schools wants to add a resort on this road, and that will increase the traffic even more.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=FQssnPDjI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Please read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii Island.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path as well as The Law of the Splintered Paddle below <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

### **The Law of the Splintered Paddle**

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law, "Kōnōwai Mōmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law

proclaimed that the defenseless (especially k?puna and keiki) across Hawaii'i be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii'i. After being added back in 1978, the law is part of Hawaii's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

**The Law of the Splintered Paddle** is also on Kamehameha Schools website, so they should want to help make Big Island roads become safer and not add to the traffic and possible traffic death toll problem. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

Besides a resort development in Keauhou Bay causing runoffs that will severely pollute the bay as the above research and science articles have shown above causing marine life to die, it will also increase in the bay's population that will seriously add to damaging even more coral, plankton and all marine life as well, and the island has severe traffic issues already with increased death tolls rising, and a resort development in Keauhou Bay will totally increase even more traffic in these already severely congested traffic areas.

Reason #5 The Big Island Doesn't Have the Resources and Infrastructure for Another Resort

Please see the articles below because the Big Island doesn't have the resources or infrastructure to safely add another resort development on island and these other NEWS and Research articles prove this point.

- 1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawaii'i Sanitary Landfill reaching capacity.

The West Hawaii'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste Hawaii'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the east side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

4) "What happens to Hawaii Island's trash and recyclables? BY MICHELLE BRODER VANDYKE HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder Vandyke Hawaii Island PUBLISHED 11:30 AM ET Dec. The future of the landfill

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent

regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community support." <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables-->

5) "The overwhelming plastic waste Hawaii visitors leave behind  
By Natasha Bourlin Aug 24, 2023

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/plastic-waste-hawaii-visitors-leave-behind-18286076.php>

6) "A county commission drafts ordinance aiming to ban recyclables at West Hawaii landfills By Megan Moseley September 6, 2023 · 1:00 AM HST  
\* Updated September 6, 2023 · 2:02 PM

Hawaii County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill." <https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

7) "Hawaii County issues mandatory 25% water restriction for North Kona August 7, 2023 · 5:21 PM HST

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend." <https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

8) "Hawaii Water Supply Closely Monitored As Severe Drought Continues by Big Island Video Newson Nov 6, 2023 at 3:28 pm STORY SUMMARY

HAWAII COUNTY - Officials say a special focus will be placed on the South Kohala Water System, which is more susceptible to drought conditions." <https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-ca%BBi-under-severe-drought/>

9) "Big Island Concerns About Water Quality Prompt A Lawsuit Over A Kona Sewage Plant Kealahehe sewage plant discharges more than 1 million gallons

of wastewater into a lava pit near the ocean. By Paula Dobbyn / February 6, 2024

Settlement talks are scheduled in an environmental lawsuit involving a county-operated Big Island sewage plant in Kona." <https://www.civilbeat.org/2024/02/concerns-about-water-quality-prompt-a-lawsuit-over-a-kona-sewage-plant/>

10) "Researchers find sewage from an oceanfront Big Island community reaches nearshore waters Hawaii Public Radio | By Russell Subiono, Sophia McCullough Published December 20, 2021 at 5:56 PM HST

There are nearly 50,000 cesspools on the Big Island, with tens of thousands posing a risk to water resources, according to the Hawaii Department of Health." <https://www.hawaiipublicradio.org/the-conversation/2021-12-20/researchers-find-sewage-from-an-oceanfront-big-island-community-reaches-nearshore-waters>

11) "Kona coast faces stark wastewater tradeoffs Current situation

There are approximately 88,000 cesspools across the state, releasing more than 200,000 cubic meters of wastewater per day to the environment. <https://www.hawaii.edu/news/2021/09/10/kona-stark-wastewater-tradeoffs/>

We ask that you start figuring out how this can never happen again? These are the kind of issues that need to be resolved before you approve more development.

12) "BIG ISLAND NEWS HECO restores power after initiating emergency outages on Big Island by: Elizabeth Ufi Posted: Jan 30, 2024 / 09:43 AM HST Updated: Jan 30, 2024 / 04:15 PM HST

An unexpected loss of several large Hawaii Electric generators left some residents on Big Island without power for parts of the morning on Tuesday, Jan. 30." <https://www.khon2.com/big-island-news/heco-initiates-30-min-rolling-outages-after-loss-of-generators/>

13) Hawaii State News Update: Hawaiian Electric initiates rolling outages throughout Big Island February 13, 2024 · 5:23 PM HST  
\* Updated February 14, 2024 · 4:21 PM

The emergency outages are being initiated in various areas around the entire island to prevent loss of power to an even greater number of customers. The timing and extent of the outages will depend on the amount of demand on the system and the availability of generators." <https://bigislandnow.com/2024/02/13/hawaii-island-customers-asked-to-reduce-electricity-use/>

14) "LOCAL NEWS

HECO issues rolling power outages around Big Island by: Emily Cervantes

15) "Here's how power outages can have repercussions for Hawai'i's water supply Hawai'i Public Radio | By Savannah Harriman-Pote  
Published February 13, 2024 at 10:59 AM HST

Water departments on O'ahu and Hawai'i Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply?

It is impossible to separate Hawai'i's power system from its water system, said Kawika Uyehara, deputy director of Hawai'i County's Department of Water Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-conserve-water-amid-power-outages>

16) U.S. Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues  
By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "we're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) NewsHawai'i County issues mandatory 25% water restriction for North Kona  
August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

18) Hawai'i Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News  
on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-ca-bbi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to their homes to help with power issues on the island.

20) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reportng\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reportng_that_several_large/?rdt=52660)

21) "NewsHawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

## Linda Churches

I am voicing my concerns with the proposed development of Keauhou Bay. During my 13 years of standup paddleboarding and paddling, Keauhou Bay has been the primary location for my water activities. During this time, I have witnessed periods of water degradation and numerous algae blooms. I am concerned with the water quality in Keauhou Bay and feel the water will only be further degraded with the addition of a resort.

Another concern I have is congestion in Keauhou Bay. There are times when launching and landing personal watercraft is difficult due to the volume of others using the Bay. Maneuvering through swimmers, families enjoying the water, and other personal watercraft can be difficult at times. I feel the addition of a resort will only exacerbate the congestion in Keauhou Bay and escalate safety issues.

Keauhou Bay is a special place that should be preserved and protected. I do not feel that the addition of a resort would accomplish this.

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-serve-power-due-to-down-generators/>

All the articles above show that a resort development will damage Keauhou Bay coral and marine life and, Big Island resources and infrastructure are currently being negatively affected from the development that is on island already, and there are years of new development that have already been approved, before having safe resources and infrastructures for new developments.

With these scientifically proven articles by some of the most professional scientists in the world, they say the a serious population increase, as well as development and resort runoff that happens because of parking lots, and... with all coastal developments, it will be dangerous for Keauhou Bay to be development because it will damage the marine ecosystems in the area.

Please, save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools because all of these articles prove it would be extremely damaging to the waters at Keauhou Bay.

Thank you,

Sincerely,

**Donna Cherrier**

**Keauhou Punahele Resident**

## Theresa Coe

We applaud your efforts to raise and maintain funds for your Kamehameha Schools foundation, but more development at Keaouhou Bay is not the answer. You must realise that the financial benefit would merely be short-term and that the long-term consequences would be dire - inter alia irreversible environmental damage, loss of native flora and fauna on land and sea, the local people's peaceful enjoyment of swimming, sailing, canoeing, volleyball will be lost.

There are much better ways to manage your finances, please do not fall into the trap of the big real estate developers who are often motivated by self-interest.

Above all be a good neighbour to all who live in Keaouhou/ Kahaluu who love it for what it is now. In hope, Theresa Coe

## Cari Coleman

As a proud graduate of Kamehameha Schools, I am writing to express my strong support for the Keaouhou Bay Management Plan Draft Environmental Impact Statement (EIS). The proposed improvements reflect a deep understanding and respect for our cultural heritage and the environment. Keaouhou Bay holds significant cultural and historical importance, not only to our local community but also to the broader Native Hawaiian community. The initiatives outlined in the management plan, such as improved facilities, enhanced conservation efforts, and increased educational opportunities, are vital for preserving the bay's natural beauty and cultural significance for future generations. The EIS provides a thorough assessment of potential environmental impacts and demonstrates a commitment to sustainable development. The heritage corridor will bring much needed care to the wahi pana sites found at Keaouhou Bay, while also providing an opportunity to educate those who come to the bay. The 10+year long-range timing of developing the 150+ low impact lodging units mauka of the bay area gives planners and Kamehameha Schools time to fully realize the model such sustainable lodging could be for Hawaii. It's time to embrace sustainable lodging practices for our visitor industry. I commend the planners for their thoughtful approach and encourage the swift adoption and implementation of this plan. It is through such efforts that we honor our past, protect our present, and ensure a thriving future for Keaouhou Bay and its surrounding community. Mahalo nui loa for your dedication and hard work.

## Rebecca Corby

Please do not allow Kam Schools to put a resort in Keauhou bay. We have plenty of resorts and hotels in Hawaii. We need to halt any new resorts and focus on preserving the precious natural resources of hawaii and make safe sustainable access to these natural wonders for local residents and visitors to enjoy with respect. That does not require more resorts. There are plenty of places for visitors to stay. Please protect this bay and do not develop it,

thank you,  
Rebecca Corby  
18 Year Hawaii Resident

mary cowen

Thank you for the comprehensive, informative report.

I support enhanced cultural and education facilities as described in the KBMP.

I DO NOT support development of a 150-unit transient accommodations lodge in this area. Hotel, condotel and other STVR opportunities exist in the area that are not at capacity.

I DO NOT support additional retail activities. Keauhou Shopping Center serves as the area's retail hub. Until all the medical service providers leased space there, retail space sat empty for years. There is not a need for more retail.

Thank you for considering Kona resident input on this major development.

Jakob Cox

First off, we do not need another shopping/cultural center in the Keauhou Bay. Second to use the GM of the Outrigger was a mistake since he sexually assaulted his employees. Third the people of Kona have fought to protect their cultural sites, and you think they want housing and shopping in an area where the local Ohana's already go, and could possibly lose or diminish access due to new development. We do not support this nor will we ever support building down in Keauhou

## Jennifer Dant

I really am having a hard time understanding why you would tear down the Keaouhou Beach hotel and turn it back into this beautiful historic area and yet want to develop Keaouhou bay into a boutique bungalow hotel. Makes no sense to me. We are already loosing so many battles to save what beautiful ocean coral we have and this will do so much damage. Not to mention all the pollution you will have to spray out to keep this new area up with landscaping and bug control. All that will wash into our ocean. Keaouhou bay is a quaint beautiful bay where I have the privilage to work and paddle out of and have been doing so for over 18 years. It would be great if the powers that be could have more of a positive influence instead of such a destructive one. We have been fighting fish collecting for years.... YEARS, how is this possible? We are loosing our fish and coral species at an alarming rate. Why isn't anyone else concerned about this??? Its a David vs. Goliath fight, and I know money is hard to be up against. But we the people beg you, rethink your future plans. Do whats best for our oceans and our beautiful island. Plant a community garden instead. Help the Aina, our Kai and our future keiki.

We need to expect better, we need to do better. This is the last chance we have to change the scales in the other direction. We are loosing our vital recourses at an alarming rate. Help the aina!

## Marc Davis

Aloha,

I as a resident of Hawai'i for 58 years am opposed to any development in this are or Bay on the Big Island of Hawai'i. The area should remain undeveloped except for limited infrastructure.

Please, DO NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their Bungalow resort project. It is scientifically proven that developments pollute nearby waters both during and after development.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have ALWAYS polluted the water in EVERY coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keauhou Bay is their habitat and this development WILL be CHANGING an Entire Ecosystem.

#### ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keauhou Bay.

The Green Sea Turtle swims in Keauhou Bay weekly and the monk seal has also been seen swimming and resting in Keauhou Bay. Both of these marine animals are on the endangered species list.

Endangered Species Act

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/conservation/endangered-species-conservation/endangered-species-ac>

FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED

The green sea turtle is federally protected and can be seen in Keauhou Bay weekly.

**Categories:** Yellow Category

Aloha e Keana -

Thank you for your comments concerning the Keauhou Bay Management Plan, Draft Environmental Impact Statement. Your comments have been received and administratively recorded.

Comments received during the 45-day public comment period will be reproduced in the Final Environmental Impact Statement, and substantive comments addressed.

The County of Hawaii and our planning consultant, G70, are copied here on this email so that they receive a copy of your feedback.

We appreciate your involvement and contribution to the environmental review process. Your input is invaluable in helping us develop a management plan that reflects the needs and concerns of our community.

Thank you once again for your engagement and commitment to the future of Keauhou Bay.

Mahalo,

The Keauhou Bay Project Team

**Subject:** [EXTERNAL] Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT

**CAUTION: This email is from an outside sender. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

To Whom It May Concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools Environment Impact Statement (EIS) for Keauhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT on Keauhou Bay as stated in all the different researched articles below.

The following article that states: "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Allowing this development WILL POLLUTE Keauhou Bay. The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!) states this fact clearly. Keauhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen because developments have been shown to ALWAYS pollute the water is that is nearby.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

#### THE ENDANGERED MONK SEAL WILL BE AFFECTED

Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keauhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keauhou Bay will likely be changed forever.

This information is from a NOAA Scientist; "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!' That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawai'i Revised Statutes (HRS) Chapter 195D and Hawai'i Administrative Rules (HAR) 13-124." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

Keauhou Bay is the monk seals and the green sea turtle's habitat. Allowing a bungalow resort to be developed in Keauhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to protect the land around Keauhou Bay from developments that destroy the habitat of these endangered species with pollution and runoff.

Does this EIS have any reports on the endangered species that frequent Keauhou Bay? This is their habitat and it needs to be "conserved".

Under the Conservation Program there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hrscurrent/Vol103\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol103_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered

species." [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keauhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keauhou Bay and the surrounding area during the building phase of this enormous project.

#### GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keauhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable!

Please read from Wikipedia, "  
Most drains have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping system." [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20dry%20wells)

The pavement from this development will cause pollution to runoff into Keauhou Bay because this treed land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keauhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> where the Hawaii government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keauhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.

These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keauhou Bay and for these endangered species habitat.

Under Section 2 (b) of the Endangered Species Act - Keauhou Bay MUST BECOME A CONSERVATION AREA for these endangered species. It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keauhou Bay.

#### ALGAE BLOOMS KILL CORAL AND MARINE LIFE

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer.

When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course developments. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Cuana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution... " <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAHOUBAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

FURTHERMORE: "If there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

#### ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN

Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keauhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

The article below is from NOAA regarding motor vehicle engines and pollution to the sea.

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant.>

Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects

News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a new report from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%20Nearly%2085%20percent,pipeline%20spills%2C%20says%20a%20new>

#### The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershed.org.au/blog/the-impact-of-stormwater-car-emissions/>

#### NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE

Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keauhou Bay during development?

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

if you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

What is ocean noise?

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key

to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

LEARN FROM OTHERS:  
RUN-OFF FROM DEVELOPMENT KILLS

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments. Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed. Keauhou Bay is a much smaller ecosystem.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow..."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay due to its size and fragility.

MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN

Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays. Manta rays are in Keauhou Bay every night to eat zooplankton, and are often seen here during the day as well.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is NO WAY to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments.

Please read the Scientific articles below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide...

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban runoff)." <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-impacts%20state%2Dwide>.

<https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-impacts%20state%2Dwide>.

This article is by the Coral Reef Alliance here in Hawaii. "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#~:text=Hawaii%20reefs%20face%20major%20global,into%20Hawaii%20waterways%20every%20day>.

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban runoff, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray

Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species>.

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs

provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0>

<https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development... This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_coral/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water..." (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_coral/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

It's Been Proven Resort Developments KILL Marine Life

This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

The ecosystem is fragile and interconnected as is stated in this article: "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food

chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural runoff, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

#### HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH

Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life." <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keaouhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keaouhou Bay, it will bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by human-kind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information

PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20slitaton.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%2C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study%20said.>

By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science

Direct <https://www.sciencedirect.com/science/article/abs/pii/S00652888120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhaJhJJAAnWAq453tRgN0jAiwel9jnR3ZoTv0PyGzA5lc\\_H0O1zcHNIP3ASnhcgKRY6\\_vkLPw49dbmBYoSq5YIMQjGBZsabdGCUH1701SLbu9x5P73xED4Kx14T0sJlvqJ1a72ZRT3rUbraxpodJd2A0NlSmWSuxB7jJEDdpJ8OGJpx7JTJWdCFXvFKJIZYeNdcJ3Sw\\_dnaUg5IZhIcjpBDImmaH15yqt15Q%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhaJhJJAAnWAq453tRgN0jAiwel9jnR3ZoTv0PyGzA5lc_H0O1zcHNIP3ASnhcgKRY6_vkLPw49dbmBYoSq5YIMQjGBZsabdGCUH1701SLbu9x5P73xED4Kx14T0sJlvqJ1a72ZRT3rUbraxpodJd2A0NlSmWSuxB7jJEDdpJ8OGJpx7JTJWdCFXvFKJIZYeNdcJ3Sw_dnaUg5IZhIcjpBDImmaH15yqt15Q%3D&tracking_referrer=abcnews.go.com)

INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS

Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. Worldwide, hotels produce almost 300,000 tonnes of waste each year." <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Keaou Bay. On Hawaii Island, we are already struggling to meet the increasing need for resources and infrastructure.

Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawaii'i landfill

September 17, 2023

The West Hawaii'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawaii'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

A County commission drafts ordinance aiming to ban recyclables at West Hawaii'i landfill

By Megan Moseley September 6, 2023

Hawaii'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

17

During a commission meeting on July 26, Ramzi Mansour, Hawaii'i County Director of Environmental Management, told commissioners the West Hawaii'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Kaahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

Time's Up For Landfills

'Gentle' demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawaii'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

## Drought Conditions On Hawai'i Island Prompt Water Supply Message

by Big Island Video News  
on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information from the [U.S. Drought Monitor](#). There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawai%CA%BBi-island-prompt-water-supply-message/>

U.S.

Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to **significant droughts**, and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the **world's largest surfing wave pool** opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe."

"We are in a **water crisis**, that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawaii, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

UPDATE: HELCO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power->

Big power supply problems continue to plague Hawaii Island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

## FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES

A Resort Development Will Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawaii News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

22

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: All of these roads only have two lanes!

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=-FQ5snPDjI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawai'i Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

MORE ARTICLES HIGHLIGHTING INFRASTRUCTURE AND RESOURCE DEFICITS, INCLUDING WATER, TRASH, ELECTRIC AND WASTEWATER:

1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity.

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste Hawaii'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the East side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

Water departments on O'ahu and Hawaii'i Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply?

It is impossible to separate Hawaii'i's power system from its water system, said Kawika Uyebara, deputy director of Hawaii'i County's Department of Water Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-conserve-water-amid-power-outages>

16) US Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "We're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) News Hawaii'i County issues mandatory 25% water restriction for North Kona August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokohau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

18) Hawaii'i Water Supply Closely Monitored As Severe Drought Continues by Big Island Video News on Nov 6, 2023 at 3:28 pm

(BIVN) — With an ongoing drought on the island of Hawaii'i, the Hawaii'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-CA%BBi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

19) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large/)

20) "Hawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

#### HISTORICAL AND CULTURAL SIGNIFICANCE:

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii. After being added back in 1978, the law is part of Hawaii's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
  - Knowing and doing what is pono (right)
  - Standing for the principle that leadership privilege is earned
  - Taking kuleana (responsibility) for those we serve
  - Doing so with compassion, love, and respect
- "We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

The Law of the Splintered Paddle is also on Kamehameha Schools website. The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.

#### IN CONCLUSION

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Eco-system in Keauhou Bay and "The Endangered Species Act of 1973 (ESA or "The Act"; 16 U.S.C. § 1531 et seq.) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from extinction as a "consequence of economic growth and development untempered by adequate concern and conservation", the ESA was signed into law by President Richard Nixon on December 28, 1973. The Supreme Court of the United States described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation".<sup>[1]</sup> [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land MUST be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawaii Island is already having serious infrastructure and resource issues that have yet to be solved. These issues MUST be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly protects the marine life and environment from further damage. The location is NOT suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bays marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

Mahalo,

## Marta Derieg

Before you destroy Keauhou Bay and strip the community of another beach access, I suggest you complete the work at the former Keauhou Beach Hotel, which is essentially inaccessible to the community. It saddens me the Kamehameha Schools is willing to continue decimating community access to resources.

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton". There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation." [https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this will cause the manta ray food source to disappear. This will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on this tour to survive.

Here is another article that proves runoff from development in this area will hurt and kill plankton, by **Frontiers in Marine Science**, "**Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon**". The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-*a* concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019.."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban run-off, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The Chesapeake Bay has a foundation that is trying to save it due to runoff pollution that developments create, and the Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water, Keauhou Bay waters won't stand a chance if development above the bay is allowed because this bay is very small.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow.."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay because it is so much smaller than the Chesapeake Bay.

If you allow Keauhou Bay to be developed there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that "Denser coastal populations...will lead to reef degradation by coastal constructions. Denser populations inland will lead to more runoff and situations..."

**Reason #3** a Resort Development WILL Increased Human Traffic In Keauhou Bay

Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information  
PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20silviculture>.

This article is by abc NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%20a%20new%20study%20said>.

If you allow this resort to be developed, you will be destroying the coral reefs in the bay because this bay is extremely small and used by a lot of locals already for fishing, canoeing, swimming, snorkeling, paddle boarding, surfing, boating...it can't afford more use by many thousands more people yearly.

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii: Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhaHjJAnWAq453tRgNQAJaWel9jnR3ZoTvOPyGZA5Ic\\_H00IzCHNIP3ASnhcgKRv6\\_vKLPw49dbmBYoX5q3YIMgOIGBZsabdGUH7OISLbu9x5P3xED4KxI4T0sJlvgQIa7ZZR3tUbraxpodJd2AaNSImWSuXBT7JEDpJ8OGJpx7ITJWdCfXvFKJIZYeNdcJ3sw\\_dnaUg5IZlhcjPBDlImmaH15yqT5O%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhaHjJAnWAq453tRgNQAJaWel9jnR3ZoTvOPyGZA5Ic_H00IzCHNIP3ASnhcgKRv6_vKLPw49dbmBYoX5q3YIMgOIGBZsabdGUH7OISLbu9x5P3xED4KxI4T0sJlvgQIa7ZZR3tUbraxpodJd2AaNSImWSuXBT7JEDpJ8OGJpx7ITJWdCfXvFKJIZYeNdcJ3sw_dnaUg5IZlhcjPBDlImmaH15yqT5O%3D&tracking_referrer=abcnews.go.com)

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%20based%20sources,and%20mortality%20in%20sensitive%20species>.

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide>.

All developments can't fully stop polluting because of runoff from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_coral/coral09\\_humannthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organism%20that%20can%20smother%20corals](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humannthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organism%20that%20can%20smother%20corals).

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_hu\\_manthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_hu_manthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

#### **Reason #4** a Resort Development WILL Increase Traffic

The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island can not handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawaii News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Please watch their video on their link below because it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists comes more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state, This time last year Hawaii island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks...

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

Please, watch the NEWS video from the link below on aerial footage in Hilo because the footage shown is the same thing that is happening on Alii Drive and Queen K HWY, and for the same reasons.

There are 2 developments already on Alii Dr. being built as of today, and more are scheduled for this road in the near future, and Alii Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow already.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening in Kona on the roads Kamehameha Schools wants to develop their resort, "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash on Alii Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direction traffic, and that adds even more traffic to this already seriously congested road, and Kamehameha Schools wants to add a resort on this road, and that will increase the traffic even more.

Here is the Island News video on the crash on Alii Dr.  
<https://www.youtube.com/watch?v=-FQSnPDjI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Please read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawai'i Island.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path as well as The Law of the Splintered Paddle below <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

### **The Law of the Splintered Paddle**

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless (especially kupuna and keiki) across Hawai'i be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai'i. After being added back in 1978, the law is part of Hawai'i's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

**The Law of the Splintered Paddle** is also on Kamehameha Schools website, so they should want to help make Big Island roads become safer and not add to the traffic and possible traffic death toll problem. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

Besides a resort development in Keaouhou Bay causing runoffs that will severely pollute the bay as the above research and science articles have shown above causing marine life to die, it will also increase in the bay's population that will seriously add to damaging even more coral, plankton and all marine life as well, and the island has severe traffic issues already with increased death tolls rising, and a resort development in Keaouhou Bay will totally increase even more traffic in these already severely congested traffic areas.

**Reason #5** The Big Island Doesn't Have the Resources and Infrastructure for Another Resort

Please see the articles below because the Big Island doesn't have the resources or infrastructure to safely add another resort development on island and these other NEWS and Research articles prove this point.

1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity."

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste Hawai'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the east side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

4) "What happens to Hawaii Island's trash and recyclables? BY MICHELLE BRODER VANDYKE HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder Vandyke Hawaii Island PUBLISHED 11:30 AM ET Dec. 17 The future of the landfill

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community support." <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables-->

5) "The overwhelming plastic waste Hawaii visitors leave behind By Natasha Bourlin Aug 24, 2023

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/plastic-waste-hawaii-visitors-leave-behind-18286076.php>

6) "A county commission drafts ordinance aiming to ban recyclables at West Hawaii landfill By Megan Moseley September 6, 2023 · 1:00 AM HST \* Updated September 6, 2023 · 2:02 PM

Hawaii County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill." <https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

7) "Hawaii County issues mandatory 25% water restriction for North Kona August 7, 2023 · 5:21 PM HST

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokohau Deepwell over the weekend." <https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

8) "Hawaii Water Supply Closely Monitored As Severe Drought Continues by Big Island Video Newson Nov 6, 2023 at 3:28 pm STORY SUMMARY

HAWAII COUNTY - Officials say a special focus will be placed on the South Kohala Water System, which is more susceptible to drought conditions." <https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawai-ca-bbi-under-severe-drought/>

9) "Big Island Concerns About Water Quality Prompt A Lawsuit Over A Kona Sewage Plant Kealahoe sewage plant discharges more than 1 million gallons of wastewater into a lava pit near the ocean. By Paula Dobbyn / February 6, 2024

Settlement talks are scheduled in an environmental lawsuit involving a county-operated Big Island sewage plant in Kona." <https://www.civilbeat.org/2024/02/concerns-about-water-quality-prompt-a-lawsuit-over-a-kona-sewage-plant/>

10) "Researchers find sewage from an oceanfront Big Island community reaches nearshore waters Hawaii'i Public Radio | By Russell Subiono, Sophia McCullough Published December 20, 2021 at 5:56 PM HST

There are nearly 50,000 cesspools on the Big Island, with tens of thousands posing a risk to water resources, according to the Hawaii'i Department of Health," <https://www.hawaiipublicradio.org/the-conversation/2021-12-20/researchers-find-sewage-from-an-oceanfront-big-island-community-reaches-nearshore-waters>

11) "Kona coast faces stark wastewater tradeoffs Current situation

There are approximately 88,000 cesspools across the state, releasing more than 200,000 cubic meters of wastewater per day to the environment. <https://www.hawaii.edu/news/2021/09/10/kona-stark-wastewater-tradeoffs/>

We ask that you start figuring out how this can never happen again? These are the kind of issues that need to be resolved before you approve more development.

12) "BIG ISLAND NEWS HECO restores power after initiating emergency outages on Big Island by: Elizabeth Ufi Posted: Jan 30, 2024 / 09:43 AM HST Updated: Jan 30, 2024 / 04:15 PM HST

An unexpected loss of several large Hawaii Electric generators left some residents on Big Island without power for parts of the morning on Tuesday, Jan. 30." <https://www.khon2.com/big-island-news/heco-initiates-30-min-rolling-outages-after-loss-of-generators/>

13) Hawaii'i State News Update: Hawaiian Electric initiates rolling outages throughout Big Island February 13, 2024 · 5:23 PM HST  
\* Updated February 14, 2024 · 4:21 PM

The emergency outages are being initiated in various areas around the entire island to prevent loss of power to an even greater number of customers. The timing and extent of the outages will depend on the amount of demand on the system and the availability of generators." <https://bigislandnow.com/2024/02/13/hawaii-island-customers-asked-to-reduce-electricity-use/>

14) "LOCAL NEWS

HECO issues rolling power outages around Big Island by: Emily Cervantes Posted: Feb 13, 2024 / 05:11 PM HST Updated: Feb 13, 2024 / 09:12 PM HST Hawaiian Electric initiated rolling outages for Big Island after several large generators became unavailable and reduced output Tuesday night." <https://www.khon2.com/local-news/heco-releases-conservation-alert-for-big-island/>

15) "Here's how power outages can have repercussions for Hawaii's water supply Hawaii'i Public Radio | By Savannah Harriman-Pote Published February 13, 2024 at 10:59 AM HST

Water departments on O'ahu and Hawaii'i Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply?

It is impossible to separate Hawaii's power system from its water system, said Kawika Uyehara, deputy director of Hawaii'i County's Department of Water Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-conserve-water-amid-power-outages>

16) U.S. Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues  
By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "we're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) NewsHawaii'i County issues mandatory 25% water restriction for North Kona  
August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

18) Hawaii Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News  
on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawai%CA%BBi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to their homes to help with power issues on the island.

20) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reportng\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reportng_that_several_large/?rdt=52660)

21) "NewsHawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 - 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will damage Keaouhou Bay coral and marine life and, Big Island resources and infrastructure are currently being negatively affected from the development that is on island already, and there are years of new development that have already been approved, before having safe resources and infrastructures for new developments.

With these scientifically proven articles by some of the most professional scientists in the world, they say the a serious population increase, as well as development and resort runoff that happens because of parking lots, and... with all coastal developments, it will be dangerous for Keaouhou Bay to be development because it will damage the marine ecosystems in the area.

Please, save Keaouhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools because all of these articles prove it would be extremely damaging to the waters at Keaouhou Bay.

Thank you,

Sincerely,

Melanie Diehl

**From:** Davina <[REDACTED]>

**To:** 221053-01 KS Keaouhou Entitlements; Alex.Roy@hawaiicounty.gov; Planning@hawaiicounty.gov; Keaouhoubay@ksbe.edu  
**Subject:** Kamehameha Schools EIS Draft For Keaouhou Bay WILL HAVE NEGATIVE IMPACT!

**Categories:** Yellow Category

To whom it may concern,

Please reject Kamehameha Schools EIS for Keaouhou Bay to become a Bungalow Resort. This is a VERY small bay and the added footprint of a 105 room Resort, that will include excess traffic, will have a **serious negative impact** in Keaouhou Bay.

Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near coastal development area. An article entitled, *"What is the biggest source of pollution in the ocean?"* by NOAA, National Oceanic and Atmospheric Administration, states, *"When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides."* It also states, *"Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called nonpoint source pollution, which occurs as a result of runoff."*

The trees you want to take down keep the runoff pollution from the golf course from going into the Bay. According to the National Library of Medicine, in their article, *"Putting the Earth in Play: Environmental Awareness and Sports"*, shares that the golf industry uses **approximately 50 pesticide active ingredients**, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are **being held off** from running into the Bay by the very trees you want to take down.

Let's not forget the marine life that will be threatened by excess pollution and traffic. Keaouhou Bay is the monk seals and the green sea turtle's habitat. More pollution and people will endanger these species.

This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced.

Kind Regards,  
Donna Dufault  
aka Davina Mar

Aloha Kamehameha Schools and County of Hawaii Planning Department. Please accept my comments on the proposed Keauhou Bay Management Plan (KBMP) Draft Environmental Impact Statement.

1. First, let me say that this is the kind of document I'd like to see for *all County of Hawaii Planning Department environmental documents*. I realize this is a draft environmental impact statement (DEIS), and is triggered by state law, and other regulatory requirements. The document is well organized; the graphics, and photo simulations are appropriate and illustrative for this proposal. This is the caliber of document that can be created by a full-service environmental preparation firm that also has other disciplines within its practice.
2. I, however, do not support the proposal by Kamehameha Schools (KS) at this location. It is hard to accept the proposal and its re-sculpting of the land, re-organization of uses, and "need" to create a retail center; and 172 (or 189 with 10% of the units as a suite mix if I am understanding this correctly) bungalows with the mission and values that are promoted by KS (see Chapter 2, Purpose and Need for the Proposed Action). Please support Option 1, the No-Action Alternative, as this is the only solution that feels appropriate of this area.
3. I am not one to count other people's money, but please tell me how an organization that has assets totaling approximately \$14 Billion dollars "needs" to re-invigorate an area it feels is "underperforming economically". This is greed, pure and simple. I am not swayed by the \$125 Million dollars in costs to construct such a proposal. I do not see how the mission and values of KS align with the butchering of this special area.
4. Surely the four other key concerns in Section 2.6 Key Issues and Concerns - 1) the integrity of natural and cultural resources is threatened in the absence of a long-term comprehensive management plan; 2) incompatible uses at the bayfront create conflicts between users and disrespect for wahi pana; 3) Kamehameha Schools lands at Keauhou Bay are underutilized for educational programming; and 4) existing circulation patterns create congestion and safety concerns - can be accommodated and completed without the "need" to establish nearly 190 luxury hotel rooms.
5. In Chapter 2, Purpose and Need for the Proposed Action, this language is used:

"However, Kamehameha Schools does not have control over all external forces that create these conflicts (e.g. other bay landowners, use and access by the general public, or government regulations). Kamehameha Schools lands at the bay are also significantly impacted by unauthorized uses, trespassing, vandalism, and other unsanctioned activities.

I don't see how such "conflicts" are the catalyst for such a drastic change, and one that many in the community don't want.

6. Section 4.16.5, Adverse Environmental Effects that Cannot Be Avoided, identifies long and short term impacts. Pursuant to this section, these impacts are:

Long-term Effects

- A select portion of the Project Area may experience passive flooding as a result of 3.2 ft. of global SLR predicted by 2100. Kamehameha Schools is committed to proactively planning and designing the Project to be resilient to ensure the ongoing successful, safe, and sustainable operation of the bay for the foreseeable future.
- In the long term, traffic volumes in the immediate area are expected to remain similar to without Project conditions. Improved parking and site circulation is expected to have long-term beneficial effects on traffic and public safety.
- An increase in visitor accommodations will result in an increase in water consumption, wastewater disposal, and solid waste generation. Therefore, there will be increased demand on existing utilities and infrastructure. Where practical and feasible, sustainable design practices and technology will be utilized to reduce demand requirements.

There are numerous Planning projects that have been approved, and not built to fully understand how the Keauhou Bay proposal will further add to the cumulative negative impacts of this proposal on the community, such as traffic, whether there is water to provide to the proposal, and dealing with sewage. I've read the information in the DEIS; I find it hard to rely upon it given what the public knows about human error at wastewater treatment facilities, the amount of brown water alerts to avoid swimming at local west side beaches, and the inability to rely upon capacity issues at these facilities. I am skeptical.

And this is before the issue climate change and Sea Level Rise (SLR). It is ill-advised to spend the money KS anticipates to build such a project when it is adjacent to a bay that had and will continue to experience the negative effects of sea level rise.

7. Section 4.17, Unresolved Issues, identifies Potential unresolved issues associated with the Proposed Project, which include:

- Identifying long-term programming of cultural heritage area
- Identification of a developer and operator for the low-impact lodging
- Agreement with the County to coordinate treatment of walkways over County rights-of-way
- Coordination with County/Potential Licensee for the removal and possible relocation of the volleyball court
- Potential partnership with DOBOR to manage boat trailer parking areas

I believe that all of these issues can be worked through, without having to economically supercharge this area of Keauhou Bay. Identifying a developer and operator of a luxury boutique/curated resort vacation experience is a phantom issue and one that is created by KS because of this proposal.

8. Section 4.14.2, Economic and Fiscal Impacts, discusses that 1,484 short term construction and project related jobs would be created by this proposal. Slightly more than 10% of that, 159 jobs, would be permanent jobs. That hardly seems like a trade-off for the community. That few new jobs for the physical disruption to the area, let alone the heartache for what this proposal intends to create?

Where are the short term workers coming from? What roads are they using? Will they be housed locally? Will a construction staging area be built for the parking for these workers as well as the storage of construction equipment? I will re-read the document in case I missed language this addresses these issues.

9. Chapter 6 discusses the Alternatives to the Proposed Action. I am familiar with this section of the DEIS, as this is a requirement in a draft Environmental Impact Report (DEIR) in California where I worked as a Planning Director or Manager. Option 4, Conveyance Alternative, reads like a gut punch. If you don't like this proposal, KS could sell the land to a developer who would pursue its own highest and best use. Please do not threaten the community, KS. Continue to work with the people you claim you support.

10. Lastly, please clarify the issue of the potential new boat trailer parking illustrated on Figure 1-10 of the document. This is the only graphic that lists this as a "potential" use. All other figures - Figure 3-34, 3-35, and 3-47 - show this as a feature that would be established, and not a "potential" use.

Please choose Option 1, the No-Action Alternative, for this proposal. KS has not made a compelling case to re-sculpt, reorganize, and financially supercharge the uses at this location. This organization continues the story of "Broken Trust" when it uses the phrase that this area of Keauhou Bay and its management plan "underperforms economically". It is Kamehameha Schools that underperforms morally and ethically.

Mahalo.  
Elizabeth Dunn

bini easley

this area is currently being used by the youth for cultural practices. please expand youth activities and not give in to commercial opportunities Soon Hawaii will no longer be Hawaii but just a playground for tourists encouraging you to look forward to our Hawaiian children's future.

To Whom It May Concern,

Please read the scientific proof in this letter and **REJECT** Kamehameha Schools Environment Impact Statement (EIS) for Keaouhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort **WILL** have a **SERIOUS NEGATIVE IMPACT** on Keaouhou Bay as stated in all the different researched articles below.

Please, **DO NOT** risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is scientifically proven that developments pollute nearby waters both during and after development.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have **ALWAYS** polluted the water in **EVERY** coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keaouhou Bay is their habitat and this development **WILL** be **CHANGING** an Entire Ecosystem.

**ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT**

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.

The Green Sea Turtle swims in Keauhou Bay weekly and the monk seal has also been seen swimming and resting in Keauhou Bay. Both of these marine animals are on the endangered species list.

### **Endangered Species Act**

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) **PURPOSES.**—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-ac>

### **FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED**

The green sea turtle is federally protected and can be seen in Keauhou Bay weekly.

The following article that states: "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and

plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Allowing this development WILL POLLUTE Keauhou Bay. The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!) states this fact clearly. Keauhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen because developments have been shown to ALWAYS pollute the water is that is nearby.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

### **THE ENDANGERED MONK SEAL WILL BE AFFECTED**

Keaouhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keaouhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keaouhou Bay will likely be changed forever.

This information is from a NOAA Scientist: "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawai'i Revised Statutes (HRS) [Chapter 195D](#) and Hawai'i

Administrative Rules (HAR) [13-124](#)." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

Keaouhou Bay is the monk seals and the green sea turtle's habitat. Allowing a bungalow resort to be developed in Keaouhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to protect the land around Keaouhou Bay from developments that destroy the habitat of these endangered species with pollution and runoff.

Does this EIS have any reports on the endangered species that frequent Keaouhou Bay? This is their habitat and it needs to be "conserved".

Under the Conservation Program there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hrscurrent/Vol103\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol103_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hrscurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keaouhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keaouhou Bay and the surrounding area during the building phase of this enormous project.

### **GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS**

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keaouhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable! Please read from Wikipedia, "

Most drains have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically there are no treatment

facilities in the piping system." [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single,discarge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single,discarge%20into%20individual%20dry%20wells)

The pavement from this development will cause pollution to runoff into Keaouhou Bay because this treed land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keaouhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references. See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> where the Hawaii government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keaouhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.

These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keaouhou Bay and for these endangered species habitat. Under Section 2 (b) of the Endangered Species Act - Keaouhou Bay MUST BECOME A CONSERVATION AREA for these endangered species. It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keaouhou Bay.

### **ALGAE BLOOMS KILL CORAL AND MARINE LIFE**

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer. When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course development. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem. Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution. . " <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms->

[and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/](https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-)

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAUHOU BAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

**FURTHERMORE:** "If there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

**ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN**

Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want

to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keauhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

The article below is from NOAA regarding motor vehicle engines and pollution to the sea.

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats. " <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant>.

Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects  
News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a [new report](#) from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-

based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%2D%20Nearly%2085%20percent.pipeline%20spills%2C%20says%20a%20new>

The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershepherds.org.au/blog/the-impact-of-stormwater-car-emissions/>

## **NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE**

Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keauhou Bay during development?

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

What is ocean noise?

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather

and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

### **LEARN FROM OTHERS: RUN-OFF FROM DEVELOPMENT KILLS**

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments.

Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed. Keauhou Bay is a much smaller ecosystem.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow..."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams... Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay due to its size and fragility.

### **MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN**

Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays.

Manta rays are in Keauhou Bay every night to eat zooplankton, and are often seen here during the day as well.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is NO WAY to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments.

Please read the Scientific articles below.

It's Been Proven Developments Severely Pollute Nearby Waters Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawai'i. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide...

This was the third major bleaching episode in Hawai'i over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-off)." <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,ad%20catastrophic%20impacts%20state%20wide.>

This article is by the Coral Reef Alliance here in Hawai'i. "An ecosystem under threat Hawai'i's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff... When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving

coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawai%CA%BBi's%20reefs%20face%20major%20global,into%20Hawai%CA%BBi's%20waterways%20every%20day>.

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report\\_does/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report_does/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019...

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban run-off, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawai'i." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>  
The coral all over Hawai'i has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development,...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species>.

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,service%20that%20coral%20reefs%20provide>.

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development... This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." <https://oceanservice.noaa.gov/education/>

[tutorial\\_coral/coral09\\_humantthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](#)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [It's Been Proven Resort Developments KILL Marine Life](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humantthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.</a></p></div><div data-bbox=)

This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem... Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result

observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

The ecosystem is fragile and interconnected as is stated in this article: "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%20%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes

and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

## **HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH**

Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?  
"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>  
And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of

life." <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles. If you allow this resort the amount of people in this bay will fully increase and, "Hawai'i's recent history has shown that the state's growing population can have an adverse effect on nearshore fish

populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature

Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%2C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study%20said.> By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.> Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." <https://www.nature.com/articles/>

### **INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS**

Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?  
There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.  
Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. Worldwide, hotels produce almost 300,000 tonnes of waste each year." <https://www.homebiogas.com/blog/hotels-waste-management/>  
As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort

Development at Keauhou Bay. On Hawai'i Island, we are already struggling to meet the increasing need for resources and infrastructure.

Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill  
September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

A County commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill

By [Megan Moseley](#) September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill. During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions. Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics,

paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka‘ahumanu Highway in Waikōloa.

“Trying to site a new landfill is close to impossible,” Adams said.

“So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill.”

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to “divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste.”

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

Time’s Up For Landfills

‘Gentle’ demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai‘i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn’t want one any bigger or more active than absolutely necessary.

Drought Conditions On Hawai‘i Island Prompt Water Supply Message

by Big Island Video News

on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai‘i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai‘i island is under “Moderate Drought” conditions, according to the latest information from the [U.S. Drought Monitor](#). There is an area under “Abnormally Dry” conditions in South Kona, however there are other, small pockets on the Big Island that are under “Severe Drought”. There is even a small spot of “Extreme Drought” in the South Point area of Ka‘ū.

“The National Weather Service’s forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event,” reported the Hawai‘i County Department of Water Supply. “Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024.”

From a Water Supply news release:

Hawaii is “on the verge of a greater catastrophe,” locals say, as water crisis continues

By [Li Cohen](#)

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to significant droughts, and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the world's largest surfing wave pool opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe." "We are in a water crisis, that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>  
Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

**UPDATE: HELCO asks for continued energy conservation  
BY SPECTRUM NEWS STAFF HAWAII ISLAND  
UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM  
ET APR. 15, 2024**

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand. "We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages." Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/helco-customers-on-hawaii-island-asked-to-conserve-power->

Big power supply problems continue to plague Hawaii Island  
Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island <https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

#### FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES

A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS? A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawai'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes. "We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen

K Highway, and for all the same reasons: All of these roads only have two lanes!

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." <https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/>

[article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=-FQSnPDji8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii'i Island...

Here are some other statistics that are even more staggering:

- 28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees
- 13% of pedestrians hit at 20 mph actually suffer fatality
- 73% of pedestrians hit at 40 mph suffer fatality
- 25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!
- 56% of fatal crashes were the result of alcohol or drugs
- 41% of fatal crashes occurred in light trucks and vans
- 49% of crashes occur during the day, outside of peak traffic hours
- Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

10) “Researchers find sewage from an oceanfront Big Island community reaches nearshore waters Hawai‘i Public Radio | By Russell Subiono, Sophia McCullough Published December 20, 2021 at 5:56 PM HST

There are nearly 50,000 cesspools on the Big Island, with tens of thousands posing a risk to water resources, according to the Hawai‘i Department of Health.” <https://www.hawaiipublicradio.org/the-conversation/2021-12-20/researchers-find-sewage-from-an-oceanfront-big-island-community-reaches-nearshore-waters>

11) ”Kona coast faces stark wastewater tradeoffs, Current situation There are approximately 88,000 cesspools across the state, releasing more than 200,000 cubic meters of wastewater per day to the environment. <https://www.hawaii.edu/news/2021/09/10/kona-stark-wastewater-tradeoffs/>

We ask that you start figuring out how this can never happen again? These are the kind of issues that need to be resolved before you approve more development.

12) "HELCO restores power after initiating emergency outages on Big Island by: Elizabeth 'Ufi Posted: Jan 30, 2024 / 09:43 AM HST Updated: Jan 30, 2024 / 04:15 PM HST

An unexpected loss of several large Hawaii Electric generators left some residents on Big Island without power for parts of the morning on Tuesday, Jan. 30." <https://www.khon2.com/big-island-news/heco-initiates-30-min-rolling-outages-after-loss-of-generators/>

13) Hawaii State News Update: Hawaiian Electric initiates rolling outages throughout Big Island February 13, 2024 · 5:23 PM HST \* Updated February 14, 2024 · 4:21 PM

The emergency outages are being initiated in various areas around the entire island to prevent loss of power to an even greater number of customers. The timing and extent of the outages will depend on the amount of demand on the system and the availability of generators." <https://bigislandnow.com/2024/02/13/hawaii-island-customers-asked-to-reduce-electricity-use/>

14) HELCO issues rolling power outages around Big Island by:

Emily Cervantes Posted: Feb 13, 2024 / 05:11 PM HST Updated: Feb 13, 2024 / 09:12 PM HST Hawaiian Electric initiated rolling outages for Big Island after several large generators became unavailable and reduced output Tuesday night."

<https://www.khon2.com/local-news/heco-releases-conservation-alert-for-big-island/>

15) "Here's how power outages can have repercussions for Hawai'i's water supply Hawai'i Public Radio | By Savannah Harriman-Pote Published February 13, 2024 at 10:59 AM HST Water departments on O'ahu and Hawai'i Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply? It is impossible to separate Hawai'i's power system from its water system, said Kawika Uyehara, deputy director of Hawai'i County's Department of Water Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-conserve-water-amid-power-outages>

16) US Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "We're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>  
17) News Hawai'i County issues mandatory 25% water restriction for North Kona

August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

18) Hawai'i Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News

on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely

monitoring its 23 public water systems, with a “special focus” placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawai%CA%BBi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

19) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large/?rdt=52660)

20) "Hawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

## **HISTORICAL AND CULTURAL SIGNIFICANCE:**

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law “Ke Kānāwai Māmalahoe” or “the Law of the Splintered Paddle.” Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai‘i. After being added back in 1978, the law is part of Hawaii’s State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

-Caring for and serving one’s people

-Knowing and doing what is pono (right)

-Standing for the principle that leadership privilege is earned

-Taking kuleana (responsibility) for those we serve

-Doing so with compassion, love, and respect

“We take that to mean that anyone who uses our roadways should be able to do so without fear of harm,” explains Tina.”

The Law of the Splintered Paddle is also on Kamehameha Schools website. The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.

### **IN CONCLUSION**

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Eco-system in Keauhou Bay and "The Endangered Species Act of 1973 (ESA or "The Act"; 16 U.S.C. § 1531 et seq.) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from extinction as a "consequence of economic growth and development untimpered by adequate concern and conservation", the ESA was signed into law by President Richard Nixon on December 28, 1973. The Supreme Court of the United States described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation".

[1] [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land **MUST** be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawai'i Island is already having serious infrastructure and resource issues that have yet to be solved. These issues **MUST** be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly protects the marine life and environment from further damage. The location is **NOT** suitable for this kind of development for both environmental and infrastructure reasons. The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying **NO** to a Bungalow Resort built by Kamehameha Schools.

Please reject this EIS because Kamehameha Schools has **NOT ACKNOWLEDGED OR ASKED** thousands of Hawaiians, or Hawaiian Descendants from Keauhou Bay how they feel about developing this land, Keauhou Bay.

They have asked **ONLY** a few families on an island that has thousands of Hawaiian people and here is video testimony from Kupuna Kumu Lily Kong who is a Keauhou Bay descendants and her and her mother **OPPOSE DEVELOPMENT!** <https://vimeo.com/994680462>

Kupuna Kumu Lily Kong who was born in Keauhou Bay and she states that she is against development. She also states that her mother was against development as well. Please listen to her words

in her testimonial video about Keauhou Bay on this link and know that this proves that descendant directly from Keauhou Bay OPPOSE THIS DEVELOPMENT <https://vimeo.com/994680462> and it is CULTURAL LAW THEY MUST BE HEARD AND ACKNOWLEDGED!

These laws were created, “After these legal victories, the Kohanaiki ‘Ohana worked to create a new law in the state of Hawaii to require Cultural Impact Statements along with Environmental Impact Statements for all future large-scale development. Act 50, the Cultural Impact Statement Law was adopted in 2000.” <https://kohanaikiohana.org/legal-victories>

Kupuna Kumu Lily Kong also states that there are burial grounds on the land that Kamehameha Schools wants to clear and it is told that Kamehameha Schools has bulldozed sacred land in the past and Keauhou Bay’s burial grounds MUST BE RESPECTED AND NOT DISTURBED!

Hawaiians locals have said that there were bones in the small cave that is at the base of Keauhou Bay. These burials need to take priority over a Bungalow Resort Development.

There are over 6,219 signatures as of Aug. 5th (these signatures grow daily) and these signatures are Hawaiians, locals and tourist and some of these Hawaiians have left comments on why they are opposing this development.

**ALL OF THESE PEOPLE HAVE A RIGHT TO BE ACKNOWLEDGED AND THEIR VOICES HAVE VALUE TO BE HEARD, THESE PEOPLE MATTER AND IT IS CULTURAL LAW THEY MUST BE ACKNOWLEDGED!**

Here is the petition link with thousands of Hawaiian signatures and comments opposing Kamehameha Schools Bungalow Resort Development. Please read these signatures and comments! <https://www.change.org/p/save-keauhou-bay-from-becoming-a-big-crowded-resort?>

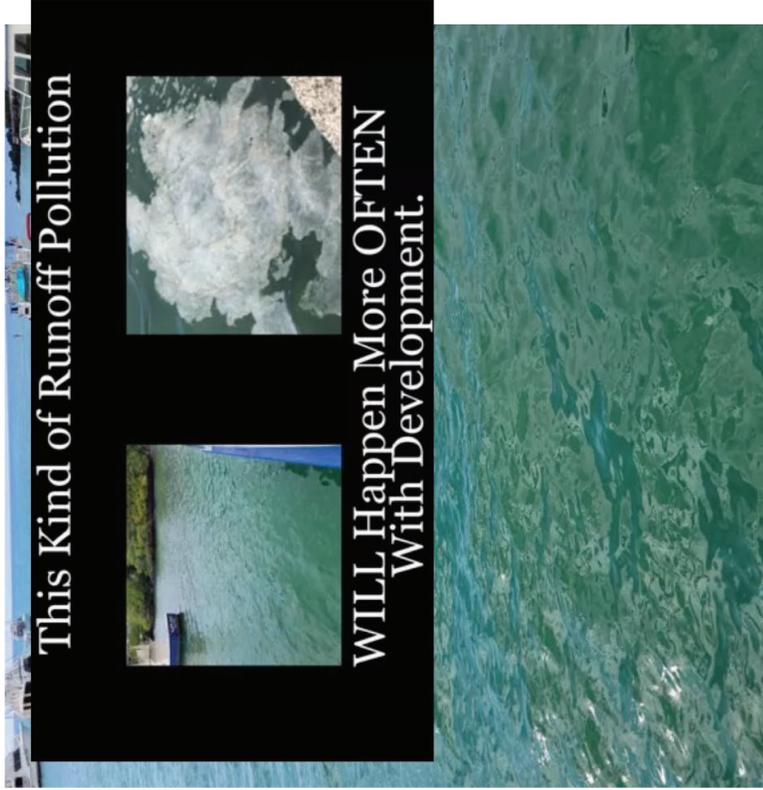

[utm\\_source=share\\_petition&utm\\_medium=custom\\_url&recruited\\_by\\_id=92a53560-1e91-11e5-b4ef-b94e90cedbdd](https://www.change.org/p/save-keauhou-bay-from-becoming-a-big-crowded-resort?utm_source=share_petition&utm_medium=custom_url&recruited_by_id=92a53560-1e91-11e5-b4ef-b94e90cedbdd)

Please reject this EIS because under Princess Bernice Pauahi Bishop’s Will it states Kamehameha Schools are her trustees and they have a “fiduciary duty” to do what is best for THEIR BENEFICIARIES (the Hawaiian people’s) and a Bungalow Resort is BEST FOR TOURISTS NOT THE HAWAIIAN PEOPLE BECAUSE THOUSANDS OF HAWAIIAN PEOPLE SINGED THE ABOVE PETITION OPPOSING KAMEAHMEHA SCHOOLS BUNGALOW RESORT.

Please reject this EIS because the Big Island DOES NOT HAVE THE RESOURCES TO PROVIDE FOR ANOTHER BIG RESORT ON ISLAND and there are 445 signatures with many comments that agree with this fact because of the factual reported articles in the Help Prioritize Big Island Developments to Keep Island’s Resources Safe for ALL petition. Please read this petition, all the signatures and comments <https://www.change.org/p/help-prioritize-big-island-developments-to-keep-island-s-resources-safe-for-all>

Mahalo,  
Rayann Ebreo

To Whom It May Concern,

Please read the scientific proof in this letter and **REJECT** Kamehameha Schools Environment Impact Statement (EIS) for Keaouhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort **WILL** have a **SERIOUS NEGATIVE IMPACT** on Keaouhou Bay as stated in all the different researched articles below.

Please, **DO NOT** risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is scientifically proven that developments pollute nearby waters both during and after development.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have **ALWAYS** polluted the water in **EVERY** coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keaouhou Bay is their habitat and this development **WILL** be **CHANGING** an Entire Ecosystem.

**ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT**

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.

The Green Sea Turtle swims in Keauhou Bay weekly and the monk seal has also been seen swimming and resting in Keauhou Bay. Both of these marine animals are on the endangered species list.

### **Endangered Species Act**

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) **PURPOSES.**—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-ac>

### **FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED**

The green sea turtle is federally protected and can be seen in Keauhou Bay weekly.

The following article that states: "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and

plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Allowing this development WILL POLLUTE Keauhou Bay. The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!) states this fact clearly. Keauhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen because developments have been shown to ALWAYS pollute the water is that is nearby.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

### **THE ENDANGERED MONK SEAL WILL BE AFFECTED**

Keaouhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keaouhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keaouhou Bay will likely be changed forever.

This information is from a NOAA Scientist: "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie'!" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawai'i Revised Statutes (HRS) [Chapter 195D](#) and Hawai'i

Administrative Rules (HAR) [13-124](#)." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

Keaouhou Bay is the monk seals and the green sea turtle's habitat. Allowing a bungalow resort to be developed in Keaouhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to protect the land around Keaouhou Bay from developments that destroy the habitat of these endangered species with pollution and runoff.

Does this EIS have any reports on the endangered species that frequent Keaouhou Bay? This is their habitat and it needs to be "conserved".

Under the Conservation Program there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hrscurrent/Vol103\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol103_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hrscurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keaouhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keaouhou Bay and the surrounding area during the building phase of this enormous project.

### **GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS**

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keaouhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable! Please read from Wikipedia, "Most drains have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically there are no treatment

facilities in the piping system." [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single,discarge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single,discarge%20into%20individual%20dry%20wells)

The pavement from this development will cause pollution to runoff into Keaouhou Bay because this treed land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keaouhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references. See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> where the Hawai'i government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keaouhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.

These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keaouhou Bay and for these endangered species habitat. Under Section 2 (b) of the Endangered Species Act - Keaouhou Bay MUST BECOME A CONSERVATION AREA for these endangered species. It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keaouhou Bay.

### **ALGAE BLOOMS KILL CORAL AND MARINE LIFE**

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer. When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course developments. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem. Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution. . " <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms->

[and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/](https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-)

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAUHOU BAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

FURTHERMORE: "If there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

**ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN**

Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want

to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keauhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

The article below is from NOAA regarding motor vehicle engines and pollution to the sea.

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats. " <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant>.

Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects  
News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a [new report](#) from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-

based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%2D%20Nearly%2085%20percent.pipeline%20spills%2C%20says%20a%20new>

The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershepherds.org.au/blog/the-impact-of-stormwater-car-emissions/>

## **NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE**

Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keauhou Bay during development?

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

What is ocean noise?

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather

and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

### **LEARN FROM OTHERS: RUN-OFF FROM DEVELOPMENT KILLS**

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments.

Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed. Keauhou Bay is a much smaller ecosystem.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow..."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams... Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay due to its size and fragility.

### **MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN**

Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays. Manta rays are in Keauhou Bay every night to eat zooplankton, and are often seen here during the day as well.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is NO WAY to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments.

Please read the Scientific articles below.

It's Been Proven Developments Severely Pollute Nearby Waters Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawai'i. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide...

This was the third major bleaching episode in Hawai'i over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-off)." <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,hard%20catastrophic%20impacts%20state%20wide.>

This article is by the Coral Reef Alliance here in Hawai'i. "An ecosystem under threat Hawai'i's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff... When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving

coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawai%CA%BBi's%20reefs%20face%20major%20global,into%20Hawai%CA%BBi's%20waterways%20every%20day>.

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report\\_does/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report_does/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019...

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban run-off, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawai'i." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>  
The coral all over Hawai'i has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development,...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species>.

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,service%20that%20coral%20reefs%20provide>.

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development... This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." <https://oceanservice.noaa.gov/education/>

[tutorial\\_coral/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](#)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [It's Been Proven Resort Developments KILL Marine Life](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.</a></p></div><div data-bbox=)

This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem... Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result

observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

The ecosystem is fragile and interconnected as is stated in this article: "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%20%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes

and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

## **HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH**

Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?  
"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>  
And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of

life." <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles. If you allow this resort the amount of people in this bay will fully increase and, "Hawai'i's recent history has shown that the state's growing population can have an adverse effect on nearshore fish

populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature

Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%2C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study%20said.> By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.> Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." <https://www.nature.com/articles/>

### **INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS**

Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?  
There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.  
Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. Worldwide, hotels produce almost 300,000 tonnes of waste each year." <https://www.homebiogas.com/blog/hotels-waste-management/>  
As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort

Development at Keauhou Bay. On Hawai'i Island, we are already struggling to meet the increasing need for resources and infrastructure.

Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill  
September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

A County commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill

By [Megan Moseley](#) September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill. During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions. Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics,

paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka‘ahumanu Highway in Waikōloa.

“Trying to site a new landfill is close to impossible,” Adams said. “So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill.”

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to “divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste.”

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

Time’s Up For Landfills

‘Gentle’ demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai‘i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn’t want one any bigger or more active than absolutely necessary.

<https://buildingindustryhawaii.com/2024/04/times-up-for-landfills/>  
Drought Conditions On Hawai‘i Island Prompt Water Supply Message

by Big Island Video News

on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai‘i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai‘i island is under “Moderate Drought” conditions, according to the latest information from the [U.S. Drought Monitor](#). There is an area under “Abnormally Dry” conditions in South Kona, however there are other, small pockets on the Big Island that are under “Severe Drought”. There is even a small spot of “Extreme Drought” in the South Point area of Ka‘ū.

“The National Weather Service’s forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event,” reported the Hawai‘i County Department of Water Supply. “Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024.”

From a Water Supply news release:

U.S.

Hawaii is “on the verge of a greater catastrophe,” locals say, as water crisis continues

By [Li Cohen](#)

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to significant droughts, and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the world's largest surfing wave pool opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe." "We are in a water crisis, that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>  
Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

**UPDATE: HELCO asks for continued energy conservation  
BY SPECTRUM NEWS STAFF HAWAII ISLAND  
UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM  
ET APR. 15, 2024**

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand. "We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages." Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/helco-customers-on-hawaii-island-asked-to-conserve-power->

Big power supply problems continue to plague Hawaii Island  
Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island <https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

#### FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES

A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS? A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawai'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes. "We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen

K Highway, and for all the same reasons: All of these roads only have two lanes!

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly. In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." <https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/>

[article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=-FQSnPDji8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii's Island...

Here are some other statistics that are even more staggering:

- 28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees
- 13% of pedestrians hit at 20 mph actually suffer fatality
- 73% of pedestrians hit at 40 mph suffer fatality
- 25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!
- 56% of fatal crashes were the result of alcohol or drugs
- 41% of fatal crashes occurred in light trucks and vans
- 49% of crashes occur during the day, outside of peak traffic hours
- Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

### **MORE ARTICLES HIGHLIGHTING INFRASTRUCTURE AND RESOURCE DEFICITS, INCLUDING WATER, TRASH, ELECTRIC and WASTEWATER:**

- 1) Hawaii Deals with Burgeoning Waste Management Problem As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawaii's Sanitary Landfill reaching capacity.

The West Hawaii's Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste Hawaii's Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the East side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of

Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

But what does the power grid have to do with the water supply? It is impossible to separate Hawai'i's power system from its water system, said Kawika Uyehara, deputy director of Hawai'i County's Department of Water Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-conserve-water-amid-power-outages>

16) US Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "We're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>  
17) News Hawai'i County issues mandatory 25% water restriction for North Kona

August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

18) Hawai'i Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News

on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely

monitoring its 23 public water systems, with a “special focus” placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawai%CA%BBi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

19) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large/?rdt=52660)

20) "Hawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

## **HISTORICAL AND CULTURAL SIGNIFICANCE:**

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law “Ke Kānāwai Māmalahoe” or “the Law of the Splintered Paddle.” Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai‘i. After being added back in 1978, the law is part of Hawaii’s State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

-Caring for and serving one’s people

-Knowing and doing what is pono (right)

-Standing for the principle that leadership privilege is earned

-Taking kuleana (responsibility) for those we serve

-Doing so with compassion, love, and respect

“We take that to mean that anyone who uses our roadways should be able to do so without fear of harm,” explains Tina.”

The Law of the Splintered Paddle is also on Kamehameha Schools website. The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.

### **IN CONCLUSION**

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Eco-system in Keauhou Bay and "The Endangered Species Act of 1973 (ESA or "The Act"; 16 U.S.C. § 1531 et seq.) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from extinction as a "consequence of economic growth and development untimpered by adequate concern and conservation", the ESA was signed into law by President Richard Nixon on December 28, 1973. The Supreme Court of the United States described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation".

[1] [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land **MUST** be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawai'i Island is already having serious infrastructure and resource issues that have yet to be solved. These issues **MUST** be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly protects the marine life and environment from further damage. The location is **NOT** suitable for this kind of development for both environmental and infrastructure reasons. The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying **NO** to a Bungalow Resort built by Kamehameha Schools.

Please reject this EIS because Kamehameha Schools has **NOT ACKNOWLEDGED OR ASKED** thousands of Hawaiians, or Hawaiian Descendants from Keauhou Bay how they feel about developing this land, Keauhou Bay.

They have asked **ONLY** a few families on an island that has thousands of Hawaiian people and here is video testimony from Kupuna Kumu Lily Kong who is a Keauhou Bay descendants and her and her mother **OPPOSE DEVELOPMENT!** <https://vimeo.com/994680462>

Kupuna Kumu Lily Kong who was born in Keauhou Bay and she states that she is against development. She also states that her mother was against development as well. Please listen to her words

in her testimonial video about Keauhou Bay on this link and know that this proves that descendant directly from Keauhou Bay OPPOSE THIS DEVELOPMENT <https://vimeo.com/994680462> and it is CULTURAL LAW THEY MUST BE HEARD AND ACKNOWLEDGED!

These laws were created, “After these legal victories, the Kohanaiki ‘Ohana worked to create a new law in the state of Hawaii to require Cultural Impact Statements along with Environmental Impact Statements for all future large-scale development. Act 50, the Cultural Impact Statement Law was adopted in 2000.” <https://kohanaikiohana.org/legal-victories>

Kupuna Kumu Lily Kong also states that there are burial grounds on the land that Kamehameha Schools wants to clear and it is told that Kamehameha Schools has bulldozed sacred land in the past and Keauhou Bay’s burial grounds MUST BE RESPECTED AND NOT DISTURBED!

Hawaiians locals have said that there were bones in the small cave that is at the base of Keauhou Bay. These burials need to take priority over a Bungalow Resort Development.

There are over 6,219 signatures as of Aug. 5th (these signatures grow daily) and these signatures are Hawaiians, locals and tourist and some of these Hawaiians have left comments on why they are opposing this development.

ALL OF THESE PEOPLE HAVE A RIGHT TO BE ACKNOWLEDGED AND THEIR VOICES HAVE VALUE TO BE HEARD, THESE PEOPLE MATTER AND IT IS CULTURAL LAW THEY MUST BE ACKNOWLEDGED!

Here is the petition link with thousands of Hawaiian signatures and comments opposing Kamehameha Schools Bungalow Resort Development. Please read these signatures and comments! <https://www.change.org/p/save-keauhou-bay-from-becoming-a-big-crowded-resort?>

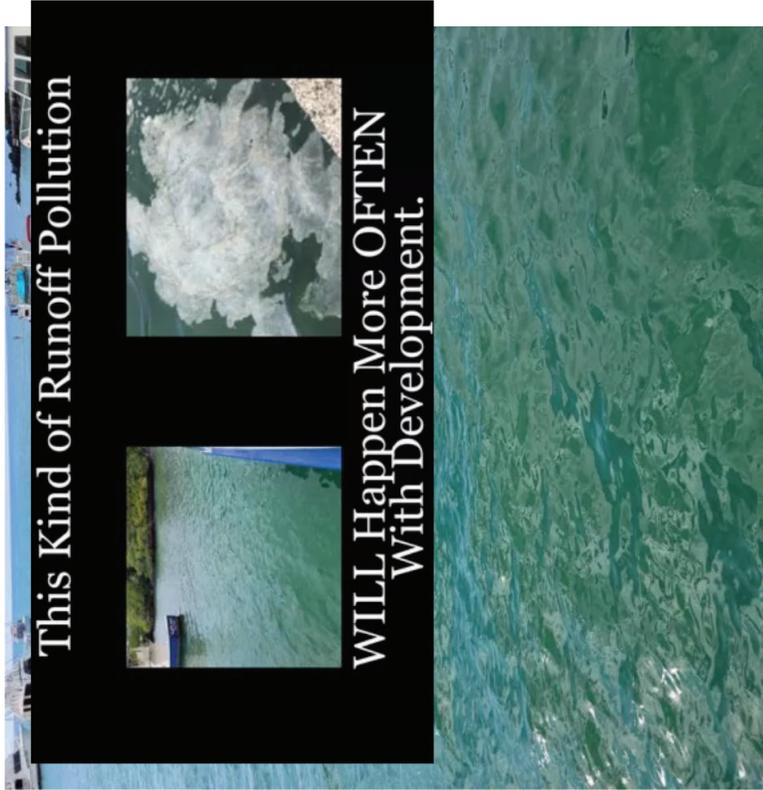

[utm\\_source=share\\_petition&utm\\_medium=custom\\_url&recruited\\_by\\_id=92a53560-1e91-11e5-b4ef-b94e90cedbdd](https://www.change.org/p/save-keauhou-bay-from-becoming-a-big-crowded-resort?utm_source=share_petition&utm_medium=custom_url&recruited_by_id=92a53560-1e91-11e5-b4ef-b94e90cedbdd)

Please reject this EIS because under Princess Bernice Pauahi Bishop’s Will it states Kamehameha Schools are her trustees and they have a “fiduciary duty” to do what is best for THEIR BENEFICIARIES (the Hawaiian people’s) and a Bungalow Resort is BEST FOR TOURISTS NOT THE HAWAIIAN PEOPLE BECAUSE THOUSANDS OF HAWAIIAN PEOPLE SINGED THE ABOVE PETITION OPPOSING KAMEAHMEHA SCHOOLS BUNGALOW RESORT.

Please reject this EIS because the Big Island DOES NOT HAVE THE RESOURCES TO PROVIDE FOR ANOTHER BIG RESORT ON ISLAND and there are 445 signatures with many comments that agree with this fact because of the factual reported articles in the Help Prioritize Big Island Developments to Keep Island’s Resources Safe for ALL petition. Please read this petition, all the signatures and comments <https://www.change.org/p/help-prioritize-big-island-developments-to-keep-island-s-resources-safe-for-all>

Mahalo,  
Rayann Ebreo

## Ann Eshabarr

Aloha,

I'm writing to protect Keauhou Bay.

There's always talk about building and little talk about the impact and infrastructure. Water pollution, traffic, wild life and the desecration of sacred land are just a few of the things I'm concerned about. Please don't allow this development. It's a heartbreaking thought. Keauhou Bay is a very special place and should remain as is with its natural beauty and mana.

Mahalo,

Ann Barrett Eshabarr.

## Denise Fadem

No more. No more building we have more than enough. STOP

## Dale Fergerstrom

My name is Dale Fergerstrom and I am in favor of Kamehameha Schools Management Plan for its lands surrounding Keaouhou Bay in Kona. I was born in Laupahoehoe Hawai'i island in 1952 and have lived my whole life on this island. I am a retired police officer with the Hawai'i County Police Department with my last assignment being the District Commander for Kona.

I am heavily involved in perpetuating the traditions and practices of the Traditional Hawaiian Canoe and visit Keaouhou Bay on a regular basis for the past 23 years. I am pleased with Kamehameha Schools effort to bring some order to the commercial over-exploitation of Keaouhou by setting forth a plan that will move a significant amount of this commercial activity away from the head of the bay and away from the Birth Site of Ali'i Kauikeouli (Kamehameha III). This move will bring some dignity back to this important Historical site.

I would like to note that some of the behavior of visitors in and around this birth site would not be tolerated by the community or the government if it were to take place at the Lincoln Memorial or the Birth Site of any of the past American Presidents.

And while this plan calling for the construction of a modest hotel on the upper sections of Kamehameha School lands mauka of the bay seems to contradict the premise of reducing commercial congestion and has raised concern in the community, it must be remembered that this whole infrastructure fix is being paid for solely by Kamehameha Schools. Kamehameha Schools will receive no financial or other help from anyone in creating or maintaining the infrastructure being proposed here. Unlike Government, KS must be able to make this endeavor self-supporting.

And no one has pointed out that much of the commercial congestion of Keaouhou Bay has been caused by the State of Hawai'i. The State's mismanagement of commercial ocean permits for this bay has played a significant role in the problems facing Keaouhou and they have not been caused by Kamehameha Schools or any of its programs.

In addition Kamehameha Schools, in this plan, is trying to bring some relief to the congestion of private small boat fishermen who are forced to use Keaouhou bay because of the shutting down the Kailua Pier Boat ramp to private boat owners after the 9-11 attack on New York City 13 years ago. The State has known full well the pressure this closure has placed on Keaouhou Bay and has done little to address it.

Again Kamehameha schools is attempting to address problems significantly caused by Government Mismanagement of this resource while receiving no financial assistance from anyone. I also feel that Kamehameha Schools commitment to the concept of "Aloha 'Aina" will ensure it will work diligently to address any environmental issues not addressed in the Environmental Impact Statement should they arise. And if they don't you can be assured that Hawaiians will hold KS accountable as we have done in the not too distant past.

creating the roadway, sewer, utilities, plus construction and furnishings. Financing to renovate and upgrade the Outrigger might be a far safer ROI for KS. I also question that the claim cited in the first paragraph of section 2.1.3 “the hustle and bustle of ocean commercial operations catering mainly to visitors cause many local families, with some long-standing generational ties to the bay, to no longer feel welcomed”. While this may be true in the case of a very few individuals, it doesn’t substantiate the investment to solve their feelings.

I would suggest a 2.3.4 Alternative Action which would address the Heritage area improvements, the parking, boat storage (again for short-term storage only), congestion at the Pier area and repositioning the commercial bayfront activity from the pier area to the corner of Old Government Road and Ehukai St. I think this would provide a much better ROI for the Trust and at the same time accomplish its heritage goals.

Thank you.

Tom Fetter

Group 70 International, Inc.  
Attn: Kawika McKeague, Principal Planner  
111 S. King Street, Suite 170  
Honolulu, HI 96813

Re: Keauhou Bay Management Plan Comments

Dear Mr. McKeague,

My name is Thompson Fetter and I have reviewed both the original 2022 and the 2024 DEIS. These contain valuable information but little financial analysis. If generating income is a key objective of the Trust, then there should be more emphasis on the financial aspects.

Since 2013 I have owned a residence at 76-120 Holua Rd on Keauhou Bay. I have observed the activities and uses of the bay firsthand. Our observation is that Keauhou Bay is currently utilized almost to capacity in the following areas:

- Automobile parking
- Boat storage (some of which is long-term and need not be adjacent to the water)
- Permanent moorings in the Bay
- Launch ramp capacity and trailer parking
- Commercial boat operations to provide visitor trips to Kealakekua Bay and Manta Ray experience (these involve up to 200 or more people a day)

The Bay also clearly has historical significance and is a site which deserves recognition. In its present state, the Bay and its immediate surrounding area are heavily utilized already. I question the assumption that there is room for significant economic growth. The lodging capacity at the former Sheraton Hotel, now the Outrigger, is far from fully utilized. I question the KS assumption that an adequate Return on Investment can be generated from the development of 150 boutique short-term rental units as proposed. This involves

RE: Comment Period for Keahou Bay Management Plan Draft EIS

He Mele komo a he mele aloha no na kupuna o ke au i hala Aloha mai kakou.

Aloha,

My name is Cindy Freitas and I'm a Native Hawaiian descended of the native inhabitants of Hawai'i prior to 1778 and born and raised in Hawai'i. I am also a practitioner who still practice the cultural traditional customary practices that was instill in me by my grandparents at a young age from mauka (MOUNTAIN TO SEA) to makai in many areas.

I OPPOSE this Plan due to the following reasons:

Construction will have significant cumulative adverse impacts on cultural, archaeological, native plants, rare plants and animal species and historic elements resources in the proposed 29 acre parcel situated in the Keahou: TMS: (3) 7-8-012:098 (1.08 acres); (3) 7-8-012:101 (0.12 acres); (3) 7-8-012:048 (0.37 acres); (3) 7-8-010:044 that is **irreversible**.

My name is Cindy Freitas and I'm a Native Hawaiian descended of the native inhabitants of Hawai'i prior to 1778 and born and raised in Hawai'i. I am also a practitioner who still practice the cultural traditional customary practices that was instill in me by my grandparents at a young age from mauka (MOUNTAIN TO SEA) to makai in many areas. I OPPOSE this Plan due to the following reasons: Construction will have significant cumulative adverse impacts on cultural, archaeological, native plants, rare plants and animal species and historic elements resources in the proposed 29 acre parcel situated in the Keahou: TMS: (3) 7-8-012:098 (1.08 acres); (3) 7-8-012:101 (0.12 acres); (3) 7-8-012:048 (0.37 acres); (3) 7-8-010:044 that is irreversible. SIHP # Ho'okuku Pond; SIHP # Kamau' ai Heiau; SIHP # 04621 Ka'io'ena or Keahiolo Heiau; SIHP # 3813 Opukaha Heiau; Aha A 'Umi Heiau; Modern House Platform; Kamohoolii Heiau; SIHP # 24264 Mo'ikeha Cave; Kaopa Well; Kualalua Braekis seepage; SIHP # 23911 Kaukulaelae Heiau; SIHP # 23912 Platform; SIHP # 23913 Platform with three layer of retaining wall; Kaimuki pit; SIHP # 24256 Possible house terrace; SIHP # 24267 Low enclosure; SIHP # 4348 Birth site of Kauikeaouli; SIHP # 5674 Platform; Mound that may contain burial; Fishermen campground; Octopus lure; Coral disc; Prehistoric use of the area; SIHP # 5695 Subsurface cultural deposit; Papamu; Temp. 736-1 Serveral walls that probably served as property boundaries; SIHP # 24216 Historic complex, two stacked rock walls, Modified outcrop interpreted as a possible historic ag clearing mound, retaining wall, Prepared niche interpreted as a storage feature; SIHP # 24265 Complex; SIHP # 24266 Habitation site; and other site that is not recorded. The Constitution of the State of Hawai'i clearly states the duty of the State and its agencies is to preserve, protect, and prevent interference with the traditional and customary rights of native Hawaiians. Article XII, Section 7 requires the State to "protect all rights, customarily and traditionally exercised for subsistence, cultural and religious purposes and possessed by ahupua'a tenants who are descendants of native Hawaiians who inhabited the Hawaiian Islands prior to 1778" (2000). In spite of the establishment of the foreign concept of private ownership and western-style government, Kamehameha III (Kauikeaouli) preserved the peoples traditional right to subsistence. As a result in 1850, the Hawaiian Government confirmed the traditional access rights to native Hawaiian ahupua'a tenants to gather specific natural resources for customary uses from undeveloped private property and waterways under the Hawaiian Revised Statutes (HRS) 7-1. In 1992, the State of Hawai'i Supreme Court, reaffirmed HRS 7-1 and expanded it to include, "native Hawaiian rights...may extend beyond the ahupua'a in which a native Hawaiian resides where such rights have been customarily and traditionally exercised in this manner" (Pele Defense Fund v. Pay, 73 Haw.578, 1992). Act 50, enacted by the Legislature of the State of Hawaii (2000) with House Bill 2895, relating to Environmental Impact Statements, proposes that: "...there is a need to clarify that the preparation of environmental assessments or environmental impact statement should identify and address effects on Hawai'i's culture, and traditional and customary rights...[H.L.B. NO. 2895] Act 16, enacted by the Legislature of the State of Hawaii (2020) with S.B. No. 2060 Section 3; (2) Historic resources; (A) Protect, preserve, and where desirable, restore those natural and manmade historic and prehistoric resources in the coastal zone management area that are significant in Hawaiian and American history and culture. HRS 711-1107 Desecration (b) A place of worship or burial (2) "Desecrate" means defacing, damaging, polluting, or otherwise physically mistreating in a way that defendant knows will outrage the sensibilities of persons likely to observe or discover the defendant's action. Therefore Applicant in all due respect should not build and destroy what is still beautiful.

agencies is to preserve, protect, and prevent interference with the traditional and customary rights of native Hawaiians. Article XII, Section 7 requires the State to "protect all rights, customarily and traditionally exercised for subsistence, cultural and religious purposes and possessed by *ahupua'a* tenants who are descendants of native Hawaiians who inhabited the Hawaiian Islands prior to 1778" (2000). In spite of the establishment of the foreign concept of private ownership and western-style government, Kamehameha III (Kauikoaouli) preserved the peoples traditional right to subsistence. As a result in 1850, the Hawaiian Government confirmed the traditional access rights to native Hawaiian *ahupua'a* tenants to gather specific natural resources for customary uses from undeveloped private property and waterways under the Hawaiian Revised Statutes (HRS) 7-1. In 1992, the State of Hawai'i Supreme Court,

reaffirmed HRS 7-1 and expanded it to include, "native Hawaiian rights...may extend beyond the *ahupua'a* in which a native Hawaiian resides where such rights have been customarily and traditionally exercised in this manner" (Pele Defense Fund v. Paty, 73 Haw.578, 1992).

Act 50, enacted by the Legislature of the State of Hawaii (2000) with House Bill 2895, relating to Environmental Impact Statements, proposes that:  
...there is a need to clarify that the preparation of environmental assessments or environmental impact statement should identify and address effects on Hawaii's culture, and traditional and customary rights...[H.B. NO. 2895]

Act 16, enacted by the Legislature of the State of Hawaii (2020) with S.B. No. 2060

Section 3; (2) Historic resources;

(A) Protect, preserve, and where desirable, restore those natural and manmade historic and prehistoric resources in the coastal zone management area that are significant in Hawaiian and American history and culture.

HRS 711-1107 Desecration

(b) A place of worship or burial

(2) "Desecrate" means defacing, damaging, polluting, or otherwise physically mistreating in a way that defendant knows will outrage the sensibilities of persons likely to observe or discover the defendant's action.

Therefore Applicant in all due respect should not build and destroy what is still beautiful.

Mahalo,

## Carol and Scott FULLER

Please be aware that more hotel development is not needed nor wanted in Keauhou Bay....please be more responsive to the community ....as it is the bay is over run with activities that destroy geography and vibe of a once pleasant place for all....NO to another non essential hotel...

## Barbara Garcia

Please reject Kamehameha Schools EIS for Keauhou Bay to become a Bungalow Resort. I was just there a few days ago and saw where it would be. This small bay does not need a new 105 room resort, there is already too many people and traffic. Bringing even more people to this small area will add to too big of a burden on the land and bay.

We are trusting that you will listen to your na'au and do what is pono to protect Keauhou Bay and its surroundings.

Mahalo nui

## Barbara Garcia

Aloha to all concerned, Please reject Kamehameha Schools EIS for Keauhou Bay to become a Bungalow Resort. I was just there a few days ago and saw where it would be. This small bay does not need a new 105 room resort, there is already too many people and traffic. Bringing even more people to this small area will add to too big of a burden on the land and bay. This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced. We are trusting that you will listen to your na'au and do what is pono to protect Keauhou Bay and its surroundings.

## Booey Hodgins Garcia

Growing up on Keauhou Bay was one of the happiest times of my life. I believe the portion of our property that the house was built on was actually a he'e'au. If this is true, I see nothing in your plans for this. Also, I feel your plan is cramming so much activity around the bay that it will lose whatever charm is left of it. The bay used to be alive with a ama, wana, coral and a lot of fish and other waterlife. Now it looks like an underwater desert with dusty sediment and nothing of the glorious sea life that thrived. Your plans are over the top and doing nothing but exploiting a beautiful bay for the sake of more money. Not so much for expressing Hawai'iana as it should be ~ beautifully. Your plan looks to me like it will be more of an eyesore with added traffic to a relatively peaceful area. Auwe 💎

## Kimberly Gay

I have been running a free volleyball league at Keauhou Bay for almost 40 years, consisting of 120 local youth members. These kids will have nowhere to go to play volleyball if this resort is built there.

**Subject:** Attention Keahou Bay EIS Comment Letter

To whom it may concern,

Please, read the scientific proof below and state in your report that this Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keahou Bay as stated in all the different reported articles below.

Please see the following article that states "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Even with storm drains if you allow this development it WILL POLLUTE Keahou Bay because as the above article (that was written in 2014 because runoff water from developments were polluting the ocean even then) states, and this is bay holds many sea creatures such as sea turtles, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals that have rested on the dock before and...

Keahou Bay is DOCUMENTED RESTING AREA for the ENDANGERED MONK SEAL, and if a resort is allowed to be built, that will bring a lot more people down to Keahou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE.

This information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media.

There's a seal on the beach! Let's go get a 'sealfie!' That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species. In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

Has there been a detailed traffic study for the increase in cars that will be added to this already severely traffic area?

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

If you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years and, "Noise Pollution

Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behaviour of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from

Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations>.

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

Please, Do NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project, because it is scientifically proven that developments will ALWAYS have rain runoff that will pollute nearby waters constantly during development and after.

Please, read the Scientific articles below written by NOAA, National Oceanic and Atmospheric Administration and other professional organizations, that prove that developments have ALWAYS polluted the water in every coastal development area.

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all Aquatic Life there, and even the Manta Rays that go there to eat zooplankton from the Manta Ray tours at night, and they eat it during the day in that area as well because they need to eat 5 times their body weight in zooplankton daily. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

If you allow this bay to be development you will be allowing all types of marine life to die and there is NO WAY to stop this from happening because polluted runoff rain water from developments can't be fully stopped. It is what has happened in ALL coastal developments.

Please read the Scientific proof below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii: Across the Hawaiian Archipelago, coral

bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide...

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-off). "<https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event>;  
<http://hawaii#:~:text=Coral%20Bleaching%20is%20Occurring%20more,had%20catastrophic%20impacts%20state%20wide>.

This article is by the Coral Reef Alliance here in Hawaii. "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawaii%20reefs%20face%20major%20global,into%20Hawaii%20BBi's%20waterways%20every%20day>.

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019...

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban run-off, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269066>

The Chesapeake Bay has a foundation that is trying to save it due to runoff pollution that was caused by developments, and the Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed because this bay is very small.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow...

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay because it is so much smaller than the Chesapeake Bay.

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide.>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water..." (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

It's Been Proven Resort Developments KILL Marine Life

The manta rays go to Keauhou Bay every night to eat zooplankton and if you allow this development that WILL have runoff water, you WILL be causing zooplankton to be seriously affected because as this article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that proves runoff from development in this area will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl- $\alpha$  concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

"Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question

important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation." [https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3\\_6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3_6_chapter12_257-274.pdf)

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this could cause the manta ray food source to disappear and that will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on the manta ray tour for their income.

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will forsure bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%2C>

<https://www.abcnews.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%2C>

If you allow this resort to be developed, you will be destroying the coral reefs in the bay because this bay is extremely small and used by a lot of locals already for fishing, canoeing, swimming, snorkeling, paddle boarding, surfing, boating...it can't afford more use by many thousands more people yearly.

If you allow Keauhou Bay to be development there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that, "Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with metapopulation theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science

Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation

management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhaJhJqAnWAq453tRqN0jAiwel9inR3ZoTv0PYGzA5lc\\_H0QJzcHNIP3ASnhcgkRy6\\_vkLPw49dbrmBYoX5g3YIMgOjGBZsabdGUH17OJLSLbu9x5P73xED4KxI4T0sJlvgQ1a7ZZRt3rUbraxp0dJd2A0nISmW5uxB7JJEddpJ18OGJpx7ITJWdCFXFKJ1ZYeNdcJ3Sw\\_dnaUg5fZhcjPBImmmaHf5yqIT5Q%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhaJhJqAnWAq453tRqN0jAiwel9inR3ZoTv0PYGzA5lc_H0QJzcHNIP3ASnhcgkRy6_vkLPw49dbrmBYoX5g3YIMgOjGBZsabdGUH17OJLSLbu9x5P73xED4KxI4T0sJlvgQ1a7ZZRt3rUbraxp0dJd2A0nISmW5uxB7JJEddpJ18OGJpx7ITJWdCFXFKJ1ZYeNdcJ3Sw_dnaUg5fZhcjPBImmmaHf5yqIT5Q%3D&tracking_referrer=abcnews.go.com)

A Resort Development WILL Increase Traffic on Already Severly Trafficed Roads

The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island can not handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawai'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Please watch their video on their link below because it is a professional report on Big Island traffic problems. <https://www.hawaii.newsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists comes more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state, This time last year Hawaii island was at five traffic deaths, as of April 1, 2024, they're at 14. Seven of which happened in the last two weeks..."

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

Please, watch the NEWS video from the link below on aerial footage in Hilo because the footage shown is the same thing that is happening on Alii Drive and Queen K HWY, and for the same reasons.

There are 2 developments already on Alii Dr. being built as of today, and more are scheduled for this road in the near future, and Alii Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow already.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening in Kona on the roads Kamehameha Schools wants to develop their resort, "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash on Alii Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direction traffic. and that adds even more traffic to this already seriously congestion road, and Kamehameha Schools wants to add a resort on this road, and that will increase the traffic even more.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=-FQ5snPDjig>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Please read this Path article, HAWAII' COUNTY'S VISION ZERO INITIATIVE

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawai'i Island.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path as well as The Law of the Splintered Paddle below <https://bathhawaii.org/hawaii-countys-vision-zero-initiative/>

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law, "Kōnōwai Mōmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless (especially kōpuna and keiki) across Hawai'i be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii. After being added back in 1978, the law is part of Hawaii's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

The Law of the Splintered Paddle is also on Kamehameha Schools website, so they should want to help make Big Island roads become safer and not add to the traffic and possible traffic death toll problem. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-199-200-years-after-k>

Besides a resort development in Keauhou Bay causing runoffs that will severely pollute the bay as the above research and science articles have shown above causing marine life to die, it will also increase in the bay's population that will seriously add to damaging even more coral, plankton and all marine life as well, and the island has severe traffic issues already with increased death tolls rising, and a resort development in Keauhou Bay will totally increase even more traffic in these already severely congested traffic areas.

The Big Island Doesn't Have the Resources and Infrastructure for Another Resort

Please see the articles below because the Big Island doesn't have the resources or infrastructure to safely add another resort development on island and these other NEWS and Research articles prove this point.

1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity.

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste Hawai'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the east side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

4) "What happens to Hawaii Island's trash and recyclables? BY MICHELLE BRODER VANDYKE HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder Vandyke Hawaii Island PUBLISHED 11:30 AM ET Dec. 17 The future of the landfill

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community support." <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables-->

5) "The overwhelming plastic waste Hawaii visitors leave behind By Natasha Bourlin Aug 24, 2023

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/plastic-waste-hawaii-visitors-leave-behind-18286076.php>

6) "A county commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill By Megan Moseley September 6, 2023 · 1:00 AM HST \* Updated September 6, 2023 · 2:02 PM

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only

working landfill." <https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

7) "Hawaii County issues mandatory 25% water restriction for North Kona August 7, 2023 . 5:21 PM HST

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokohau Deepwell over the weekend." <https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

8) "Hawaii Water Supply Closely Monitored As Severe Drought Continues by Big Island Video Newson Nov 6, 2023 at 3:28 pm STORY SUMMARY

HAWAII COUNTY - Officials say a special focus will be placed on the South Kohala Water System, which is more susceptible to drought conditions." <https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-CA%BBi-under-severe-drought/>

9) "Big Island Concerns About Water Quality Prompt A Lawsuit Over A Kona Sewage Plant Kealakehe sewage plant discharges more than 1 million gallons of wastewater into a lava pit near the ocean. By Paula Dobbyn / February 6, 2024

Settlement talks are scheduled in an environmental lawsuit involving a county-operated Big Island sewage plant in Kona." <https://www.civilbeat.org/2024/02/concerns-about-water-quality-prompt-a-lawsuit-over-a-kona-sewage-plant/>

10) "Researchers find sewage from an oceanfront Big Island community reaches nearshore waters Hawaii Public Radio | By Russell Subiono, Sophia McCullough Published December 20, 2021 at 5:56 PM HST

There are nearly 50,000 cesspools on the Big Island, with tens of thousands posing a risk to water resources, according to the Hawaii Department of Health." <https://www.hawaiipublicradio.org/the-conversation/2021-12-20/researchers-find-sewage-from-an-oceanfront-big-island-community-reaches-nearshore-waters>

11) "Kona coast faces stark wastewater tradeoffs Current situation

There are approximately 88,000 cesspools across the state, releasing more than 200,000 cubic meters of wastewater per day to the environment. <https://www.hawaii.edu/news/2021/09/10/kona-stark-wastewater-tradeoffs/>

We ask that you start figuring out how this can never happen again? These are the kind of issues that need to be resolved before you approve more development.

12) "BIG ISLAND NEWS HECO restores power after initiating emergency outages on Big Island by: Elizabeth 'Ufi Posted: Jan 30, 2024 / 09:43 AM HST Updated: Jan 30, 2024 / 04:15 PM HST

An unexpected loss of several large Hawaii Electric generators left some residents on Big Island without power for parts of the morning on Tuesday, Jan. 30." <https://www.khon2.com/big-island-news/heco-initiates-30-min-rolling-outages-after-loss-of-generators/>

13) Hawaii State News Update: Hawaiian Electric initiates rolling outages throughout Big Island February 13, 2024 . 5:23 PM HST  
\* Updated February 14, 2024 . 4:21 PM

The emergency outages are being initiated in various areas around the entire island to prevent loss of power to an even greater number of customers. The timing and extent of the outages will depend on the amount of demand on the system and the availability of generators." <https://bigislandnow.com/2024/02/13/hawaii-island-customers-asked-to-reduce-electricity-use/>

14) "LOCAL NEWS

HECO issues rolling power outages around Big Island by: Emily Cervantes Posted: Feb 13, 2024 / 05:11 PM HST Updated: Feb 13, 2024 / 09:12 PM HST Hawaiian Electric initiated rolling outages for Big Island after several large generators became unavailable and reduced output Tuesday night." <https://www.khon2.com/local-news/heco-releases-conservation-alert-for-big-island/>

15) "Here's how power outages can have repercussions for Hawaii's water supply Hawaii Public Radio | By Savannah Harriman-Pote Published February 13, 2024 at 10:59 AM HST

Water departments on O'ahu and Hawaii Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply?

It is impossible to separate Hawaii's power system from its water system, said Kawika Uyehara, deputy director of Hawaii County's Department of Water Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-conserve-water-amid-power-outages>

16) U.S. Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues  
By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "we're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) NewsHawaii'i County issues mandatory 25% water restriction for North Kona August 7, 2023 . 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

18) Hawaii'i Water Supply Closely Monitored As Severe Drought Continues by Big Island Video News on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii%CA%BBi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

20) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

21) "NewsHawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 . 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will damage Keauhou Bay coral and marine life and, Big Island resources and infrastructure are currently being negatively affected from the development that is on island already, and there are years of new development that have already been approved, before having safe resources and infrastructures for new developments.

With these scientifically proven articles by some of the most professional scientists in the world, they say the a serious population increase, as well as development and resort runoff that happens because of parking lots, and... with all coastal developments, it will be dangerous for Keauhou Bay to be development because it will damage the marine ecosystems in the area.

Please, save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools because all of these articles prove it would be extremely damaging to the waters at Keauhou Bay.

Thank you,

Sincerely,

Robert & Kimberly Gay

## Amy Gillum

If Kamehameha Schools' goal is to "inspire" I can think of no worse way to do that than by taking a beautiful, quiet, historic bay and turn it into a resort area. I think the only thing to be gained by this misguided effort to develop the bay is to line the pockets of the very entity that is supposed to be stewards of the aina. It is so obvious that the plan would add traffic, congestion, people, pollution and trash in addition to taxing overburdened water treatment facilities. How can you truly call yourselves stewards? All of us that love and treasure Keauhou Bay see right through your ruse. The real reason for development? Profit.

Please do not move forward with this plan!

Amy Gillum

Kailua-Kona resident and user of Keauhou Bay

## Mesepa Gomes

This is not right I'm for restoring the land, and the history, and the culture and the heritage, it is not right that you guys say it's for the people and for the land when all I can see is a big outline that says resort, we do not need another resort we do not want another resort, you guys need to do better on the behalf of the Hawaiian people. They should be Hawaiian homes so Hawaiian don't have to keep moving away. I don't see how another resort is going to help the lamb or the ocean. All I see is money and greed in this project, but it doesn't matter what the people have to say you guys will do what you guys wanna do no matter what the Hawaiian people have to say and keep using Your power for money there is so much other things you guys can do with this land but yeah here's another resort. That's all I have to say. Do better Kamehameha schools

## Deborah Green

To whom it may concern, As a condo owner on Kamehameha III Road... I object to further development of Keaouhou Bay... for all the scientific reasons listed below and for the increased traffic (read pollution and quality of life) on Kam III, the further depletion of our limited water supply, and the poor infrastructure of our electrical grid... and the concern that there is not plan for a route should we have another tsunami. I fully support all the scientific reasons this is a terrible plan... and I can help being very anger about the potential destruction of an area that has been very Kama'aina friendly... watching the keiki run on the beaches, jump into the ocean and enjoy themselves... family picnics, canoeing... etc. This really takes a beautiful, wonderful and much enjoyed location away from those who love and treasure it... just for the sake of adding another tourist resort... NO! It's wrong.. greedy and destructive.. Please read the scientific proof in this letter and REJECT Kamehameha Schools EIS for Keaouhou Bay to become a Bungalow Resort. Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keaouhou Bay as stated in all the different researched articles below. Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Shoals to develop their bungalow resort project, because it is scientifically proven that developments pollute nearby waters constantly during development and after. Please read these Scientific articles written by NOAA, National Oceanic and Atmospheric Administration and many other professional organizations, that have studied and proved that developments has ALWAYS polluted the water in every near coastal developed area. First, does this EIS have any kind of reports and studs on how the endangered species and marine life will handle the extra pollution due to development and golf course runoff because Keaouhou Bay is their habitat and this development WILL be CHANGING an Entire Ecosystem. In the Endangered Species Act of 1973 Under Section 2 (b), "to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay. The Green Sea Turtle swims in Keaouhou Bay weekly and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list. The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/> "Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA) , as well as locally by Hawai'i Revised Statutes (HRS) Chapter 195D and Hawai'i Administrative Rules (HAR) 13-124." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/ENDANGERED SPECIES CONSERVATION Endangered Species Act> "Section 2. Findings, Purposes, and Policy (4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to— (b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section." This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-act> Keaouhou Bay IS the monk seals and the green sea turtle's habitat and to allow a bungalow resort to be developed in Keaouhou Bay, that is these endangered species habitat, is to threaten these

endangered species habit with golf course runoff pollution, as well as development pollution and hence, threaten their habitat, hence their lives, and goes completely against the Endangered Species Act of 1973. The words in the Endangered Species Act states, "to conserve" and conserving the endangered species that enter into Keaouhou Bay would be to NOT DEVELOP A BUNGALOW RESORT because this would cause serious pollution runoff that would pollute the bay and endanger these already endangered species, the green sea turtle and the monk seal. Sincerely and praying for some kuliama.... Deborah Green

To whom it may concern,

As a condo owner on Kamehameha III Road... I object to further development of Keaouhou Bay...for all the scientific reasons listed below and for the increased traffic (read pollution and quality of life) on Kam III, the further depletion of our limited water supply, and the poor infrastructure of our electrical grid... and the concern that there is not plan for a route should we have another tsunami.

I fully support all the scientific reasons this is a terrible plan... and I can help being very anger about the potential destruction of an area that has been very Kama'aina friendly... watching the keiki run on the beaches, jump into the ocean and enjoy themselves... family picnics, canoeing... etc. This really takes a beautiful, wonderful and much enjoyed location away from those who love and treasure it...just for the sake of adding another tourist resort...NO! It's wrong.. greedy and destructive..

Please read the scientific proof in this letter and REJECT Kamehameha Schools EIS for Keaouhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keaouhou Bay as stated in all the different researched articles below.

Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Shools to develop their bungalow resort project, because it is scientifically proven that developments pollute nearby waters constantly during development and after.

Please read these Scientific articles written by NOAA, National Oceanic and Atmospheric Administration and many other professional organizations, that have studied and proved that developments has ALWAYS polluted the water in every near coastal developed area.

First, does this EIS have any kind of reports and studs on how the endangered species and marine life will handle the extra pollution due to development and golf course runoff because Keaouhou Bay is their habitat and this development WILL be CHANGING an Entire Ecosystem.

In the Endangered Species Act of 1973 Under Section 2 (b), "to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.

The Green Sea Turtle swims in Keaouhou Bay weekly and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawai'i Revised Statutes (HRS) Chapter 195D and Hawai'i Administrative Rules (HAR) 13-124." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

#### ENDANGERED SPECIES CONSERVATION

Endangered Species Act

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section." This was taken from <https://www.fisheries.noaa.gov/national/conservation/endangered-species-conservation/endangered-species-act>

Keaouhou Bay IS the monk seals and the green sea turtle's habitat and to allow a bungalow resort to be developed in Keaouhou Bay, that is these endangered species habitat, is to threaten these endangered species habit with golf course runoff pollution, as well as development pollution and hence, threaten their habitat, hence their lives, and goes completely against the Endangered Species Act of 1973.

The words in the Endangered Species Act states, "to conserve" and conserving the endangered species that enter into Keaouhou Bay would be to NOT DEVELOP A BUNGALOW RESORT because this would cause serious pollution runoff that would pollute the bay and endanger these already endangered species, the green sea turtle and the monk seal.

Sincerely and praying for some kuliana....

Deborah Green

**Bryce Groark**

Aloha Kamehameha Schools.

I am a Keauhou resident.

Please see attached letter for my comments on the Keauhou Bay Management Plan (KBMP).

August 1, 2024

Jeannette Gurung

Dear Kamehameha Schools.

I am a Keaouhou Bay resident for 20 years, writing to express my deep concerns regarding the Kamehameha Schools (KS) Keaouhou Bay Management Plan (KBMP), specifically as it relates to the proposed priorities and their potential impacts on our local community and environment.

I believe that the current direction of the KBMP raises several significant issues that need to be addressed to better align with the community's needs and values.

- 1. History of Failed Stewardship:** KS has demonstrated a troubling lack of stewardship with the land already under its care in Keaouhou, evident from ongoing issues such as broken toilets, persistent water wastage, use of chemical poisons near the coastline for weeds, and totally inadequate management of homelessness and drug-related problems. Given this poor track record of stewardship, we have skepticism about KS's ability and care to effectively manage new developments while never addressing basic existing challenges.
- 2. Environmental Concerns:** The proposed development poses several environmental risks. Increased construction/roads and land use will lead to significant ecological disruption in the Keaouhou Bay area, which is already challenged. Ocean water quality is bad in and around the Keaouhou and He'eia Bay area due to poor land management practices. Increased issues with your development such as habitat destruction, increased runoff, and pollution will add even more detrimental effects on local wildlife and marine ecosystems.
- 3. Excessive Concrete and Pollution:** The expansion of concrete parking lots and other infrastructural elements will 100% lead to increased pollution and harm the environment. Building a retail center in Keaouhou Bay with all those parking spots is totally irresponsible - destroying nature for everyone so that KS can attempt to make a profit.
- 4. Infrastructure Strain:** Adding high-end vacation rentals and commercial spaces could strain local infrastructure, primarily the archaic sewage and waste management systems that are currently in place and perpetually challenged.
- 5. Previous Failures in Retail and Dining:** There is a historical precedent of failed retail and dining ventures in Keaouhou which suggests that similar developments most likely will not achieve the anticipated success.
- 6. Local Housing Needs:** The focus on high-end vacation rentals and other revenue-generating developments is exactly what the Keaouhou community does not need.

On behalf of my family of 5 who love, respect, play, and work to steward Keaouhou and He'eia Bays, I urge you to reconsider the current plan. We don't know one resident who thinks this is a good idea. We are all so scared as to how much this will ruin our community.

Aloha.

Bruce Groark

To whom it may concern,

Please read the scientific proof in this letter and **REJECT Kamehameha Schools EIS for Keaouhou Bay to become a Bungalow Resort.**

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keaouhou Bay as stated in all the different researched articles below.

Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project, because it is scientifically proven that developments pollute nearby waters constantly during development and after.

Please read these Scientific articles written by NOAA, National Oceanic and Atmospheric Administration and many other professional organizations, that have studied and proved that developments has ALWAYS polluted the water in every near coastal developed area.

**First, does this EIS have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development and golf course runoff because Keaouhou Bay is their habitat and this development WILL be CHANGING an Entire Ecosystem.**

**In the Endangered Species Act of 1973 Under Section 2 (b), "to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.**

The Green Sea Turtle swims in Keaouhou Bay weekly and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawaii are protected by the [Endangered Species Act \(ESA\)](#) and additionally protected by [Hawaii Revised Statutes Chapter 195D \(HRS\)](#) and [Hawaii Administrative Rules \(HAR\) 13-124](#)." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

"Hawaiian monk seals are protected federally by the ESA and the [Marine Mammal Protection Act \(MMPA\)](#), as well as locally by Hawaii Revised Statutes (HRS) Chapter 195D and Hawaii Administrative Rules (HAR) [13-124](#)." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

## [ENDANGERED SPECIES CONSERVATION](#)

Endangered Species Act

### "Section 2. Findings, Purposes, and Policy

**(4) the United States has pledged itself as a sovereign state in the international community to conserve** to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—**The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved**, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section." This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-ac>

Keaouhou Bay IS the monk seals and the green sea turtle's habitat and to allow a bungalow resort to be developed in Keaouhou Bay, that is these endangered species habitat, is to threaten these endangered species habit with golf course runoff pollution, as well as development pollution and hence, threaten their habitat, hence their lives, and goes completely against the Endangered Species Act of 1973.

The words in the Endangered Species Act states, "to conserve" and conserving the endangered species that enter into Keaouhou Bay would be to NOT DEVELOP A BUNGALOW RESORT because this would cause serious pollution runoff that would pollute the bay and endanger these already endangered species, the green sea turtle and the monk seal.

**Does this EIS have any reports on the endangered species that frequent Keaouhou Bay because this is their habitat.**

**Under the Conservation Program there should be research done on endangered species and their associated ecosystems, which is Keaouhou Bay. Because this bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.**

**"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry**

**out programs for the conservation, management, and protection of such species and their associated ecosystems."** [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

**Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species."** [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please see that developing Kamehameha Schools Bungalow Resort in Keauhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would happen a lot more often due to taking out the natural pollution filter, that is the trees and the land that is there now.

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keauhou Bay more severely because of the bungalow resort development's pavement. As of right now the trees and land that this development wants to clear and develop into a bungalow resort is a Natural Pollution Filter.

Please read from **Wikipedia**, "**Most drains have a grating into a canal, river, lake, reservoir, sea or ocean. Other than catchbasins, typically there are no treatment facilities in the piping system.**" [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20drains%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20drains%20wells)

It's the pavement that this development wants to put in that will cause a lot of pollution to runoff into Keauhou Bay because this top land that is directly below the golf course (that they want to clear) soaks in the golf course pesticides, fertilizer, weed killer... and is the BEST AND ONLY PROTECTION POLLUTION FILTER Keauhou Bay has from the golf course pollution.

Please see this site at <https://health.hawaii.gov/lepo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> because on page 2 it **states from the Hawaii government that Natural Ground Cover has 10% runoff, where has development has 55% runoff.**

**These trees and land** are saving monk seals and green sea turtles habitat from the golf course pollution and this land **MUST BE PRESERVED and CONSERVED** as the natural protector for Keauhou Bay hence, **for these endangered species habitat.**

**Under Section 2 (b) of the Endangered Species Act** - Keauhou Bay MUST BECOME a CONSERVATION AREA for these endangered species because it is their habitat as of today, and to allow a resort development to be built above this bay would threaten the very lives of these endangered species because it will allow golf course toxic pollution and development pollution to run into these species natural habitat, which is Keauhou Bay.

Keauhou Bay has trees and land just under the golf course (that Kamehameha Schools wants to clear for their bungalow resort) that protects Keauhou Bay from a lot of algae blooms because it soaks up pollution that is runoff from fertilizer, weed killer... in the golf course, and unfortunately when there is a severely heavy rain storm the land up on top of the bay has a greater runoff than normal from the golf course pollution, and pollution foam and algae blooms happen because of it.

If you clear this land, this kind of algae bloom will happen a lot more often and end up killing a lot of coral and marine life as stated in the many articles that will follow.

One of these articles is in the Global Coral Reef Alliance. They researched the reef before and after a golf course development, and even though this development is not a golf course development, it is still a development and it will also be located just under a golf course and this will allow the pollution from the golf course to come down to the bay a lot more often because the natural land that soaks up this pollution will be gone.

**Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?**

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development..The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution..

" <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-quana-cay-abaco-bahamas/>

if you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING KEAUHOU BAY'S ECOSYSTEM because the golf course runoff won't have the best protection which is the natural trees and land that can soak up the polluted water most of the year and polluted foam algae blooms will happen a lot more often.

Here is another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef

...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases.." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

**Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?**

This needs to be fully known because you will be changing an entire ecosystem to build a bungalow resort. Because it rains in Keauhou Bay many nights out of the year and the land they want to clear absorbs the golf course toxins so this bay is not as severely polluted as it will be with pavement and development, and when serious storms come Keauhou Bay won't stand a chance because the land can't keep ALL golf course pollutants out during this time and pavement won't even come close.

"if there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

**Federally Protected Green Sea Turtle Swim in Keauhou Bay Often**

The green sea turtle that is federally protected and can be seen in Keauhou Bay weekly. Please see the following article that states "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES

**Why does Hawaii have a runoff problem?**

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

if polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

if you allow this development it WILL POLLUTE Keauhou Bay as the above article (that was written in 2014 because runoff water from developments were polluting the ocean even then) states, and this bay holds many sea creatures such as the protected green sea turtle, spotted eagle rays, manna rays, octopus, dolphins, fish, coral, monk seals that have rested on the dock before and...that will ALL be harmed by the more severe pollution runoff that WILL happen because developments can't help but pollute the water nearby.

Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL, and if a resort is allowed to be built, that will bring a lot more people down to Keauhou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE.

**Has the EIS done any research on what a high population would do in such a small area, and what will happen to the endangered species that live there because it's their habitat and a high population will change this bay forever?**

This information is by NOAA Scientist. "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media.

There's a seal on the beach! Let's go get a 'sealifie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species. In a [recent study](#), NOAA scientists used social media to monitor human activities around endangered [Hawaiian monk seals](#). They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

#### **Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?**

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, in Hilo, Puna, and there are Ocean View and Volcano housing construction projects as well. The entire Big Island has construction projects all over.

#### **Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?**

Because, "Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises.

Worldwide, hotels produce almost [300,000 tonnes of waste](#) each year." <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means these resources and infrastructures will be taxed even more in the near future.

Please read the below articles that prove that Big Island doesn't have the resources or infrastructure for a Bungalow Resort Development because it will increase the need for resources and infrastructure that the island doesn't have as of today.

#### **Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill**

September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years. (File photo)

Of the 900 total votes in our most recent poll, which asked people to weigh in on the best way to extend the life of the Big Island's [only remaining landfill](#), all of the above was the most popular answer, garnering 274 votes, or 30%.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

#### **A county commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill**

By [Megan Moseley](#) September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look

deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

### Time's Up For Landfills

'Gentle' demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

<https://buildingindustryhawaii.com/2024/04/times-up-for-landfills/>

### Drought Conditions On Hawai'i Island Prompt Water Supply Message

by Big Island Video News

on Oct 5, 2023 at 3:59 pm

**(BIVN)** – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information **from the U.S. Drought Monitor**. There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawaii%CA%BB-i-island-prompt-water-supply-message/>

### U.S.

**Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues**

By [Li Cohen](#)

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to [significant droughts](#), and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the [world's largest surfing wave pool](#) opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. " ... We are on the verge of a greater catastrophe."

"We are in a [water crisis](#), that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawaii, told CBS News, saying that if the reasons for this crisis aren't soon addressed, **"We may come to a point where we have to decide ... who gets water and who doesn't."**

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island parts need to be shipped and the power plant has generators that are not working and because of this, and other reasons, the Big Island needs to seriously conserve power so that everyone will have power, and if this problem of shipping parts can happen once it can happen again.

#### UTILITIES

UPDATE: HECO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HECO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity use is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount

of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power->

#### Big power supply problems continue to plague Hawaii island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

#### Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

### **What You Need To Know**

**-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity**

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

**Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?**

**Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? Because they will have employees with cars, guests with cars, visitors with cars and this would range at times at least over 200 cars or more, parking above Keauhou Bay causing serious car population because of all these added cars right next to the bay.**

Article below is from NOAA.

**What is the biggest source of pollution in the ocean?**

**Most ocean pollution begins on land.**

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or **construction sites can run off** into waterways, harming fish and wildlife

habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant.>

Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report  
Oil in the Sea: Inputs, Fates, and Effects

### **News Release September 28, 2022**

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a [new report](#) from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean

environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20D%2D%20Nearly%2085%20percent,pipeline%20spills%2C%20says%20a%20new>

The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershepherds.org.au/blog/the-impact-of-stormwater-car-emissions/>

**Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keauhou Bay during development?**

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behaviour of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

## OCEANS POLLUTION

How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

### **What is ocean noise?**

"Ocean noise refers to sounds made by human activities that can **interfere with or obscure** the ability of marine animals to **hear natural sounds in the ocean**."

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

**The Chesapeake Bay has a foundation that is trying to save it due to runoff pollution that was caused by developments, and the Chesapeake Bay is a lot bigger than Keauhou Bay.** If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed because this bay is very small.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...**runoff is a significant source of harmful nitrogen pollution that continues to grow...**

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

**Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.**

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20open%20areas.>

**If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay because it is so much smaller than the Chesapeake Bay.**

**Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?**

**Because the studies below show developments kill coral, marine life and zooplankton are kill and negatively affected as well, and zooplankton is the manta ray food. Manta rays are in this bay every night to eat zooplankton and sometimes they are in this bay during the day time too.**

If you allow this bay to be development you will be allowing all types of marine life to die and there is NO WAY to stop this from happening because polluted runoff rain water from developments can't be fully stopped. It is what has happened in ALL coastal developments.

Please read the Scientific proof below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA. "Coral Bleaching is occurring more frequently in Hawaii". Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic Impacts state-wide...

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban runoff). "<https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more, had%20catalytic%20impacts%20state%20wide.>

This article is by the Coral Reef Alliance here in Hawaii. "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." "<https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawaii%20reefs%20are%20major%20global,into%20Hawaii%20waterways%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." "[https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is "We're driving change in research integrity and publication ethics." This is some of their article information. "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. **Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban runoff, may be exacerbated under high thermal stress.** In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." "<https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all Aquatic Life there, and even the Manta Rays that go there to eat zooplankton from the Manta Ray tours at night, and they eat it during the day in that area as well because they need to eat 5 times their body weight in zooplankton daily. Please see the cited information below.

**"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.**

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates "<https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

**Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development,...can impede coral growth and reproduction, disrupt overall**

**ecological function, and cause disease and mortality in sensitive species."**

<https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,service%20that%20coral%20reefs%20provide.>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organism%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organism%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

It's Been Proven Resort Developments KILL Marine Life

The manta rays go to Keauhou Bay every night to eat zooplankton and if you allow this development that WILL have runoff water, you WILL be causing zooplankton to be seriously affected because as this article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle

environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem...

Here is another article that proves runoff from development in this area will hurt and kill plankton, by **Frontiers in Marine Science**, "**Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon**. The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl- $\alpha$  concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

"Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "**Toxic Effects of Pollutants on Plankton**. There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants,

**transfer them to sediments and other organisms, and function in their biological transformation."** [https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this could cause the manta ray food source to disappear and that will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on the manta ray tour for their income.

**Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?**

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, **there likely be more than 6,300 people descending on Kona.**" <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life." <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

**Where are the EIS reports on human density because this resort will increase this area in population by hundreds. Below are reports that human population destroy coral reefs.**

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the **destruction of sensitive marine habitats** such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of **sediments** into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracts <https://oceantracts.org/librari/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will force bringing a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coa>

stal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%20a%20new%20study%20said>.

If you allow this resort to be developed, you will be destroying the coral reefs in the bay because this bay is extremely small and used by a lot of locals already for fishing, canoeing, swimming, snorkeling, paddle boarding, surfing, boating...it can't afford more use by many thousands more people yearly.

If you allow Keauhou Bay to be developed there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that, "Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with metapopulation theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation>.

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii. Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhaJhJqAnWAq453tRgN0jAWe9jnR3ZoTv0P](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhaJhJqAnWAq453tRgN0jAWe9jnR3ZoTv0P)

[VGzA5Ic\\_H001zcHNIP3ASnhcgKRv6\\_vKLPw49dbmBYoX5q3YIMgQIGBZsabdCUH7OISLbu9x5P3xED4KxI4T0sJlvgQ1a7ZZRT3rUbraxpodJ2AoNISmWWSuxB7JIEDpJ8OGJpx71T3WdCfXFKJIZYeNdcJ3sw\\_dnaUg5IZlhcjPBDlmmaH15yqT5Q%3D&tracking\\_referrer=abcnews.go.com](https://www.abcnews.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%20a%20new%20study%20said)

**A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads. Where are the traffic study reports for this EIS because with 150 rooms comes over 150 cars because you must include employee cars, as well as visitors for the people staying in the resort, and what if the guests have more than one car?**

The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island can not handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawaii News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Please watch their video on their link below because it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists comes more accidents more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state. This time last year Hawaii island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks...

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he

added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example, "On the Big Island, the mayor had to issue [an emergency order](#) shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

Please, watch the NEWS video below on aerial footage in Hilo because the footage shown is the same thing that is happening on Alii Drive and Queen K HWY, and for the same reasons, all of these roads only have 2 lanes.

There are 2 developments already on Alii Dr. being built as of today, and more are scheduled for this road in the near future, and Alii Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems, traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening in Kona on the roads Kamehameha Schools wants to develop their resort, "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash on Alii Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direct traffic. and that

adds even more traffic to this already seriously congestion road, and Kamehameha Schools wants to add a resort on this road that will increase the traffic by 100's of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=-FQ5snPDji8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Please read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawai'i Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path as well as The Law of the Splintered Paddle below <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

**The Law of the Splintered Paddle**

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law, "K?n?wai M?malahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless (especially k?puna and keiki) across Hawai'i be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai'i. After being added back in 1978, the law is part of Hawai'i's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

#### **The Law of the Splintered Paddle is also on Kamehameha Schools**

**website**, so they should want to help make Big Island roads become safer and not add to the traffic and possible traffic death toll problem. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

**Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious Resource and Infrastructure issues. Please read the articles below.**

#### **The Big Island Doesn't Have the Resources and Infrastructure for Another Resort**

Please see the articles below because the Big Island doesn't have the resources or infrastructure to safely add another resort development on island and these other NEWS and Research articles prove this point.

- 1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

- 2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity.

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25

years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

- 3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste Hawai'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the east side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

4) "What happens to Hawaii Island's trash and recyclables? BY MICHELLE BRODER VANDYKE HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder Vandyke Hawaii Island PUBLISHED 11:30 AM ET Dec. 17 The future of the landfill

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community support." <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables-->

5) "The overwhelming plastic waste Hawaii visitors leave behind By Natasha Bourlin Aug 24, 2023

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/plastic-waste-hawaii-visitors-leave-behind-18286076.php>

6) "A county commission drafts ordinance aiming to ban recyclables at West Hawaii landfill By Megan Moseley September 6, 2023 · 1:00 AM HST \* Updated September 6, 2023 · 2:02 PM

Hawaii's County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill." <https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

21) "NewsHawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will damage Keauhou Bay coral and marine life and, Big Island resources and infrastructure are currently being negatively affected from the development that is on island already, and there are years of new development that have already been approved, before having safe resources and infrastructures for new developments.

With these scientifically proven articles by some of the most professional scientists in the world, they say the a serious population increase, as well as development and resort runoff that happens because of parking lots, and... with all coastal developments, it will be dangerous for Keauhou Bay to be development because it will damage the marine ecosystems in the area.

**Please, save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools because all of these articles prove it would be extremely damaging to the waters at Keauhou Bay.**

Thank you,

---

**To:** 221053-01 KS Keauhou Entitlements  
**Subject:** Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT

**Categories:** Yellow Category

To Whom It May Concern,

Please read the scientific proof in this letter and **REJECT** Kamehameha Schools Environment Impact Statement (EIS) for Keauhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a **SERIOUS NEGATIVE IMPACT** on Keauhou Bay as stated in all the different researched articles below.

Please, **DO NOT** risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is scientifically proven that developments pollute nearby waters both during and after development.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have **ALWAYS** polluted the water in **EVERY** coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keauhou Bay is their habitat and this development **WILL** be **CHANGING** an Entire Ecosystem.

**ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT**

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keauhou Bay.

The Green Sea Turtle swims in Keauhou Bay weekly and the monk seal has also been seen swimming and resting in Keauhou Bay. Both of these marine animals are on the endangered species list.

Endangered Species Act

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/conservation/endangered-species-conservation/endangered-species-ac>

#### FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED

The green sea turtle is federally protected and can be seen in Keauhou Bay weekly.

The following article that states: "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservi.ce.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Allowing this development WILL POLLUTE Keauhou Bay. The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!) states this fact clearly. Keauhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen because developments have been shown to ALWAYS pollute the water that is nearby.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

#### THE ENDANGERED MONK SEAL WILL BE AFFECTED

Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keauhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keauhou Bay will likely be changed forever.

This information is from a NOAA Scientist: "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie'!" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawai'i Revised Statutes (HRS) Chapter 195D and Hawai'i Administrative Rules (HAR) 13-124." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

Keauhou Bay is the monk seals and the green sea turtle's habitat. Allowing a bungalow resort to be developed in Keauhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to protect the land around Keauhou Bay from developments that destroy the habitat of these endangered species with pollution and runoff.

Does this EIS have any reports on the endangered species that frequent Keauhou Bay? This is their habitat and it needs to be "conserved".

Under the Conservation Program there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hrs/current/Vol0103\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol0103_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm).

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hrs/current/Vol0103\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol0103_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keauhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keauhou Bay and the surrounding area during the building phase of this enormous project.

#### GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keauhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable!

Please read from Wikipedia, "[https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells)"

Most drains have a single large exit at their point of discharge (often covered by a [grating](#)) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping system.

The pavement from this development will cause pollution to runoff into Keauhou Bay because this treed land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keauhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEE-7.15.14.pdf> where the Hawaii government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keauhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.

These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keauhou Bay and for these endangered species habitat.

Under Section 2 (b) of the Endangered Species Act - Keauhou Bay MUST BECOME A CONSERVATION AREA for these endangered species. It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keauhou Bay.

#### ALGAE BLOOMS KILL CORAL AND MARINE LIFE

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer.

When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course developments. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution..

" <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAUHOU BAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef."

"... After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

FURTHERMORE: "If there are [toxic algal blooms](#), like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

#### ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN

Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keauhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

The article below is from NOAA regarding motor vehicle engines and pollution to the sea.

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant.>

Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects

News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a [new report](#) from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2022/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%20Nearly%2085%20percent,pipeline%20spills%2C%20sa ys%20a%20new>

#### The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwaterishighered.org.au/blog/the-impact-of-stormwater-car-emissions/>

#### NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE

Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keauhou Bay during development?

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation

Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

#### How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

What is ocean noise?

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

#### LEARN FROM OTHERS: RUN-OFF FROM DEVELOPMENT KILLS

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments. Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed. Keauhou Bay is a much smaller ecosystem.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow...

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak

into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay due to its size and fragility.

#### MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN

Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays. Manta rays are in Keauhou Bay every night to eat zooplankton, and are often seen here during the day as well.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is NO WAY to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments.

Please read the Scientific articles below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide...

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-off). " <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event->

[hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,had%20catastrophic%20impacts%20state%20wide.](#)

This article is by the Coral Reef Alliance here in Hawaii". "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/wherewe-work/hawaiian-islands/#:~:text=Hawai%CA%BB%20reefs%20face%20major%20global,Intro%20Hawai%CA%BB%20waterways%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, falling sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban runoff, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?doi=10.1371/journal.pone.0269068>

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral->

[pollution.html#:~:text=impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species.](#)

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0>

[0#:~:text=Coastal%20development%20and%20runoff%20lead,service%20that%20coral%20reefs%20provide.](#)

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

It's Been Proven Resort Developments KILL Marine Life

This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

The ecosystem is fragile and interconnected as is stated in this article: "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keaouhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

#### HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH

Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life." <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keaouhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keaouhou Bay, it will bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denner%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs,

which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in *Nature Sustainability*. " [https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-](https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-20190828/)

[scientists/story?id=96308858&:text=The%20less%20people%20at%20a%20area%2C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who%20visit%20a%20new%20stud](https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-20190828/)

[y%20said.](https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-20190828/)

By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct [https://www.science-direct.com/science/article/abs/pii/S0065288120300328#:~:text=Aquacultur](https://www.science-direct.com/science/article/abs/pii/S0065288120300328#:~:text=Aquacultur%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.)

[e%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.](https://www.science-direct.com/science/article/abs/pii/S0065288120300328#:~:text=Aquacultur%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.)

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgONhahjIAWAg453RgN0IAIWei9nR3oTlV0PvGzA5lc\\_H0O1zcHNIP3ASnhcgKRY6\\_vkLPw49dbmBYoX5g3Y1MgQIGBZsapidGUH7O1SLbu9x5Pr3xED4Kx4T0slyvQIa7ZRR3Ubraxpod42AoNISM5uxB7JfEDdplj8OGJpx71TWdCfXFKIZYeNdcJ3Sw\\_dnaUg5ZlhcjPBDImmaH115yqT5Q%3D&tracking\\_referrer=abcnews-go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgONhahjIAWAg453RgN0IAIWei9nR3oTlV0PvGzA5lc_H0O1zcHNIP3ASnhcgKRY6_vkLPw49dbmBYoX5g3Y1MgQIGBZsapidGUH7O1SLbu9x5Pr3xED4Kx4T0slyvQIa7ZRR3Ubraxpod42AoNISM5uxB7JfEDdplj8OGJpx71TWdCfXFKIZYeNdcJ3Sw_dnaUg5ZlhcjPBDImmaH115yqT5Q%3D&tracking_referrer=abcnews-go.com)

#### INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS

Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. Worldwide, hotels produce almost 300,000 tonnes of waste each year." <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Kealahou Bay. On Hawaii's Island, we are already struggling to meet the increasing need for resources and infrastructure.

Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawaii's landfill

September 17, 2023

The West Hawaii's Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawaii's landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill>

A County commission drafts ordinance aiming to ban recyclables at West Hawaii's landfill

By [Megan Moseley](#), September 6, 2023

Hawaii's County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawaii's County Director of Environmental Management, told commissioners the West Hawaii's Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

Time's Up For Landfills

'Gentle' demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

<https://buildingindustryhawaii.com/2024/04/times-up-for-landfills/>

Drought Conditions On Hawai'i Island Prompt Water Supply Message

by Big Island Video News  
on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information from the U.S. Drought Monitor. There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Kā ū.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawaii%CA%BBi-island-prompt-water-supply-message/>

[U.S.](#)

Hawaii is "on the verge of a greater catastrophe", locals say, as water crisis continues

By [Li Cohen](#)

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to [significant droughts](#), and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the [world's largest surfing wave pool](#) opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. " ... We are on the verge of a greater catastrophe."

"We are in a [water crisis](#), that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

UPDATE: HELCO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity use is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power->

Big power supply problems continue to plague Hawaii Island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES

A Resort Development Will Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawaii'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: All of these roads only have two lanes!

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=EQSsnPDjI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii's Island...

Here are some other statistics that are even more staggering:

- 28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees
- 13% of pedestrians hit at 20 mph actually suffer fatality
- 73% of pedestrians hit at 40 mph suffer fatality
- 25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!
- 56% of fatal crashes were the result of alcohol or drugs
- 41% of fatal crashes occurred in light trucks and vans
- 49% of crashes occur during the day, outside of peak traffic hours
- Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

18) Hawaii Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News  
on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawaii, the Hawaii County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-ca%BB%BI-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

19) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/Bigisland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/Bigisland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large/?rdt=52660)

20) "Hawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

#### HISTORICAL AND CULTURAL SIGNIFICANCE:

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai'i. After being added back in 1978, the law is part of Hawai'i's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

The Law of the Splintered Paddle is also on Kamehameha Schools website. The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.

#### IN CONCLUSION

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Eco-system in Keauhou Bay and "The Endangered Species Act of 1973 (ESA or "The Act"; 16 U.S.C. § 1531 [et seq.](#)) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from [extinction](#) as a "consequence of economic growth and development untempered by adequate concern and conservation", the ESA was signed into law by President [Richard Nixon](#) on December 28, 1973. The [Supreme Court of the United States](#) described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation". [1] [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land MUST be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawai'i Island is already having serious infrastructure and resource issues that have yet to be solved. These issues MUST be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly protects the marine life and environment from further damage. The location is NOT suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

Mahalo,

Ivy Jenna Hancock

I am no expert, but I can see that the Kona Coast is already overpopulated, and we are befouling our nest. Kahalu'u Bay is already being polluted by leakage from nearby cesspools since the sewer line only extends as far as the EPA mandate; I have not heard that the Keaouhu development project involves an extension of that sewer. In any case, runoff from the acres of pavement in the new development will pollute Keaouhu Bay. What is more, fresh water supplies are not guaranteed in this dry region, so one wonders how existing wells will handle an increase in demand. Regarding traffic (and evacuation safety), Ali'i Drive is already completely impassable at several times during the day. How can the area support another such influx of population? And how does this plan for luxury dwellings correspond to the need for affordable housing in the area?

I'm really perplexed as to why KSBE needs to generate additional revenues now from the development of that prime piece of real estate above Keaouhu Bay. A 1995 *Wall Street Journal* article describes the Bishop Estate as "the nation's wealthiest charity," with an endowment estimated at \$10 billion. This is apparently greater than the combined endowments of Harvard and Yale universities. How can KSBE possibly need the revenue from this destructive and short-sighted development to fund its cultural projects?

Kamehameha Schools is rightly famous for its faithful stewardship of the historical sites at Kahalu'u Manowai and elsewhere. Their proposal to develop the open lands above Keaouhu Bay seems contradictory to the philosophy represented by that stewardship. Please read the scientific proof in this letter and REJECT Kamehameha Schools Environment Impact Statement (EIS) for Keaouhu Bay to become a Bungalow Resort. Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT on Keaouhu Bay as stated in all the different researched articles below. Please, DO NOT risk polluting the water in Keaouhu Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is **scientifically proven** that developments pollute nearby waters both **during and after development**.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have **ALWAYS** polluted the water in **EVERY** coastal development area. Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keaouhu Bay is their habitat and this development **WILL be CHANGING an Entire Ecosystem**.

**ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT**

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhu Bay.

The Green Sea Turtle swims in Keaouhu Bay weekly and the monk seal has also been seen swimming and resting in Keaouhu Bay. Both of these marine animals are on the endangered species list.

**Endangered Species Act**

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—  
(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-act>

**Species-act**

**FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED**

The green sea turtle is federally protected and can be seen in Keaouhu Bay weekly.

The following article that states: **"POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"**

**Why does Hawaii have a runoff problem?**

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less

Aloha e Michael,

Thank you for your comments concerning the Keaouhu Bay Management Plan, Draft Environmental Impact Statement. Your comments have been received and administratively recorded.

Comments received during the 45-day public comment period will be reproduced in the Final Environmental Impact Statement, and substantive comments addressed.

Since you also provided a copy to the County of Hawai'i and our planning consultant, G70, we will not be forwarding them a duplicate copy.

We appreciate your involvement and contribution to the environmental review process. Your input is invaluable in helping us develop a management plan that reflects the needs and concerns of our community.

Thank you once again for your engagement and commitment to the future of Keaouhu Bay.

Mahalo,

The Keaouhu Bay Project Team

**Subject:** [EXTERNAL] Kamehameha Schools EIS Draft For Keaouhu Bay WILL HAVE NEGATIVE IMPACT

**CAUTION: This email is from an outside sender. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

Aloha to you all:

I write today to voice my opposition to the proposed development of land above Keaouhu Bay by the Kamehameha Schools to develop the land on the bluff above Keaouhu Bay and build 150 Resort-style bungalows. A groundswell of opposition has arisen to this move. Like many Kona residents, my wife and I are alarmed by what we've read

dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles. "Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/> **Allowing this development WILL POLLUTE Keauhou Bay.** The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!) states this fact clearly. Keauhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen because developments have been shown to ALWAYS pollute the water is that is nearby.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawaii are protected by the Endangered Species Act (ESA) and additionally protected by [Hawaii Revised Statutes Chapter 195D \(HRS\)](#) and [Hawaii Administrative Rules \(HAR\) 13-124](#)." This information was taken from this site <https://dnr.hawaii.gov/dar/species/sea-turtles/>

**THE ENDANGERED MONK SEAL WILL BE AFFECTED**  
Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keauhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

**Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keauhou Bay will likely be changed forever.**  
This information is from a NOAA Scientist; "Study shows selfie culture impacts how people behave when posing images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered [Hawaiian monk seals](#). They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-ony-four-over-selfies>  
NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the [Marine Mammal Protection Act \(MMPA\)](#), as well as locally by Hawaii Revised Statutes (HRS) [Chapter 195D](#) and Hawaii Administrative Rules (HAR) [13-124](#)." This was taken from <https://dnr.hawaii.gov/dar/hawaiian-monk-seal/>

**Keauhou Bay is the monk seals and the green sea turtle's habitat.** Allowing a bungalow resort to be developed in Keauhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. **By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.**

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to protect the land around Keauhou Bay from developments that destroy the habitat of these endangered species with pollution and runoff

**Does this EIS have any reports on the endangered species that frequent Keauhou Bay? This is their habitat and it needs to be "conserved".**

Under the **Conservation Program** there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hscr/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hscr/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hscr/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hscr/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keauhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keauhou Bay and the surrounding area during the building phase of this enormous project.

**GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS**  
"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshiniegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keauhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable! Please read from Wikipedia."

Most drains have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically no treatment facilities in the piping system." [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20dr%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20dr%20wells)

The pavement from this development will cause pollution to runoff into Keauhou Bay because this tree land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keauhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEE-7.15.14.pdf> where the Hawaii government states that Natural Ground Cover has 10% runoff, where has

development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keauhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.

These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keauhou Bay and for these endangered species habitat.

Under Section 2 (b) of the Endangered Species Act - Keauhou Bay MUST BECOME A CONSERVATION AREA for these endangered species. It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species' natural habitat of Keauhou Bay.

**ALGAE BLOOMS KILL CORAL AND MARINE LIFE**  
The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer.

When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

**Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.**

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course development. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

**Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?**

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution. . . " <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keaouhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAHOUBAY'S ECOSYSTEM. Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef."

...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases. " <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef/>

**Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?**

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keaouhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

**FURTHERMORE:** "If there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservation.org/blog/2023/03/31/what-sea-foam/>

#### ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN

**Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keaouhou Bay?**

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keaouhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keaouhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

**The article below is from NOAA regarding motor vehicle engines and pollution to the sea.**

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant.>

**Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects**

News Release September 28, 2022

**WASHINGTON** — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a [new report](#) from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2022/09/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20Nearly%2085%20percent,pipeline%2C%20says%20a%20new>

**The Impact Of Stormwater – Car Emissions**

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershedherds.org.au/blog/the-impact-of-stormwater-car-emissions/>

5

#### NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE

**Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keaouhou Bay during development?**

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

**How Does Noise Pollution Harm Marine Species?**

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dair/in-marine-managed-areas/hawaii-marine-life-conservation-districts#:~:text=Sportfishing%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

**What is ocean noise?**

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

**LEARN FROM OTHERS:**

#### RUN-OFF FROM DEVELOPMENT KILLS

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments. Chesapeake Bay is a lot bigger than Keaouhou Bay, if it's being drastically hurt by runoff water from developments, Keaouhou Bay waters won't stand a chance if development above the bay is allowed. Keaouhou Bay is a much smaller ecosystem.

**This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow..."**

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

6

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20leopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay due to its size and fragility.

### **MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN**

**Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?**

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays. Manta rays are in Keauhou Bay every night to eat zooplankton, and are often seen here during the day as well.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is NO WAY to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments.

Please read the Scientific articles below.

#### **It's Been Proven Developments Severely Pollute Nearby Waters**

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide..."

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban runoff)." <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event>

<https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event>

**This article is by the Coral Reef Alliance here in Hawaii!** "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawaii%CA%BB%20reefs%20face%20major%20global,info%20Hawaii%CA%BB%20wate%20wavs%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and

development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)  
This is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information. "**Coral taxonomy and local stressors drive**

**bleaching prevalence across the Hawaiian Archipelago in 2019...**

**We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian**

**Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors,**

**such as tourism and urban runoff, may be exacerbated under high thermal stress.** In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in

Hawaii!" <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The coral all over Hawai'i had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

**"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.**

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

**Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development,...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species."** <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%20based%20sources,an%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development... This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother

coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project) **And among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival**" [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,info%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,info%20the%20atmosphere%20within%20days.)

**It's Been Proven Resort Developments Kill Marine Life**

This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like

**phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change.** Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon. The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. **This occurred in a relatively short time considering that the experiment lasted less than three weeks.** The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

**The ecosystem is fragile and interconnected as is stated in this article:** "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is

how toxins and pollution will affect this crucial link in the food chain". This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#~:text=Zooplankton%20are%20also%20sensitive%20to,light%20%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, **"Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage.** Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.doe.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.doe.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keahou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

#### **HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH**

**Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?**

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spoilright-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: **The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life.**" <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

**Where are the EIS reports on human density? Below are reports that show human population on destroys coral reefs.**

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution."

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development/#~:text=E-Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keahou Bay. **Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it.** Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas-hawaii-marine-life-conservation.>

districts/#~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.">https://www.marinebio.org/creatures/zooplankton/#~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.

#### **It's Been Proven an Increase in Human Population Destroys Coral Reefs**

If a Bungalow Resort is allowed to be built in Keahou Bay, it will bring a serious increase in human traffic. **"Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs.** Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#~:text=Denser%20coastal%20populations%20and%20greater%20more%20runoff%20and%20salination.>

This article is by ABC NEWS, **"This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found.** The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian Islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=963308858#~:text=The%20less%20people%20at%20a,there%20are%20the%20resear,ech%20found.&text=The%20millions%20of%20tourists%20who,world%20%20a%20new%20study%20said.> By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

#### **"Denser coastal populations and greater wealth will lead to reef degradation by coastal**

**construction.** Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from: Science

Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#~:text=Aquaculture%20will%20drive%20some%20shoring,0%20runoff%20and%20salination.>

Another article by Nature Sustainability, **"Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity.** By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, **coral reefs both attract and suffer from coastal tourism.** Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." #### **INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND**

**STRUGGLING FOR ANSWERS**

**Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?**

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

**Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the**

**Resources and Infrastructures for their resort development?**

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. **Worldwide, hotels produce almost 300,000 tonnes of waste each year.**" <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Keahou Bay. On Hawaii Island, we are already struggling to meet the increasing need for resources and infrastructure.

**Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill**

September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

**A County commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill**

By Mecan Moseley September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of

Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

**Time's Up For Landfills**

"Gentle" demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

**Drought Conditions On Hawai'i Island Prompt Water Supply Message**

By Big Island Video News

on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information from the [U.S. Drought Monitor](#). There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'i.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

**From a Water Supply news release:**

**Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues**

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to [significant droughts](#), and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the [world's largest surfing wave pool](#) opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe."

**"We are in a water crisis, that has to be made very clear,"** Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

**UPDATE: HELCO asks for continued energy conservation**

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawai'i Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

**Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawai'i Island because of the unavailability of several generators and lower than normal wind and solar resources.**

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/hcco-customers-on-hawaii-island-asked-to-conserve-power/>

**Big power supply problems continue to plague Hawai'i Island**

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

**The company explained that it faces an "extremely tight" supply of power at peak use periods.** especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plaque-hawaii-island>

**Hawaii Island customers urged to reduce electricity use through April**

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

**-If there is not enough electricity to meet demand,** Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumblocalnews.com/hilo/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

**FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES**

**A Resort Development Will Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?**

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawaii's News Now, "Report shows alarming surge in Hawaii Island traffic deaths. The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch

the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "**Hawaii Island has most traffic fatalities in state.** This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

**"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here,"** he added. <https://www.khon2.com/local-news/7-traffic-fatalities-are-hawaii-island-in-march/>

**The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.**

<https://www.khon2.com/local-news/7-traffic-fatalities-are-hawaii-island-in-march/>

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-iams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: **All of these roads only have two lanes!** There are two developments already on Alii Drive being built as of today, and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalov Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-iams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-iams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=FQSnPDjI8>

**Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.**

**Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:**

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

**"That's just Big Island traffic,"** is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

 By Li Cohen  
 Updated on: April 11, 2024 / 8:23 AM EDT / CBS News  
 In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says. "We're in deep trouble."  
<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>
- 17) **News Hawaii County issues mandatory 25% water restriction** for North Kona  
 August 7, 2023 · 5:21 PM HS  
 A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokohau Deepwell over the weekend.  
<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>
- 18) **Hawaii Water Supply Closely Monitored As Severe Drought** Continues  
 by Big Island Video News  
 on Nov 6, 2023 at 3:28 pm  
 (BIVN) – With an ongoing drought on the island of Hawaii, the Hawaii County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.  
<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawai-ca%BBi-under-severe-drought/>  
 This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>  
 Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.
- 19) **"Hawaiian Electric is reporting that several large generators** on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large/?rdt=52660)

**20** **"Hawaiian Electric asking Big Island customers to conserve power due to down generators**  
March 25, 2024 · 11:49 AM HST  
According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

### **HISTORICAL AND CULTURAL SIGNIFICANCE:**

#### **The Law of the Splintered Paddle**

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a device, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unarmed. The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii. After being added back in 1978, **the law is part of Hawaii's State Constitution today.**

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

**"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."**

**The Law of the Splintered Paddle is also on Kamehameha Schools website.** The historical value of this law should be enough to help make Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-rmg-true-200-years-after-k>

**Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.**

### **IN CONCLUSION**

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Eco-system in Keaouhou Bay and "The Endangered Species Act of 1973 (ESA) or "The Act"; 16 U.S.C. § 1531 [et seq.](#) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from extinction as a "consequence of economic growth and development untempered by adequate concern and conservation", the ESA was signed into law by President [Richard Nixon](#) on December 28, 1973. The Supreme Court of the United States described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation" [\[1\]](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973) [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keaouhou Bay on the other. This land MUST be conserved in order to keep Keaouhou Bay safe for all the marine life to be able to live there for years to come. In addition to the natural disaster this will cause, Hawaii Island is already having serious infrastructure and resource issues that have yet to be solved. These issues MUST be solved before considering another resort development on Big Island. We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keaouhou Bay, the birthplace of King Kamehameha III. Keaouhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly protects the marine life and environment from further damage. The location is NOT suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keaouhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

Please reject this EIS because Kamehameha Schools has NOT ACKNOWLEDGED OR ASKED thousands of Hawaiians, or Hawaiian Descendants from Keaouhou Bay how they feel about developing this land. Keaouhou Bay.

They have asked ONLY a few families on an island that has thousands of Hawaiians and her and her mother OPPOSE DEVELOPMENT! <https://vimeo.com/994680462>

Kupuna Kumu Lily Kong who was born in Keaouhou Bay and she states that she is against development. She also states that her mother was against development as well. Please listen to her words in her testimonial video about Keaouhou Bay on this link and know that this proves that descendant directly from Keaouhou Bay OPPOSE THIS DEVELOPMENT <https://vimeo.com/994680462> and it is CULTURAL LAW THEY MUST BE HEARD AND ACKNOWLEDGED!

These laws were created. After these legal victories, the Kohanaki 'Ohana worked to create a new law in the state of Hawaii to require Cultural Impact Statements along with Environmental Impact Statements for all future large-scale development. Act 50, the Cultural Impact Statement Law was adopted in 2000. " <https://kohanakiohiana.org/legal-victories>

Kupuna Kumu Lily Kong also states that there are burial grounds on the land that Kamehameha Schools wants to clear and it is told that Kamehameha Schools has bulldozed sacred land in the past and Keaouhou Bay's burial grounds MUST BE RESPECTED AND NOT DISTURBED!

Hawaiians locals have said that there were bones in the small cave that is at the base of Keaouhou Bay. These burials need to take priority over a Bungalow Resort Development.

There are over 6,219 signatures as of Aug. 5th (these signatures grow daily) and these signatures are Hawaiians, locals and tourist and some of these Hawaiians have left comments on why they are opposing this development.

ALL OF THESE PEOPLE HAVE A RIGHT TO BE ACKNOWLEDGED AND THEIR VOICES HAVE VALUE TO BE HEARD, THESE PEOPLE MATTER AND IT IS CULTURAL LAW THEY MUST BE ACKNOWLEDGED! Here is the petition link with thousands of Hawaiian signatures and comments opposing Kamehameha Schools Bungalow Resort Development. Please read these signatures and comments! [https://www.change.org/p/save-keaouhou-bay-from-becoming-a-big-crowded-resort?utm\\_source=share\\_petition&utm\\_medium=custom\\_url&recruited\\_by\\_id=922a53560-1e91-1-1e5-b4ef-b94e90cedb0d](https://www.change.org/p/save-keaouhou-bay-from-becoming-a-big-crowded-resort?utm_source=share_petition&utm_medium=custom_url&recruited_by_id=922a53560-1e91-1-1e5-b4ef-b94e90cedb0d)

Please reject this EIS because under Princess Bernice Pauahi Bishop's Will it states Kamehameha Schools are her trustees and they have a "fiduciary duty" to do what is best for THEIR BENEFICIARIES (the Hawaiian people's) and a Bungalow Resort is BEST FOR TOURISTS NOT THE HAWAIIAN PEOPLE BECAUSE THOUSANDS OF HAWAIIAN PEOPLE SINGED THE ABOVE PETITION OPPOSING KAMEAHMEHA SCHOOLS BUNGALOW RESORT.

Please reject this EIS because the Big Island DOES NOT HAVE THE RESOURCES TO PROVIDE FOR ANOTHER BIG RESORT ON ISLAND and there are 445 signatures with many comments that agree with this fact because of the factual reported articles in the [Help Prioritize Big Island Developments to Keep Island's Resources Safe for ALL petition](#). Please read this petition, all the signatures and

**comments** <https://www.change.org/p/help-prioritize-big-island-developments-to-keep-island-s-resources-safe-for-all>

My wife and I add our voices to those of our neighbors in opposing this move.

Respectfully yours,

Michael and Ines Hanly

## Antu Harvey

Please Do Not exploit Keauhou 'āina to extract money. Any more development in that culturally sacred and environmentally fragile and unique place will destroy its remaining qualities. Stop turning the Kona coast into another Kohala coastal resort area or another Waikiki.

We live here full-time. We are being pushed out by all this commercial development to the sole benefit of investors and tourists. We want to save this, one of the few remaining places where we can see and feel connected to our heritage, so our keiki and future generations can see and feel connected to it and at be at peace.

I am the Executive Director of Pūlama iā Kona Heritage Council and live in the village of Hōlualoa, very near where the Kealakowa'a road and several hōlua were still visible until mostly bulldozed during the past 75 years. It breaks my heart that the Keauhou hōlua was bulldozed for a golf course. Please stop before all is obliterated, leaving only a few photos and interpretive signs.

Others have researched and have shared the severe adverse Environmental, Public Safety and Infrastructure impact concerns.

We are at a tipping point. It is time we must slow down this destruction of our unique and precious remaining landscapes. Please suspend this project or better yet, reimagine your kuleana regarding its protection and highest use for the health and survival of our 'āina.

Mahalo for your time and consideration.

~Antu

**Subject:** Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT!

**Categories:** Yellow Category

To whom it may concern,

Please reject Kamehameha Schools EIS for Keauhou Bay to become a Bungalow Resort. This is a VERY small bay and the added footprint of a 105 room Resort, that will include excess traffic, will have a serious negative impact in Keauhou Bay

Please, Do NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near coastal development area. An article entitled, "What is the biggest source of pollution in the ocean?" by NOAA, National Oceanic and Atmospheric Administration, states, "When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides." It also states, "Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called, nonpoint source pollution, which occurs as a result of runoff."

The trees you want to take down keep the runoff pollution from the golf course from going into the Bay. According to the National Library of Medicine, in their article, "Putting the Earth in Play: Environmental Awareness and Sports," shares that the golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are being held off from running into the Bay by the very trees you want to take down.

Let's not forget the marine life that will be threatened by excess pollution and traffic. Keauhou Bay is the monk seals and the green sea turtle's habitat. More pollution and people will endanger these species.

This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced.

Kind Regards,

Adele Henkel  
Kailua Kona, Hawaii

Email: [Keaauhobay@g70.design](mailto:Keaauhobay@g70.design)

Fax: (808) 523-5866

August 6, 2024

Aloha,

My name is Michael Herbert and I live in the Keaauhoo makai area with my wife and our two children. I have reviewed the Keaauhoo Bay Conceptual Plan. This is my second time submitting and sharing ideas I have about Keaauhoo Bay development plans.

I am disappointed that the restoration of the Holua was not included in your plan. To respond, I've hand drawn a 3.5 foot by 6.5 foot map for a Holua Cultural Park that I can envision (jpeg file attached).

I also made a brief video to clearly explain the Holua Cultural Park map.

Here is a link to my video: [https://youtu.be/3B\\_MiBFYMcE](https://youtu.be/3B_MiBFYMcE)

My wife and I have owned a home in Keaauhoo since 2004. We were married at the Keaauhoo hotel (when it was the Sheraton) in 2009. We are raising our two young children here in Keaauhoo, and our family benefits daily from the many special features of this place.

I have reviewed the Keaauhoo Bay Conceptual Plan. I am pleased that commercial development is being confined to the cliff top (proposed resort area) and south end of the bay. The inclusion of the Heritage Center, restoration of anchialine ponds and foot pathways by the Mo'ikeha cave are excellent. The proposed additions of quality picnic & grill areas to the north end of the Bay will be enjoyed by locals and visitors. Seeing the Keaauhoo Canoe Club incorporated into the plan was also a relief.

However, I have two specific areas of concern:

**1. Restore and rebuild the holua (North).**

We often walk with our children, neighbors, and visitors and point out to them the magnificent Royal Holua. I cannot help but imagine the intense speeds attained descending the slide and admire the bravery of those who participated in the sport. Equally impressive is the amount of resources and social coordination needed by the Hawaiian community here at Keaauhoo to build the hole.

The Royal Holua should be restored as completely as possible, and should once again be a place for people to practice the sport and for spectators to enjoy it. The proposed redevelopment of this area presents a once-in-a-generation opportunity to make bold moves to reclaim this magnificent feature and revive traditions surrounding holua sled racing. Keaauhoo Bay could become the epicenter for the revival of the Holua. I urge KS to take advantage of the opportunity and act more fully on the vision to restore this area by bringing back the Royal Holua.

I have a clear concept for a Holua Cultural Park. I attached a picture of a hand-drawn map and have made a short video explaining the map. Here again is a link to my brief Holua Cultural Park video: [https://youtu.be/3B\\_MiBFYMcE](https://youtu.be/3B_MiBFYMcE)

**2. DO NOT make the Old Kona Road a thoroughfare.**

Land use on the north end of Keaauhoo Bay should focus on the physical and cultural revival of the Holua. Do not use Old Kona Road as a connector between Kamehameha III Road and Kaliaopapa Road, as this would abolish all hopes of restoring the Holua. Extend Old Kona Road from its joint with Kaliaopapa on the south side of the bay and pave just as far as is needed to serve the resort development above the cliffs and no farther.

**Security**

Opening the Old Kona Road to connect the north end of the Bay to the proposed resort could introduce security concerns for your guests. We live down here in the condos off Kamehameha III Rd. At night, some of the people who meet up in the dark north end of the bay are unstable. My family usually avoids the area after dark. Connecting Old Kona Road as a primary entrance to your resort's main parking lot would grant anyone easy access and diminish the security of your property.

Keep your Resort property physically cut off from the north end of the bay. I suggest simply creating a turnaround in your resort parking lot that loops into a section of Old Kona road. In addition, if the Holua is restored, another strong and beautiful physical barrier would be created that offers even greater separation. The Holua would cleanly break away the proposed resort from the day use grill and picnic areas in the North. I'm sure your guests will enjoy the added security and seclusion that this plan offers.

**Traffic Safety**

If opened, the Old Kona Road would pass right next to the proposed picnic and grill areas. Children will likely be running around and playing in the area. Vehicle traffic to the proposed resort including visitors, employees, and delivery trucks would be passing by the picnic areas constantly. This is unsafe.

The current plan does not properly balance residents' safety and enjoyment of the proposed added picnic areas with visitors' resort access. Access to the resort should only be allowed via Kaliaopapa Street, where all other Keaauhoo Bay commercial and resort activity is currently concentrated.

**Resort Access/Traffic Light**

I understand easy resort access for your guests may be a priority, but don't take this too far. Limit vehicular resort access to the intersection of Old Kona Road and Kaliaopapa Street. At this new paved intersection, install a traffic light that is triggered by pressure plates on Old Kona Road's stop line. A pressure-plate controlled stop light will manage traffic at the intersection of Old Kona Road, Kaliaopapa Street and Ehukai Street, which would serve the Outrigger Resort, Keaauhoo Pier, as well as the proposed Keaauhoo Bay front retail and cliff top resort.

Many visitors have moved beyond the mindset when resorts nodes were developed to exclude local culture; visitors seek enriching experiences that, while comfortable, allow an opportunity to learn about and celebrate local, and especially indigenous culture. The new development should reflect that evolution in the visitor industry. KS has truly remarkable resources and the ability to realize an inclusive, restorative, and transformative vision for this place.

I strongly urge you to reconsider you plan and restore the Royal Holua. It was already overrun and abandoned once before. Second chances don't come often. If you proceed as planned, the Holua will be lost.

I would be happy to talk further with KS about any of these ideas. I plan to stay in this area and want to help make it the best it can be for present and future generations. The land and waters of Keaauhoo Bay have a powerful story to tell; let the story be told.

Thank you,

Michael Herbert

**Subject:** Proposed Keaouhou Bay Bungalow Resort  
**Categories:** Yellow Category

Whom It May Concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools Environment Impact Statement (EIS) for Keaouhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT on Keaouhou Bay as stated in all the different researched articles below.

Please, DO NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is **scientifically proven** that developments pollute nearby waters both **during and after development**.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have **ALWAYS** polluted the water in **EVERY** coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keaouhou Bay is their habitat and this development **WILL be CHANGING an Entire Ecosystem**.

#### **ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT**

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.

The Green Sea Turtle swims in Keaouhou Bay weekly and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list.

#### **Endangered Species Act**

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-ac>

#### **FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED**

The green sea turtle is federally protected and can be seen in Keaouhou Bay weekly.

The following article that states: "**POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES**"

#### **Why does Hawaii have a runoff problem?**

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

**Allowing this development WILL POLLUTE Keaouhou Bay.** The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!) states this fact clearly. Keaouhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen **because developments have been shown to ALWAYS pollute the water is that is nearby.**

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawaii are protected by the [Endangered Species Act \(ESA\)](#) and additionally protected by [Hawaii's](#)

[Revised Statutes Chapter 195D \(HRS\)](#) and [Hawaii Administrative Rules \(HAR\) 13-124](#). This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>.

### THE ENDANGERED MONK SEAL WILL BE AFFECTED

Keaouhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keaouhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

**Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keaouhou Bay will likely be changed forever.**

This information is from a NOAA Scientist; **"Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!'"** That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a [recent study](#), NOAA scientists used social media to monitor human activities around endangered [Hawaiian monk seals](#). They discovered that human disturbance is more common than they thought. "<https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the [Marine Mammal Protection Act \(MMPA\)](#), as well as locally by Hawai'i Revised Statutes (HRS) [Chapter 195D](#) and Hawai'i Administrative Rules (HAR) [13-124](#)." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

**Keaouhou Bay is the monk seal's and the green sea turtle's habitat.** Allowing a bungalow resort to be developed in Keaouhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. **By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.**

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to **protect the land around Keaouhou Bay** from developments that destroy the habitat of these endangered species with pollution and runoff.

**Does this EIS have any reports on the endangered species that frequent Keaouhou Bay? This is their habitat and it needs to be "conserved".**

Under the **Conservation Program** there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hircurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hircurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hircurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hircurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keaouhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keaouhou Bay and the surrounding area during the building phase of this enormous project.

### GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS

"The golf industry uses [approximately 50 pesticide active ingredients](#), including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keaouhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable!

Please read from Wikipedia, "  
Most drains have a single large exit at their point of discharge (often covered by a [grating](#)) into a [canal](#), river, lake, [reservoir](#), sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping system." [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single%20discharge%20into%20individual%20dry%20wells)

The pavement from this development will cause pollution to runoff into Keauhou Bay because this treed land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keauhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> where **the Hawai'i government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keauhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.**

**These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keauhou Bay and for these endangered species habitats.**

Under Section 2 (b) of the Endangered Species Act - **Keauhou Bay MUST BECOME A CONSERVATION AREA for these endangered species.** It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keauhou Bay.

#### **ALGAE BLOOMS KILL CORAL AND MARINE LIFE**

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer.

When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

**Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.**

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course developments. Through this development is

not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

**Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?**

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Cuana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution... " <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-cuana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAUHOU BAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

**Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?**

This needs to be fully assessed because **you will be changing an entire ecosystem** to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

**FURTHERMORE:** "If there are [toxic algal blooms](#), like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

## ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN

**Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?**

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keauhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

**The article below is from NOAA regarding motor vehicle engines and pollution to the sea.**

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant.>

**Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects**

News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a [new report](#) from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%2D%20Nearly%2085%20percent,pipeline%20spills%2C%20says%20a%20new>

## The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwaterfisherherds.org.au/blog/the-impact-of-stormwater-car-emissions/>

## NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE

**Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keauhou Bay during development?**

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

## How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

### **What is ocean noise?**

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred

habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

### **LEARN FROM OTHERS: RUN-OFF FROM DEVELOPMENT KILLS**

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments. Chesapeake Bay is **a lot bigger** than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed. Keauhou Bay is a much smaller ecosystem.

**This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states,** "...runoff is a significant source of harmful nitrogen pollution that continues to grow..."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and

other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay due to its size and fragility.

### **MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN**

**Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?**

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays. Manta rays are in Keauhou Bay every night to eat zooplankton, and are often seen here during the day as well.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is NO WAY to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments.

Please read the Scientific articles below.

### **It's Been Proven Developments Severely Pollute Nearby Waters**

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide..."

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban runoff)." <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event>:

[hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,had%20catastrophic%20impacts%20state%20wide.](https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event)

**This article is by the Coral Reef Alliance here in Hawaii:** "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/wwhere-we-work/hawaiian-islands/#~:text=Hawaii%20reefs%20face%20major%20global,into%20Hawaii%20waterways%20every%20day>.

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "**Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019...**

**We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban run-off, may be exacerbated under high thermal stress.** In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

**"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.**

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

**Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development,...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species."** <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%20based%20sources,and%20mortality%20in%20sensitive%20species>.

Article by Environmental Evidence, "**Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide.**" <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0>  
[https://oceanservice.noaa.gov/education/tutorials/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals](https://oceanservice.noaa.gov/education/tutorials/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals).

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. **Land-based runoff and pollution discharges can result from dredging, coastal development... This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.**

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorials/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals](https://oceanservice.noaa.gov/education/tutorials/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals).

Another article by NOAA, "**Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project.)**

**Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival"** [https://oceanservice.noaa.gov/education/tutorials/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days](https://oceanservice.noaa.gov/education/tutorials/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days).

**It's Been Proven Resort Developments KILL Marine Life**

This article by MarinBIO states, "**Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change.** Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. **This occurred in a relatively short time considering that the experiment lasted less than three weeks.** The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

**The ecosystem is fragile and interconnected as is stated in this article:** "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creates/zooplankton/#:~:text=Zooplankton%20MarineBIO.,https://www.marinebio.org/creates/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, **"Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage.** Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

## HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH

13

## Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: **The overwhelming majority (97%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life.**" <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

## Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean

Tracks [https://oceantracks.org/library/human-impacts/coastal-](https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20i)

[development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.](https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.)

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. **Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it.** Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of

14

future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dair/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

### **It's Been Proven an Increase in Human Population Destroys Coral Reefs**

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will bring a serious increase in human traffic. **"Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs.** Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, **"This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found.** The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%2C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study%20said.>

By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

**"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction.** Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, **"Coral reefs and coastal tourism in Hawaii Coral reefs are popular** for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, **coral reefs both attract and suffer from coastal tourism.** Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." ### **INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS**

#### **Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?**

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

#### **Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?**

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. **Worldwide, hotels produce almost 300,000 tonnes of waste each year.**" <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Keauhou Bay. On Hawaii Island, we are already struggling to meet the increasing need for resources and infrastructure.

#### **Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill**

September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

### **A County commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill**

By [Megan Moseley](#), September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

### **Time's Up For Landfills**

17

'Gentle' demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

### **Drought Conditions On Hawai'i Island Prompt Water Supply Message**

by Big Island Video News  
on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information from the [U.S. Drought Monitor](#). There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

## Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By [Li Cohen](#)

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to [significant droughts](#), and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the [world's largest surfing wave pool](#) opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. " ... We are on the verge of a greater catastrophe."

**"We are in a water crisis, that has to be made very clear,"** Wayne Tanaka, director of Sierra Club of Hawaii, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

### UPDATE: HELCO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure

that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

### Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power->

### Big power supply problems continue to plague Hawaii Island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

**The company explained that it faces an "extremely tight" supply of power at peak use periods,** especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "**Hawaii Island has most traffic fatalities in state.**" This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

**"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here,"** he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

**The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.**

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue [an emergency order](#) shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: **All of these roads only have two lanes!**

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation,

## Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

**-If there is not enough electricity to meet demand,** Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

## FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES

**A Resort Development Will Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?**

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawaii News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a

Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html).

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=FQ5snPDii8>

**Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.**

**Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:**

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii's Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

**"That's just Big Island traffic,"** is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

## HISTORICAL AND CULTURAL SIGNIFICANCE:

### The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii. After being added back in 1978, **the law is part of Hawaii's State Constitution today.**

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned

28

-Taking kuleana (responsibility) for those we serve

-Doing so with compassion, love, and respect

**“We take that to mean that anyone who uses our roadways should be able to do so without fear of harm,” explains Tina.”**

**The Law of the Splintered Paddle is also on Kamehameha Schools website.** The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

**Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.**

## IN CONCLUSION

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Eco-system in Keauhou Bay and "The **Endangered Species Act of 1973 (ESA)** or "The Act"; 16 U.S.C. § 1531 [et seq.](#)) **is the primary law in the United States for protecting and conserving imperiled species.** Designed to protect critically imperiled species from [extinction](#) as a "consequence of economic growth and development untempered by adequate concern and conservation", the ESA was signed into law by President [Richard Nixon](#) on December 28, 1973. The [Supreme Court of the United States](#) described it as "the most comprehensive legislation for the preservation of endangered species enacted by any nation".<sup>[1]</sup>" [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land MUST be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawai'i Island is already having serious infrastructure and resource issues that have yet to be solved. These issues MUST be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly protects the marine life and environment from further damage. The location is NOT suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

Mahalo,

David Hill, Captain Cook

## Theresa Holderread

I've read the management plan for Keauhou Bay. I'm trying to figure out how the development of that land, into a proposed bungalow resort, aligns with the plan or the vision of Kamehameha Schools? I can understand the cultural aspect of the proposal and if the plan was to build affordable housing for the community but that doesn't seem to be the case. Also, if the mission/vision of Kamehameha Schools is to protect/be good stewards of the aina, why expose Keauhou Bay to the potential pollution from groundwater runoff etc? Aloha e Theresa -

Thank you for your comments concerning the Keauhou Bay Management Plan, Draft Environmental Impact Statement. Your comments have been received and administratively recorded.

Comments received during the 45-day public comment period will be reproduced in the Final Environmental Impact Statement, and substantive comments addressed.

The County of Hawai'i and our planning consultant, G70, are copied here on this email so that they receive a copy of your feedback.

We appreciate your involvement and contribution to the environmental review process. Your input is invaluable in helping us develop a management plan that reflects the needs and concerns of our community.

Thank you once again for your engagement and commitment to the future of Keauhou Bay.

Mahalo,

The Keauhou Bay Project Team

## Michael Hooser

This will affect our ocean and the area negatively. Golf course run of and damaging of reefs are just a couple of the negative impacts. Kamehameha schools supposed to be here for the Hawaiian people. Why are you trying to accommodate more haoles coming to the island???? We need self sustainability not more tourism. Hawaiians have been trying to hammer this point across and you guys aren't listening. I have so little faith in so called Hawaiian organization's like yours claiming your here for the betterment of our lands and claiming to help the people. This is just greed at its ugliest. So many displaced kanaka and you guys are proposing this atrocity. Disgusting

## Myland Hui

NO!!! Perhaps upgrading the area for boats and trailers but NO to the development of the resort cottages. The impact to this pristine area would be devastating. Most disturbed would be the water quality and negative environmental impact to the wildlife in the bay from runoff. Really? Is this what our ancestors would have wanted?

## Marcie Ide

Aloha All,

In the 1960's, I grew up on Keauhou Bay with my kapuna in a rental near where the Outrigger Kona Resort chapel is now located. Keauhou Bay is the source from where I come from.

I applaud most of the proposed development activities in the Keauhou Bay Management Plan to "reorient commercial activities away from culturally sensitive areas to alleviate congestion and establish a new place-based cultural educational center."

I support this opportunity to develop a scenic and open space heritage corridor that protects habitats, maintains biodiversity, and promotes outdoor recreation with trails, picnic tables and bathrooms.

· Restore the cultural landscape with physical features, trees, pathways, and pavilions, that express the historical significance of his birthplace.

· Restore the Old Kona Road and Keauhou Trail to provide access mainly for pedestrians, bicycles, the handicapped and parking.

I understand the need for Kamehameha Schools to optimize and invest in revenue opportunities that provide long-term economic returns. However, money isn't the most important issue here. Keauhou Bay and the nearshore waters are too small and fragile to support more development.

Keauhou Bay needs the protection and support of the existing natural filtering system between the golf course and the beach.

The bungalow development imposes a significant environmental impact, paving over this natural filtering system, by adding additional hardscape. It also defines what kinds of people and incomes can enjoy this development. It becomes a destination that works for fewer and fewer types of people.

The bungalow concept is symptomatic of over-tourism and lack of affordable housing. "People here need authentic, affordable workforce housing. The needs of this community do not include more hotel rooms." Rebecca Villegas, a Hawaii County Council member whose district includes Keauhou Bay.

The draft environmental impact study arguments are conclusory and underdeveloped. The potential impacts of the increased traffic, noise, marine water quality, and demand on the area's drinking water supply have yet to be analyzed.

Keauhou Bay is one of the last historically untouched areas on the island that has not been overdeveloped and enjoyed by locals and visitors for many decades. Once we lose this land to another development, we will never see it again.

Warmly,  
Marcie Ide

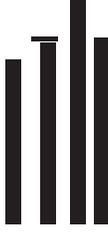

Wayfinding :

I understand the need for Kamehameha Schools to optimize and invest in revenue opportunities that provide long-term economic returns. However, money isn't the most important issue here. Keaouhou Bay and the nearshore waters are too small and fragile to support more development.

Keaouhou Bay needs the protection and support of the existing natural filtering system between the golf course and the beach.

The bungalow development imposes a significant environmental impact, paving over this natural filtering system, by adding additional hardscape. It also defines what kinds of people and incomes can enjoy this development. It becomes a destination that works for fewer and fewer types of people.

The bungalow concept is symptomatic of over-tourism and lack of affordable housing. “People here need a authentic, affordable workforce housing. The needs of this community do not include more hotel rooms.” Rebecca Villegas, a Hawaii County Council member whose district includes Keaouhou Bay.

The draft environmental impact study arguments are conclusory and underdeveloped. The potential impacts of the increased traffic, noise, marine water quality, and demand on the area's drinking water supply have yet to be analyzed.

Keaouhou Bay is one of the last historically untouched areas on the island that has not been overdeveloped and enjoyed by locals and visitors for many decades. Once we lose this land to another development, we will never see it again.

# Jeanne Isola

I cannot believe the KS is even considering plans to develop this small area and this tiny, beautiful bay that is the site of Kamehameha's birthplace. Every morning and evening, looking down at Keaouhou Bay, the phrase, 'Malama the aina' is the refrain that runs through my mind. With this outrageous proposal to develop this sacred land, KS threatens to fail to uphold the pledge to 'malama the aina.' I fervently hope that this devastating plan does not come to fruition.

Debra Javar

Note: Since the Kamehameha Research Comment Letter is Step 1 & 2 in HHS's Proposed Kamehameha Schools EIS Draft EIS, I have a Negative Impact in Keaouhou Bay. The letter has to come before the EIS is released. You are not allowed to comment on the EIS until after you have read it. I just copy the letter and send it, because I add more researched information to it on how a Bungalow Resort WILL HURT Keaouhou Bay for years to come. Copy and Paste this letter in the Step 1 & 2. Google search how to copy and paste from the device you have should you not know how. Malaha for your time! Comment Letter Below To whom it may concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools EIS for Keaouhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have SERIOUS NEGATIVE IMPACT in Keaouhou Bay as stated in all the different researched articles below.

First, describe EIS how they find of species and studies on how the endangered species and marine life will handle the extra pollution due to development and golf course runoff because Keaouhou Bay is their habitat and this development WILL be changing an entire ecosystem.

In the Endangered Species Act of 1973 Under Section 2 (b), "to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.

The Green Sea Turtle swims in Keaouhou Bay weekly and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawaii are protected by the Endangered Species Act (ESA) and additionally protected by Hawaii Revised Statutes Chapter 195D (HRS) and Hawaii Administrative Rules (HAR) 13-124." This information was taken from the site <https://dlt.hawaii.gov/dar/species/sea-turtle/>

"Hawaiian monk seals are protected federally by the ESA, and the Marine Mammal Protection Act (MMPA), as well as locally by Hawaii's Revised Statutes (HRS) Chapter 195D and Hawaii Administrative Rules (HAR) 13-124." This was taken from <https://dlt.hawaii.gov/dar/hawaiian-monk-seal/>

### ENDANGERED SPECIES CONSERVATION

#### Endangered Species Act

#### Section 2. Findings, Purposes, and Policy

(4) The United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section. This was taken from <https://www.federalregister.gov/documents/2017/06/23/2017-12041/endangered-species-conservation>

Keaouhou Bay IS the monk seals and the green sea turtles' habitat and to allow a bungalow resort to be developed in Keaouhou Bay, that is these endangered species habitat, is to threaten these endangered species habit with golf course runoff pollution, as well as development pollution and hence, threaten their habitat, hence their lives, and goes completely against the Endangered Species Act of 1973.

The words in the Endangered Species Act states, "to conserve" and conserving the endangered species that enter into Keaouhou Bay would be to NOT DEVELOP A BUNGALOW RESORT because this would cause serious pollution runoff that would pollute the bay and endanger these already endangered species, the green sea turtle and the monk seal.

Does this EIS have any reports on the endangered species in Keaouhou Bay because this is their habitat.

"195D-5. Conservation programs (a) The department shall conduct research on indigenous species, wildlife, and land plants, and on endangered species and their associated ecosystems, such as all other lands and waters, and other lands, water, and air, in order to determine their status and to determine appropriate management and protection of such species and their associated ecosystems." This was taken from [https://www.caip.hawaii.gov/legis/statutes/Vol03\\_C10012\\_42/0000HR\\_00150/00150\\_HRS\\_0195D-0005.htm](https://www.caip.hawaii.gov/legis/statutes/Vol03_C10012_42/0000HR_00150/00150_HRS_0195D-0005.htm)

Please see that developer's Kamehameha Schools Bungalow Resort in Keaouhou Bay would threaten endangered species due to the unavoidable development and golf course pollution runoff that would happen a lot more often due to taking out the natural pollution filter, that is the trees and the land that is there now.

"The golf industry uses approximately 50 pesticides active ingredients, including chlorpyrifos, insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to the height the mowers can more vulnerable to pests, which leads to more pesticides use." <https://www.golfcourse.com/news/pesticides/>

These pesticides will be in the pollution runoff that will enter Keaouhou Bay more severely because of the bungalow resort development pavement. As of right now the trees and land that this development wants to clear and develop into a bungalow resort is a Natural Pollution Filter.

Please read from Wikipedia. \*

Monk seals have a single large ear at their point of discharge (often covered by a grating) into a canal, over, lake, reservoir, sea or ocean. Other than canals, seals typically have no treatment facilities in the piping system. [https://en.wikipedia.org/wiki/Storm\\_drain#/media/File:Storm\\_drain\\_in\\_the\\_urban\\_environment.jpg](https://en.wikipedia.org/wiki/Storm_drain#/media/File:Storm_drain_in_the_urban_environment.jpg)

In the pavement that this development wants to put in that will cause a lot of pollution to runoff into Keaouhou Bay because this top land that is directly below the golf course (that they want to clear) soaks in the golf course pesticides, fertilizers, weed killer... and is the BEST ANIMAL PROTECTION POLLUTION FILTER Keaouhou Bay has from the golf course pollution.

Please see this site at <https://health.hawaii.gov/epa/files/2013/09/Stormwater-MS4-Pesticides-HF-7.13.14.pdf> because it states that the Hawai'i government that Natural Ground Cover has 100% runoff where has development has 5% runoff and that storm drains here in Hawai'i get untreated polluted runoff water into the ocean.

These trees and land are saving monk seals and green sea turtles' habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keaouhou Bay, hence for these endangered species habitat.

Under Section 2 (b) of the Endangered Species Act - Keaouhou Bay MUST BECOME a CONSERVATION AREA for these endangered species because it is their habitat as of today, and to allow a resort development to be built above the bay would threaten the very lives of these endangered species because it will allow golf course toxic pollution and development pollution to run into these species natural habitat, which is Keaouhou Bay.

Keaouhou Bay has the trees and land just under the golf course (that Kamehameha Schools want to clear for their bungalow resort) that protects Keaouhou Bay from a lot of algae blooms because it soaks up pollution that is runoff from fertilizer, weed killer... in the golf course, and unfortunately when there is a severely heavy rain storm the land up on top of the bay has a greater runoff than normal from the golf course pollution, and pollution from algae blooms happen because of it.

If you clear this land, this kind of algae bloom will happen a lot more often and end up killing a lot of coral and marine life as stated in the many articles that will follow.

One of these articles is in the Global Coral Reef Alliance. They researched the reef before and after a golf course development and even though this development is not a golf course development, it is still a development and it will also be located just under a golf course and this will allow the pollution from the golf course to come down to the bay a lot more often because the natural land that soaks up this pollution will be gone.

Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guam, Oahu, Hawaii, Palau, and Tahiti"

Introduction: Bahamas coral reef deterioration

This study is through the first ever to evaluate the health of coral reef ecosystem and fisheries before and after a golf course development. The vast majority of corals have died from a combination of <https://www.globalwarming.org/golf-course-kill-coral-reef-and-fisheries-harmful-algae-blooms-and-diseases-caused-by-nutrient-runnoff-from-golf-course-development-on-gaunias-ay-ahoo-bahama/> and land that can soak up the polluted water most of this year and polluted foam algae blooms will happen a lot more often.

Here is another study by the Coral Reef Alliance titled, "Coral course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef"  
<https://www.globalwarming.org/golf-course-fertilizer-nutrient-enrichment-leads-to-harmful-algae-blooms-on-a-bahamian-coral-reef/>

"After construction new algae blooms appeared within the golf course greens, smothering corals in adjacent reefs, along with sharply increased coral diseases..."

Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?

This needs to be fully known because you will be changing an entire ecosystem to build a bungalow resort. Because it rains in Keauhou Bay many nights out of the year and the land they want to clear will keep ALL golf course pollution out during this time and pavement won't even come close.

"If there are toxic dead blooms, like red tide, or toxic cyanobacteria, like paralytic shellfish poisons, in the water, when swimmers are splashed with the bubbles of sea foam, when those bubbles pop, the toxins can become airborne and compromise the air that is breathed in this location." <https://oceanstudies.org/blog/2023/03/31/what-are-dead-turtles>

Federally Protected Green Sea Turtles Swam in Keauhou Bay Often TURTLES

Why does Hawaii have so many dead turtles?  
Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the sun, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, the extra from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chicoreview.com/news/pollution/leakoff-to-hawaii-endangers-green-sea-turtles/>

Even with storm drains if you allow this development it WILL POLLUTE Keauhou Bay as the above article that was written in 2014 because runoff water from developments were polluting the ocean even then states, and this boy holds many sea creatures such as the protected green sea turtle, spotted eagle rays, mantle rays, octopus, dolphins, fish, coral, monk seals that have rested on the dock before and... and will ALL be harmed by the more severe pollution runoff that WILL happen because developments can't help but pollute the water nearby.

Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL, and if a resort is allowed to be built, that will bring a lot more people down to Keauhou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfishness because it is fully known this is now a SHELTER CULTURE.

Has the EIS done any research on what a high population would do in such a small area, and what will happen to the endangered species that live there because it's their habitat and a high population will change this bay forever?

Because this information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posing images of an endangered species on social media. There's a seal on the beach left to get a selfie?" That must have been when nearly 18 percent of people on Instagram thought before approaching an endangered species. In a recent study, NOAA <https://www.fishbase.org/news-story/endangered-hawaiian-monk-seal-gets-600-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles inhabit can be a serious disturbance for these endangered species.

Has the EIS done any research or reports on the endangered species and the high population that this resort will bring in?

There are many big housing developments currently under construction in Keolu Kona, Waikoloa Village, in Hilo, Puna, and there are Ocean View and Volcano housing construction projects as well. The entire Big Island has constructive projects all over.

Has Keauhou beach EIS done any kind of reports or surveys about how Big Island Resources will provide for their resort? Because as of now, Island Resources and Infrastructure are having serious negative issues and many developments are not even completed as of yet.

**From:** Susie J. <[ksbe@hawaiicounty.gov](mailto:ksbe@hawaiicounty.gov)>  
**Sent:** Monday, July 29, 2024 2:41 PM

**Subject:** Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT!

**Categories:** Green Category  
**Subject:** Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT!

To whom it may concern,  
Please reject Kamehameha Schools EIS for Keauhou Bay to become a Bungalow Resort. This is a VERY small bay and the added footprint of a 105 room Resort, that will include excess traffic, will have a **serious negative impact** in Keauhou Bay.

Please, Do NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near coastal development area. An article entitled, "What is the biggest source of pollution in the ocean?" by NOAA, *National Oceanic and Atmospheric Administration*, states, "When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides." It also states, "Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called *nonpoint source pollution, which occurs as a result of runoff.*"

The trees you want to take down keep the runoff pollution from the golf course from going into the Bay. According to the National Library of Medicine, in their article, "Putting the Earth in Play: Environmental Awareness and Sports," shares that the golf industry uses **approximately 50 pesticide active ingredients**, including chlorpyrifos — an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are **being held off** from running into the Bay by the very trees you want to take down.

Let's not forget the marine life that will be threatened by excess pollution and traffic. Keauhou Bay is the monk seals and the green sea turtle's habitat. More pollution and people will endanger these species.

This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced.

Kind Regards,

C.S. Jenkins

Laura Johnson

Please see the attached letter. Thank you for your consideration.

To whom it may concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools EIS for Keaouhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keaouhou Bay as stated in all the different researched articles below.

First, does this EIS have any kind of report or study on how the endangered species and marine life will handle the extra pollution due to this development? Keaouhou Bay is their habitat and this development WILL be changing an entire ecosystem.

**In the Endangered Species Act of 1973 Under Section 2 (b), "to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved," This would be Keaouhou Bay.**

The Green Sea turtle swims in Keaouhou Bay and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list. Monk Seals are considered extremely endangered.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by [Hawai'i Revised Statutes Chapter 195D \(HRS\)](#) and [Hawai'i Administrative Rules \(HAR\) 13-124](#)." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

"Hawaiian monk seals are protected federally by the ESA and the [Marine Mammal Protection Act \(MMPA\)](#), as well as locally by Hawai'i Revised Statutes (HRS) Chapter 195D and Hawai'i Administrative Rules (HAR) [13-124](#)." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

#### **ENDANGERED SPECIES CONSERVATION**

Endangered Species Act

"**Section 2. Findings, Purposes, and Policy**

**(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—**

**(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."** This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-act>

Keaouhou Bay IS the monk seal's and the green sea turtle's habitat and to allow a bungalow resort to be developed in Keaouhou Bay is to threaten that habitat with golf course runoff pollution, as well as development pollution and hence, threaten their lives, and goes completely against the Endangered Species Act of 1973.

The words in the Endangered Species Act states, "to conserve" and conserving the endangered species that enter into Keaouhou Bay would be to NOT DEVELOP A BUNGALOW RESORT because this would cause serious pollution runoff (taking out the natural pollution filter - trees and the land that is there now) that would pollute the bay and endanger these already endangered species. .

**Does this EIS have any reports on the endangered species in Keaouhou Bay because this is their habitat.**

"**§195D-5 Conservation programs.** (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." This was taken from [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Cho121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Cho121-0200D/HRS0195D/HRS_0195D-0005.htm).

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshingolf.com/pages/the-environmental-impact-of-golf-courses>

Please read from [Wikipedia](#),

**Most drains** have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping system.

"[https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells)

More pavement and less trees/land will cause a lot of pollution to runoff into Keaouhou Bay because this top land that is directly below the golf course (that they want to clear) soaks in the golf course pesticides, fertilizer, weed killer... and is the BEST AND ONLY PROTECTION POLLUTION FILTER Keaouhou Bay has from the golf course pollution. More runoff promotes huge algae blooms which hurts these species, and also coral, fish and other ocean life.

Please see this site at <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> because it states from the Hawai'i government that **Natural Ground Cover has 10% runoff, where has development has 55% runoff.**

**Under Section 2 (b) of the Endangered Species Act** - Keaouhou Bay MUST BECOME a CONSERVATION AREA for these endangered species because it is currently their habitat and to allow a resort development to be built above this bay would threaten the lives of these endangered species because it will allow golf course toxic pollution and development pollution to run into these species' natural habitat.

**Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?**

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and

fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, and land-based sources of pollution.

" <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING KEAUHOU BAY'S ECOSYSTEM.

Here is another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef

...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

**Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?**

"If there are **toxic algal blooms**, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

**Federally Protected Green Sea Turtle Swim in Keauhou Bay Often**

The green sea turtle that is federally protected and can be seen frequently in Keauhou Bay. Please see the following article that states "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES

**Why does Hawaii have a runoff problem?**

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL, and if a resort is allowed to be built, that will bring a lot more people down to Keauhou Bay and if a monk seal is resting, they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE.

Has the EIS done any research on what a high population would do in such a small area, and what will happen to the endangered species that live there because it's their habitat and a high population will change this bay forever?

This information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media.

There's a seal on the beach! Let's go get a 'selfie'!" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species. In a [recent study](#), NOAA scientists used social media to monitor human activities around endangered [Hawaiian monk seals](#). They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high human population in monk seal and sea turtle habitat can be a serious disturbance for these endangered species.

**Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?**

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano as well. The entire Big Island has construction projects all over.

**Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?**

Because as of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means these resources and infrastructures will be taxed even more in the near future.

Please read the below articles that prove that Big Island doesn't have the resources or infrastructure for a Bungalow Resort Development because it will increase the need for resources and infrastructure that the island doesn't have as of today.

**Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill**

September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years. (File photo)

Of the 900 total votes in our most recent poll, which asked people to weigh in on the best way to extend the life of the Big Island's [only remaining landfill](#), all of the above was the most popular answer, garnering 274 votes, or 30%.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

**A county commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill**

**By Moseley September 6, 2023**

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So, what are we going to do? So, I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

**Time's Up for Landfills**

**'Gentle' demolition strategies can help preserve resources**

**PAULA BENDER April 2, 2024**

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

**Drought Conditions on Hawai'i Island Prompt Water Supply Message**

**by Big Island Video News  
on Oct 5, 2023 at 3:59 pm**

**(BIVN)** – With moderate to severe drought conditions being reported across Hawai'i Island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information **from the U.S. Drought Monitor**. There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Kā'ū.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawaii%CA%BBi-Island-prompt-water-supply-message/>

**U.S.**

**Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues**

**By Li Cohen**

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to **significant droughts**, and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the **world's largest surfing wave pool** opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. " ... We are on the verge of a greater catastrophe."

"We are in a [water crisis](https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/), that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawaii, told CBS News, saying that if the reasons for this crisis aren't soon addressed, **"We may come to a point where we have to decide ... who gets water and who doesn't."**

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island parts need to be shipped and the power plant has generators that are not working and because of this, and other reasons, the Big Island needs to seriously conserve power so that everyone will have power, and if this problem of shipping parts can happen once it can happen again.

#### UTILITIES

UPDATE: HECO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HECO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity use is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power>

**Big power supply problems continue to plague Hawaii Island**

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

**Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.**

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

#### What You Need to Know

**-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity**

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

**Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150-room bungalow resort in?**

**Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keaouhou Bay, what traffic and increased population studies have they done? Because they will have employees with cars, guests with cars, visitors with cars and this would range at times at least over 200 cars parking above Keaouhou Bay causing serious car runoff pollution.**

Article below is from NOAA.

### What is the biggest source of pollution in the ocean?

Most ocean pollution **begins on land**.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant.>

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off or sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the **destruction of sensitive marine habitats** such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of **sediments** into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

Does this EIS have any reports on noise pollution?

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years and, "Noise Pollution

Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation

Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlmr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation->

[districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.](#)

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it.

Please read the Scientific articles written by NOAA, National Oceanic and Atmospheric Administration and other professional organizations, that prove that developments have ALWAYS polluted the water in every coastal development area.

**Has there been any reports in this EIS with regards to zooplankton and development and golf course pollution?**

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all Aquatic life there, and even the Manta Rays that go there to eat zooplankton from the Manta Ray tours at night, and they eat it during the day in that area as well because they need to eat 5 times their body weight in zooplankton daily. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

If you allow this bay to be developed, you will be contributing to the deaths of many types of marine life and there is NO WAY to stop this from happening because polluted runoff rain water from developments can't be fully stopped. It is what has happened in ALL coastal developments.

Please read the Scientific proof below.

It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide..."

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-off)." <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event>

[hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,had%20catastrophic%20impacts%20state%20wide.](#)

This article is by the Coral Reef Alliance here in Hawaii: "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawaii%CA%BB1%20reefs%20face%20major%20global,into%20Hawaii%CA%BB1%20waterways%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forneyeb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forneyeb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. **Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban runoff, may be exacerbated under high thermal stress.** In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

**The Chesapeake Bay has a foundation that is trying to save it due to runoff pollution that was caused by developments, and the Chesapeake Bay is a lot bigger than Keauhou Bay.** If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed because this bay is very small.

This Article is by the Chesapeake Bay Foundation, "Saving a National Treasure", states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow ..."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

**Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now, Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.**

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20leopardy.>

**If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay because it is so much smaller.**

**Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development, can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species."** <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0>.  
**Of:~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide.**

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

It's Been Proven Resort Developments KILL Marine Life

The manta rays go Keauhou Bay every night to eat zooplankton and if you allow this development that WILL have runoff water, you WILL be causing zooplankton to be seriously affected because as this article by Marin BIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are

highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem...

Here is another article that proves runoff from development in this area will hurt and kill plankton, by **Frontiers in Marine Science**, "**Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon** The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

"Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by Marine BIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to%20light%20and%20increases%20in%20predation.>

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "**Toxic Effects of Pollutants on Plankton** There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation." [https://scope.dpe.carnegiescience.edu/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dpe.carnegiescience.edu/SCOPE_12_3.6_chapter12_257-274.pdf)

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this could cause the manta ray food source to disappear and that will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on the manta ray tour for their income.

**Where in this EIS are the fully researched and studied reports on what will happen to plankton in Keauhou Bay if this development is allowed?**

**Where are the EIS reports on human density because this resort will increase this area in population. Below are reports that human population destroy coral reefs.**

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National Center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20are%20greater%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii: the less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment – especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=9630885&#:~:text=The%20less%20people%20at%20a%20site,there%20are%20the%20research%20found.&text=The%20million%20of%20tourists%20who%20world%20are%20new%20study%20said.>

If you allow this resort to be developed, you will be destroying the coral reefs in the bay. This bay is used by many locals who have a right to fish, canoe, swim, snorkel, paddle board, and surf here. It can't afford to be used by many thousands more people yearly.

If you allow Keauhou Bay to be developed there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that, "Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with metapopulation theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science

Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation" <https://www.nature.com/articles/s41893-022-01021-1>

**A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads. Where are the traffic study reports for this EIS? With 150 rooms comes over 150 cars because you must include employee cars, as well as visitors for the people staying in the resort, and what if the guests have more than one car?**

The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island cannot handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawai'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Please watch their video on their link below because it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists comes more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state, this time last year Hawaii island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks...

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added. <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on the Big Island has increased drastically and safety issues and infrastructure need to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-iams-lets-talk-about-solutions/>

Please, watch the NEWS video below on aerial footage in Hilo because the footage shown is the same thing that is happening on Aali Drive and Queen K HWY, and for the same reasons, all of these roads only have 2 lanes.

There are 2 developments already on Aali Dr. being built as of today, and more are scheduled for this road in the near future, and Aali Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems, traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening in Kona on the roads Kamehameha Schools wants to develop their resort, "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-iams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8423-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-iams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8423-8313ef8c4c19.html)

There was a crash on Aali Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direct traffic, and that adds even more traffic to this already seriously congested road, and Kamehameha Schools wants to add a resort on this road that will increase the traffic by 100's of cars.

Here is the Island News video on the crash on Aali Dr. <https://www.youtube.com/watch?v=FQSSnPDiI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Please read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawai'i Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans  
-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path as well as The Law of the Splintered Paddle below <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

### **The Law of the Splintered Paddle**

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law, "kanawai Māmālahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless (especially kupuna and keiki) across Hawai'i be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai'i. After being added back in 1978, the law is part of Hawai'i's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
  - Knowing and doing what is pono (right)
  - Standing for the principle that leadership privilege is earned
  - Taking kuleana (responsibility) for those we serve
  - Doing so with compassion, love, and respect
- "We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

**The Law of the Splintered Paddle is also on Kamehameha Schools website**, so they should want to help make Big Island roads become safer and not add to the traffic and possible traffic death toll problem. <https://www.kstbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-true-200-years-after-k>

Besides a resort development in Keauhou Bay causing runoffs that will severely pollute the bay as the above research and science articles have shown, causing marine life to die, it will also increase the bay's population that will seriously add to damaging even more coral, plankton and all marine life as well, and

the island has severe traffic issues already with increased death tolls rising, and a resort development in Keauhou Bay will totally increase even more traffic in these already severely congested traffic areas.

The Big Island Doesn't Have the Resources and Infrastructure for Another Resort

Please see the articles below because the Big Island doesn't have the resources or infrastructure to safely add another resort development on island and these other NEWS and Research articles prove this point.

### 1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

### 2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity.

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years. " <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

### 3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste

Hawai'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the east side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

### 4)"What happens to Hawaii Island's trash and recyclables? BY MICHELLE BRODER VanDyke HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder VanDyke Hawaii Island PUBLISHED 11:30 AM ET Dec. 17 The future of the landfill

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community support." <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables->

5) "The overwhelming plastic waste Hawaii visitors leave behind  
By Natasha Bourlin Aug 24, 2023

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/Plastic-waste-hawaii-visitors-leave-behind-18286076.php>

6) "A county commission drafts ordinance aiming to ban recyclables at West Hawaii'i landfill By Megan Moseley September 6, 2023 · 1:00 AM HST  
\* Updated September 6, 2023 · 2:02 PM

Hawaii'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill." <https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

7) "Hawaii'i County issues mandatory 25% water restriction for North Kona August 7, 2023 · 5:21 PM HST

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend." <https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

8) "Hawaii'i Water Supply Closely Monitored As Severe Drought Continues by Big Island Video Newson Nov 6, 2023 at 3:28 pm STORY SUMMARY

HAWAII'I COUNTY - Officials say a special focus will be placed on the South Kohala Water System, which is more susceptible to drought conditions." <https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-under-severe-drought/>

9) "Big Island Concerns About Water Quality Prompt A Lawsuit Over a Kona Sewage Plant Kealakehe sewage plant discharges more than 1 million gallons of wastewater into a lava pit near the ocean. By Paula Dobbyn / February 6, 2024

Settlement talks are scheduled in an environmental lawsuit involving a county-operated Big Island sewage plant in Kona." <https://www.civilbeat.org/2024/02/concerns-about-water-quality-prompt-a-lawsuit-over-a-kona-sewage-plant/>

10) "Researchers find sewage from an oceanfront Big Island community reaches nearshore waters Hawaii'i Public Radio | By Russell Subiono, Sophia McCullough Published December 20, 2021 at 5:56 PM HST

There are nearly 50,000 cesspools on the Big Island, with tens of thousands posing a risk to water resources, according to the Hawaii'i Department of Health." <https://www.hawaiipublicradio.org/the-conversation/2021-12-20/researchers-find-sewage-from-an-oceanfront-big-island-community-reaches-nearshore-waters>

11) "Kona coast faces stark wastewater tradeoffs Current situation

There are approximately 88,000 cesspools across the state, releasing more than 200,000 cubic meters of wastewater per day to the environment. <https://www.hawaii.edu/news/2021/09/10/kona-stark-wastewater-tradeoffs/>

We ask that you start figuring out how this can never happen again? These are the kind of issues that need to be resolved before you approve more development.

12) "BIG ISLAND NEWS HECO restores power after initiating emergency outages on Big Island by: Elizabeth 'Ufi Posted: Jan 30, 2024 / 09:43 AM HST Updated: Jan 30, 2024 / 04:15 PM HST

An unexpected loss of several large Hawaii Electric generators left some residents on Big Island without power for parts of the morning on Tuesday, Jan. 30." <https://www.khon2.com/big-island-news/heco-initiates-30-min-rolling-outages-after-loss-of-generators/>

13) Hawaii'i State News Update: Hawaiian Electric initiates rolling outages throughout Big Island February 13, 2024 · 5:23 PM HST

\* Updated February 14, 2024 · 4:21 PM

The emergency outages are being initiated in various areas around the entire island to prevent loss of power to an even greater number of customers. The timing and extent of the outages will depend on the amount of demand on the system and the availability of generators." <https://bigislandnow.com/2024/02/13/hawaii-island-customers-asked-to-reduce-electricity-use/>

14) "LOCAL NEWS

HECO issues rolling power outages around Big Island by: Emily Cervantes Posted: Feb 13, 2024 / 05:11 PM HST Updated: Feb 13, 2024 / 09:12 PM HST Hawaiian Electric initiated rolling outages for Big Island after several large generators became unavailable and reduced output Tuesday night." <https://www.khon2.com/local-news/heco-releases-conservation-alert-for-big-island/>

15) "Here's how power outages can have repercussions for Hawaii's water supply Hawaii'i Public Radio | By Savannah Harriman-Pote Published February 13, 2024 at 10:59 AM HST

Water departments on O'ahu and Hawaii'i Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply?

It is impossible to separate Hawaii'i's power system from its water system, said Kawika Uyebara, deputy director of Hawaii'i County's Department of Water Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-ohahu-are-asked-to-conserve-water-amid-power-outages>

16) U.S. Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "we're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) News Hawaii'i County issues mandatory 25% water restriction for North Kona

August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

18) Hawaii'i Water Supply Closely Monitored as Severe Drought Continues

by Big Island Video News

on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-ca%BBi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to their homes to help with power issues on the island.

20) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large/?rdt=52660)

21) "News Hawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 · 11:49 AM HST

According to the utility company, this is a usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will damage Keauhou Bay coral and marine life and, Big Island resources and infrastructure are currently being negatively affected from the development that is on island already, and there are years of new development that have already been approved, before having safe resources and infrastructures for new developments.

With these scientifically proven articles by some of the most professional scientists in the world, they say a serious population increase, as well as development and resort runoff that happens because of parking lots, and... with all coastal developments, it will be dangerous for Keauhou Bay to be developed because it will damage the marine ecosystems in the area.

Please, save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools because all of these articles prove it would be extremely damaging to the waters at Keauhou Bay.

Mahalo for your consideration,

Laura Johnson

Kailua Kona

## Jon Jokiel

I agree that Commercial Operations should be located away from sensitive areas. I'm not sure what low impact lodging means? If you are creating more lodging for the tourists, it's not going to be low impact. The additional traffic and congestion to this area is not sustainable unless roads are improved. I have doubts that cultural programming will actually be increased. I'm not in agreement with this Management Plan as it looks too big for this precious area.

## Keri Jones

Aloha, I am writing regarding concerns in the Keauhou Bay development project. Whereas I am happy it includes some restoration of cultural sites, I believe tourism housing and promotion overall in this area is a mistake. I have seen the damage tourism has done to the waters off Kona in the past 20 years, and without mandatory education and control of human impact, this will only worsen. As a resident, I am also concerned about further stressing the infrastructure in the Kona area. We have regular power outages, low hospital capacity, water system failures, sewage spills, and already inadequate road systems, especially in tsunami evacuation areas. Creating another tourism area in an already stressed bay at a time when the state is trying to shut down vacation rentals, which disperse the impact of tourism more widely, makes no sense. Let's take care of the land and water and people already here then talk about more tourist development. We don't want to be another Waikiki.

To whom it may concern,

Please reject Kamehameha Schools EIS for Keauhou Bay to become a Bungalow Resort. This is a VERY small bay and the added footprint of a 105 room Resort, that will include excess traffic, will have a **serious negative impact** in Keauhou Bay.

Please, Do NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near coastal development area. An article entitled, "*What is the biggest source of pollution in the ocean?*" by NOAA, *National Oceanic and Atmospheric Administration*, states, "*When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides.*" It also states, "*Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called nonpoint source pollution, which occurs as a result of runoff.*"

The trees you want to take down keep the runoff pollution from the golf course from going into the Bay. According to the National Library of Medicine, in their article, "*Putting the Earth in Play: Environmental Awareness and Sports*," shares that the golf industry uses **approximately 50 pesticide active ingredients**, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are **being held off** from running into the Bay by the very trees you want to take down.

Let's not forget the marine life that will be threatened by excess pollution and traffic. Keauhou Bay is the monk seals and the green sea turtle's habitat. More pollution and people will endangered these species.

This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced.

Kind Regards,  
Nawahine Kaho'opi'i

Senator Dru Mamo Kanuha

Please see attached.

**The Senate**  
**Office of the Majority Leader**

STATE CAPITOL  
HONOLULU, HAWAII 96813

**Senator Dru Mamo Kanuha Comments Regarding**  
**KEAHOHU BAY MANAGEMENT PLAN DRAFT EIS**  
Date Submitted: June 26, 2024

Thank you for the opportunity to provide my comments regarding the Draft Environmental Impact Statement (DEIS) of the Keaouhou Bay Management Plan, which was published on June 23, 2024 with the State of Hawai'i Office of Planning and Sustainable Development. At this time, I have been pleased with Kamehameha Schools' (KS) emphasis on community engagement throughout this process, including with my Senate office, to ensure that all community members have a chance to provide their mana'o on the impacts of KS' plans for the future.

Keaouhou Bay represents not only a revered community gathering place, but more importantly a living artifact of Native Hawaiian history. As the birthplace of Kauikeaouli, who would later become Kamehameha III and Mō'i o Ke Aupuni 'o Hawai'i in 1814, Keaouhou, in the ahupua'a of Kahalu'u, holds some of our most culturally significant ancient sites and historic event locations that forever changed Hawai'i's history.

With the high-use of Keaouhou Bay by residents, visitors, and community groups in present times, I see much value in devising comprehensive management plan that aims to address the challenges that have resulted from these multiple uses that sometimes conflict with one another in a relatively confined geographic space. To this regard, I appreciate KS' reorientation of commercial activities away from culturally-sensitive areas, as well as their intent to establish a place-based cultural education center.

Furthermore, I trust that KS will continue to engage the community throughout the entire process, especially concerning the proposed lodging in the resort-zoned plateau mauka of Keaouhou Bay. Ensuring ongoing dialogue and collaboration will be crucial to balancing development with the preservation of cultural and historical integrity, benefiting both current and future generations.

Mahalo again for the opportunity to provide my mana'o, and should you have any questions with regard to the foregoing, please do not hesitate to reach out to my office.

Me ka ha'aha'a,

Senator Dru Mamo Kanuha  
3<sup>rd</sup> Senatorial District (Kona, Ka'u, Volcano)

## Alexis Kerver

Aloha pumehana,

My name is Alexis Kerver. I grew up in Kealahou and currently reside in Ka'u. My 'ohana resides in Holualoa and I am a haumana of a hālan located in Keaouhou mauka. Keaouhou Bay is a special place to my heart and I care deeply about the health and well-being of this honorable and significant place. I have a Masters degree in Natural Resources and Environmental Management with a speciality in Environmental Policy and Economics from the University of Hawai'i at Mānoa. I am writing to provide brief commentary on the draft EIS for the Keaouhou Bay Management Plan, specifically in regard to the proposed bungalow resort development. While I acknowledge and agree with the need for reorganization of existing infrastructure and activities, and the potential economic benefits of this project, I have significant concerns regarding the environmental and social impacts of the proposed bungalow resort, particularly related to water usage and environmental protection. I also find that the current Draft EIS lacks sufficient detail on these critical issues.

### Environmental Concerns

**Removal of Vegetation Buffer:** The proposed development plans to remove the last buffer zone of vegetation that protects Keaouhou Bay from runoff. This vegetation is essential for filtering pollutants, reducing erosion, and maintaining the bay's water quality. Its removal could lead to increased runoff, pollution, and sedimentation, negatively impacting the marine ecosystem.

**Recommendation:** Retain and enhance the existing vegetation buffer zone by removing the invasive vegetation and restoring a native dryland forest. Profit generated from the new recreation services and restaurant proposed in the project management plan could support the restoration of this native dryland forest and provide conservation jobs and educational opportunities for the youth and residents of Kona. Regular monitoring of water quality should be mandated to ensure that the development of the other project components do not adversely impact the bay.

### Water Usage Concerns

**Drought Conditions and Water Consumption Limits:** Kona is experiencing significant drought conditions, and residents are frequently subject to water consumption limits. Introducing another resort in this area, which already has substantial resort development, will place further strain on our limited water resources. This development will likely, in the long term, prioritize water use for tourists over residents, exacerbating existing water shortages.

**Recommendation:** Develop a comprehensive water management plan that prioritizes conservation and sustainable use. This should include advanced water-saving technologies such as greywater recycling, rainwater catchment, and low-flow fixtures. Additionally, the project should commit to offsetting its water use by contributing to community water conservation initiatives and infrastructure improvements.

### Insufficient Information in Draft EIS

**Lack of Water Consumption Plan:** The current Draft EIS does not provide sufficient information on Kamehameha Schools' plan for water consumption. Given the severe drought conditions and recurring water restrictions in Kona, a detailed water management strategy is crucial for assessing the project's feasibility and impact.

**Recommendation:** The EIS should include a detailed water consumption plan outlining how the resort will source, use, and conserve water. This plan should address potential impacts on local

water supplies and include mitigation measures to ensure that the development does not exacerbate water scarcity for residents.

I understand you may read the above statement pertaining to water and think about the numerous operations in Kona already using limited water resources and say "everyone else is doing it why not us", however, for this exact reason it is every more pertinent that Kamehameha Schools leads by an example in the area of development and considers these broader impacts often overlooked by foreign developers more deeply. A precedent of over-development in coastal regions has already been set by existing development projects (for example, Hokulua and Kohanaiki). Kamehameha Schools has the opportunity to exemplify pono development and restore the area being considered for a bungalow resort to a native dryland forest that truly protects and preserves Keaouhou Bay and provides meaningful opportunities for our youth.

While the proposed bungalow resort development by Kamehameha Schools in Keaouhou Bay may offer economic benefits, the removal of the vegetation buffer and the increased demand for water in an area already struggling with drought conditions are significant concerns.

As established care-takers of 'āina with an endowment valued at 14.7 Billion (Google Financial, 2021), I trust that Kamehameha Schools and project leaders will 1) understand fully the potential irreversible environmental damage a resort development will have on Keaouhou Bay, 2) deeply consider the "opportunities" this provides for our keiki and local residents, and 3) provide the community with a robust and complete EIS statement, including a SMA Permit Application, prior to making any decisions to move forward.

I feel the Keaouhou Bay Management Plan is well intentioned and mostly provides a great vision for reorganizing the existing activities and providing some new opportunities and revenue streams. I absolutely and firmly oppose the development of the bungalow resort and encourage Kamehameha Schools to reconsider this component of the plan. Mahalo for considering my commentary and recommendations.

Respectfully,

Alexis Kerver, MEM,

Assistant Researcher/West Hawaii Site Facilitator, UH Mānoa CTAHR

### Insufficient Information in Draft EIS

- Lack of Water Consumption Plan:** The current Draft EIS does not provide sufficient information on Kamehameha Schools' plan for water consumption. Given the severe drought conditions and recurring water restrictions in Kona, a detailed water management strategy is crucial for assessing the project's feasibility and impact.
- Recommendation:** The EIS should include a detailed water consumption plan outlining how the resort will source, use, and conserve water. This plan should address potential impacts on local water supplies and include mitigation measures to ensure that the development does not exacerbate water scarcity for residents.

I understand you may read the above statement pertaining to water and think about the numerous operations in Kona already using limited water resources and say "everyone else is doing it why not us", however, for this exact reason it is every more pertinent that Kamehameha Schools leads by an example in the area of development and considers these broader impacts often overlooked by foreign developers more deeply. A precedent of over-development in coastal regions has already been set by existing development projects (for example, Hoku'i'a and Kohanaiki). Kamehameha Schools has the opportunity to exemplify pono development and restore the area being considered for a bungalow resort to a native dryland forest that truly protects and preserves Keauhou Bay and provides meaningful opportunities for our youth.

While the proposed bungalow resort development by Kamehameha Schools in Keauhou Bay may offer economic benefits, the removal of the vegetation buffer and the increased demand for water in an area already struggling with drought conditions are significant concerns.

As established care-takers of 'āina with an endowment valued at 14.7 Billion (Google Financial, 2021), I trust that Kamehameha Schools and project leaders will 1) understand fully the potential irreversible environmental damage a resort development will have on Keauhou Bay, 2) deeply consider the "opportunities" this provides for our keiki and local residents, and 3) provide the community with a robust and complete EIS statement, including a SMA Permit Application, prior to making any decisions to move forward.

I feel the Keauhou Bay Management Plan is well intentioned and mostly provides a great vision for reorganizing the existing activities and providing some new opportunities and revenue streams. I absolutely and firmly oppose the development of the bungalow resort and encourage Kamehameha Schools to reconsider this component of the plan. Mahalo for considering my commentary and recommendations.

**Subject:** Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT

**Categories:** Green Category

To Whom It May Concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools Environment Impact Statement (EIS) for Keauhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT on Keauhou Bay as stated in all the different researched articles below.

Please, DO NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is scientifically proven that developments pollute nearby waters both during and after development.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have ALWAYS polluted the water in EVERY coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keauhou Bay is their habitat and this development WILL be CHANGING an Entire Ecosystem.

#### ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keauhou Bay.

The Green Sea Turtle swims in Keauhou Bay weekly and the monk seal has also been seen swimming and resting in Keauhou Bay. Both of these marine animals are on the endangered species list.

Endangered Species Act

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to —

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-ac>

#### FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED

The green sea turtle is federally protected and can be seen in Keauhou Bay weekly.

The following article that states: "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Allowing this development WILL POLLUTE Keauhou Bay. The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!) states this fact clearly. Keauhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen because developments have been shown to ALWAYS pollute the water is that is nearby.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

#### THE ENDANGERED MONK SEAL WILL BE AFFECTED

Keaou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keaou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keaou Bay will likely be changed forever.

This information is from a NOAA Scientist: "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie'!" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawai'i Revised Statutes (HRS) Chapter 195D and Hawai'i Administrative Rules (HAR) 13-124." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

Keaou Bay is the monk seals and the green sea turtle's habitat. Allowing a bungalow resort to be developed in Keaou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to protect the land around Keaou Bay from developments that destroy the habitat of these endangered species with pollution and runoff.

Does this EIS have any reports on the endangered species that frequent Keaou Bay? This is their habitat and it needs to be "conserved".

Under the Conservation Program there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keaou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keaou Bay and the surrounding area during the building phase of this enormous project.

#### GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinogolf.com/pages/the-environmental-impact-of-golf-courses>

"These pesticides will be in the pollution runoff that will enter Keaou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable!

Please read from Wikipedia. "

Most drains have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping system."[https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells)

The pavement from this development will cause pollution to runoff into Keauhou Bay because this treed land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keauhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> where the Hawai'i government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff.

These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keauhou Bay and for these endangered species habitat.

Under Section 2 (b) of the Endangered Species Act - Keauhou Bay MUST BECOME A CONSERVATION AREA for these endangered species. It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keauhou Bay.

#### ALGAE BLOOMS KILL CORAL AND MARINE LIFE

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer.

When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course developments. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to

the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution..." <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAHOHU BAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

FURTHERMORE: "If there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

## ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN

Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keaouhou Bay?

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keaouhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keaouhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

The article below is from NOAA regarding motor vehicle engines and pollution to the sea.

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20can%20be%20a%20pollutant.>

Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects

News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a new report from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%20early%2085%20percent,pipeline%20s pills%2C%20says%20a%20new>

## The Impact Of Stormwater – Car Emissions

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershed.org.au/blog/the-impact-of-stormwater-car-emissions/>

## NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE

Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keaouhou Bay during development?

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

## How Does Noise Pollution Harm Marine Species?

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlmr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation->

determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban runoff)." <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,hard%20catastrophic%20impacts%20state%20wide.>

This article is by the Coral Reef Alliance here in Hawai'i. "An ecosystem under threat Hawai'i's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawai%CA%BBi%20reefs%20face%20major%20global,into%20Hawai%CA%BBi%20waterways%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban runoff, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawai'i." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The coral all over Hawai'i has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

"That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%20based%20sources,and%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide.>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water... (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

It's Been Proven Resort Developments KILL Marine Life

This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-*a* concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

The ecosystem is fragile and interconnected as is stated in this article: "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria) indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20al,so%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

#### HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH

Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life." <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human->

impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keaouhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations>.

It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keaouhou Bay, it will bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation>.

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in Nature Sustainability." <https://abcnews-go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%20the%20research%20found,&text=The%20millions%20of%20tourists%20who,world%20d%20a%20new%20study%20said>.

By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation>.

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation" [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhalhijAmWaq453rRgN0ajWel9mR3ZoTv0PyGzA5lc\\_H001zcHNIP3ASnhcgkRy6\\_vkLPw49dbmBYoXSg3Y1MgQIGBZsapdGUH1701SLbu9x5P1-3xD4Kxl4T0slvgQ1a7Z2Rt3Ubraxpodjd2AonNISmWSuxB7jEDdpj80Gjpx71TjWdCXvFKjZYen djfj3Sw\\_dnaUg5IZlhcgPBDImmaH15yqT5Q%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhalhijAmWaq453rRgN0ajWel9mR3ZoTv0PyGzA5lc_H001zcHNIP3ASnhcgkRy6_vkLPw49dbmBYoXSg3Y1MgQIGBZsapdGUH1701SLbu9x5P1-3xD4Kxl4T0slvgQ1a7Z2Rt3Ubraxpodjd2AonNISmWSuxB7jEDdpj80Gjpx71TjWdCXvFKjZYen djfj3Sw_dnaUg5IZlhcgPBDImmaH15yqT5Q%3D&tracking_referrer=abcnews.go.com)

INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS

Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Village, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. Worldwide,

hotels produce almost 300,000 tonnes of waste each year." <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Keauhou Bay. On Hawaii's Island, we are already struggling to meet the increasing need for resources and infrastructure.

Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawaii's landfill

September 17, 2023

The West Hawaii's Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawaii's landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

A County commission drafts ordinance aiming to ban recyclables at West Hawaii's landfill

By Megan Moseley September 6, 2023

Hawaii's County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawaii's County Director of Environmental Management, told commissioners the West Hawaii's Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

Time's Up For Landfills

'Gentle' demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawaii's government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

<https://buildingindustryhawaii.com/2024/04/times-up-for-landfills/>

Drought Conditions On Hawaii's Island Prompt Water Supply Message

by Big Island Video News  
on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information from the U.S. Drought Monitor. There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'i.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawai%CA%BBi-island-prompt-water-supply-message/>

U.S.

Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to significant droughts, and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the world's largest surfing wave pool opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. " ... We are on the verge of a greater catastrophe."

"We are in a water crisis, that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

UPDATE: HELCO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power->

Big power supply problems continue to plague Hawaii Island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

-If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrulumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES

A Resort Development WILL Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawai'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: All of these roads only have two lanes!

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=-FQSnPDji8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii's Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

MORE ARTICLES HIGHLIGHTING INFRASTRUCTURE AND RESOURCE DEFICITS, INCLUDING WATER, TRASH, ELECTRIC AND WASTEWATER:

1) Hawaii Deals with Burgeoning Waste Management Problem

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff | January 10, 2020

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled." <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

2) "Big Island Now readers seem to agree that there's likely no single solution for slowing down the timeline of the West Hawai'i Sanitary Landfill reaching capacity.

"The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years." <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste Hawai'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the East side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

Water departments on O'ahu and Hawaii Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply?

It is impossible to separate Hawaii's power system from its water system, said Kawika Uyebara, deputy director of Hawaii's Department of Water

Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-conserve-water-amid-power-outages>

16) US Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and it isn't addressed soon, one community member says, "We're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) News Hawaii'i County issues mandatory 25% water restriction for North Kona August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

18) Hawaii's Water Supply Closely Monitored As Severe Drought Continues

by Big Island Video News  
on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawaii, the Hawai'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-CA%BBi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiiaelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

19) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large/?rdt=52660)

20) "Hawaiian Electric asking Big Island customers to conserve power due to down generators

March 25, 2024 - 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

#### HISTORICAL AND CULTURAL SIGNIFICANCE:

The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai'i. After being added back in 1978, the law is part of Hawaii's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

-Caring for and serving one's people

-Knowing and doing what is pono (right)

-Standing for the principle that leadership privilege is earned

-Taking kuleana (responsibility) for those we serve

-Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."

The Law of the Splintered Paddle is also on Kamehameha Schools' website. The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.

#### IN CONCLUSION

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that adding another development is going to cause devastating, lasting, effects on the Eco-system at Keauhou Bay.

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other.

In addition to the natural disaster this will cause, Hawai'i Island is already having serious infrastructure and resource issues that have yet to be solved.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace

of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels.

The trees that currently stand on the land that is threatened to be developed clearly protect the marine life and environment from further damage. The location is not suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

Mahaalo,

Kellie Kilcup

---

**From:** Patricia Knezek <[REDACTED]>  
**Sent:** Monday, August 5, 2024 4:56 AM

**Cc:** Patricia Knezek  
**Subject:** Kamehameha Schools EIS Draft: For Keauhou Bay WILL HAVE NEGATIVE IMPACT

**Categories:** Yellow Category

Hello,

Below I cut and past the already researched letter that has been provided. But I want to take a moment to send a personal plea to reject the Kamehameha Schools Environment Impact Statement (EIS) for Keauhou Bay to become a Bungalow Resort. My sister and I own a condo at Keauhou Palena. We deliberately bought in this area because it was \*not\* overdeveloped, it had easy access to a beach used by locals, it is a quiet and relatively low-traffic area, it is relatively unpolluted, and it offers a sense of ohana. I lived on Oahu for a while as a child, and I have watched that disappear there. My sister and I bought this condo to retire in. We are NOT resort people, we do not support this development. As noted below, the scientific evidence indicates that the development \*will\* have a negative impact on the area and its flora and fauna. Please leave this local area local.

Thank you - Patricia Knezek  
Keauhou Palena #1304

\*\*

To Whom It May Concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools Environment Impact Statement (EIS) for Keauhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT on Keauhou Bay as stated in all the different researched articles below.

Please, DO NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is **scientifically proven** that developments pollute nearby waters both **during and after development**.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have **ALWAYS** polluted the water in **EVERY** coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keaouhou Bay is their habitat and this development **WILL be CHANGING an Entire Ecosystem.**

#### **ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT**

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keaouhou Bay.

The Green Sea Turtle swims in Keaouhou Bay weekly and the monk seal has also been seen swimming and resting in Keaouhou Bay. Both of these marine animals are on the endangered species list.

#### **Endangered Species Act**

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-ac>

#### **FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED**

The green sea turtle is federally protected and can be seen in Keaouhou Bay weekly.

The following article that states: "**POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES**"

#### **Why does Hawaii have a runoff problem?**

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According

to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

**Allowing this development WILL POLLUTE Keaouhou Bay.** The above article, written in 2014 (because runoff water from developments were polluting the ocean even then!!!) states this fact clearly. Keaouhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen **because developments have been shown to ALWAYS pollute the water is that is nearby.**

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the [Endangered Species Act \(ESA\)](#), and additionally protected by [Hawai'i Revised Statutes Chapter 195D \(HRS\)](#) and [Hawai'i Administrative Rules \(HAR\) 13-124](#)." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

#### **THE ENDANGERED MONK SEAL WILL BE AFFECTED**

Keaouhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keaouhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

**Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keaouhou Bay will likely be changed forever.**

This information is from a NOAA Scientist: "**Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!'**" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered [Hawaiian monk seals](#). They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the [Marine Mammal Protection Act \(MMPA\)](#), as well as locally by Hawai'i Revised Statutes (HRS) [Chapter 195D](#) and Hawai'i Administrative Rules (HAR) [13-124](#)." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

**Keauhou Bay is the monk seals and the green sea turtle's habitat.** Allowing a bungalow resort to be developed in Keauhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. **By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.**

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to **protect the land around Keauhou Bay** from developments that destroy the habitat of these endangered species with pollution and runoff.

**Does this EIS have any reports on the endangered species that frequent Keauhou Bay? This is their habitat and it needs to be "conserved".**

Under the **Conservation Program** there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hrscurrent/Vo103\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vo103_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hrscurrent/Vo103\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vo103_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keauhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keauhou Bay and the surrounding area during the building phase of this enormous project.

#### **GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS**

"The golf industry uses [approximately 50 pesticide active ingredients](#), including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keauhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable!

Please read from Wikipedia, "

Most drains have a single large exit at their point of discharge (often covered by a [grating](#)) into a [canal](#), river, lake, [reservoir](#), sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping system." [https://en.wikipedia.org/wiki/Storm\\_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#:~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells)

The pavement from this development will cause pollution to runoff into Keauhou Bay because this treed land that will become a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keauhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEE-Z.15.14.pdf> where **the Hawai'i government states that Natural Ground Cover has 10% runoff, where has development has 55% runoff. So, even if you have storm drains the pavement this development will create will cause more runoff into Keauhou Bay than the Natural Ground Cover that is has now, that has been protecting the bay from golf course pollution for years.**

**These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keauhou Bay and for these endangered species habitat.**

Under Section 2 (b) of the Endangered Species Act - **Keauhou Bay MUST BECOME A CONSERVATION AREA for these endangered species.** It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keauhou Bay.

#### **ALGAE BLOOMS KILL CORAL AND MARINE LIFE**

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer.

When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

**Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.**

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course developments. Though this development is not a golf course development,

it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

### **Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?**

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution..

" <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAUHOU BAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

### **Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?**

This needs to be fully assessed because **you will be changing an entire ecosystem** to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

**FURTHERMORE:** "If there are [toxic algae blooms](#), like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservation.org/blog/2023/03/31/what-sea-foam/>

## **ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN**

### **Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?**

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keauhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

### **The article below is from NOAA regarding motor vehicle engines and pollution to the sea.**

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife

habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirty%20ocean%20be%20a%20pollutant.>

### **Land-based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects**

News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a [new report](#) from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution. The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/oil-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%2D%20Nearly%2085%20percent,pipeline%20spills%2C%20saves%20a%20new>

### **The Impact Of Stormwater – Car Emissions**

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating

local waterways." <https://www.stormwatershedshelpers.org.au/blog/the-impact-of-stormwater-cal-emissions/>

### **NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE**

**Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keauhou Bay during development?**

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

### **How Does Noise Pollution Harm Marine Species?**

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

### **What is ocean noise?**

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and

offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

### **LEARN FROM OTHERS: RUN-OFF FROM DEVELOPMENT KILLS**

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments. Chesapeake Bay is **a lot bigger** than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed. Keauhou Bay is a much smaller ecosystem.

**This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states,** "...runoff is a significant source of harmful nitrogen pollution that continues to grow..."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20leopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay due to its size and fragility.

## **MANTA RAY HABITAT, CORAL REEF BLEACHING, & MARINE LIFE ~ THE DEVASTATING EFFECTS OF DEVELOPMENT ON THE OCEAN**

**Are there any reports in this EIS about what the impact to the coral, marine life, plankton especially zooplankton will be because of this development?**

The studies below show that developments kill coral, and marine life. Zooplankton are part of this marine life and they are also killed and negatively affected. Zooplankton are food for manta rays. Manta rays are in Keauhou Bay every night to eat zooplankton, and are often seen here during the day as well.

Allowing this bay developed will also be a death sentence for many types of marine life including planktons. There is NO WAY to stop this from happening due to the fact that polluted runoff rain water from developments can't be fully stopped. This has been shown to happen in ALL coastal developments.

Please read the Scientific articles below.

### **It's Been Proven Developments Severely Pollute Nearby Waters**

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawaii". Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts statewide...

This was the third major bleaching episode in Hawaii over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban runoff). " <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,hard%20catastrophic%20impacts%20state%2Dwide.>

**This article is by the Coral Reef Alliance here in Hawaii.** "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/where-we-work/hawaiian-islands/#:~:text=Hawai%CA%BBi's%20reefs%20face%20major%20global,into%20Hawai%CA%BBi's%20waterways%20every%20day.>

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "**Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019...**

**We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban runoff, may be exacerbated under high thermal stress.** In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The coral all over Hawaii has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keauhou Bay will be devastating to the coral, reef fish, and all aquatic life there. Manta Rays need to eat 5 times their body weight in zooplankton daily. Their population will be severely affected should the plankton die. Please see the cited information below.

**"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.**

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat>

**Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development,... can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species."** <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=impacts%20from%20land%2Dbased%20sources,and%20mortality%20in%20sensitive%20species.>

Article by Environmental Evidence, "**Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide.**" <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide.>

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. **Land-based runoff and pollution discharges can result from dredging, coastal development... This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.**

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_coral/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.](https://oceanservice.noaa.gov/education/tutorial_coral/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals.)

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water..." (All of those are show up in every development project.)

**Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival"** [https://oceanservice.noaa.gov/education/tutorials/coral\\_coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorials/coral_coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

#### **It's Been Proven Resort Developments Kill Marine Life**

This article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem...."

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. **This occurred in a relatively short time considering that the experiment lasted less than three weeks.** The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-a concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

**The ecosystem is fragile and interconnected as is stated in this article:** "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, **"Toxic Effects of Pollutants on Plankton: There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage.** Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in

natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The manta ray food source will likely disappear. This will be devastating for the manta ray populations. Furthermore, if manta rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the manta ray tour for their income.

#### **HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH**

**Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?**

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than 6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: **The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life.**" <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

**Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.**

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal->

### **Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill**

September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

### **A County commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill**

By [Megan Moseley](#), September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

### **Time's Up For Landfills**

'Gentle' demolition strategies can help preserve resources

16

PAULA BENDER April 2, 2024

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

<https://buildingindustryhawaii.com/2024/04/times-up-for-landfills/>

### **Drought Conditions On Hawai'i Island Prompt Water Supply Message**

by Big Island Video News  
on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information [from the U.S. Drought Monitor](#). There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

### **From a Water Supply news release:**

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawai%CA%BBi-island-prompt-water-supply-message/>

[U.S.](#)

### **Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues**

By [LiCohen](#)

17

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to [significant droughts](#), and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the [world's largest surfing wave pool](#) opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. "... We are on the verge of a greater catastrophe."

**"We are in a water crisis, that has to be made very clear,"** Wayne Tanaka, director of Sierra Club of Hawaii, told CBS News, saying that if the reasons for this crisis aren't soon addressed, "We may come to a point where we have to decide ... who gets water and who doesn't."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

#### UPDATE: HELCO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity use is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

#### Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind

18

generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

#### Big power supply problems continue to plague Hawaii Island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

**The company explained that it faces an "extremely tight" supply of power at peak use periods,** especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

#### Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

19

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

**-If there is not enough electricity to meet demand**, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

## **FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES**

**A Resort Development Will Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?**

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars, plus the regular locals who go there to paddle and enjoy the bay. All this could range in over 300 cars a day because of this resort development.

The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawaii News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "**Hawaii Island has most traffic fatalities in state**. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

**"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here,"** he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

**The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.**

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." This is happening all over Big Island. <https://www.civilbeat.org/2024/02/langty-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: **All of these roads only have two lanes!**

There are two developments already on Alii Drive being built as of today; and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313e8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313e8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=FQ5snPDjI8>

**Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.**

**Read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE:**

3) **Hawaii Island Has Decades of Landfill Space But Still Faces Challenges in Dealing With Its Waste**  
Hawaii'i Public Radio Published January 9, 2020 at 5:00 AM HST

"Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the East side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona." <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

4) **"What happens to Hawaii Island's trash and recyclables?"** By MICHELLE BRODER VANDYKE HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder Vandyke Hawaii Island PUBLISHED 11:30 AM ET Dec. 17 The future of the landfill

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community support." <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables->

5) **"The overwhelming plastic waste Hawaii visitors leave behind**  
By Natasha Bourlin Aug 24, 2023

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/plastic-waste-hawaii-visitors-leave-behind-18286076.php>

6) **"A County commission drafts ordinance aiming to ban recyclables** at West Hawaii'i landfill By Megan Moseley September 6, 2023 · 1:00 AM HST  
\* Updated September 6, 2023 · 2:02 PM

Hawaii'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill." <https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

7) **"Hawaii'i County issues mandatory 25% water restriction** for North Kona August 7, 2023 · 5:21 PM HST

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokohau Deepwell over the weekend." <https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii'i Island...

Here are some other statistics that are even more staggering:

-28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees

-13% of pedestrians hit at 20 mph actually suffer fatality

-73% of pedestrians hit at 40 mph suffer fatality

-25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!

-56% of fatal crashes were the result of alcohol or drugs

-41% of fatal crashes occurred in light trucks and vans

-49% of crashes occur during the day, outside of peak traffic hours

-Of all the crash fatalities, most were males between 20 to 24-years old.

**"That's just Big Island traffic,"** is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

Water departments on O'ahu and Hawai'i Island have advised customers to conserve water ahead of possible storm-related power outages this month.

But what does the power grid have to do with the water supply?

It is impossible to separate Hawai'i's power system from its water system, said Kawika Uyebara, deputy director of Hawai'i County's Department of Water Supply. <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-ohahu-are-asked-to-conserve-water-amid-power-outages>

16) **US Hawaii is "on the verge of a greater catastrophe,"** locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is *ola i ka wai*, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "We're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

17) News Hawai'i County issues mandatory 25% water restriction for North Kona August 7, 2023 · 5:21 PM HS

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

18) **Hawai'i Water Supply Closely Monitored As Severe Drought** Continues

by Big Island Video News on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawai%C4%BBi-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

**19) "Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."**

[https://www.reddit.com/r/Bigisland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_la/rlge/7rtdt=52660](https://www.reddit.com/r/Bigisland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_la/rlge/7rtdt=52660)

**20) "Hawaiian Electric asking Big Island customers to conserve power due to down generators**

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

## **HISTORICAL AND CULTURAL SIGNIFICANCE:**

### **The Law of the Splintered Paddle**

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

26

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kanāwai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai'i. After being added back in 1978, **the law is part of Hawaii's State Constitution today.**

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

**"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."**

**The Law of the Splintered Paddle is also on Kamehameha Schools website.** The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

**Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.**

## **IN CONCLUSION**

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that allowing this development is going to cause devastating, lasting, effects on the Eco-system in Keauhou Bay and "The Endangered Species Act of 1973 (ESA or "The Act"; 16 U.S.C. § 1531 *et seq.*) is the primary law in the United States for protecting and conserving imperiled species. Designed to protect critically imperiled species from *extinction* as a "consequence of economic growth and development untempered by adequate concern and conservation", the ESA was signed into law by President **Richard Nixon** on December 28, 1973. The **Supreme Court of the United States** described it as

27

"the most comprehensive legislation for the preservation of endangered species enacted by any nation".<sup>[1]</sup> [https://en.wikipedia.org/wiki/Endangered\\_Species\\_Act\\_of\\_1973](https://en.wikipedia.org/wiki/Endangered_Species_Act_of_1973)

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other. This land MUST be conserved in order to keep Keauhou Bay safe for all the marine life to be able to live there for years to come.

In addition to the natural disaster this will cause, Hawaii Island is already having serious infrastructure and resource issues that have yet to be solved. These issues MUST be solved before considering another resort development on Big Island.

We need to work in harmony with the land and the people before pushing forward with new developments, especially in sacred and special places like Keauhou Bay, the birthplace of King Kamehameha III. Keauhou Bay is a small, fragile Eco-system, that is already pressured by boating, golfing, population issues, and hotels that are all around the entire bay.

The trees that currently stand on the land that is threatened to be developed clearly protects the marine life and environment from further damage. The location is NOT suitable for this kind of development for both environmental and infrastructure reasons.

The cost of what stands to be lost is far too high to allow this to happen.

Please save Keauhou Bay's marine life and help the island's resources by saying NO to a Bungalow Resort built by Kamehameha Schools.

## Paul Koenigshofer

From what I can see now this plan is far too big. We already face traffic problems from the tour boat operators that are overusing the Bay. Too many tourists speeding up and down Kam 3 to get to the tours. Now with your proposed plan to expand development the traffic will only become worse. I saw how big you parking lots are and worry very much about how many people this is going to put in our very small bay. I also worry what all these cars will do to the water quality. The oil, and the tire dust that will run into the bay when it rains. This will be devastating. I'm also worried about what your develop plan will do to the special place where there are some old ruins of old Hawaiian settlement and shoreline on the south/end tip of the bay, and also the small beach area, and end of Slide. Also the King's Birthplace area. I believe injecting this amount of people into the Bay is going to be too harmful and life-changing for what it is now. Way too much parking, way too many tour operations, and way too much parking and pavement. Please do not let it happen like this. I believe it will ruin this sacred and beautiful Bay, and change our neighborhood drastically forever.

## Jessica Kuzmier

To who it may concern,

I am writing in opposition to the current EIS Draft for Keauhou Bay. I am not opposed to the education center, but I believe that the proposed bungalow resort plan will do untold damage to the landscape and to the ocean below. I have read up on this area, and I believe that the undeveloped land is a kind of sink to absorb a great deal of fertilizer and runoff from the golf course. I also have heard how the undeveloped land is a barrier for when there is heavy rain, preventing harmful algae blooms due to heavy rain. Given this, although it is claimed to be 'low impact', any infrastructure leading to the bungalows will only decimate what is right now acting as a barrier to additional damage to the bay.

I really like the idea of the historical sites being cleaned up and believe this would provide a wonderful educational opportunity for the students to undertake this mission. I've heard that the KS would also restore the cave there, which I believe would be wonderful as well. But I can't in good conscience feel that this proposed resort is good for the area and the community. As the island (and state in general) is entering a period of considering the impacts of overtourism, adding a whole new one in an area that is a historical site with ecological and cultural heritage does not seem aligned with this objective. I am also against the development of Old Kona Road, as this also seems to be carved right into a fragile ecosystem. If it does anything at all to mitigate traffic congestion I believe it will be offset by the additional traffic that the resort will create and all the additional parking services that will be entailed.

Mahalo for taking the time to hear my views. Jessica Kuzmier, Kona Town

**Subject:** Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT

**Categories:** Green Category

To who it may concern,

I am writing in opposition to the current EIS Draft for Keauhou Bay. I am not opposed to the education center, but I believe that the proposed bungalow resort plan will do untold damage to the landscape and to the ocean below. I have read up on this area, and I believe that the undeveloped land is a kind of sink to absorb a great deal of fertilizer and runoff from the golf course. I also have heard how the undeveloped land is a barrier for when there is heavy rain, preventing harmful algae blooms due to heavy rain. Given this, although it is claimed to be 'low impact', any infrastructure leading to the bungalows will only decimate what is right now acting as a barrier to additional damage to the bay.

I really like the idea of the historical sites being cleaned up and believe this would provide a wonderful educational opportunity for the students to undertake this mission. I've heard that the KS would also restore the cave there, which I

believe would be wonderful as well. But I can't in good conscience feel that this proposed resort is good for the area and the community. As the island (and state in general) is entering a period of considering the impacts of overtourism, adding a whole new one in an area that is a historical site with ecological and cultural heritage does not seem aligned with this objective. I am also against the development of Old Kona Road, as this also seems to be carved right into a fragile ecosystem. If it does anything at all to mitigate traffic congestion I believe it will be offset by the additional traffic that the resort will create and all the additional parking services that will be entailed.

Mahalo for taking the time to hear my views. Jessica Kuzmier, Kona Town

**Categories:** Green Category

Aloha,  
I am writing to express my support for the Keaouhou Bay Management Plan and the draft EIS. I have been scuba diving at Keaouhou since I logged my first manta ray night dive on August 13, 1985. In the intervening 38 years, and over 14,500 logged scuba dives, I've seen very few improvements to the infrastructure surrounding the bay despite a giant increase in the recreational and commercial use of the bay.  
I have been fortunate to see the Kamehameha presentation of their proposed plans to improve the shore facilities twice. They display a commitment to improving the area culturally, structurally, recreationally and commercially.

I think they seem to have a good plan to greatly improve the land around Keaouhou Bay for the community, the environment and Kamehameha schools.

Please advance the proposed improvements to Keaouhou Bay.

Thank you.  
Sincerely  
Keller Laros

Dear Kamehameha School Trustees:

I am writing to ask that you reconsider (and reject) the current management plan for Keaouhou Bay. Although the plan may advance point #4 of your mission ["Optimize and invest in revenue opportunities that align to the betterment of our beneficiaries or the management of our assets and provide long-term economic returns"], I believe that it will permanently negatively impact points 1-3 of your mission and therefore the plan should be rejected. I do NOT believe that the current plan will:

- Establish and expand place-based cultural stewardship activities to cultivate a strong Native Hawaiian identity.
- Support engaging, high-quality, and meaningful educational experiences that include a strategic collaboration with other organizational partners
- Support nurturing a positive and enduring relationship with community members within the Keaouhou Bay region that share similar values and a commitment to education, 'āina, and culture

Who am I and why do I think this? I am a visitor from Pennsylvania who has been coming to the Big Island for more than fifty years. I first came right out of high school—in 1974. I came again in 1983 with my husband. And in 2000, I came with my husband and son, and we've been coming back almost every year since 2000. I am an emerita law professor and I've spent two sabbaticals here. Since my retirement, I've been spending 10 weeks here each year. We try to learn about Hawaii's history and respect the culture while we are visiting and while we are away. Starting with our 2000 visits, we have stayed in the Keaouhou Bay area, in rentals located on or off Kam3. I was around when the Kamehameha Schools decided to allow owners—many of whom are from the Mainland - to convert their leasehold interests to fee simple interest ownership.

Over the course of 50 years, I've seen many changes on the Big Island—some are positive, but many are not. The land and the ocean are central to all of Hawaii and its communities. They are certainly central to Native Hawaiian identity. But they are also central to all the kamaaina who live here and to visitors like me. I fear that the short term financial gain that the Kamehameha schools might realize by developing "sustainable, low rise, low-impact lodging on resort-zoned upper plateau of Bay" will be offset by the long-term impacts of yet another resort development. I know from friends and from news sources that Hawaii has issues with sufficient water and sewage treatment. It seems sensible to make sure these issues are addressed before putting more strain on the existing systems. The plan will necessitate additional parking—I know from my experiences at home that covering land with parking creates issues for the 'āina. From what I have read, the development is likely to create periodic runoff issues for the ocean and negatively impact the ocean and sea-life, which are already under stress from a warming climate and lack of sufficient sewage treatment which leads to more frequent Brown Water closures. See, e.g., the [3/20/24 EPA Region 9 consent order](#), with the County of Hawaii regarding its insufficient sewage facilities, Docket NO. CWA-309(a)-24-003 ).

Anecdotally and as a long-time snorkeler, one of the things I've noticed over the years is how the color of some of the tropical fish has changed, as they and their food chain are forced to eat more algae and eat fewer varieties of coral. Another example - I used to call Kalahele turtle beach because of the number of turtles we would see there on every snorkel, including on the beach. That number is now severely reduced. I fear the same will happen at Keaouhou Bay. The ocean and sea-life are already stressed—the management plan would certainly add to the stressors facing the Bay and the ocean. And...in addition to everything else, putting in new commercial space when there are so many vacant spaces around town seems wasteful. Please note the number of empty stores in the Keaouhou Shopping Center, which is less than one mile away and which the Kamehameha Schools also owns and manages. Similar to the conversion of the leasehold interest condos to fee simple condos, once this change is made, it cannot be undone.

One of the songs I play with my various ukulele groups is Waimanalo Blues—"The beaches they sell to build their hotels my father and I once knew...Singing Waimanalo Blues." This is a very powerful song. I urge the Trustees to avoid the temptation of this "revenue opportunity." I truly believe that if you trustees carefully examine your mission, you will agree that the best exercise of your fiduciary duty is to reject the proposed management plan. It is not consistent with Princess Pauahi Paki's vision. Although there are aspects of the proposed management plan that are very positive and promote the culture and protect the land, I fear that the overwhelming impact will be negative. There will be more traffic, resort housing that does not help alleviate the affordable housing crisis on the island, excess commercial space, and permanent negative impacts on the land and sea. Once lost this is unlikely to be regained.

Please examine your **ENTIRE** fiduciary duty and **REJECT** the management plan. If you haven't read the book "**Broken Trust**" by (Judge and Native Hawaiian) [Samuel P. King](#) and [Kandall W. Roth](#), a University of Hawaii law professor, I urge you to do so before making your decision about Keaouhou Bay.

Sincerely yours, Laurel S. Terry

Aloha e Laurel,

Thank you for submitting your comments regarding the Draft Environmental Impact Statement (DEIS) for the Keahou Bay Management Plan. We appreciate your engagement in this important environmental review process.

Please be advised that we have received and administratively recorded. However, it is important to note that your submission was made after the closure of the official 45-day comment period as outlined in the Hawaii Administrative Rules 11-200.1-25 (Public Review Requirements for Draft Environmental Impact Statements). Consequently, comments received outside this designated period are not required to be addressed or considered in the final decision-making process.

However, Kamehameha Schools, as the Applicant, values all feedback and may choose to consider the validity, significance, and relevance of any substantive comments provided as it pertains to the scope, analysis, and process of this DEIS.

Thank you once again for your participation.

Mahalo,

The Keahou Bay Project Team

**Cc:** keahoubay <keahoubay@ksbe.edu>  
**Subject:** [EXTERNAL] Please reject the KS Keahou Bay Management Plan request for a special use permit

**CAUTION: This email is from an outside sender. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

Dear Mr Roy, Ms. Kern, Ms. Hamman (and others),

First of all, I would like to thank the Kamehameha Schools for posting on its website a link to provide comments on the Draft EIS for the Keahou Bay Management Plan. I submitted the attached letter at that link.

Because the link was provided by the Kamehameha Schools and because the KS Trustees have the power to decide whether they want to proceed with their proposed management plan, I directed my comment letter to the KS Trustees. I urged them to think about their fiduciary duty broadly and to abandon the proposed Keahou Bay Management plan in its current form.

I am sending this email because I'm not sure who reviews the DEIS comments that are submitted online, and I want to make sure that I also reach out and direct my comments to the relevant County of Hawaii officials regarding the requested special use permit and the proposed Keahou Bay management plan.

I hope that the County decides that now is NOT the appropriate time to issue a special use permit that would authorize a new road at Keahou Bay and a new resort development. I would note that as I write this email, there is a 25% water conservation order because 2 of the wells are down. I also know that the County of Hawaii has serious sewage capacity issues. (In addition to the brown water alerts in the past month, and the EPA consent order referenced in my comment letter, I know that many of my friends in Kona who are on septic systems worry about their required conversion and the capacity of the local sewage systems.)

All in all, it seems that now is not the right time to place additional burdens on these systems that a new road and new resort area would add. As a visitor who has been staying in the Keahou Bay/Kam3 area for more than 20 years, I enjoy watching the local volleyball teams practice, the canoes, the families who fish and play in the water - especially on weekends - and the relative lack of development. I am a snorkeler, and I have noticed the negative impact that development has had on coral, fish, and honu. I recognize that the proposed management plan intends to enhance many cultural aspects of the area, but I fear that the overall impact of the management plan will be negative (and permanent) as the plan adds more resort condos, additional paved parking, a new road, and competition for a scarce resource. The ocean is already stressed - this plan will add to it. I hope the County denies the special use permit (and that the KS Trustees reconsider this plan.)

Mahalo,

Laurel Terry

PS Feel free to share this email. I am happy to speak further about the perspective of a long-time visitor. Heather Laursen

To Whom It May Concern,

I am ardently pleading for you to reject Kamehameha Schools Environment Impact Statement (EIS) for Keaouhou Bay to become a Bungalow Resort. The Bungalow Resort development will have a detrimental and increasingly deleterious effect on Keaouhou Bay; at this time that we are aware of the species of our climate crisis, this is unacceptable that this Development project be considered in light of the research available to demonstrate the harm it will bring to our Bay. I would deem it irresponsible for you to accept this proposal, and I am seeing a growing concern from young who you may expect to bring you to court if your stamp of approval allows for this risk to our environment to occur.

The risks of polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project are demonstrated in research you should be aware of:  
National Oceanic and Atmospheric Administration (NOAA), <https://www.fisheries.noaa.gov/national/conservation/endangered-species-act>  
... showing that such developments in coastal areas pollute the water and endanger marine life and the delicate ecosystem.  
The green sea turtle and monk seal are endangered species that depend on Keaouhou Bay for habitat.  
<https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>  
<https://dlnr.hawaii.gov/dar/species/sea-turtles/>  
<https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-sealies/>  
<https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

The stretch of trees adjacent to the golf course has provided a barrier of protection from runoff of the chemicals from reaching the Bay, this development project would remove this barrier, and with development work overall, there will be harmful runoff into the Bay effecting marine life including our fast disappearing corals. My daughter attended WHEA and studied coral reefs for many years and she and her friends are greatly concerned to observe our coral reef and ecosystem in dire situation. Please take responsibility...this development will be vastly harmful to all that we love about being here in such a sacred place.

<https://rainorshiniegolf.com/pages/the-environmental-impact-of-golf-courses>  
<https://health.hawaii.gov/epo/files/2013/09/Stormwater-MSH-Presentation-HEF-7.15.14.pdf>

I have worked in Keaouhou Bay and swam in the waters for 16 years, it is a relatively pristine bay, compared to areas on the island where heavy development has affected the area. I am seeing my daughter after an occasion of heavy precipitation causing runoff from the golf courses, we were concerned with the degree of farming, the algae blooms in the waters. My daughter and I were concerned and confused at the time but then as we've become more educated we understand that it was because of the golf course polluting, with the trees removed in the furthering of development we will expect these waters to be blooming with algae, forming of the waters, and the marine life increasingly suffering.  
<https://www.globalcoral.org/golf-course-fertilizer-rnnoof-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef/>  
<https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

We claim it as historical, and so we should treat it as such, and respect it and keep it "less developed", as it is developed to a degree already of course, with businesses at the Bay and accommodation at Ourigger. And further development would be in contrast to the goals of Kamehameha Schools goal of sustaining the land. Their goal of educating on the history of King Kamehameha's birth site can still continue as even the Ourigger has a historical walk to educate tourists. We do not need to put our Bay and this historical site at risk through this development.  
Thank you for your time and consideration, I will eagerly look to your decision to deny this request for development. Any other decision will bring great consternation from the community.

Aloha e Marie,

Thank you for your comments concerning the Keauhou Bay Management Plan, Draft Environmental Impact Statement. Your comments have been received and administratively recorded.

Comments received during the 45-day public comment period will be reproduced in the Final Environmental Impact Statement, and substantive comments addressed.

Since you also provided a copy to the County of Hawaii and our planning consultant, G70, we will not be forwarding them a duplicate copy.

We appreciate your involvement and contribution to the environmental review process. Your input is invaluable in helping us develop a management plan that reflects the needs and concerns of our community.

Thank you once again for your engagement and commitment to the future of Keauhou Bay.

Mahalo,

The Keauhou Bay Project Team

**Subject:** [EXTERNAL] Fwd: EIS Draft For Keauhou Bay

**CAUTION: This email is from an outside sender. Do not click on links or open attachments unless you recognize the sender, and know the content is safe.**

Aloha,

Please **reject Kamehameha Schools Bungalow Resort project.**

Firstly, please, do not risk **polluting the water in Keauhou Bay** by allowing development. It is a proven fact that developments always pollute nearby waters due to constant runoff (especially during heavy rain or storms). An article by NOAA entitled, "What is the biggest source of pollution in the ocean?" states "... **this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides.**" It also states **"Eighty percent of pollution to the**

**marine environment comes from the land. One of the biggest sources is called non-point source pollution which occurs as a result of runoff."**

Also, **cutting the trees down** will automatically change this small, yet **very important eco-system**. This would allow the **runoff pollution from the golf course easy access to the Bay**. According to the National Library of Medicine, in their article, **Putting the Earth in Play: Environmental Awareness and Sports**, it says that "the golf industry uses **approximately 50 pesticide active ingredients**", all of which are **toxic and detrimental to near shore waters and their inhabitants**.

And most importantly, for me, is the **marine life that will be threatened**, not only by the excess pollution but by the sheer number of people- normally not there- that would be using the Bay. **Keauhou Bay is a monk seal and green sea turtle habitat**. More pollution and people will **further endanger these (already endangered) animals, not to mention the toxicity to the reef and fish**.

I'm not quite sure I understand how a resort here could be culturally helpful. The eco-system of the Bay would change forever (and not for the better). Seems to me to be nothing more than a way to make money. Can't they find a less intrusive place to develop?

Mahalo Nui for your consideration to my viewpoints.

## Marlies Lee

Instead of building new hotels, we should take care of local people to make sure they have everything they need before we cater to more tourists. Do we have enough resources? We don't have enough hotel rooms?

Make a food farm instead, so we don't rely on the mainland. We should focus on remodeling existing places and not disturb precious historic land. And locals deserve more than WORKFORCE housing, no balcony, just so minimal, I despise the word WORKFORCE!!!

Build low income housing with gardens and balconies, do something meaningful for Hawaiians. Thank you

## Brianna Leever

aloha, i am writing today as a concerned resident in kona. There is no question that there is substantial data to show the negative and ongoing effects of a golf course and development on the marine life- our most valuable and precious resource here on hawaii island. there are many ways that the community can create important income streams for the kamehameha schools, especially on land already owned. one such idea i propose is creating camping spots and charging for permits on land that is already fit for camping. sites like hipcamp allow you to easily monetize existing spaces to charge guests for camping and making enjoyment of the outdoors available now and for years to come. i implore you to please consider the long term impact of such a selfish decision, not just for the aina, but for the people for generations to come.

**Categories:** Green Category

To whom it may concern,

Please reject Kamehameha Schools EIS for Keahou Bay to become a Bungalow Resort. This is a VERY small bay and the added footprint of a 105 room Resort, that will include excess traffic, will have a **serious negative impact** in Keahou Bay.

Please, Do NOT risk polluting the water in Keahou Bay by allowing Kamehameha Schools to develop their bungalow resort project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near coastal development area. An article entitled, "*What is the biggest source of pollution in the ocean?*" by NOAA, National Oceanic and Atmospheric Administration, states, "*When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides.*" It also states, "*Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called, nonpoint source pollution, which occurs as a result of runoff.*"

The trees you want to take down keep the runoff pollution from the golf course from going into the Bay. According to the National Library of Medicine, in their article, "*Putting the Earth in Play: Environmental Awareness and Sports*," shares that the golf industry uses **approximately 50 pesticide active ingredients**, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are **being held off** from running into the Bay by the very trees you want to take down.

Let's not forget the marine life that will be threatened by excess pollution and traffic. Keahou Bay is the monk seals and the green sea turtle's habitat. More pollution and people will endangered these species.

This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced.

Kind Regards,  
Sandra Vacchio

**Subject:** Kamehameha Schools EIS Draft For Keaouhou Bay WILL HAVE NEGATIVE IMPACT

**Categories:** Yellow Category

aloha,

i am writing today as a concerned resident in kona. There is no question that there is substantial data to show the negative and ongoing effects of a golf course and development on the marine life- our most valuable and precious resource here on hawaii island.

there are many ways that the community can create important income streams for the kamehameha schools, especially on land already owned.

one such idea i propose is creating camping spots and charging for permits on land that is already fit for camping. sites like hipcamp allow you to easily monetize existing spaces to charge guests for camping and making enjoyment of the outdoors available now and for years to come.

i implore you to please consider the long term impact of such a selfish decision, not just for the aina, but for the people for generations to come.

mahalo,  
Bri Leevever

Aloha e Veronique,

Thank you for your comments concerning the Keaouhou Bay Management Plan, Draft Environmental Impact Statement. Your comments have been received and administratively recorded.

Comments received during the 45-day public comment period will be reproduced in the Final Environmental Impact Statement, and substantive comments addressed.

The County of Hawai'i and our planning consultant, G70, are copied here on this email so that they receive a copy of your feedback.

We appreciate your involvement and contribution to the environmental review process. Your input is invaluable in helping us develop a management plan that reflects the needs and concerns of our community.

Thank you once again for your engagement and commitment to the future of Keaouhou Bay.

Mahalo,

The Keaouhou Bay Project Team

**CAUTION: This email is from an outside sender. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

To whom it may concern,

Please reject Kamehameha Schools EIS for Keaouhou Bay to become a Bungalow Resort. This is a VERY small bay and the added footprint of a 105 room Resort, that will include excess traffic, will have a **serious negative impact** in Keaouhou Bay.

Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near coastal development area. An article entitled, "*What is the biggest source of pollution in the ocean?*" by NOAA, *National Oceanic and Atmospheric Administration*, states, "*When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides.*" It also states, "*Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called nonpoint source pollution, which occurs as a result of runoff.*"

The trees you want to take down keep the runoff pollution from the golf course from going into the Bay. According to the National Library of Medicine, in their article, "*Putting the Earth in Play: Environmental Awareness and Sports*," shares that the golf industry uses **approximately 50 pesticide active ingredients**, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are **being held off** from running into the Bay by the very trees you want to take down.

Let's not forget the marine life that will be threatened by excess pollution and traffic. Keaouhou Bay is the monk seals and the green sea turtle's habitat. More pollution and people will endanger these species.

This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced.

Kind Regards,  
Veronique Leferink

## Kana Leohano

Aloha to Decision-makers,

It is critical that the EIS and, ultimately, the building project it represents be rejected. Kamehameha Schools claims to be living with Aloha and caring for the 'Aina? A me Ke Kai?? It is preposterous to add 105 hotel rooms with accompanying traffic to this tiny side street. Perhaps even worse is the proposal to cut down a huge number of trees that protect Keaouhou Bay by filtering rain running off the land which often includes golf course chemicals.

Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop this "bungalow resort" project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near-coastal development area. An article entitled, "*What is the biggest source of pollution in the ocean?*" by NOAA, *National Oceanic and Atmospheric Administration*, states, "*When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides.*" It also states, "*Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called 'nonpoint source pollution', which occurs as a result of runoff.*"

According to the National Library of Medicine, in their article, "*Putting the Earth in Play: Environmental Awareness and Sports*," the golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are being held off from running into the Bay by the trees that would be destroyed and removed if this project were to be allowed.

Let's not forget the marine life that would be threatened by excess pollution and traffic. Keaouhou Bay is habitat for monk seals and green sea turtles. More pollution and people would endanger these loved animals.

Keaouhou Bay is worth protecting. People catch fish there. I love to swim there. The Canoe club puts-in there. Please do not put a resort in such a small area. Future generations would be deprived.

If destroyed, it would not be restorable.

With Aloha a me ha'a ha'a,  
Kana Leohano

**RE: Comment Period for Keaauhau Bay Management Plan Draft EIS**

**For the record I am quoting from the American Declaration on the Rights of Indigenous Peoples (2016) ▼ Article XI.**

**Protection against genocide .** Indigenous peoples have the right not to be the object of any form of genocide or attempts to exterminate them.

It is Our Human Right, Our Constitutional Right and Our Right as Indigenous People to be self-determined, to freely determine our political status, to freely pursue our economic, social, and cultural development as a community. (Partial quote from American Rights of Indigenous Peoples)

Aloha Kakou

O Clare kou Inoa. Noho au Honokohauiki, Mokuokeawe. I am an Indigenous Practitioner of over 50 years, working with Customary Traditional and Cultural Practices, last thirty years with Hawaiian lineal Descendants. There are at least 20 SHP sites and hundreds of burials which you all should be aware of in this “ Keaauhau Bay Management Draft EIS.”

***In Hawaiian thinking sustainability is where and what we come from and instead of creating it, we are returning to it. This is the approach with our na keiki, to become green and sustainable. This testimony is in regard to the Keaauhau Bay Management Plan Draft of EIS.***

The Kona Field System, is part of the Keaauhau ahupuaa and essential to “Native Hawaiian rights HRNS 7-1. Protect water rights and Act 50 states....need to clarify that the preparation of environments assessments or environmental impact statement should identify and address effects on Hawaii’s culture and traditional and customary rights. (HB No.2060). I was honored from 2000-2015 to help bring back this Native Hawaiian cultural traditional practice at Ka Mala o Ehuuikaimalino.

**Article XII, Section 7 of the Hawai’i Constitution** obligates the State Land Use Commission (LUC) to protect the reasonable exercise of customarily and traditionally exercised rights of native Hawaiians to the extent feasible when granting a petition for reclassification of district boundaries. In order to effectuate the State’s obligation to protect native Hawaiian customary and traditional practices while reasonably accommodating competing private interests, the Hawai’i Supreme provided the following analytical framework as an outcome of Ka Pa ‘akai O Ka ‘a/ha v. Land Use Commission (94 Hawai’i 3], 7 P.3d 1068, September 1], 2000.).

**Section 711**

**711-1107 deals more generally with all acts of desecration; i.e., acts of physical damage to or mistreatment of venerated places and objects under. In a public place the national flag or any other object of veneration by a substantial segment of the public.**

The Native inhabitants of Hawaii prior to 1778 Ahupuaa has kuleana to protect their iwi kupuna, sacred sites that still keep them connected to their lands.

**Act 50, enacted by the Legislature of the State of Hawaii (2000) with House Bill 2895, relating to Environmental Impact Statements, proposes that...there is a need to clarify that the preparation of environmental assessment or environmental impact statement should identify and address effects on Hawaii’s culture, and traditional and customary rights...[H.B. NO. 2895]**

**You all have kuleana that needs to protect this land which connects our native peoples to what is sacred to them, to feed them physically, mentally and spiritually, essential to live.**

Me ka haahaa,

Clare Loprinzi, Indigenous Practitioner

Please, DO NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. It is **scientifically proven** that developments pollute nearby waters both **during and after development**.

Below are scientific articles written by the National Oceanic and Atmospheric Administration (NOAA), Global Coral Reef Alliance, Hawaii Government, and many other professional organizations, that have studied and shown that developments have **ALWAYS** polluted the water in **EVERY** coastal development area.

Does this EIS (Environmental Impact Statement) have any kind of reports and studies on how the endangered species and marine life will handle the extra pollution due to development, and the golf course runoff? Keauhou Bay is their habitat and this development **WILL** be **CHANGING** an Entire Ecosystem.

**ENDANGERED SPECIES CONSERVATION IMPACTED BY DEVELOPMENT**

In the Endangered Species Act of 1973 Under Section 2 (b), "To provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved." This would be Keauhou Bay.

The Green Sea Turtle swims in Keauhou Bay weekly and the monk seal has also been seen swimming and resting in Keauhou Bay. Both of these marine animals are on the endangered species list.

**Endangered Species Act**

"Section 2. Findings, Purposes, and Policy

(4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—

(b) **PURPOSES**.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section."

This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-act>

**FEDERALLY PROTECTED GREEN SEA TURTLES WILL BE AFFECTED**

The green sea turtle is federally protected and can be seen in Keauhou Bay weekly.

The following article that states: **"POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES"**

**Why does Hawaii have a runoff problem?**

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way

**To:** keauhoubay <keauhoubay@ksbe.edu>  
**Subject:** [EXTERNAL] Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT!

**CAUTION: This email is from an outside sender. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

To Whom It May Concern,

Please read the scientific proof in this letter and REJECT Kamehameha Schools Environment Impact Statement (EIS) for Keauhou Bay to become a Bungalow Resort.

Please state in your report that a Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT on Keauhou Bay as stated in all the different researched articles below.

to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

**Allowing this development WILL POLLUTE Keauhou Bay.** The above article, written in 2014 (because runoff water from developments was polluting the ocean even then!!) states this fact clearly. Keauhou Bay is home to countless sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals, and more and that will ALL be harmed by the severe pollution runoff that WILL happen because developments have been shown to ALWAYS pollute the water is that is nearby.

The Green Sea Turtle is protected by more than one law. "All sea turtles in Hawai'i are protected by the Endangered Species Act (ESA) and additionally protected by Hawai'i Revised Statutes Chapter 195D (HRS) and Hawai'i Administrative Rules (HAR) 13-124." This information was taken from this site <https://dlnr.hawaii.gov/dar/species/sea-turtles/>

### THE ENDANGERED MONK SEAL WILL BE AFFECTED

Keauhou Bay is known as a RESTING AREA for the ENDANGERED MONK SEAL. If another resort is allowed to be built, in addition to the pollution, it will also bring a lot more people down to Keauhou Bay. This increases the chances of a resting monk seal being disturbed by humans trying to get close, take "selfie" photos, and being generally uninformed and harmful. Please see article on Selfie Culture and its harmful effects below.

**Has the EIS done any research on what an increased population would do in such a small area, and what will happen to the endangered species that live there? With a significantly increased population their habitat of Keauhou Bay will likely be changed forever.**

This information is from a NOAA Scientist: "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species.

In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought." <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies>

NOAA clearly states a high population in a place where monk seals and sea turtles habitat can be a serious disturbance for these endangered species.

"Hawaiian monk seals are protected federally by the ESA and the Marine Mammal Protection Act (MMPA), as well as locally by Hawai'i Revised Statutes (HRS) Chapter 195D and Hawai'i Administrative Rules (HAR) 13-124." This was taken from <https://dlnr.hawaii.gov/dar/hawaiian-monk-seal/>

**Keauhou Bay is the monk seals and the green sea turtle's habitat.** Allowing a bungalow resort to be developed in Keauhou Bay, the habitat of these endangered species, is to threaten their life and habitat with golf course runoff pollution, as well as development pollution. **By threatening their habitat, and hence their lives, this development goes completely against the Endangered Species Act of 1973.**

The verbiage in the Endangered Species Act states, "to conserve". In this case, "to conserve" would be to protect the land around Keauhou Bay from developments that destroy the habitat of these endangered species with pollution and runoff.

**Does this EIS have any reports on the endangered species that frequent Keauhou Bay? This is their habitat and it needs to be "conserved".**

Under the Conservation Program there should be research done on endangered species and their associated ecosystems. A large bungalow resort development WILL FOREVER CHANGE THIS ECOSYSTEM.

"§ 195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." [https://www.capitol.hawaii.gov/hrscurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Also, under this same Conservation program, "(2) Taking such action as may be necessary to ensure that actions authorized, funded, or carried out by them do not jeopardize the continued existence of threatened or endangered species." [https://www.capitol.hawaii.gov/hrscurrent/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrscurrent/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm)

Please consider that developing a Kamehameha Schools Bungalow Resort in Keauhou Bay WILL threaten endangered species due to the unavoidable development and golf course pollution runoff that would be caused by removing the all the trees that currently serving as a natural pollution filter, and replacing the land with housing, cars, humans, and waste. There would also be tremendous runoff damage into Keauhou Bay and the surrounding area during the building phase of this enormous project.

### GOLF COURSE POLLUTION KILLS MARINE LIFE AND DRASTICALLY CHANGES ECOSYSTEMS

"The golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. Having to trim golf turf to low heights also makes it even more vulnerable to pests, which leads to more pesticide use." <https://rainorshinegolf.com/pages/the-environmental-impact-of-golf-courses>

These pesticides will be in the pollution runoff that will enter Keauhou Bay more severely should the natural habitat of the trees be removed and replaced with pavement. This is unavoidable!

Please read from Wikipedia, "Most drains have a single large exit at their point of discharge (often covered by a grating) into a canal, river, lake, reservoir, sea or ocean. Other than catch basins, typically there are no treatment facilities in the piping system." [https://en.wikipedia.org/wiki/Storm\\_drain#%3A~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells](https://en.wikipedia.org/wiki/Storm_drain#%3A~:text=Most%20drains%20have%20a%20single,discharge%20into%20individual%20dry%20wells)

The pavement from this development will cause pollution to runoff into Keauhou Bay because this treed land that will absorb a housing development is situated directly between the golf course and the Bay. These trees, which absorb all the pollution from the golf course is the BEST AND ONLY PROTECTION POLLUTION FILTER Keauhou Bay has from the golf course pesticides, fertilizer and weed killer. See the below paragraph for further references.

See page 2 at: <https://health.hawaii.gov/epo/files/2013/09/Stormwater-MS4-Presentation-HEF-7.15.14.pdf> where the Hawai'i government states that **Natural Ground Cover has 10% runoff, where has development has 55% runoff.**

**These trees and land are saving monk seals and green sea turtles habitat from the golf course pollution and this land MUST BE PRESERVED and CONSERVED as the natural protector for Keauhou Bay and for these endangered species habitat.**

Under Section 2 (b) of the Endangered Species Act - **Keauhou Bay MUST BECOME A CONSERVATION AREA for these endangered species.** It is currently their habitat, and to allow a large resort development to be built above this bay clearly threatens the lives of these endangered species by allowing golf course toxic pollution and development pollution to run into these species natural habitat of Keauhou Bay.

#### **ALGAE BLOOMS KILL CORAL AND MARINE LIFE**

The trees that are slated to be cleared for the development further protect Keauhou Bay from algae blooms that have been proven to be caused by pollution that is runoff from fertilizer and weed killer.

When there is heavy rain the land above the bay has a greater runoff than normal. Without the trees, the runoff from the golf course pollution will pour into the Bay likely causing frequent algae blooms.

**Algae blooms have been shown to kill coral and marine life as stated in the many articles that will follow.**

One of these articles is from the Global Coral Reef Alliance. They have researched the effects on reefs before and after a golf course development. Though this development is not a golf course development, it is located just below a golf course and exposes the bay to the pollution from the golf course by removing the proven natural filter of the trees and natural ecosystem.

**Has this EIS done any kind of research about the algae blooms that happen after a serious storm because of the golf course runoff pollution?**

This information was taken from Global Coral Reef Alliance and it is an actual study on the how coral and marine life are affected before and after development. It's titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution. . . <https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keauhou Bay you WILL be agreeing to pollute this bay for years to come and COMPLETELY CHANGING and possibly DESTROYING KEAHOUBAY'S ECOSYSTEM.

Another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef.

"...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef>

**Does this EIS have any studies or reports on the extra runoff pollution due to clearing land and adding pavement?**

This needs to be fully assessed because you will be changing an entire ecosystem to build a bungalow resort. It rains in Keauhou Bay many nights out of the year and this kind of pollution will kill the beautiful and necessary coral in the Bay.

**FURTHERMORE:** "If there are [toxic algal blooms](#), like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://oceanconservancy.org/blog/2023/03/31/what-sea-foam/>

#### **ENGINE POLLUTION CAUSES ISSUES IN THE OCEAN**

**Does this EIS have any detailed traffic studies for the increase in cars that will be added to this already severely traffic area they want to build their 150 room bungalow resort in? Have they done any studies on the pollution these cars WILL have in Keauhou Bay?**

Because this Bungalow Resort could have over 150 extra cars and over 300 or more extra people in and out of Keauhou Bay, what traffic and increased population studies have they done? There will be employees with cars, guests with cars, visitors with cars. At times this would range to over 200 cars (likely more), coming in and out of, and parking above Keauhou Bay thereby causing serious car population issues because of all these added cars right next to the bay.

**The article below is from NOAA regarding motor vehicle engines and pollution to the sea.**

What is the biggest source of pollution in the ocean?

Most ocean pollution begins on land.

"Millions of motor vehicle engines drop small amounts of oil each day onto roads and parking lots. Much of this, too, makes its way to the sea.

Some water pollution actually starts as air pollution, which settles into waterways and oceans. Dirt can be a pollutant. Top soil or silt from fields or construction sites can run off into waterways, harming fish and wildlife habitats." <https://oceanservice.noaa.gov/facts/pollution.html#:~:text=Millions%20of%20motor%20vehicle%20engines,Dirt%20or%20soil%20from%20fields%20or%20construction%20sites,Dir%20soil%20or%20silt%20from%20fields%20or%20construction%20sites%20can%20run%20off%20into%20waterways%20harming%20fish%20and%20wildlife%20habitats%20.>

**Land-Based Runoff Remains Top Source of Oil in the Ocean, Says New Report Oil in the Sea: Inputs, Fates, and Effects**

News Release September 28, 2022

WASHINGTON — Oil in runoff, primarily from cities and vehicles, is the top source of oil entering the ocean, says a [new report](#) from the National Academies of Sciences, Engineering, and Medicine. In North American waters, estimated ocean oil pollution from land-based runoff is up to 20 times higher than it was 20 years ago, and oil spills, natural oil seeps, and discharge from oil and gas operations remain major sources of pollution.

The report recommends actions that government and others should take to minimize oil pollution, and calls for sustained research funding to better understand how oil reaches and affects ocean environments. <https://www.nationalacademies.org/news/2002/05/01-in-the-sea-inputs-fates-and-effects#:~:text=WASHINGTON%20%2D%2D%20Nearly%2085%20percent,pipeline%20spills%2C%20says%20a%20new>

### **The Impact Of Stormwater – Car Emissions**

"Car emissions are not limited to exhaust fumes that contribute to air pollution. They can also leak automotive fluid and release heavy metals that can contribute to stormwater pollution, contaminating local waterways." <https://www.stormwatershepherds.org.au/blog/the-impact-of-stormwater-car-emissions/>

### **NOISE POLLUTION'S HARMFUL EFFECT ON MARINE LIFE**

**Does this EIS have any reports on the noise pollution that will happen and what it could do to marine life in Keaouhou Bay during development?**

Because if you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years to come and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behavior of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished."

The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/>

### **How Does Noise Pollution Harm Marine Species?**

"However, over the past few decades, noise pollution in the marine environment has increased dramatically and is threatening the natural soundscape of the marine environment. Ships, seismic surveys, explosions, construction, and sonar devices have made the once peaceful environment into a loud, chaotic home which is extremely damaging for marine wildlife. This type of pollution is often overlooked in comparison to others but its impacts are now being documented across all types of marine ecosystems." <https://earth.org/noise-pollution-in-the-ocean/>

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dhr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations.>

### **What is ocean noise?**

"Ocean noise refers to sounds made by human activities that can interfere with or obscure the ability of marine animals to hear natural sounds in the ocean.

Many marine organisms rely on their ability to hear for their survival. Sound is a highly efficient means of communication underwater and is the primary way that many marine species gather and understand information about their environment. Many aquatic animals use sound to find prey, locate mates and offspring, avoid predators, guide their navigation and locate habitat, as well as to listen and communicate with each other.

Over the last century, human activities such as shipping, recreational boating, and energy exploration have increased along our coasts, offshore, and deep ocean environments. Noise from these activities can travel long distances underwater, leading to increases and changes in ocean noise levels in many coastal and offshore habitats.

These rising noise levels can negatively impact ocean animals and ecosystems. Higher noise levels can reduce the ability of animals to communicate with potential mates, other group members, their offspring, or feeding partners. Noise can also reduce an ocean animal's ability to hear environmental cues that are vital for survival, including those key to avoiding predators, finding food, and navigating to preferred habitats." <https://oceanservice.noaa.gov/facts/ocean-noise.html>

### **LEARN FROM OTHERS: RUN-OFF FROM DEVELOPMENT KILLS**

The Chesapeake Bay has a foundation that is trying to save their bay due to runoff pollution that was caused by developments. Chesapeake Bay is **a lot bigger** than Keaouhou Bay. If it's being drastically hurt by runoff water from developments, Keaouhou Bay waters won't stand a chance if development above the bay is allowed. Keaouhou Bay is a much smaller ecosystem.

**This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states,** "...runoff is a significant source of harmful nitrogen pollution that continues to grow ...

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or local waterways. (Right now Keaouhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20are%20placed%20in%20jeopardy.>

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keaouhou Bay due to its size and fragility.

**change.** Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in predation. As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem...

Here is another article that shocking shows that in a very short time, big changes can occur due to runoff. A development will hurt and kill plankton, by Frontiers in Marine Science, "Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. **This occurred in a relatively short time considering that the experiment lasted less than three weeks.** The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-*a* concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

**The ecosystem is fragile and interconnected as is stated in this article:** "Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%20and%20increases%20in%20predation.>

A research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses "Toxic Effects of Pollutants on Plankton: **There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage.** Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation."

[https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3.6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3.6_chapter12_257-274.pdf)

All the above articles show that development of Keauhou Bay WILL hurt plankton life and marine life in the bay because pollutant runoff is inevitable and unavoidable during construction and afterwards. The mania ray food source will likely disappear. This will be devastating for the mania ray populations. Furthermore, if mania rays die or leave the area, the loss will in turn affect many lively hoods from locals on the island who depend on the mania ray tour for their income.

## HUMAN POPULATION INCREASES LINKED DIRECTLY TO CORAL DEATH

**Does this EIS have any reports on their resort adding to the population increase that happens during IRONMAN?**

"On average, each Ironman racer brings three people with them to the Big Island. Counting members of the media, VIPs who come from around the globe to watch and the triathlons partners, there likely be more than

6,300 people descending on Kona..." <https://bigislandnow.com/2023/10/07/ironman-2023-in-kona-shines-spotlight-on-some-of-best-women-triathletes-in-the-world/>

And "Resident dissatisfaction with tourists is multifaceted: **The overwhelming majority (92%) of locals felt visitors were not educated enough on protecting Hawaii's natural environment and local resources; other factors include the impact of the vacation rental industry and ignorance of the residents' quality of life.**" <https://www.triathlete.com/culture/news/kona-locals-ask-ironman-visitors-for-respect/>

**Where are the EIS reports on human density? Below are reports that show human population destroys coral reefs.**

"The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution.

-Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds.

-Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs."

The above information was taken from the Education Development Center, INC., from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development/#:~:text=Coastal%20development%20may%20cause%20the,negatively%20impact%20entire%20food%20webs.>

There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keauhou Bay. **Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it.** Marine life will suffer from this development as stated in this letter in many different scientific reported articles.

If you allow this resort the amount of people in this bay will fully increase and, "Hawaii's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20bare,effect%20on%20nearshore%20fish%20populations.>

## It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will bring a serious increase in human traffic. **"Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs.** Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regard to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information

PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denster%20coastal%20populations%20and%20greater,te%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, **"This is how tourists are destroying coral reefs in Hawaii. The less people at a certain site, the more coral there are, the research found.** The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in *Nature Sustainability*." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858&:text=The%20less%20people%20at%20a,there%20are%20C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%20C%20a%20new%20study%20said.>

By allowing this development you are stressing an already fragile Eco-system. The small bay is currently used by many locals for boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. We know, and research shows, that more people cause more damage. The area simply cannot afford or support this development.

**"Denser coastal populations and greater wealth will lead to reef degradation by coastal construction.** Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with meta-population theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20all,viat%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, **"Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity.** By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhaHjJAjAWAq453RgN0jAJWv9jnr3Z0Tv0PyGzA5lc\\_H00JzeHNIP3ASnhc\\_gKRy6\\_vKLPw49dbmBYoXSg3YJMG0IGBZsapdGUH70ISLbu9x5P3xED4KxI4T0sJlvgQIa72ZRtRtUbraxp0dId2AoNlSmW.SuxB7JHEDqJ80CJpx71TJWdCFXvFKJZYeNdelj3Sw\\_dnaUe5IzhejPBDlmmaH15vqT5Q%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhaHjJAjAWAq453RgN0jAJWv9jnr3Z0Tv0PyGzA5lc_H00JzeHNIP3ASnhc_gKRy6_vKLPw49dbmBYoXSg3YJMG0IGBZsapdGUH70ISLbu9x5P3xED4KxI4T0sJlvgQIa72ZRtRtUbraxp0dId2AoNlSmW.SuxB7JHEDqJ80CJpx71TJWdCFXvFKJZYeNdelj3Sw_dnaUe5IzhejPBDlmmaH15vqT5Q%3D&tracking_referrer=abcnews.go.com)

### INFRASTRUCTURE AND RESOURCES ON AN ISLAND ALREADY HIGHLY IMPACTED AND STRUGGLING FOR ANSWERS

**Has the EIS done any research or reports on the Resources and Infrastructure it will need for a bungalow resort?**

There are many big housing developments currently under construction in Kailua Kona, Waikoloa Villages, Hilo, Puna, Ocean View and Volcano. The entire Big Island has construction projects already in progress.

**Has Kamehameha Schools EIS done any kind of reports or surveys to know if Big Island has the Resources and Infrastructures for their resort development?**

"Hotel waste management refers to all the practices and processes that hotels implement to handle and dispose of the multiple types of waste generated on their premises. **Worldwide, hotels produce almost 300,000 tonnes of waste each year.**" <https://www.homebiogas.com/blog/hotels-waste-management/>

As of now, the Big Island's Resources and Infrastructure are having serious negative issues and many more developments that have been approved are not even completed as of yet, which means our island's resources and infrastructure will be taxed even more severely in the near future.

Please read the below articles that prove Big Island does not have the resources or infrastructure for a 143-Unit Bungalow Resort Development at Keaou Bay. On Hawaii Island, we are already struggling to meet the increasing need for resources and infrastructure.

### Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawai'i landfill

September 17, 2023

The West Hawai'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.

The West Hawai'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

### A County commission drafts ordinance aiming to ban recyclables at West Hawai'i landfill

By Megan Moseley, September 6, 2023

Hawai'i County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawai'i County Director of Environmental Management, told commissioners the West Hawai'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics, paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Ka'ahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste,

metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste.”

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

### **Time’s Up For Landfills**

‘Gentle’ demolition strategies can help preserve resources

PAULA BENDER April 2, 2024

As Hawai‘i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn’t want one any bigger or more active than absolutely necessary.

<https://buildingindustryhawaii.com/2024/04/times-up-for-landfills/>

### **Drought Conditions On Hawai‘i Island Prompt Water Supply Message**

by Big Island Video News  
on Oct 5, 2023 at 3:59 pm

(BIVN) – With moderate to severe drought conditions being reported across Hawai‘i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai‘i island is under “Moderate Drought” conditions, according to the latest information [from the U.S. Drought Monitor](#). There is an area under “Abnormally Dry” conditions in South Kona, however there are other, small pockets on the Big Island that are under “Severe Drought”. There is even a small spot of “Extreme Drought” in the South Point area of Ka‘ū.

“The National Weather Service’s forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event,” reported the Hawai‘i County Department of Water Supply. “Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024.”

### **From a Water Supply news release:**

<https://www.bigislandvideonews.com/2023/10/05/drought-conditions-on-hawai%CA%BBi-island-prompt-water-supply-message/>

[U.S.](#)

### **Hawaii is “on the verge of a greater catastrophe,” locals say, as water crisis continues**

By [Li Cohen](#)

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to [significant droughts](#), and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the [world’s largest surfing wave pool](#) opened up on the island — filled with freshwater.

“They’re not using it to drink or to support life, they’re using it to make money. They’re commodifying it,” said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O‘āhu Water Protectors. “... We are on the verge of a greater catastrophe.”

“**We are in a water crisis, that has to be made very clear.**” Wayne Tanaka, director of Sierra Club of Hawai‘i, told CBS News, saying that if the reasons for this crisis aren’t soon addressed, “We may come to a point where we have to decide ... who gets water and who doesn’t.”

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island, parts need to be shipped. The power plant currently has generators that are not working, and because of this (and other reasons), the Big Island needs to seriously conserve power so that everyone will have power. If this problem of shipping parts can happen once, it can and will happen again.

### **UPDATE: HELCO asks for continued energy conservation**

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawai‘i Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HELCO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

“We’re grateful for our customers’ efforts to conserve electricity, especially between 5 to 9 p.m., when electricity us is highest, because it does make a difference,” said Hawaiian Electric spokesperson Kristen Okinaka. “By working together, we’re helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages.”

**Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawai‘i Island because of the unavailability of several generators and lower than normal wind and solar resources.**

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the

amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

<https://spectrumlocalnews.com/hi/hawaii/news/2024/04/15/heco-customers-on-hawaii-island-asked-to-conserve-power->

### **Big power supply problems continue to plague Hawaii Island**

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

**The company explained that it faces an "extremely tight" supply of power at peak use periods**, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

<https://energycentral.com/news/big-power-supply-problems-continue-plague-hawaii-island>

### **Hawaii Island customers urged to reduce electricity use through April**

BY SARAH YAMANAKA HILO PUBLISHED 9:00 AM ET MAR. 26, 2024

What You Need To Know

-Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity

-When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use

-Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays

**-If there is not enough electricity to meet demand**, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

### **FURTHERMORE: TRAFFIC, LACK OF RESOURCES, AND FATALITIES**

#### **A Resort Development Will Increase Traffic on Already Severely Trafficked Roads. Are there traffic study reports for this EIS?**

A development with 150 rooms comes with over 150+ cars. Employees, guests, and visitors will all have cars. The Big Island already has a serious traffic issue due to a lack of infrastructure. This is in part due to poor planning, and in part due to geography challenges.

The articles below by different NEWS companies highlight the point that many traffic issues stem from lack of infrastructure and resources. Adding more cars to the road by building another resort in an area that is already stressed, will only increase the already mounting problems with traffic.

This NEWS article by Hawai'i News Now, "Report shows alarming surge in Hawaii Island traffic deaths. The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the Island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Watch the video on their link below as it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists there will be more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "**Hawaii Island has most traffic fatalities in state**. This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks.

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

**"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here,"** he added. "<https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

#### **The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.**

Please read this article because what it says about Oahu is a mirror for Big Island. The traffic problems they discuss are the same issues here on Big Island; and it also gives one Big Island example, "On the Big Island, the mayor had to issue an [emergency order](#) shutting down Waipio Valley Road due to overuse and poor prior

-Of all the crash fatalities, most were males between 20 to 24-years old.

“That’s just Big Island traffic,” is a common sentiment. But what if we didn’t have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?”

This was taken from Path <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

### **1) Hawaii Deals with Burgeoning Waste Management Problem**

As landfills face closure and waste-to-energy projects stall, various counties in Hawaii are dealing with waste management issues. Waste360 Staff January 10, 2020

“Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.” <https://www.waste360.com/landfill/hawaii-deals-with-burgeoning-waste-management-problem>

### **2) "Big Island Now readers seem to agree that there’s likely no single solution for slowing down the timeline of the West Hawai’i Sanitary Landfill reaching capacity.**

The West Hawai’i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years.” <https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

### **3) Hawaii Island Has Decades of Landfill Space But Still Faces Challenges In Dealing With Its Waste**

Hawai’i Public Radio Published January 9, 2020 at 5:00 AM HST

“Hawaii Island is in the enviable position of having a landfill with anywhere from 20 to 100 years of capacity left to take in trash. But the island still wrestles with significant issues like plastic products that are no longer being recycled.

For the past four decades, trash from the East side of Hawaii Island has been dumped in a landfill outside of Hilo. But now trash from all parts of the island is being trucked to a facility north of Kona.” <https://www.hawaiipublicradio.org/local-news/2020-01-09/hawaii-island-has-decades-of-landfill-space-but-still-faces-challenges-in-dealing-with-its-waste>

### **4)“What happens to Hawaii Island’s trash and recyclables? BY MICHELLE BRODER VANDYKE HAWAII ISLAND PUBLISHED 11:30 AM ET DEC. 17, 2022 By Michelle Broder Vandyke Hawaii Island PUBLISHED 11:30 AM ET Dec. 17**

The West Hawaii Landfill will be full in about 20 years. Finding a location for the next landfill is a concern, according to the DEM officials. They said it will be challenging to find a location for a future landfill because of stringent regulations and costs related to planning, environmental regulations, design and construction that will take many years to complete. It will also require community support.” <https://spectrumlocalnews.com/hi/hawaii/news/2022/12/15/what-happens-to-hawaii-island-s-trash-and-recyclables-->

### **5) “The overwhelming plastic waste Hawaii visitors leave behind**

By Natasha Bourlin Aug 24, 2023

maintenance.” This is happening all over Big Island. <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

The news video below shows aerial footage in Hilo. The footage shown is the same thing that is happening on Alii Drive and Queen K Highway, and for all the same reasons: **All of these roads only have two lanes!**

There are two developments already on Alii Drive being built as of today, and more are scheduled for this road in the near future. Alii Drive and Queen K Highway are the roads Kamehameha Schools Bungalow Resort will be using if approved, and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow because of so many people who now live here and all the visitors that come yearly.

In addition, the concern on Kona side is tsunami evacuations rather than lava evacuations. In this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every weekday and often on weekends as well.

Here is the news article by KITV NEWS that highlights the traffic issues discussed above: “Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution.” [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash recently on Alii Drive (see video below). When there is an accident on Alii Drive, it turns the already small two-lane road into only one lane that requires a flagger to help direct traffic. Kamehameha Schools wants to add a resort on this tiny road that will increase the traffic by hundreds of cars.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=-FQSanPDji8>

**Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.**

### **Read this Path article, HAWAII COUNTY’S VISION ZERO INITIATIVE:**

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawai’i Island...

Here are some other statistics that are even more staggering:

- 28% of roadside crashes were the result of someone leaving the roadway and going into barriers or trees
- 13% of pedestrians hit at 20 mph actually suffer fatality
- 73% of pedestrians hit at 40 mph suffer fatality
- 25% of fatal crashes were the result of distracted driving... So PLEASE put those cell phones away and pay attention to the road!
- 56% of fatal crashes were the result of alcohol or drugs
- 41% of fatal crashes occurred in light trucks and vans
- 49% of crashes occur during the day, outside of peak traffic hours

Hawaii saw more than 9 million visitors last year. Those tourists' first stops are often big-box and convenience stores, where they buy bottled water, plastic sand toys, single-use bodyboards, noodles, floaties and inner tubes for their trips." <https://www.sfgate.com/hawaii/article/plastic-waste-hawaii-visitors-leave-behind-18286076.php>

It is impossible to separate Hawaii'i's power system from its water system, said Kawika Uyebara, deputy director of Hawaii'i County's Department of Water Supply." <https://www.hawaiipublicradio.org/local-news/2024-02-13/residents-on-hawaii-island-and-oahu-are-asked-to-serve-water-amid-power-outages>

**16) US Hawaii is "on the verge of a greater catastrophe,**" locals say, as water crisis continues

By Li Cohen

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

In Hawaii, one of the most important sayings is ola i ka wai, "water is life" — a phrase that not only sums up what it means to exist on an island, but what it means to live, period. But now, one of the largest of the island chain's land masses is facing a triple threat to its sole freshwater source, and if it isn't addressed soon, one community member says, "We're in deep trouble."

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

A mandatory 25% water restriction has been issued for various communities in North Kona due to the failure of the Honokōhau Deepwell over the weekend.

<https://bigislandnow.com/2023/08/07/hawaii-county-issues-mandatory-25-water-restriction-for-north-kona/>

### 18) **Hawai'i Water Supply Closely Monitored As Severe Drought Continues**

by Big Island Video News  
on Nov 6, 2023 at 3:28 pm

(BIVN) – With an ongoing drought on the island of Hawai'i, the Hawai'i County Department of Water Supply says it is closely monitoring its 23 public water systems, with a "special focus" placed on the South Kohala Water System.

<https://www.bigislandvideonews.com/2023/11/06/water-supply-closely-monitored-as-hawaii-ca%BBj-under-severe-drought/>

This is a map of Power Outages on the Big Island. This map wouldn't have been created if Power Outages were not a problem. <https://www.hawaiianelectric.com/safety-and-outages/power-outages/hawaii-island-outage-map>

Please, give Tax Breaks to all homes that provide solar and/or wind turbine to there homes to help with power issues on the island.

### 19) **"Hawaiian Electric is reporting that several large generators on the Big Island are experiencing a range of issues and may lead to the need for rolling outages if supply does not meet demand."**

[https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian\\_electric\\_is\\_reporting\\_that\\_several\\_large/?rdt=52660](https://www.reddit.com/r/BigIsland/comments/1bnuar3/hawaiian_electric_is_reporting_that_several_large/?rdt=52660)

### 20) **"Hawaiian Electric asking Big Island customers to conserve power due to down generators**

March 25, 2024 · 11:49 AM HST

According to the utility company, this is an usual situation as the large generators are experiencing mechanical problems resulting in a reduced output. The largest generator, an independent power producer that sells electricity to Hawaiian Electric, is offline with significant mechanical issues.

The plant generates 60 megawatts or nearly one-third of the typical peak demand of 180 megawatts on the island."

<https://bigislandnow.com/2024/03/25/hawaiian-electric-asking-big-island-customers-to-conserve-power-due-to-down-generators/>

All the articles above show that a resort development will further deplete and stress resources and infrastructure on an island already struggling. There are years of new development that have already been approved but not completed. It is not responsible or prudent to continue to develop this resort under these current conditions.

## **HISTORICAL AND CULTURAL SIGNIFICANCE:**

### **The Law of the Splintered Paddle**

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law "Ke Kānawai Māmalahoe" or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless, especially kupuna and keiki, be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawai'i. After being added back in 1978, **the law is part of Hawaii's State Constitution today.**

It is symbolic of servant leadership, reinforcing the importance of:

-Caring for and serving one's people

-Knowing and doing what is pono (right)

-Standing for the principle that leadership privilege is earned

-Taking kuleana (responsibility) for those we serve

-Doing so with compassion, love, and respect

**"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."**

**The Law of the Splintered Paddle is also on Kamehameha Schools website.** The historical value of this law should be enough to help make

Big Island roads become safer, and not adding to the traffic and issues of our already dangerous roads. <https://www.ksbe.edu/article/the-lessons-of-the-law-of-the-splintered-paddle-ring-true-200-years-after-k>

**Does this EIS have any reports about how this development will safely add to the land fill on Big Island, and are there reports proving the island has enough water for another big resort, what about reports on how much power this resort will use because the Big Island already has serious resource and infrastructure issues.**

## **IN CONCLUSION**

The articles cited in this letter, many by some of the most esteemed scientists in the world, show with clarity that adding another development is going to cause devastating, lasting, effects on the Eco-system at Keauhou Bay.

This location, currently acting as a natural filter, is especially vulnerable due to having a golf course on one side and a natural treasure like Keauhou Bay on the other.

In addition to the natural disaster this will cause, Hawai'i Island is already having serious infrastructure and resource issues that have yet to be solved.

## Sylvie Madison

I strongly oppose any development that will have a detrimental effect on the bay and its fragile ecosystem. Also it is shameful that a hotel is being planned to be built there.

From the testimony of Richard Bennet, MS, Phd:

Keaouhou Bay is a small bay inlet on Hawai'i Island and, as such, is subject to much more degradation than the open shore area of West Hawai'i. As such, the Bay requires special protections.

The following comments pertain specifically to water quality issues affecting Keaouhou Bay. The draft EIS does not address these nor accounts for the fact that the State and the EPA list Keaouhou Bay as an Impaired Water Body under section 303 D of the Clean Water Act (CWA). That law requires that impacts to the Bay be mitigated and that further impairment does not occur. This requirement under the law has not been met. Any development in the watershed needs to be conducted by a careful evaluation of this fact. Under the law, remediation begins by conducting a Total, Maximum Daily Loading study known as a TMDL. The Bay is listed as impaired for exceeding the limits for turbidity. Turbidity has several causes in near-shore waters, such as runoff water with fine sediments and phytoplankton. Our research shows that turbidity is a problem in Keaouhou Bay in the absence of surf events. The turbidity is also due to the overgrowth of marine phytoplankton. Our studies show that turbidity declines along a line moving offshore. The inner Bay has very poor circulation and is where most sediments and other factors causing turbidity arise. Phytoplankton grow in response to increased temperature and nutrient loading in the Bay. The lack of adequate circulation amplifies the problem.

Sylvie Madison

Aloha e Michele,

Thank you for your comments concerning the Keauhou Bay Management Plan, Draft Environmental Impact Statement. Your comments have been received and administratively recorded.

Comments received during the 45-day public comment period will be reproduced in the Final Environmental Impact Statement, and substantive comments addressed.

The County of Hawai'i and our planning consultant, G70, are copied here on this email so that they receive a copy of your feedback.

We appreciate your involvement and contribution to the environmental review process. Your input is invaluable in helping us develop a management plan that reflects the needs and concerns of our community.

Thank you once again for your engagement and commitment to the future of Keauhou Bay.

Mahalo,

The Keauhou Bay Project Team

The manta ray population in this area is rare and an experience sought after by wonderful people all over the world. Don't fuck it up!

Aloha nui –

Mahalo for the opportunity to provide comments on the Draft Environmental Impact Statement for the Keauhou Bay Management Plan. My name is Lilie Makaila. I would like to take a paragraph or two to make clear my interest in this plan, kuleana to this wahi pana and my concerns for the future of Keauhou.

I do not live in Keauhou, but I am a lineal descendant of Keauhou ahupua'a, specifically to the pāhale of Keauhou Bay. My 'ohana are the Ha'ani'os and the Ka'imihanas. Your Figure 4-5 depicts the 'āina of my 'ohana who was living there through the 1950's. My ancestor Ka'aha 'āinaakahaku Nāihe (nee Ka'imihana) lived to be over 100 years old, traveled much, and always called Keauhou her home. An article in the Star-Bulletin from 1930 published a photo of my late kūpuna and called her the "Oldest Traveler" at 104. She would holoholo between Big Island and O'ahu on the steamboats, and she often shared of the healing waters of Keauhou and how she swam there in her youth and as a centurian. She was a well-known lā'au lapa'au who is credited with saving the life of C. Montague Cook as an infant. She is featured in a photo at the Bishop Museum where she is practicing ulana lauhala, a practice that was passed down through many generations of my 'ohana on both the Ka'imihana and Ha'ani'o lines. Helen Roberts, during her fieldwork for the Hawaiian Legend and Folklore Commission (1923-1924), recorded four unpublished mele for Ke Ali'iwahine Kap'i'olani dictated to her by my kūpuna Ka'aha 'āina. She passed in 1942. The Star-Bulletin claimed she was the oldest person in Hawai'i at the time, thought to be 116 or even as old as 119. She raised many keiki at Keauhou, including my Tūtū's Tūrūman, Kahaleamiani Ka'imihana. He was known as the blind fisherman of Keauhou. He would lead boats out to lay net and surround the schools of 'ōpēlu and akule along the coastline. He raised his children there, including my Tūtū's mother, Rachel Lāhela Ka'imihana and instilled the importance of Keauhou in subsequent generations. 'Ike that was passed down to me as well.

Now that I feel like I have appropriately shared my kuleana to Keauhou, I will keep my comments organized and concise:

- **I am in support of the heritage corridors, open space, redevelopment of community and public spaces and access, additional parking, and mālama & conservation of wahi pana at Keauhou.** These efforts are what I consider the kuleana of the landowner, and should have been implemented as a part of appropriate land management and stewardship. The sooner the better on these points.
- **I am not in support of the proposed "low-density, sustainable bungalow" type resort development.** I think the use of the terms "low-density" and "sustainable" are misleading, and only make sense when compared to a potential 745-unit, 7-9 story resort development. However, that comparison is based on the existing resort-zoning, a remnant of a time in Hawai'i when aggressive development rampaged unchecked without consideration of our 'āina or our communities. We have moved on from that, and the development of that type of high-density resorts will be challenged by the people of Hawai'i today, myself included.
- **I am not in support of the proposed Kaimuki Retail/Dining component.** Firstly, just because you have given inoa Hawai'i to the development zones does not make the zones Hawai'i. They are components of a plan, and the use of inoa Hawai'i seems strategic.

Secondly, I do not support commercial development in this special place. The 29-acre site is surrounded by extensive development including commercial and retail spaces. The Keauhou Shopping center is located nearby and is a KS development and source of revenue for the trust. I do not believe that KS needs MORE retail and commercial spaces.

- **I think relocating the existing commercial vendors and adding limited small-scale vendors and kiosks could be appropriate for the space.** If these provide opportunities for local and native businesses, then I would be supportive. If the businesses catered to both the community and visitors, then I would be supportive. I am not supportive of any development that is targeted for visitors only, I am only supportive of development that supports the local and native communities.
- **I do not believe that the alternatives suggested in this Draft EIS are genuinely suggested as potential alternatives.** I believe that each is offered as a strategy to make your proposed development more palatable. And, as a scare tactic saying "Doesn't 172-units sound better than 745-units, cuz we could do that ya know". And it is pushing the narrative that if "we" don't support the proposed development, "worse" could happen. Each of your alternatives suggest maximum development conditions, no lower-density alternatives are included aside from "no action" which suggests that as the landowner, KS will leave things to continue to be unmanaged, including the sacred sites identified. Please include a lower-density alternative. Here is a suggestion: Uncle Bobby Camara commented that instead of 1800 sf bungalows, look at small hale catered to local families and visitors for short-term rentals units. A smaller scale, more simple short-term rental development geared towards local people might have HALF the units, at 86-units. These could be very simple construction and priced at \$100/night with State ID for each guest. This would generate at least \$3M in revenue annually. If the goal is for this area to be self-sufficient and be able to sustain the cost of operation and maintenance, isn't \$3M enough? These types of lower density alternative should have been included.
- **The document suggests that the landowner seeks to ensure that the long-term operation and maintenance does not take from resources meant for its educational spending, but the endowment for the trust is \$14.6B and last year alone the trust spent almost half a billion dollars.** I do not believe that the funds needed to maintain the wahi pana and community spaces even compares to what is already spent by the trust. It is however the kuleana of the landowner to property steward its lands, and these are the costs of doing so.
- **KS owns 364,000 acres across the pae 'āina, and stewardship of those lands is the kuleana of the landowner.** Proposing that \$100M of resort and commercial development is a REQUIREMENT needed to maintain the lands at Keauhou is simply false. And as such, KS should reconsider these components of the proposed development and instead look for less impactful long-term uses that better support the community. Based on your breakdown of costs, instead of the proposed \$124M development, remove the proposed resort and commercial/retail/dining components, save yourself \$100M, and invest \$24M in appropriate stewardship and management of the 'āina at Keauhou.
- **The consultation for this project appears to only be completed to "check a box" and does not meaningfully incorporate the concerns expressed by kūpuna and kama 'āina.**

**DEIS for the Keauhou Bay Management Plan**  
Comment

August 4, 2024

A huge majority of the comments received are from folks who do not support the proposed resort and commercial development and ask for other alternatives that better support the local community. Meaningful consultation means that you will act on the major themes expressed by those you have consulted with and that their mana'o will be used to alter the plan as needed. You have not done this. The incorporation of the "Housing Alternative" is an excellent example of not meaningfully incorporating mana'o of participants. You took their suggestion to look at a housing alternative for local families needing homes, and looked at the highest density development option for housing. Meaningful exploration of the intention of that suggested alternative would have looked at low-density single-family homes or multi-family development at least of similar density to the proposed resort development not looking at the highest possible build out. What a missed opportunity to really listen to those you have consulted and genuinely explore their suggested alternative.

- **In light of the lack of meaningful effort put to potential alternatives, I find this DEIS incomplete and ask that you revise and try again.** Perhaps more consultation would be a good thing, especially since the kipuana who you relied on to complete your CIA have expressed in their comments their lack of support for the proposed resort and commercial development components as well.

**Ho'i hou ka wai i uka o Ao** – these waters are muddled, perhaps you should delve further upstream to find clearer, better waters.

Ola ka 'āina,

Lilitie Makaila

**Jeffrey and Leann Malison**

Aloha: We are residents of the Keauhou Punahale condo development just a short distance away from Keauhou Bay, and we oppose the Keauhou Bay Management Plan as proposed by Kamehameha Schools. The following are our reasons for opposing this plan: The plan calls for the development of a new hotel adjacent to the bay. Such construction will certainly come with increased run-off into the bay, damaging corals, fish and other marine life, especially the well-known local manta population. Keauhou Bay already has one large hotel and numerous other rental housing units adjacent to its shore. The small bay already has a very high level of human use. Adding another hotel to the bay area will greatly increase the level of human use to a point that further damage to the corals and other marine life will be inevitable. The development plan including the re-routing of roads near the bay will greatly increase traffic and traffic congestion in an area that is already heavily trafficked. Such an increase in traffic will decrease the overall quality of living in the area and increase traffic safety concerns and problems. Mahalo for allowing us to express our concerns and opinions on this proposal.

Jeffrey Malison

We are residents of the Keauhou Punahele condo development just a short distance away from Keauhou Bay, and we oppose the Keauhou Bay Management Plan as proposed by Kamehameha Schools. The following are our reasons for opposing this plan:

- The plan calls for the development of a new hotel adjacent to the bay. Such construction will certainly come with increased run-off into the bay, damaging corals, fish and other marine life, especially the well-known local manta population.
- Keauhou Bay already has one large hotel and numerous other rental housing units adjacent to its shore. The small bay already has a very high level of human use. Adding another hotel to the bay area will greatly increase the level of human use to a point that further damage to the corals and other marine life will be inevitable.
- The development plan including the re-routing of roads near the bay will greatly increase traffic and traffic congestion in an area that is already heavily trafficked. Such an increase in traffic will decrease the overall quality of living in the area and increase traffic safety concerns and problems.

Mahalo for allowing us to express our concerns and opinions on this proposal.

Keauhou Bay--NO RESORT!

**Subject:**  
**Categories:** Yellow Category

**Subject:** Kamehameha Schools EIS Draft For Keauhou Bay WILL HAVE NEGATIVE IMPACT!

To whom it may concern,

Please reject Kamehameha Schools EIS for Keauhou Bay to become a Bungalow Resort. This is a VERY small bay and the added footprint of a 105 room Resort, that will include excess traffic, will have a **serious negative impact** in Keauhou Bay.

Please, Do NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near coastal development area. An article entitled, "*What is the biggest source of pollution in the ocean?*" by NOAA, *National Oceanic and Atmospheric Administration*, states, "*When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides.*" It also states, "*Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called, nonpoint source pollution, which occurs as a result of runoff.*"

The trees you want to take down keep the runoff pollution from the golf course from going into the Bay. According to the National Library of Medicine, in their article, "*Putting the Earth in Play: Environmental Awareness and Sports*," shares that the golf industry uses **approximately 50 pesticide active ingredients**, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are **being held off** from running into the Bay by the very trees you want to take down.

Let's not forget the marine life that will be threatened by excess pollution and traffic. Keauhou Bay is the monk seals and the green sea turtle's habitat. More pollution and people will endangered these species.

This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced.

Kind Regards,  
Ellen Manko, RN

David Markley

Subject: Keaouhou Bay Management Plan DEIS

Dear Mr. McKeague

Thank you for the opportunity to comment on the Keaouhou Bay Management Plan Draft Environmental Impact Statement (DEIS).

My wife and I have owned a condominium unit in the Keaouhou Resort, which we have visited annually.

We commented on the inadequacy of the scoping document in April 20, 2022.

While some of the comments in that letter have been superficially addressed, there remain areas where transportation related impacts have not been adequately or accurately analyzed. Accordingly, the probability of significant adverse impacts due to the proposed development still exists unless there is significant reduction in the scale and character of the proposed action and/or significant increase in tangible mitigation that significantly reduces the impacts of the proposed development. The following is a summary of our initial review and comments.

Impact Area and Impacted Intersections - As noted in our previous comment letter, we strongly believe the impact area analyzed should be expanded to include the intersections of Ali'i Drive at Keaouhou Shopping Center Access, Kamehameha III Road at the Keaouhou Shopping Center access, and Kamehameha III Road at Kuakini Highway at the very least. These are intersections where volumes are higher and the impact of a the project-generate traffic volume increases will have a larger impact.

We request an updated traffic analysis (and other related noise and air quality analyses) to include this expanded study area.

Redistribution of Traffic Volume - The construction of Old Kona Road to connect Kamehameha III Road with Kaliopapa Street will result in a major shift in traffic volume away from Kaliopapa Street to Kamehameha III Road with associated forecasts, safety, noise and air quality impacts. The traffic analysis states the traffic forecasts considered such a redistribution of traffic, but this statement is not supported by the numerical analysis. Consideration of redistribution of volume was limited to the project-generated volumes only but did not reflect the redistribution of existing and non-project growth in traffic volume.

The effect of the proposed through-road connection on future traffic volumes will have a greater impact than the project trip generation. It is reasonable to expect that 65% to 75% of all traffic (current volumes, other non-project traffic volume increases and future traffic from the proposed development) will use Kamehameha III Road to access the proposed project. This is because most of the population density, commercial opportunities, tourist and entertainment destinations, and transportation services are north of the proposed development. This shift in background traffic will significantly erode the residential character of neighborhoods currently relying on Kamehameha III Road as primary access.

We request a revised traffic study that includes a figure showing the 2035 traffic volume forecast with the proposed through road connection but without the proposed development. This would show that 2035 volumes will shift from the existing pattern to a pattern where the majority of the non-project traffic enters and leaves the Keaouhou via Kamehameha III Road.

Safety Analysis - The "Existing Conditions" paragraph on page 4-117 states: "The Project Area is in (a) congested area with a high volume of pedestrian and vehicular traffic. This has resulted in functional hazardous conflicts between pedestrians, bicyclists, and vehicles (cars, buses, delivery trucks, and boat trailers."

This sounds like a demolition derby, yet there is no documentation of existing traffic safety conditions in the traffic analysis, sources of the safety issues, forecast of continuation of the unsafe trend, and/or how such impacts would be mitigated with the proposed development.

One specific example is the conflict between motor vehicle traffic and pedestrians along Kaliopapa Street. It is noted that there is substantial parking along the lower portion of this road where no sidewalks exist. Yet Figure 4-42 – Proposed Circulation, shows this road as a "Vehicles Only" road. The pedestrian paths are nice, but pedestrians who park along Kaliopapa Street will follow the path of least

resistance and will walk along the road as they make their way to and from Keaunohu Bay. There needs to be a sidewalk at least on one side of the road so pedestrians are not forced to walk in the street.

We request documentation of safety impacts in the study area forecast of future conditions with the new through road connection and proposed development, and effective mitigation including sidewalks on both sides of these roads, bike lanes, and traffic calming/speed reduction measures to reduce the frequency and severity of this problem.

**Air Quality and Noise Analysis** – Since the traffic forecasts are erroneous, all air quality and noise analysis are also in error. The noise disruption from traffic along Kamehameha III Road is already disruptive. As noted above, the majority of both background traffic volume and project generated traffic volume will use Kamehameha III Road. Traffic congestion, noise (duration and intensity), and air quality impacts will significantly worsen, particularly for residents adjacent to this section of the road.

We request that Air Quality and Noise studies be revised to reflect the significant shift in traffic volume associated with the development and through road connection that is part of the proposed action.

In summary, we request that a Supplemental DEIS be prepared for public review to address an updated traffic analysis addressing the items noted above, any associated Noise and Air Quality analyses, and other non-traffic issues.

Thank you for considering our request for additional analysis and effective voluntary mitigation. Please respond to our comments as part of your public review process and/or issuance of a Supplemental DEIS by email.

Sincerely,  
David Markley

## janet Matlock

Mahalo for this opportunity to review and comment on the Keaouhou Bay DEIS. There are myriad reasons to oppose this plan — including mauka-makai environmental, historical, cultural, economic, and educational to name but a few — but I will focus this letter primarily on what appears to be Kamehameha Schools / Bishop Estate's primary motivator: money.

Section 2.6.2 claims:

"Lands are Underperforming Economically"  
"The Kamehameha Schools properties are prime properties that could generate significant revenues from appropriate development to support the management of Kamehameha Schools assets and provide long-term economic returns. However, these lands are currently underutilized, and do not yield equitable returns or market-based rent revenues for the organization. A key component of the plan is to ensure its economic sustainability. Revenue generated from commercial lease rent will be redirected to support the KBMP's desired educational and cultural resource management priorities..."

This assumption, that Keaouhou Bay is a "prime property that could generate significant revenues," flies directly in the face of section 2.6.1:

"Integrity of Natural and Cultural Resources are Threatened"  
"Cultural resources include the tangible and intangible places and landscapes that our kupuna once lived, worked, played, and passed. For Native Hawaiians, these places provide a spiritual connection to the practices and knowledge of their kupuna (ancestors/elders) and continue to contribute to a sense of identity and well-being..."

It makes no sense to increase commercial development specifically intended to be marketed for high-end tourism in order for this place to provide spiritual connection, unless one is worshipping the almighty dollar.

It is baffling at best that Kamehameha Schools sees this sacred wahi pana first and foremost as a source of income. KS's website states the current endowment is \$14.6 Billion and the investment portfolio is reported at \$9.6 Billion, with the smallest portion of that portfolio being real assets. (see attached file)

How much of a rounding error would the Keaouhou Bay proposed development be? And at what intangible price to the 'āina?

During the April 2022 talk story, one participant asked, "...If the intent is to increase kama'āina and kupu'āina access, why is this being accomplished by putting in hotel rooms and fine dining? What are financial metrics to meet successful mission at Keaouhou Bay. Is it the same for all properties. Could bungalows at another KS owned site be used to provide financial returns needed."

The response was, "KS's objective is to steward the land in perpetuity. There are no existing revenue generating uses at Bay to fund the needed stewardship. We don't want to drain on other endowment funds set aside for education. Acceptable rate of returns have been studied." (sic)

So: KS holds a \$14.6 Billion endowment with a \$9.6 Billion investment portfolio, yet believes it does not have enough money to fund the proposed "educational centers" (and additional commercial developments) proposed for Keaouhou Bay?

This does not make sense. If I had control of this endowment, I would be building more schools and educating more Hawaiian keiki, not causing environmental degradation in order to develop yet another high-end "bungalow" resort.

KS already owns land leased for multiple resort properties, including one on Keaouhou Bay that seems to be "under-performing." Given KSBE's track record with hotels in this ahupua'a, perhaps caretaking the one already on-site might be a better approach?

I would like to close by referencing a submission contained in Appendix B, EISPN Comment Letters, by Alysia Fischer (KS's response was boilerplate):

"As an archaeologist who worked on site in Keaouhou Bay for multiple impact assessment and tsunami mitigation projects, I am vehemently opposed to any development that would add more commercial or residential impact to the area. Along with the uncontrolled sea level rising, any further development would negatively impact the invaluable historical and cultural resources of the area. Kamehameha Schools, the county, and the state can do better with "fundraising" for education and the preservation of this area instead of hiding it within the guise of obtaining the funds through further "for profit" development. Preservation and improvement projects are always welcome and encouraged, but it shouldn't come at the high cost of changing the physical and cultural landscape to this extent."

I completely agree. It is simply not fathomable that KS cannot allocate funds to accomplish appropriate stewardship goals without bulldozing, paving, and commercializing via exclusive tourism this fragile and already-impacted little bay.

Mahalo for your time and attention.

Janet Matlock  
Kai lua Kona

**Peter Matlock**

Mahalo for this opportunity to comment on the Keahou Bay Management Plan Draft Environmental Impact Statement.

Reading this Draft EIS is an exercise in cognitive dissonance. Critical objectives of the KS mission and intent for Keahou Bay are directly undermined by the planned development. Furthermore, it lacks creativity by perpetuating "same old" approaches for Hawai'i economic development, and will further deteriorate the already fragile nature of Keahou Bay and its marine health.

It is important to first recognize the good parts of this plan, and to acknowledge good work done by KS to fulfill Princess Pauahi's will to educate Hawaiian students and preserve Hawaiian culture. Enhancing respectful space around the birthplace of Kaunakouli and other significant cultural sites in historic Keahou Bay is needed.

That said, the current plan does not meet stated KS and project objectives, and is worse than the "No Action Alternative."

Many others will provide additional details on Draft EIS deficiencies. Selected comments are:

1. The Plan claims to increase access to Keahou Bay by Kama'aina and Kupi'aina ("create a greater sense of inclusivity at the bayfront", pg. 1-14), yet development of high-end hotels and commercial activity (which is the essence of this Plan) elsewhere in the Islands has previously and consistently resulted in the exact opposite effect.

Keahou Bay provides one of the few areas for ocean access in Kona and is used heavily by Hawaiians, other locals, visitors, families, churches, community groups, fishermen, swimmers, boaters, paddlers, those on SUPs, kayakers, local volleyball players, and children jumping for hours into the water. There is little confidence these activities will continue if surrounded by high-end hotels, retail, and restaurants. It is difficult to give KS credibility for its claims to help people, when it has for years not fixed its restaurants at the Ka'ilimohie Beach Park—which is the most basic of steps to encourage a "greater sense of inclusivity."

2. The Plan quotes Dr. Konia Freitas, the "noted Native Hawaiian scholar from the Kamakakōkōkalamī Center for Hawaiian Studies, [who] explains spatial legitimacy as a need to respond and challenge certain assumptions that Native Hawaiian values cannot be authenticated in the contemporary urban form. The persistence of these assumptions 'bolsters the colonial construct of indigenous life as incompatible with modernity and cedes the urban realm as a perpetually colonized space' (Koh and Freitas, 2018). Dr. Freitas postulates that planning for places that are inclusive of Native Hawaiian perspectives, in response to these questionable assumptions, must begin through an inclusive framework that goes beyond an aesthetic response but seeks to be 'generative of social, economic, and political meaning.' This KBMP also aims to purposefully pursue the 'Aina Aloha Economic Futures Declaration (AAEF) with a specific focus to 'assess collective kuleana to restore degraded environments, sustainably managed human-occupied spaces, and protect the vibrancy of intact ecosystems.'" (pg. 2-4)

It is admirable that KS seeks to incorporate Hawaiian perspectives and kuleana in management of its spaces, but—frankly—nothing seems to exude colonialism more than high-end luxury hotels and resort retail, and it is difficult to understand how more development, run-off, and pressure on already-stressed Keahou Bay will "protect the vibrancy of intact ecosystems."

3. The Plan asserts "Many consulted parties described commercial activities at the bayfront as incompatible with and disrespectful to the significant cultural landmark. The abundant commercial activity at the bayfront area has also caused a perception of exclusivity that some feel lacks true inclusivity of Native Hawaiian and kama'aina residents to the area. Long-time Keahou residents express the sentiment that the bayfront is too commercialized and the feeling expressed is that many Native Hawaiian families are no longer welcomed. The KBMP is a reinvestment and application of key foundational principles and values that promote an inclusive cultural/community space at Keahou Bay." (pg. 2-9)

If we understand correctly, KS acknowledges that Keahou Bay is currently too commercial, and then asks us to accept that its solution to this is yet MORE commercial activity. This is self-contradictory.

4. The Plan states "The mission of Kamehameha Schools is to create educational opportunities in perpetuity to improve the capability and well-being of people of Hawaiian ancestry. Kamehameha Schools' Vision 2040 seeks to improve the well-being of 'āina (land) and the lāhau (Hawaiian people) within one generation." (pg. 2-2)

This is an eminently laudable objective. With approximately 55% of Native Hawaiians now living outside of the Hawai'i Islands, improving Hawaiian well-being is more critical than ever. However, this Plan fails to address this concern, is itself risky (note history of prior hotels at Kahalu'u), and undermines the intent to improve well-being by holding needed improvements to Keahou cultural/historic sites hostage to development that will seriously degrade Keahou Bay health and public access—with the end result of a net decline in well-being.

5. The consistent underlying theme in this Plan is KS desire for profit. We are asked to accept as an article of faith that revenues from ONLY the Plan's 29.12 acres can be used to support desired renovations and support students in the future, whereas Princess Pauahi's estate currently comprises 363,800 acres and a portfolio valued at \$13.1 billion (https://investments.kshb.edu/history/#:~:text=Today%2C%20her%20heir%20has%20grown,as%20a%20June%202003%2C%20%202022.). This amount of building will cause serious environmental degradation to a bay critical to Hawaiian history and culture—does KS not

have other locations to build its hotel?

6. The Plan shows a lack of creativity by proposing more of the "same old" for economic development. The history of KS hotels in Kahala'u shows two that were ultimately taken down. Building hotels is not without risk. Why not, for example, instead move all boating check-in activities to Keauhou Shopping Center storefronts and bus visitors to the bay (allowing the opportunity for cultural education). This would facilitate construction of cultural venues at the bay, preclude the need for more environmentally damaging development and additional parking along the bay, and increase foot traffic at the under-utilized shopping mall—hence increasing KS revenues from existing infrastructure. It could likely be that this approach has a greater return on investment than a risky hotel development. Or, why not take the bold move of seeking to preserve as much land as possible in an undeveloped state, while restoring Native Hawaiian archeological remains (as is being done in Kahala'u), so that future generations can learn directly from this historically rich area that once featured seven royal centers?

7. When it is said the Plan will "Address the opportunity gap within Kona's existing visitor accommodation inventory" then it is clear that KS is thinking more as a real estate developer than as a steward of Hawaiian education and cultural preservation.

8. Keauhou Bay is already stressed, to the detriment of marine life. Those who use Keauhou Bay know not to enter it with an open cut, which is a sad reversal from when Native Hawaiians and others would seek out ocean saline water to heal wounds. Studies show Keauhou Bay water has high, if not the highest, levels of fecal bacteria along the Kona Coast. We know development and paving over more areas for buildings and parking increases runoff, which causes further water degradation. Increased development under this Plan undermines our ability to rejuvenate a healthy bay, also undermining key relationships among land, ocean, and people.

9. The proposed boat traffic will also undermine bay water quality, and further impede use by all who enjoy non-motor boat use, recreation, and fishing in Keauhou Bay.

There is much more. To repeat: the "No Action Alternative" is the better choice than the proposed Plan.

Mahalo nui loa for this opportunity to provide input.

Peter Matlock

Orion McCarthy

July 30, 2024

To whom it may concern,

Thank you for soliciting public comment on the proposed development at Keaouhou Bay. My name is Dr. Orion McCarthy. I am writing to express my concern about the impact of the proposed development on the nearshore coastal ecosystem within Keaouhou Bay.

I recently received my PhD in marine biology from the Scripps Institution of Oceanography in San Diego, California. Much of my doctoral research focused on the temporal dynamics of coral reefs in Maui Nui, focusing on the human and environmental drivers responsible for reef change over time. In addition, I also attended the UH Marine Option Program's QUEST field school in Ke'ei, Hawaii, where I gained familiarity with Kona's unique reef system, which is characterized by higher reef fish abundance and biomass (Donovan et al. 2018; Jouffray et al. 2019) and large amounts of habitat structural complexity (McCarthy et al. 2022) compared to elsewhere in the Hawaiian Islands.

**Hawaiian coral reefs are culturally, economically, and ecologically important**, and have been identified as hotspots of coral resilience (Sully et al. 2022). However, coral cover in the state of Hawaii has declined over the past few decades (Rodgers et al. 2015; Asner et al. 2022), due in part to chronic impacts from nearshore development. **A recent study focused on coral reefs in Kona found that reefs with healthy fish populations and reduced exposure to wastewater and urban runoff were better able to recover after bleaching events than reefs exposed to elevated land-based impacts** (Gove et al. 2023). This matches other findings from elsewhere in the Pacific (Donovan et al. 2021), which have consistently found a negative impact of elevated nutrients and wastewater on corals, especially as they struggle to adapt to bleaching events and other climate impacts.

I have no issue with the broad concepts underpinning the Keaouhou Bay Management Plan. I celebrate the Kamehameha School's vision for protecting, highlighting, and celebrating Hawaiian culture and heritage as well as promoting coastal access for kama'āina. However, I question whether some aspects of the plan align with this vision, specifically the plan to develop a resort adjacent to Keaouhou Bay. Furthermore, **the draft Environmental Impact Statement (EIS) barely touches on the impact of this development on Keaouhou's coral reefs.**

The EIS mentions the value of Keaouhou's reef, citing coral cover as high as 62% (which is considerably higher than the statewide average; Rodgers et al. 2015), but maintains that impacts to reefs will be minimal because the development will occur only on land. This is shortsighted, because **coral reefs are directly impacted by land-based sources of pollution. Furthermore, the EIS does not propose a convincing plan for dealing with wastewater and stormwater from the proposed development.** The geology of the Big Island is characterized by extremely porous rocks, which allows wastewater and stormwater pumped into dry wells to percolate up onto the reef. This makes Kona's reef especially susceptible to impacts from coastal runoff and wastewater (Gove et al. 2023). Similar upwelling has negatively impacted coral reefs in nearby Maui from the Lahaina Wastewater Reclamation Facility (Williams et al. 2016).

**To ensure the future resilience of Keaouhou Bay's coral reefs, the Keaouhou Bay Management Plan should bolster plans to deal with wastewater and stormwater impacts and reconsider development of the proposed resort at Keaouhou Bay.** On an island with such high housing costs and tourism impacts, it is questionable why a resort is being built here at all, instead of low-income housing reserved for locals and not tourists. Locals are the ones who use and appreciate Keaouhou Bay's coastal resources year-round, and these resources should not be further degraded by development in support of tourism.

Thank you for considering these concerns.

Sincerely,

Dr. Orion McCarthy

## Peter McCormick

My wife and I own one of only two residential properties on Ehukai St on the south side of Keahou Bay and are the only full-time residents on the south side of Keahou Bay, from the Outrigger all the way around the bay to Kamehameha III Road. We are very happy with the plans for redevelopment and beautification of the area. We do have some requests we are hoping will be considered for actions now, during redevelopment, and once completed. Those are as follows:

1. Most of Ehukai St is already designated by the County and marked as no parking but this is rarely enforced, even when the police are called. Illegal parking creates a safety hazard for pedestrians along this street. In cooperation with the County, please consider adding sidewalks with curbs along both sides of Ehukai St and eliminate all parking along the street.

2. On a daily basis we have people trespass across our property at 78-131 Ehukai St. They came from the shoreline public access area on your property at the Outrigger and from your vacant and unsupervised lot on the Northeast end of Ehukai St where you plan to create the commercial spaces. Our property extends to the high-water mark according to the shoreline survey on file with the County. This is a fixed lava rock shoreline with cliff, which has not changed in generations. This lava rock shoreline with cliff does not allow passage across the waterfront without trespassing. The high-water mark is below the cliff level. There is no public right of passage in this area. It is not a beach access corridor nor has the County taken the necessary steps to condemn and buy the land to form a public right of way. Therefore, we would like you to take immediate action to address this issue and incorporate this into your development plans. Signage, physical barriers, and plantings would all help.

3. We are concerned about additional noise from effectively moving the retail operations in the area closer to the only two residential properties on Ehukai St. Although the Outrigger hosts wedding right next to our property, there are very good about ensuring all noise stops by 10 PM. Manta Ray tours currently run past 10 PM. We want to ensure that the residential 10 PM quiet hours will still be observed.

4. The public access parking area on your land on Ehukai St is embarrassing. Can you please pave it, mark the spaces, pick up the trash, and start maintaining it? There was a derelict van with long expired tags parked there for 4 weeks until last week. I waited for the Outrigger to do something about it. They didn't. When I finally called the police, they told me mine was the first report about this vehicle. That is absurd. This is on your land that the Outrigger leases. The Outrigger staff seems to think the public access areas are someone else's responsibility. It is your land!

5. You have not been good stewards of your land in the area. Hoping you can start to change that now. No reason to wait for redevelopment. You can remove junk vehicles, pick up trash, and do something when people decide to camp and car camp. You have multiple people camping on your properties now. That adds trash and will likely lead to brush fires at some point. I have reached out multiple times to your asset manager for the area. She has been mostly responsive but it is an ongoing problem that requires more than a reactionary approach to one of the few full-time residents in the area.

6. Please consider ending Kaleiopapa St at the County boat ramp and not continuing it as it is now past Fair Winds Snorkel Cruises. There are only eight parking spaces there now at the end so it would have a negligible impact on parking. It would open up the area more to recreation, improve pedestrian safety, and allow for more green space around the significant cultural monuments and the cave.

7. Your lots in the area on Ehukai St, Kaleiopapa St, and Kamehameha III Rd are not zoned to be

storage yards or boat yards but that is how they are being used now. Your tenants illegally store derelict cars, trailers, boats, and heavy equipment and make boat repairs. All of this looks terrible and leads to environmental damage of the land and the bay. Please clean this up immediately and factor this in for future plans.

## Paul-Richard McCullough

I am unequivocally against any resort development in Keauhou Bay. Keauhou Bay should not be viewed as a profit center for Kamehameha Schools but a historic and sacred place to be respected and protected. Overrunning sacred sites with tourists just to make money is not pono, it is not aloha.

**From:** Jasmin McCracken <[REDACTED]>  
**Sent:** Sunday, July 21, 2024 11:00 AM  
**To:** 221053-01 KS Keauhou Entitlements  
**Subject:** Keauhou Bay

**Categories:** Green Category

My family loves Keauhou Bay. We paddle, sail, and play volleyball here. Please reject Kamehameha Schools EIS for Keauhou Bay to become a Bungalow Resort. This is a VERY small bay and the added footprint of a 105 room Resort, that will include excess traffic, will have a serious negative impact in Keauhou Bay.

Please, Do NOT risk polluting the water in Keauhou Bay by allowing Kamehameha Schools to develop their bungalow resort project. Research has shown that developments pollute nearby waters constantly during development and after.

Developments have ALWAYS polluted the water in every near coastal development area. An article entitled, "What is the biggest source of pollution in the ocean?" by NOAA, National Oceanic and Atmospheric Administration, states, "When large tracts of land are plowed, the exposed soil can erode during rainstorms. Much of this runoff flows to the sea, carrying with it agricultural fertilizers and pesticides." It also states, "Eighty percent of pollution to the marine environment comes from the land. One of the biggest sources is called, nonpoint source pollution, which occurs as a result of runoff."

The trees you want to take down keep the runoff pollution from the golf course from going into the Bay. According to the National Library of Medicine, in their article, "Putting the Earth in Play: Environmental Awareness and Sports," shares that the golf industry uses approximately 50 pesticide active ingredients, including chlorpyrifos—an insecticide that is banned for residential use by the EPA due to developmental hazards. These pollutions and more are being held off from running into the Bay by the very trees you want to take down.

Let's not forget the marine life that will be threatened by excess pollution and traffic. Keauhou Bay is the monk seals and the green sea turtle's habitat. More pollution and people will endanger these species.

This Bay is worth protecting. Please do not put a resort in such a small area. Future generations will be deprived of what it currently is, and it could never be replaced.

🌺 Mahalo,

Jasmin McCracken

## Kathleen McMillen

June 30, 2024

Attn: Mr. : Kawika McKeague  
G70 Consultant via email (keahoubay@g70.design)

Subject: Keahou Bay Management Plan Draft Environmental Impact Statement(DEIS)

My biggest concern with the Kamehameha Schools (KS) proposed project is the already fragile water quality of the bay. There should be no development of any kind near Keahou Bay until the sewer situation is resolved in the area. Several waterfront homes on the north side of this bay have only cesspools. And even the few that have septic tanks are at too low an elevation and are too close to the ocean to have adequate leach fields, thus increasing the bacteria levels in the bay. These lots need to be connected to the nearby local private sewer system or the County sewer lines, if the private system is not available. KS's lazy response to this issue in the April 2022 meeting was the area is out of their jurisdiction. Hmm, I bet they would find a way to make it happen if approval of their proposed resort was predicated on getting all the bayfront homes on sanitary sewer line. It would require some work with the local private system and the County DPW, but it is doable. And if the County doesn't have the will to disapprove of this project, the County should make sure the bayfront lots are connected to a sewer line before allowing development of the resort or anything else in the vicinity of Keahou Bay.

This problem is compounded by runoff after it rains. The drainage maps in the DEIS show it all flows toward the bay. Some is surface runoff and much is runoff just below the surface and it is particularly significant after a heavy rain. After very heavy rains the bay occasionally turns green from algae blooms creating very unhealthy conditions for users of the bay. Added development will add stress to this bay and may reverse its health permanently. The State Clean Water Branch does occasional monitoring of the bay waters and shows average bacteria counts are rising over the years.

Do we really want to add to the already fragile and congested conditions with a resort that only one-percenters can afford to enjoy?

The April 2022 meeting was supposed to be a scoping meeting where community input was taken seriously. It was clear to me and many others present that KS had already made up their minds on the scope of the project and were only there because the meeting is a requirement of the EIS legal process. Volume II of the most recent Draft EIS Appendix A and B summarizes the public input at the 2022 meeting and the inadequate answers by KS. The latter part of Appendix B shows many comments of community individuals who disagreed with the proposed project. Just about every single one of those comments was answered by KS with the exact same long boiler plate answer. That is so lazy on the part of KS and their consultant, but more importantly, insulting and disrespectful to the community. KS didn't even try to pretend to care what the community thought. I have seen better responses to proposed development in Kona from outside profit driven private developers.

Throughout the DEIS, KS made the comment that they need the revenue from the proposed resort to fund the needed cultural improvements in the plan. That is just not true. We all know KS has vast land holdings, many places to build a resort where the environment is not as fragile as it is at Keahou Bay. Or better yet, so we don't add another unneeded resort, how about improving the management of their many existing holdings (like the Keahou Shopping Center) thus improving their income stream.

In 2008, Kamehameha Schools said this when demolishing the Lagoon and Keahou Beach hotels to add a more appropriate cultural park: "Our charter for future development here is to make things pono, or right, to solve the mistakes of the past and move ahead. We want to make sure that any and all future development in Keahou, first and foremost, is culturally correct." The proposed resort is in conflict with this statement.

## Rebecca Melendez

Aloha,

Please reject Kamehameha Schools EIS because Keauhou Bay is declared Impaired water H1713293 by the EPA Clean Water Act. This bay needs to be preserved because it is a natural resource that is very sensitive.

"The State of Hawaii Conservation District is a designated land area managed by the Department of Land and Natural Resources (DLNR) through the Office of Conservation and Coastal Lands (OCCCL). This district was established to protect Hawaii's natural resources and encompasses various land types including watersheds, scenic areas, parklands, wilderness areas, beach reserves, and habitats for endemic plants and wildlife. The Conservation District also includes submerged lands makai of the shoreline."

<https://dlnr.hawaii.gov/occl/conservation-district/>

Keauhou Bay is a natural resource and **NEEDS TO BE PROTECTED**. Under the EPA Clean Water Act it is Impaired water area and DLNR it should be conserved because it is an extremely sensitive area.

The district is divided into five subzones:

Protective: The most environmentally sensitive areas.

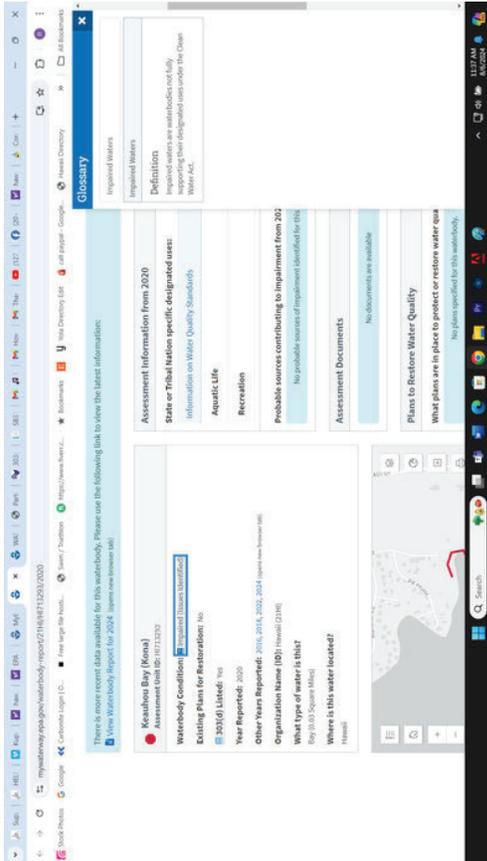

Limited: Areas with some environmental sensitivity.

Resource: Areas designated for resource conservation.

General: The least environmentally sensitive areas.

Special: Areas with unique land uses

Rebecca Melendez

**From:** Rebecca Melendez  
**Sent:** Thursday, July 4, 2024 6:48 AM  
**To:** 221053-01 KS Keaouhou Entitlements; Roy, Alex; Keaouhoubay@ksbe.edu  
**Subject:** Letter #2 Attention Keaouhou Bay EIS Comment Letter

To Whom It May Concern, The endangered Monk Seal has been known to rest in Keaouhou Bay and if a resort is allowed to be built, that will bring a lot more people down to Keaouhou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE. This information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media. There's a seal on the beach! Let's go get a 'selfie!'" That must have been what nearly 18 percent of people on Instagram thought before approaching an endangered species. In a recent study, NOAA scientists used social media to monitor human activities around endangered Hawaiian monk seals. They discovered that human disturbance is more common than they thought. " <https://www.fisheries.noaa.gov/feature-story/endangered-hawaiian-monk-seals-cry-foul-over-selfies> Has there been a detailed traffic study for the increase in cars that will be added to this already severely traffic area? "The number of people living on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat and through run-off of sediments and pollution. Coastal development involves activities such as the creation of harbors, stabilization of shorelines, and aquaculture that involve the destruction of sensitive marine habitats such as mangroves, coral reefs, and seagrass beds. Coastal development may cause the run-off of sediments into coastal habitats, which can smother corals or seaweeds and reduce the amount of light available for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs." The above information was taken from the Education Development Center, INC, from their Coastal Development page called Ocean Tracks <https://oceantracks.org/library/human-impacts/coastal-development#:~:text=Coastal%20development%20may%20cause%20the,negatively%20increase%20of%20food%20webs>. If you allow this Bungalow Resort to be developed you will increase constant noise in this bay for years and, "Noise Pollution Research shows that underwater noise from construction, shipping and naval vessels significantly impacts the natural behaviour of cetaceans and many other marine species. This can be seen when mass beaching events occur or breeding success is diminished." The above information was taken from the Ocean Conservation Trust <https://oceanconservationtrust.org/ocean-advocacy/think-ocean/ways-to-think-ocean/> If you allow this resort the amount of people in this bay will fully increase and, "Hawai'i's recent history has shown that the state's growing population can have an adverse effect on nearshore fish populations. Protecting this important resource for the enjoyment of future generations is essential. Ideally, management of the resource should balance the needs of different user groups, but the welfare of the marine environment on which its inhabitants depend must be the most important consideration." This was taken from Hawaii's own Division of Aquatic Resources <https://dlnr.hawaii.gov/dar/marine-managed-areas/hawaii-marine-life-conservation-districts/#:~:text=Snorkeling%20and%20SCUBA%20diving%20are,effect%20on%20nearshore%20fish%20populations>. There is nothing Kamehameha Schools can do to their development that can stop the guests of this possible Bungalow Resort from going to Keaouhou Bay. Human traffic WILL seriously increase if this resort is allowed to be built and the marine life will be negatively affected by it. Marine life will suffer from this development as stated in this letter in many different scientific reported articles. Please, see this information and state in your report that this Bungalow Resort will have a SERIOUS NEGATIVE IMPACT in Keaouhou Bay as it's been proven in all the articles above. Thank you, Sincerely, Rebecca Melendez

To Whom It May Concern,

The endangered Monk Seal has been known to rest in Keaouhou Bay and if a resort is allowed to be built, that will bring a lot more people down to Keaouhou Bay and if a monk seal is resting they most likely will disturb the monk seal with their selfies because it is fully known this is now a SELFIE CULTURE.

This information is by NOAA Scientist, "Study shows selfie culture impacts how people behave when posting images of an endangered species on social media.

## Rebecca Melendez

To whom it may concern, Heavy storms can come in and serious toxins from the golf course are able to run into Keaouhou Bay causing Algae Blooms and Sea Foam, even with the best filter that is trees and land because at times tropical storms are more than any land can absorb. This doesn't happen that often but if you allow this Bungalow Resort development in Keaouhou bay, algae blooms and sea foam will happen more often because fertilizer, pesticides, waste... will be allowed to runoff into the bay because the natural pollution filter, the trees and land will be gone and pavement can't hold as much runoff as the natural trees and land. "If there are toxic algal blooms, like red tide, or man-made contaminants, like pesticides or detergents in the water, those toxins are contained within the bubbles of sea foam. When those bubbles pop, the toxins can become airborne and compromise the air that is breathed in that location." <https://dlnr.hawaii.gov/dar/species/sea-turtles/> ENDANGERED SPECIES CONSERVATION Endangered Species Act" Section 2. Findings, Purposes, and Policy (4) the United States has pledged itself as a sovereign state in the international community to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction, pursuant to—(b) PURPOSES.—The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section." This was taken from <https://www.fisheries.noaa.gov/national/endangered-species-conservation/endangered-species-act> The word in the very Endangered Species Act states, "to conserve" and conserving the endangered species that enter into Keaouhou Bay would be to NOT DEVELOP A BUNGALOW RESORT because this would cause serious runoff that would pollute the bay and endanger these already endangered species the green sea turtle and the monk seal. "§195D-5 Conservation programs. (a) The department shall conduct research on indigenous aquatic life, wildlife, and land plants, and on endangered species and their associated ecosystems, and shall utilize the land acquisition and other authority vested in the department to carry out programs for the conservation, management, and protection of such species and their associated ecosystems." This was taken from [https://www.capitol.hawaii.gov/hrs/current/Vol03\\_Ch0121-0200D/HRS0195D/HRS\\_0195D-0005.htm](https://www.capitol.hawaii.gov/hrs/current/Vol03_Ch0121-0200D/HRS0195D/HRS_0195D-0005.htm) Please, see that developing a Kamehameha Schools Bungalow Resort in Keaouhou Bay would threaten endangered species due to the unavoidable pollution runoff that would happen a lot more often due to taking out the natural pollution filter; that is the trees and the land. Thank you, Rebecca Melendez

Hilo, HI 96720

Via E-Mail: [planning@hawaiiicounty.gov](mailto:planning@hawaiiicounty.gov)

RE: Keauhou Bay Management Plan EISPN

Aloha—

Kamehameha Schools (“KS”) is to be lauded for its planning and expenditures to create and implement the Keauhou Bay Management Plan (KBMP), which appears to dovetail with plans to develop the area around Kahalu’u Beach Park as part of a larger cultural and educational corridor between Kahalu’u and Keauhou.

My concern is that the EISPN contains a couple of erroneous assumptions and in other respects may lead to an EIS that does not take a “hard look” and some important issues. These are discussed below.

A. Erroneous Assumptions

1. “Very Low Rainfall and Runoff” (EISPN 3’16). The EISPN assumes that because rainfall reaches “a maximum average of 35 inches per year” that there is “very low rainfall and runoff” into the bay. This is based on a 2016 NOAA analysis and does not account for any changes in those averages in the last eight years. This must be reconsidered in light of the rapid changes brought on by climate warming. This assumption also appears to be internally inconsistent with other statements in the EISPN. See, notably EISPN 4-4 at Paragraph 11 acknowledging that “Portions of the Project Area are also located within the AE and VE Flood Zones.”

In my experience, regardless of the historic maximum rainfall average, there are several heavy rains each year that flood across the Old Kona Road onto the adjoining downslope to the bay. The force of the water is sufficient to dig a noticeable trench across the road and into the downslope to the bay carrying rocks and dirt from the road with it.

The flooding also flows down Kamehameha III Hwy sufficient to overflow the curb at the end of the road, dumping silty water directly into Keauhou Bay. The bay water turns brown and is unattractive for swimming

following these events. See, photo attached electronically as Exhibit A to this letter. Others are available on request.

2. No Rare, Threatened, or Endangered Species or Habitats (EISPN at Paragraph 9)  
The EISPN notes that: "The Project is not expected to affect any rare, threatened, or endangered species or habitats." I should be noted that Monk Seals have been known to haul out to rest on the old Keaouhou boat ramp, south of the rock wall on the north side of the bay. See, photo attached electronically as Exhibit B to this letter.

#### B. Silt Accumulation in the Bay

The federal National Oceanographic and Atmospheric Administration ("NOAA") has listed Keaouhou Bay One as a "Marine Protected Area" that is to be "permanently protected year-round" and that such "protection be in perpetuity".<sup>1</sup> Historically, the federal Environmental Protection Agency ("EPA") also performed a water quality analysis of various bodies of water every four years. In 2006 and 2010 the EPA found that the water in Keaouhou Bay was "good", but in 2014 it concluded that it was "good" for recreational use, it was "impaired" due to "turbidity" as it relates to "Fish, Shellfish, and Wildlife Protection and Propagation."<sup>2</sup>

- C. Nitrogen Pollution. An undated research study in about 2015 out of the University of Hawai'i, Manoa, Department of Botany, found that: "[O]f all the West Coast of the Big Island, the highest average percentage of tissue N [Nitrogen] and predicted N concentration was found in the surface samples of Keaouhou Bay." This study was comprehensive and included the full West coast of the Island of Hawaii from the North tip to South Point.

The study discusses Keaouhou Bay in part as follows:

Keaouhou Bay nutrient-rich groundwater plumes demonstrated high values for nitrogen (5.0 to 5.9 δ15N values and high ulva (green algae)

<sup>2</sup> United States Environmental Protection Agency, Waterbody Quality Assessment Report Water Quality Assessment and TMDL Information, 2010 and 2014 Waterbody Reports for Keaouhou Bay (Kona). Last consulted April 22, 2022, at: [https://aspub.epa.gov/waters10/atians\\_waterbody/control?p\\_au\\_id=HI713293&p\\_cycle=2014#atrainments](https://aspub.epa.gov/waters10/atians_waterbody/control?p_au_id=HI713293&p_cycle=2014#atrainments)

The information at this site (now 8-years old) is listed as out-of-date, but the alternative site given for the information says that the data is not available for Keaouhou Bay.

abundance in the bay. Ecologically successful green algae like U. fasciata are potentially invasive. Coastal waters near harbors, industrial complexes, and residential areas with nutrient-rich and/or fresh water input often have blooms of Ulva species that coat ships' hulls, cover pilings and shorelines, and restrict outflow pipes. U. fasciata is classified as a marine fouling organism, and studies in control and eradication are presently underway.

The study further noted that:

In Keaouhou Bay the potential sources of anthropogenic nutrients include leaching cesspools, surface road and field runoff during rain events, fish biomass, golf course contribution and vessel borne and bilged biomass.<sup>3</sup>

These government and University of Hawaii analyses are admittedly dated, but as a frequent observer of Keaouhou Bay and given the exhibits attached to this letter I would have the say the situation in Keaouhou Bay has not improved and if anything worsened over the last eight years. The EIS should take a "hard look" at these problems and transparently assess them.

- D. User Conflicts. KS has developed the Keaouhou Bay Management Plan ("KBMP") to "reorient uses at the bay and establish new place-based cultural education and revenue generating opportunities." The EISPN recognizes that Keaouhou Bay is "highly used by residents, visitors, and community groups, which creates congestion and competing interests." KS then describes the purpose of the Project that is the subject of the EISPN is to: "develop resilient communities by stewarding the 'aima to support resilient economies, cultural landscapes, diverse learning, and career pathways." Concluding that: "The Project aims to achieve this goal by reorienting uses and directing new development in appropriate areas around Keaouhou Bay based upon community and organizational values that were identified during the Management Plan process." (EISPN 1-1)

Pregnant in all of this is the potential for renewed conflicts between the customers of a 156-unit "Appropriate Boutique Resort." Estimating an average of two to four people per unit could mean a daily occupancy of between some 300 to 600 guests. These people would come from very different backgrounds and have purposes in coming to Hawai'i that could

**Subject:** Kamehameha Schools EIS Draft For Keaouhu Bay WILL HAVE NEGATIVE IMPACT!  
**Attachments:** Keaouhu Bay Green.jpg; Keaouhu Bay Green Algae.jpg  
**Categories:** Yellow Category

To whom it may concern,

Please, read the scientific proof below and state in your report that this Bungalow Resort WILL have a SERIOUS NEGATIVE IMPACT in Keaouhu Bay as stated in all the different reported articles below.

Keaouhu Bay has the trees and land just under the golf course (that Kamehameha Schools wants to clear for their bungalow resort) that protects Keaouhu Bay from a lot of algae blooms because it soaks up the polluted land from fertilizer, weed killer... and unfortunately when there is a severely heavy rain storm the land up on top of the bay has a greater runoff than normal from the golf course and an algae bloom happens.

I took these photos and they show this kind of an algae bloom that happened in Keaouhu Bay Feb. 13, 2023.

If you clear this land, this kind of algae bloom will happen more often and end up killing a lot of coral and marine life as stated in the two Global Coral Reef Alliance articles because this is what happened in the Bahamas when they researched the reef before and after a golf course development, and even though this development is not a golf course development, it will be just under one and this will allow the pollution from the golf course to come down to the bay a lot more often.

This information was taken from Global Coral Reef Alliance titled, "Golf courses kill coral reefs and fisheries: harmful algae blooms and disease cause by nutrient runoff from golf course development on Guana Cay, Abaco, Bahamas

Introduction: Bahamas coral reef deterioration

This study is thought the first ever to evaluate the health of coral reef ecosystems and fisheries before and after a golf course development.. The vast majority of corals have died from a combination of factors including global warming, new diseases, land-based sources of pollution... "<https://www.globalcoral.org/golf-courses-kill-coral-reefs-and-fisheries-harmful-algae-blooms-and-disease-caused-by-nutrient-runoff-from-golf-course-development-on-guana-cay-abaco-bahamas/>

If you allow a Bungalow Development in Keaouhu Bay you WILL be agreeing to pollute this bay for years to come because the golf course runoff won't have the best protection which is the natural trees

and land that can soak up the polluted water most of the year and this kind of harmful algae bloom will happen more often.

Here is another study by the Coral Reef Alliance titled, "Golf course fertilizer runoff causes nutrient enrichment leading to harmful algae blooms on a Bahamian coral reef

...After construction new algae blooms appeared nearest the golf course green, smothering corals in adjacent reefs, along with sharply increased coral diseases..." <https://www.globalcoral.org/golf-course-fertilizer-runoff-causes-nutrient-enrichment-leading-to-harmful-algae-blooms-on-a-bahamian-coral-reef/>

The green sea turtle that is federally protected can be seen in Keaouhu Bay weekly. Please see the following article that states "POLLUTED RUNOFF IN HAWAII ENDANGERS GREEN SEA TURTLES

Why does Hawaii have a runoff problem?

Historically, in the tropics of Hawaii, precipitation was absorbed into the soil, according to the Clean Water Branch of Hawaii's Department of Health. Any potential pollution or contaminants on the ground surface would get pushed into the soil by the rain, and plant roots and microbes would help break down the pollution into less dangerous components. However, with urban and agricultural development, less and less of the pollution gets pulled into the soil, and more of it gets washed out into storm drains. From there, the pollutants make their way to streams, rivers and the ocean that surrounds Hawaii. According to the state agency, most of these contaminants are nutrients from fertilizer, bacteria from animal waste, oil, garbage and yard waste...

If polluted runoff reaches the ocean, it can wreak havoc on marine life, including endangered green sea turtles." Taken from <https://www.chemservice.com/news/polluted-runoff-in-hawaii-endangers-green-sea-turtles/>

Even with storm drains if you allow this development it WILL POLLUTE Keaouhu Bay as the above article (that was written in 2014 because runoff water from developments were polluting the ocean even then) states, and this bay holds many sea creatures such as the protected green sea turtle, spotted eagle rays, manta rays, octopus, dolphins, fish, coral, monk seals that have rested on the dock before and...that will ALL be harmed by the more severe pollution runoff that WILL happen because developments can't help but pollute the water nearby.

Please, hear these words and help keep Keaouhu Bay from pollution so the coral and all the marine life will live for years to come in the bay.

Please, state this Bungalow Development WILL cause a SEVERE NEGATIVE IMPACT if allowed.

Thank you,

Sincerely,

Rebecca Melendez

COUNTY OF HAWAII  
PLANNING DEPARTMENT  
101 Pauahi Street, Suite 3  
Hilo, HI 96720

Via E-Mail: [planning@hawaiicounty.gov](mailto:planning@hawaiicounty.gov)

RE: Keauhou Bay Management Plan EISPN

Aloha—

Kamehameha Schools (“KS”) is to be lauded for its planning and expenditures to create and implement the Keauhou Bay Management Plan (KBMP), which appears to dovetail with plans to develop the area around Kahalu’u Beach Park as part of a larger cultural and educational corridor between Kahalu’u and Keauhou.

My concern is that the EISPN contains a couple of erroneous assumptions and in other respects may lead to an EIS that does not take a “hard look” and some important issues. These are discussed below.

A. Erroneous Assumptions

1. “Very Low Rainfall and Runoff” (EISPN 3’16). The EISPN assumes that because rainfall reaches “a maximum average of 35 inches per year” that there is “very low rainfall and runoff” into the bay. This is based on a 2016 NOAA analysis and does not account for any changes in those averages in the last eight years. This must be reconsidered in light of the rapid changes brought on by climate warming. This assumption also appears to be internally inconsistent with other statements in the EISPN. See, notably EISPN 4-4 at Paragraph 11 acknowledging that “Portions of the Project Area are also located within the AE and VE Flood Zones.”

In my experience, regardless of the historic maximum rainfall average, there are several heavy rains each year that flood across the Old Kona Road onto the adjoining downslope to the bay. The force of the water is sufficient to dig a noticeable trench across the road and into the downslope to the bay carrying rocks and dirt from the road with it.

The flooding also flows down Kamehameha III Hwy sufficient to overflow the curb at the end of the road, dumping silty water directly into Keauhou Bay. The bay water turns brown and is unattractive for swimming

following these events. See, photo attached electronically as Exhibit A to this letter. Others are available on request.

2. No Rare, Threatened, or Endangered Species or Habitats (EISPN at Paragraph 9)  
The EISPN notes that: “The Project is not expected to affect any rare, threatened, or endangered species or habitats.” I should be noted that Monk Seals have been known to haul out to rest on the old Keauhou boat ramp, south of the rock wall on the north side of the bay. See, photo attached electronically as Exhibit B to this letter.

B. Silt Accumulation in the Bay

The federal National Oceanographic and Atmospheric Administration (“NOAA”) has listed Keauhou Bay One as a “Marine Protected Area” that is to be “permanently protected year-round” and that such “protection be in perpetuity”.<sup>1</sup> Historically, the federal Environmental Protection Agency (“EPA”) also performed a water quality analysis of various bodies of water every four years. In 2006 and 2010 the EPA found that the water in Keauhou Bay was “good”, but in 2014 it concluded that it was “good” for recreational use, it was “impaired” due to “turbidity” as it relates to “Fish, Shellfish, and Wildlife Protection and Propagation.”<sup>2</sup>

- C. Nitrogen Pollution. An undated research study in about 2015 out of the University of Hawaii, Manoa, Department of Botany, found that: “[O]f all the West Coast of the Big Island, the highest average percentage of tissue N [Nitrogen] and predicted N concentration was found in the surface samples of Keauhou Bay.” This study was comprehensive and included the full West coast of the Island of Hawaii from the North tip to South Point.

The study discusses Keauhou Bay in part as follows:

Keauhou Bay nutrient-rich groundwater plumes demonstrated high values for nitrogen (5.0 to 5.9 δ15N values and high ulva (green algae)

---

<sup>1</sup> See, National Oceanic and Atmospheric Administration, NOAA’s National Ocean Service, Management & Budget Office, Coral Reef Habitat Assessment for U.S. Marine Protected Areas: State of Hawaii: NW and Main Hawaiian Islands, Special Projects (February, 2009). Last consulted April 22, 2022, at: <http://www.coris.noaa.gov>

<sup>2</sup> United States Environmental Protection Agency, Waterbody Quality Assessment Report Water Quality Assessment and TMDL Information, 2010 and 2014 Waterbody Reports for Keauhou Bay (Kona). Last consulted April 22, 2022, at: [https://aspub.epa.gov/waters10/atians\\_waterbody/control?p\\_au\\_id=HI713293&p\\_cycle=2014#attainments](https://aspub.epa.gov/waters10/atians_waterbody/control?p_au_id=HI713293&p_cycle=2014#attainments)

The information at this site (now 8-years old) is listed as out-of-date, but the alternative site given for the information says that the data is not available for Keauhou Bay.

abundance in the bay. Ecologically successful green algae like U. fasciata are potentially invasive. Coastal waters near harbors, industrial complexes, and residential areas with nutrient- rich and/or fresh water input often have blooms of Ulva species that coat ships' hulls, cover pilings and shorelines, and restrict outflow pipes. U. fasciata is classified as a marine fouling organism, and studies in control and eradication are presently underway.

The study further noted that:

In Keaouhou Bay the potential sources of anthropogenic nutrients include leaching cesspools, surface road and field runoff during rain events, fish biomass, golf course contribution and vessel borne and bilged biomass.<sup>3</sup>

These government and University of Hawaii analyses are admittedly dated, but as a frequent observer of Keaouhou Bay and given the exhibits attached to this letter I would have the say the situation in Keaouhou Bay has not improved and if anything worsened over the last eight years. The EIS should take a "hard look" at these problems and transparently assess them.

D. User Conflicts. KS has developed the Keaouhou Bay Management Plan ("KBMP") to "reorient uses at the bay and establish new place-based cultural education and revenue generating opportunities." The EISPN recognizes that Keaouhou Bay is "highly used by residents, visitors, and community groups, which creates congestion and competing interests." KS then describes the purpose of the Project that is the subject of the EISPN is to: "develop resilient communities by stewarding the 'aima to support resilient economies, cultural landscapes, diverse learning, and career pathways." Concluding that: "The Project aims to achieve this goal by reorienting uses and directing new development in appropriate areas around Keaouhou Bay based upon community and organizational values that were identified during the Management Plan process." (EISPN 1-1)

Pregnant in all of this is the potential for renewed conflicts between the customers of a 156-unit "Appropriate Boutique Resort." Estimating an average of two to four people per unit could mean a daily occupancy of between some 300 to 600 guests. These people would come from very different backgrounds and have purposes in coming to Hawai'i that could

<sup>3</sup> See, Megan Daller, "Preventing the introduction and spread of nutrient driven invasive algal blooms and coral reef degradation in West Hawaii", University of Hawai'i, Manoa, Department of Botany

well conflict with and overwhelm the residents of Hawai'i who now use Keaouhou Bay for very different purposes. The EIS must take a "hard look" at these potential conflicts and offer transparent and effective alternatives to address them, including "no action" on the resort development.

E. Wastewater. The EISPN briefly describes existing KS controlled sewage system. (EISPN 3-19 at Paragraph 3.19). It also describes the potential for "Unavoidable and Unresolved Impacts. (EISPN 4-2 at Paragraph 4.6). I will just note that when we paddle canoes past the condos north of the bay we can smell and see evidence of sewage effluent in the ocean. When we paddled south we now have the benefit of a similar experience off shore from the new million-dollar homes constructed a few years ago. The EIS should take a "hard look" at the effect a 156-unit resort will have on sewage entering Keaouhou Bay.

Thank you for the opportunity to comment.

**Subject:** Big Island DOES NOT Have Resources for Kamehameha Schools Resort EIS- IT MUST BE REJECTED AS NEGATIVE IMPACT in Keahou Bay

**Categories:** Yellow Category

Aloha,

Can you please show me where in Kamehameha Schools EIS does it have any researched evidence that Big Island resources and infrastructure are able to accommodate another resort?

There has been a serious increase in population after COVID and after the Maui fires, and I have included many different articles that show Big Island resources and infrastructure already are having serious NEGATIVE issues supporting the people who live here and visit here.

Can you please read the articles below about Big Island resources and infrastructure and see that the Big Island doesn't have the resources or infrastructure for another resort development?

Has Kamehameha Schools EIS done any sincere calculated reports that can prove this 150 rooms bungalow resort that could bring in over 300 extra visitors on island or more when maxed out, have they proven in any way that the island resources and infrastructure can handle this?

This is a survey that was copyright 2013 and that is eleven years ago so please consider the survey numbers have increased by a lot. This is just to give you an idea of what tourism resources consume on island. Please, see this survey report on this link

[https://kohalacenter.org/archive/pdf/Research\\_BI\\_ResourceUseWasteGenerationTourism.pdf](https://kohalacenter.org/archive/pdf/Research_BI_ResourceUseWasteGenerationTourism.pdf)

This is in the Introduction, "The tourism industry annually attracts about 6 million visitors to the state of Hawaii (Hawaii Tourism Authority 2010), and it accounts for one-quarter of the state's gross domestic product and one-third of its jobs (DBEDT 2010; Thomas 2009). The island of Hawaii (the Big Island) welcomes more than one million tourists annually. The highest growth (67% in daily visitors on the Big Island was registered between 1990 and 2007 (DBEDT 2008). It is widely known that the tourism industry is an economic engine for the Big Island. Tourism utilizes a significant share of the total electricity and fuel used on the island; however, the total amount and detailed breakdowns have not been quantified. The economic growth of the island must be carefully assessed and managed to mitigate negative impacts on its environment and sustainability."

This information is on page 8 under Summary and Conclusion, "The estimates show that the tourism sector surveyed for this study accounts for 21.7% of the island's total energy consumption, 44.7% of the islandwide water consumption, and 10.7% of the island-wide waste generation."

The above information is a report that shows around what the tourism industry consumed in island resources 11 years ago. Does Kamehameha Schools EIS have any kind of report like this one, because it needs to be shown that Big Island has the resources for this kind of resort development.

The articles below will show that Big Island DOES NOT have the resources and infrastructure for another resort development and for this you must reject this EIS and show that it WILL HAVE NEGATIVE IMPACT on Big Island.

### Big Island Now poll No. 27 results: More than one solution needed to help extend life of West Hawaii'i landfill

September 17, 2023

The West Hawaii'i Sanitary Landfill, the only remaining landfill on the Big Island, is forecast to reach capacity within the next 20 to 25 years. (File photo)

Of the 900 total votes in our most recent poll, which asked people to weigh in on the best way to extend the life of the Big Island's [only remaining landfill](#), all of the above was the most popular answer, garnering 274 votes, or 30%.

The West Hawaii'i landfill became the island's only one after the Hilo Landfill closed three years ago. It only has about 20 to 25 years left before it can no longer be used to store rubbish.

<https://bigislandnow.com/2023/09/17/big-island-now-poll-no-27-results-more-than-one-solution-needed-to-help-extend-life-of-west-hawaii-landfill/>

### A county commission drafts ordinance aiming to ban recyclables at West Hawaii'i landfill

By [Megan Moseley](#)  
September 6, 2023

Hawaii County's Environmental Management Commission is developing an ordinance that aims to prohibit the amount of recyclable materials ending up in the island's only working landfill.

During a commission meeting on July 26, Ramzi Mansour, Hawaii County Director of Environmental Management, told commissioners the West Hawaii'i Sanitary Landfill only has 20 to 25 years left before it reaches capacity.

With the Hilo Landfill permanently closed in 2020, the clock is ticking for the island's sole dump. Commission chairperson Georjean Adams said it's a good time to start looking into solutions.

Adams said the proposed ordinance is in its early stages and is more about getting the conversation started about how to prevent unnecessary, or recyclable items — green waste, metals, plastics,

paper, paperboard and glass — from ending up in the rubbish dump, located off Queen Kaahumanu Highway in Waikōloa.

"Trying to site a new landfill is close to impossible," Adams said. "So what are we going to do? So I was looking around, and the commission agreed, to look deeply into the idea of diverting the recyclables out and at least slow the filling up of the landfill."

The proposed ordinance refers to the 2019 Integrated Solid Waste Management Plan that commits the county to "divert, as much as feasible, commercial and municipal solid waste, including but not limited to green waste, metals, plastics, paper, paperboard, and glass to help achieve goals related to climate resiliency, renewable energy, sustainable agriculture, and zero waste."

<https://bigislandnow.com/2023/09/06/new-draft-ordinance-aims-to-ban-recyclables-at-west-hawaii-landfill/>

### Time's Up For Landfills

'Gentle' demolition strategies can help preserve resources

PAULA BENDER

• APRIL 2, 2024

As Hawai'i government officials grapple with the challenge of limited landfill space statewide, federal restrictions set in place by the Environmental Protection Agency are ruling out possible locations that were once considered for new landfills.

Hawaii Act 73 states landfills must be located at least half a mile from residential areas; are prohibited from being located in areas with heavy rain and steep slopes, as well as agricultural and/or conservation lands; above aquifers; 300 feet beyond streams; and 1,000 feet beyond the ocean.

New landfills are also now prohibited from being created in tsunami inundation zones, 100-year flood zones and wetlands. There are also concerns that landfills near airports will attract birds, resulting in damage to aircraft and fatalities among pilots and passengers.

The City & County of Honolulu is in the process of identifying its next landfill and it doesn't want one any bigger or more active than absolutely necessary.

<https://buildingindustryhawaii.com/2024/04/times-up-for-landfills/>

**Drought Conditions On Hawai'i Island Prompt Water Supply Message by Big Island Video News**

on Oct 5, 2023 at 3:59 pm

**(BIVN)** – With moderate to severe drought conditions being reported across Hawai'i island, local water department officials issued a statement this week on the need for customers to use drinking water wisely.

Most of Hawai'i island is under "Moderate Drought" conditions, according to the latest information **from the U.S. Drought Monitor**. There is an area under "Abnormally Dry" conditions in South Kona, however there are other, small pockets on the Big Island that are under "Severe Drought". There is even a small spot of "Extreme Drought" in the South Point area of Ka'u.

"The National Weather Service's forecast calls for the existing drought conditions to expand over the entire island and intensify over the upcoming months due to the ongoing El Niño event," reported the Hawai'i County Department of Water Supply. "Peak dryness is expected to occur from around January through February 2024. The El Niño event will likely persist well into spring 2024."

From a Water Supply news release:

**U.S.**

**Hawaii is "on the verge of a greater catastrophe," locals say, as water crisis continues**

By **Li Cohen**

Updated on: April 11, 2024 / 8:23 AM EDT / CBS News

And recent years have seen compounding problems: less rain, leading to significant droughts, and repeated jet fuel leaks and PFAS chemical spills contaminating water systems. All of this significantly limits available water use for locals, many of whom say tourism is only worsening the situation. Just months ago, the world's largest surfing wave pool opened up on the island — filled with freshwater.

"They're not using it to drink or to support life, they're using it to make money. They're commodifying it," said Healani Sonoda-Pale, who is Native Hawaiian and a member of advocacy group O'ahu Water Protectors. " ... We are on the verge of a greater catastrophe."

"We are in a water crisis, that has to be made very clear," Wayne Tanaka, director of Sierra Club of Hawai'i, told CBS News, saying that if the reasons for this crisis aren't soon addressed, **"We may come to a point where we have to decide ... who gets water and who doesn't."**

<https://www.cbsnews.com/news/hawaii-water-crisis-climate-change/>

Because this is an island parts need to be shipped and the power plant has generators that are not working and because of this, and other reasons, the Big Island needs to seriously conserve power so that everyone will have power, and if this can happen once it can happen again.

#### UTILITIES

UPDATE: HECO asks for continued energy conservation

BY SPECTRUM NEWS STAFF HAWAII ISLAND

UPDATED 6:28 PM ET APR. 16, 2024 PUBLISHED 9:05 AM ET APR. 15, 2024

HILO, Hawaii — Hawaiian Electric continues to urge Hawaii Island customers to reduce their electricity use to prevent the need for rolling outages.

In a news release Tuesday afternoon, the utility stated that Monday saw a reduced demand of approximately 5 megawatts. That, combined with increased wind and solar battery storage prevented the need for rolling blackouts on Monday. HECO credited conservation efforts, particularly those by large businesses and government customers, for the reduction in electricity demand.

"We're grateful for our customers' efforts to conserve electricity, especially between 5 to 9 p.m., when electricity use is highest, because it does make a difference," said Hawaiian Electric spokesperson Kristen Okinaka. "By working together, we're helping to ensure that enough power can be available for all customers and prevent or minimize the impacts of rolling outages."

Hawaiian Electric announced Monday afternoon that it may initiate rolling outages in parts of Hawaii Island because of the unavailability of several generators and lower than normal wind and solar resources.

In a news release, the utility said that outages could start as early as 6:30 p.m. and rotate around the island for 30-minute intervals. The impacted areas and the timing of the outages will be based on wind generation and the amount of electric demand that needs to be reduced. Individuals who are dependent on electrically powered life support medical equipment are advised to arrange for a backup power supply.

The outages are being done to prevent power loss to even more customers, who are all being asked to conserve electricity throughout the month.

#### Big power supply problems continue to plague Hawaii island

Apr 8, 2024

The company has been facing an unusual situation with mechanical problems at three of the island's five largest power plants while part of the largest plant undergoes an annual overhaul. All four of these affected power plants are owned by the utility or an affiliate of its parent company.

Also contributing to the trouble is lower output from a geothermal plant, which has the third-largest generation capacity on the island and is owned by an independent operator.

"This is an unusual situation, driven mainly by the unavailability of several large generators that have experienced mechanical problems, are at reduced output, or are undergoing maintenance," Hawaiian Electric said in its March 25 announcement asking customers to use less electricity, especially on weekdays from 5 to 9 p.m.

The company explained that it faces an "extremely tight" supply of power at peak use periods, especially when production from wind, solar and hydroelectric facilities is lower than normal. Those sources of variable, renewable energy can supply up to 15% of electricity needs on the island.

"Without enough supply to meet electricity demand, the company may initiate rolling outages of up to an hour around the island," the March 25 announcement said.

#### COMMUNITY

Hawaii Island customers urged to reduce electricity use through April

BY SARAH YAMANAKA HILO

PUBLISHED 9:00 AM ET MAR. 26, 2024

#### What You Need To Know

- Hawaii Island customers may see alerts asking them to conserve energy, especially on days when there isn't much wind that generates up to 15% of electricity
- When alerts are issued, Hawaiian Electric is asking customers to take immediate action to minimize electricity use
- Even when no alerts are issued, customers — including hotels and large retailers — are urged to reduce electricity use as much as possible, especially between 5 and 9 p.m. on weekdays
- If there is not enough electricity to meet demand, Hawaiian Electric may initiate rolling outages of up to an hour around the island

<https://spectrumlocalnews.com/hi/hawaii/news/2024/03/25/hawaii-island-customers-urged-to-reduce-electricity-use-through-april>

Thank you for your time,

Sincerely,

Rebecca Melendez

[Add: Please see the photos of the Endangered Green Sea Turtle and the Endangered Monk Seal, which inhabit the Keanahou Bay.](https://www.fishbase.org/ncic/species/Endangered_Species_Act/status) The Endangered Species Act states, "The Endangered Species Act of 1973, which provides for the protection of certain species, and their habitats, both on land and in the water." [https://www.fishbase.org/ncic/species/Endangered\\_Species\\_Act/status](https://www.fishbase.org/ncic/species/Endangered_Species_Act/status)

The Endangered Monk Seal and the Endangered Green Sea Turtle both swim and live in Keanahou Bay, and the Endangered Species Act states, "provides a framework to conserve and protect endangered and threatened species, and their habitats, both on land and in the water." [https://www.fishbase.org/ncic/species/Endangered\\_Species\\_Act/status](https://www.fishbase.org/ncic/species/Endangered_Species_Act/status)

habitat. It is to discuss these endangered species habit with development pollution and hence, threaten their lives, and go completely against the Endangered Species Act of 1973. The number of People live on the coasts has rapidly increased in recent decades, causing significant development of coastal areas. Coastal development can negatively impact the ocean through the destruction of coastal marine habitat through runoff of sediments and pollution. Coastal development involves activities such as the construction of buildings, stabilization of shorelines, and agriculture that involves the denaturation of sensitive marine habitats for photosynthesis. Losses of primary producers and important habitat-forming species such as corals can negatively impact entire food webs. This was taken from this site <https://oceanicnews.org/library/human-impact-coastal-development/>

[https://www.fishbase.org/ncic/species/Endangered\\_Species\\_Act/status](https://www.fishbase.org/ncic/species/Endangered_Species_Act/status)

course runoff that WILL happen because of the cleared land and installed pavement that will allow golf course runoff to be severe. Is there an in depth report on how much it rains in Keanahou because it rains annually at night throughout the entire year. Now, The golf industry uses approximately 50 pesticide active ingredients, including chlopyrifos—an insecticide that is banned for residential use by the EPA <https://morningstar.com/pages/active-ingredients-of-golf-courses>

<https://morningstar.com/pages/active-ingredients-of-golf-courses>

now the trees and land that they want to clear and develop their bungalow resort is, is a natural pollution filter, the land soaks in these pesticides and is the BEST protection filter Keanahou Bay has from golf course runoff. <https://morningstar.com/pages/active-ingredients-of-golf-courses>

Keanahou Bay, hence for these endangered species habitat. Please refer to Keanahou Bay and fully threaten the lives of these endangered species, as well as completely go against the Endangered Species Act of 1973 under Section 2. Findings, Purpose, and Policy (a) FINDINGS.—The Congress finds and declares that— (1) various species of fish, wildlife, and plants in the United States have been rendered extinct as a consequence of economic growth and development untempered by adequate concern and conservation; (2) certain species of fish, wildlife, and plants in the United States are now threatened with extinction through the actions of man; and (3) it is the policy of the United States to use the authority provided by this Act to protect and propagate such species and their habitats as of today and to allow a resort/development to be built above this Bay would threaten the very lives of these endangered species because it will allow golf pollution and development pollution to run into the species natural habitat, which is Keanahou Bay. Thank you, Sincerely, Rebecca Melendez

## Rebecca Melendez

Aloha,

I received this letter from Richard H. Bennett MS, PhD Applied Life Sciences LLC to send to you. Please, see this information and know that this bungalow resort Development WILL have a serious negative impact on the bay because of the water quality he mentions in his letter.

Thank you,

Sincerely,

Rebecca Melendez

July 24, 2024,

VIA EMAIL

COMMENTS REGARDING:

Draft Environmental Impact Statement (DEIS)  
for the Kamehameha Schools Keauhou Bay Management Plan  
Keauhou, Hawai'i Island, Hawai'i

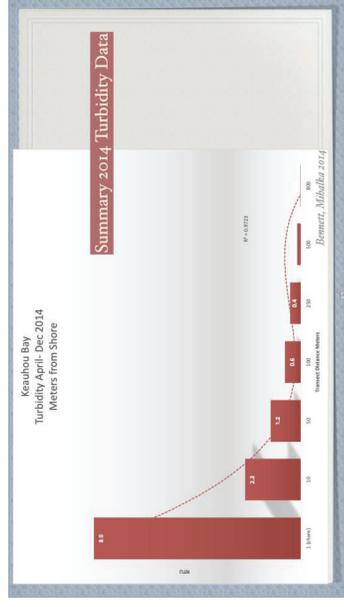

Richard H. Bennett MS, PhD  
Applied Life Sciences LLC

The following comments pertain specifically to water quality issues affecting Keauhou Bay. The draft EIS does not address these nor accounts for the fact that the State and the EPA list Keauhou Bay as an Impaired Water Body under section 303 D of the Clean Water Act (CWA). That law requires that impacts to the Bay be mitigated and that further impairment does not occur. This requirement under the law has not been met. Any development in the watershed needs to be conducted by a careful evaluation of this fact. Under the law, remediation begins by conducting a Total Maximum Daily Loading study known as a TMDL. The Bay is listed as impaired for exceeding the limits for turbidity. Turbidity has several causes in near-shore waters, such as runoff water with fine sediments and phytoplankton. Our research shows that turbidity is a problem in Keauhou Bay in the absence of surf events. The turbidity is also due to the overgrowth of marine phytoplankton. Our studies show that turbidity declines along a line moving offshore. The inner Bay has very poor circulation and is where most sediments and other factors causing turbidity arise. Phytoplankton grow in response to increased temperature and nutrient loading in the Bay. The lack of adequate circulation amplifies the problem.

The photo was taken in the summer of 2007 in response to concerns about the greening of Keauhou Bay. The brand name on the canoe paddle is not legible. (photo credit Bennett).

Figure 1. Nine-month summary of turbidity data for the Bay.

(Bennett 2002)

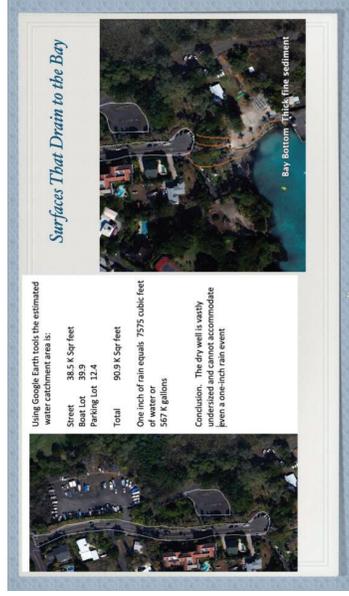

The nine-month summary chart above shows that turbidity is worse at the shoreline and decreases non-linearly in waters offshore. The slight rise in turbidity at 250 meters may be more of a phytoplankton effect than sediment.

The DEIS makes the following statement regarding groundwater:

*Due to the low frequency of substantial rainfall and high permeability of the soils throughout the Project in this area, surface runoff generally does not occur in the typical rainfall occurrence. Runoff either percolates into the underlying groundwater or evaporates into the atmosphere. There are no drainage reports or calculations on file with the County of Hawai'i or DOT for the adjacent public roadways or surrounding developed properties. However, existing stormwater runoff peak flow estimates for the three (3) drainage basins within the Project Area are presented in Table 4-4.*

The draft EIS fails to account for surface water runoff from Kamehameha III Road. At the Bayside terminus of the road is a dry well. It is typically loaded with sediment and unable to handle the storm flows that come down the length of the road. Thereafter, water overflows the curb and goes down the driveways and the slope into the Bay. As it does, it picks up considerable sediment and delivers it to the near-shore waters, increasing the turbidity problem (Fig 3).

Figure 2. Rain catchment area and water volume estimate.

(Bennett 2002)

As calculated above, a one-inch rain can produce over five hundred thousand gallons of water, with most of the flow eroding fine sediments as it enters the Bay (Figure 3). The County of Hawai'i was made aware of this dry well failure four years ago. Some of this water comes off of Kamehameha Schools land.

The DEIS statement that rainwater percolates to groundwater suggests groundwater is the terminus and the water does not flow to the sea. For at least 25 years, it was the position of the State that groundwater under the land does not communicate with the sea. Considerable research, such as Kneeb (2010), Dulai (2020), Peterson (2009), and others, shows that the State's policy is specious and not science-based. The State's anchialine system is a subterranean estuary (Bishop 2015). Consequently, the DEIS must reconsider the implication that the local groundwater is an inconsequential endpoint for fresh and waste water flows. A recent US Supreme Court decision held that wastewater disposal to the nearshore groundwater without the necessary permit was a violation of the CWA (see footnote page 7).

Figure 3. Stormwater and sediment Flow into the Bay.

The photos suggest considerable sediment erosion into the Bay.

Nutrient Degradation and Impairment of the Bay.

The draft EIS does not account for the elevated levels of nutrients in the Bay. Again, our research shows that nitrogen and phosphorus exceed state standards. Unlike other locations, it is unfortunate that the Hawai'i Department of Health fails to measure these nutrients in the Bay. Thus, conducting a nutrient analysis of the Bay waters was necessary. That analysis is provided below.

Figure 5. Non-permitted wastewater discharge to the Bay

Some years ago, federal funds were provided to upgrade the Bay boat launch facilities. Before the upgrade, boat wash water flowed over the surface and into the Bay. A dry well was installed, and it drained to surface water only a few feet below the drain. Boat wash water is potable water. The wash water contains fish liquids, blood, and particulate fish waste. This wastewater may be a source of ammonia in the Bay. Washed bilge water often contains oil products. The data in Figure 5 is from the wash water surface drain at Honokohau Harbor.

Since it is obvious this wash water flows into the Bay in the groundwater, the State should have applied for an NPDES permit. Such a permit is required for any ocean discharge of wastewater, especially in waters known to be impaired under the CWA. This requirement has been affirmed by the Supreme Court<sup>1</sup>.

#### Conclusions

The surface water and groundwater flows from the proposed development and those in the upper watershed need to be considered to ensure that further degradation of this impaired water body does not occur. This is referred to herein as a TMDL. Given the environmental ethics of Kamehameha Schools and the legal history of the Public Trust Doctrine of the State Constitution<sup>2</sup>, we suggest that these environmental impacts described above be studied for the project design and mitigated.

<sup>1</sup> *Courty of Maui, Hawaii v. Hawaii Wildlife Fund*, 140 S. Ct. 1462, 590 U.S. 165, 206 L. Ed. 2d 640 (2020).

<sup>2</sup> *Kelly v. 1250 Oceanside Partners*, 140 P.3d 985, 111 Haw. 205 (2006).

Keaouhou Bay is a small bay inlet on Hawaii'i Island and, as such, is subject to much more degradation than the open shore area of West Hawaii'i. As such, the Bay requires special protections.

Sincerely,

/s/ R.H. Bennett MS, PhD, President

Terr Yoshinaga| 7 days ago

Problem: Kanehahua Schools wants Keanah Bay to become a Bungalow Resort. This is a VERY small bay. The Resort will have 105 rooms that means 200+ more people in this small area. This will have serious negative impacts on the bay like more pollution, traffic congestion, negatively affect the endangered species there and more!

The Keanah Bay should be protected as is. Keanah Bay should not be developed for the preservation of the peninsula. It would be the most of the many units for the same reason were put in such a small place. It would ruin the beauty of the bay and the habitat for the birds that live here for the benefit of all of us. In 1920 the government was established. Its main purpose was to protect the land from being sold to the people and animals who leave. We don't want it. traffic, and trash. Government is here to serve the community not promote a business that cause repurable harm to the people and animals who leave. We don't want it.

The historical and sacred place has already become over-used and abused by all the tour/ snorkel companies bringing in hundreds of tourists each day and night! Shame on the DNR for issuing permits to these greedy tour companies! More traffic at all hours, more pollution from all the mobs in the water, and also more noise and litter. We don't want to see the beautiful place go to the same fate as the other islands. We need to stop the greedy tourists from coming and the greedy companies from destroying what we left with a huge development and King Kong You want this beautiful place to turn into Maui/Kona? Save Kealahou! Save our way of life and Aiea. Too much tourism is killing Hawaii. Each year, each decade the important and beautiful spots are vanishing, to become just like any other ordinary place in the World. Don't let this happen! PK.

## Why this petition matters

Rebecca Melendez

To whom it may concern,

Please reject Kamehameha Schools' EIS because they have NOT followed the subpart 150. By law, they MUST do what is BEST for the Hawaiian people's cultural practices and it is proven developments WILL pollute nearby waters and if these waters get polluted, the Hawaiian people will be paddling canoes, swimming, fishing, in polluted water.

Kamehameha Schools' Bungalow Resort Development will clear land that has been protecting Keaouhou Bay from golf course runoff pollution for years, and the development will fill an entire ecosystem. The "Natural Ground Cover has 10% runoff, when a development has 55% runoff..." This was taken from NOAA's website and this researched article proves the natural land has been soaking up the above golf course pollutants before it runs into the bay for years.

SCIENTIFICALLY PROVES that development will pollute Keaouhou Bay because of the golf course runoff that will happen. "Costal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." This info is from Environmental Evidence Journal website and SCIENTIFICALLY PROVES that development KILL CORAL AND MARINE LIFE.

Please watch this video <https://www.youtube.com/watch?v=17SH4deq4A0>

In their EIS they have NOT contacted as many Hawaiian people as they NEED to contact to prove that the Hawaiian people want this bungalow resort because in the ONLY public meeting, they had in 2022 (it was on this zoom call) there were many people on this zoom call and EVERY SINGLE PERSON ON THIS ZOOM CALL OPPOSED THE BUNGALOW RESORT DEVELOPMENT and there were plenty Hawaiians on the call.

Kamehameha Schools have NOT spoken with the Kong family who are descendants from Keaouhou Bay and this video is of Kapuna Kumu Lily Kong who was born in Keaouhou Bay and she states that she is against development. She also states that her mother was against development as well. Please listen to her words in her testimonial video about Keaouhou Bay on this link and know that this proves that descendant directly from Keaouhou Bay OPPOSE THIS DEVELOPMENT <https://www.youtube.com/watch?v=9460462> and IS CULTURAL LAW THEY MUST BE HEARD AND ACKNOWLEDGED!

The laws were created, "After these legal victories, the Kohalaiki' Oluana worked to create a new law in the state of Hawaii to require Cultural Impact Statements along with Environmental Impact Statements for all future large-scale development. Act 150, the Cultural Impact Statement Law was adopted in 2006." <https://hawaii.kamehameha.org/legal-services>

Kapuna Kumu Lily Kong also states that there are burial grounds on the land that Kamehameha Schools wants to clear and it is told that Kamehameha Schools has bulldozed sacred land in the past and Keaouhou Bay's burial grounds MUST BE RESPECTED AND NOT DISTURBED!

I was also told by Hawaiians that there were bones in the small cave that is at the base of Keaouhou Bay. These burials need to take priority over a Bungalow Resort Development.

Kamehameha Schools has completely IGNORED this petition that OPPOSES their development resort in Keaouhou Bay because when I presented this petition to them, Marisa Harman told me, "Those are many signatures that AIE wants. The civic tourists that they want to visit too in their Bungalow Resort Development, and these people are signing a petition OPPOSING this resort development."

Also, please see hundreds of signatures on this petition that are the Hawaiian people and I have met Kamehameha Schools these signatures and the statements from this petition they can read what Hawaiians local and distant are saying about why they are OPPOSING their resort development and Kamehameha Schools has NOT read it considered that these comments have value in any way.

There are over 6,198 signatures as of Apr. 5th and these signatures and comments HAVE A RIGHT TO BE ACKNOWLEDGED AND THEY HAVE VALUE TO BE HEARD, THESE PEOPLE MATTER AND IT IS CULTURAL LAW THEY MUST BE ACKNOWLEDGED!

Here is the petition link [https://www.change.org/p/save-keaouhou-bay-from-becoming-a-big-crowded-resort?source=share\\_petition&utm\\_medium=custom\\_inf&recruited\\_by=4f92a5356691e9111e548450460b2ebfd](https://www.change.org/p/save-keaouhou-bay-from-becoming-a-big-crowded-resort?source=share_petition&utm_medium=custom_inf&recruited_by=4f92a5356691e9111e548450460b2ebfd)

Please read and acknowledge this petition and the 6,198 signatures (grows daily with more signatures and comments) on this petition and acknowledge the comments from the Hawaiian people, locals and tourists on this petition because I have copied ALL of comments as of today and added them below.

Petition: Save Keaouhou Bay From Becoming a Big Crowded Resort

Keaouhou Bay is historical sacred land. It's also a small commercial and quiet residential area, with a local canoe club that uses the bay daily, local volleyball groups that play there daily, families BBQ every week-end, local funeral services, baptisms local kids enjoy swimming, and visitors enjoy paddle boarding and kayaking all the time without a crowd.

Read their information on this link [https://www.kobe.edu/keaouhou\\_bay/](https://www.kobe.edu/keaouhou_bay/)

It's possibly the last untouched historical area that has not been seriously developed and it has been a comfortable and quiet bay for locals and visitors alike for many years without a big resort crowd.

The beach is just over the size of one volleyball court that is there, with an even smaller park on the other side. It doesn't have a crowded feel and it's not big enough to become a resort area.

It is also the historical site of the birthplace of the Hawaiian people's King, Kamehameha III. The area holds much history and is a very sacred area to everyone, especially the Hawaiian people.

Developers are considering building this area up and putting 1,500 Resort-style bungalows in this very historical, quiet, charming, and small commercial and residential area that many people have enjoyed as it is for many decades.

Not only is the area not big enough for a new resort, but there is also already a nice hotel at the point of this bay and Time Share homes right next to that.

Both of those work very well with this area and offer tourists a lot of fun places to stay without taking away from the land, its history, quietness, and the small commercial buildings that have been there for many years.

Updating the commercial buildings that are already there would be great, and adding a nice cultural center there would be nice for everyone as well, not just tourists having bungalows.

To have a cultural center where people can learn more about the land, and the Hawaiian people can have a place of their own at King Kamehameha III's birthplace would be great.

Creating a walkway or the disabled can get from the Northside to the Southside would be another great add, but NOT building 150 new bungalows for a lot of people who don't even live here, who will then crowd the bay because the bay will be the focus for them staying there.

Now, besides putting another resort in this area, they want to open up the old road that has been beautifully overgrown with native plants and is located just above the canoe club and goes right through King Kamehameha III's birth site.

This will bring a lot of traffic right through this beautiful historical place where many local, local family funerals, baptisms, birthday parties... it will overcrowd this very small special area that locals and visitors have been using for many decades, in many different loving ways.

Putting a road in could also increase the temperature there because of the pavement, and the traffic that will then pass through this beautiful, historical, sacred, and quiet area will be huge.

Trees shade this area right now very well and also help keep the erosion down by helping stop a lot of mud and debris from going into the ocean after big tropical storms that the island has sometimes. Without trees the bay could be extra muddy.

Plus, they want to add more commercial shops to Keaouhou Bay, and Keaouhou Shopping Center has a lot of empty For Lease stores available. To create more shops when there are shops empty and for

Lease in Keanah Shopping Center just above the bay, is not being sustainable and using what we already have.

Please HELP SAVE Keanah Bay from becoming a big Resort area. It is one of the last historically untouched areas on the island that has not been overdeveloped and has been fully enjoyed completely by locals and visitors for many decades.

Lisa Lopez 1 day ago

Please stop building and adding more to areas that need open space...it's too crowded already.

Elizabeth A Cochran 2 days ago

Want to save Kaniakakua Bay from being destroyed by more new developments

Gina Harvey 2 days ago

It is important to protect small communities and special ecosystems from over development which puts too much strain on these areas.

Kathryn Mahack 2 days ago

I live in Keanah and want to have this beautiful part of Hawaii NOT ruined. Kanehahua School sits all of the hillside behind go. It is full of coquina as brush just waiting for a fire! Take care of the land you are already supposed to be RESPONSIBLE for!

Keri Johns 3 days ago

The people who live here and pay taxes should come first...Hawaiians should have homes first!

Judy MacDonald 3 days ago

Keanah Bay is a historical site that should be preserved for residents and visitors use.

Glenda Jennings 5 days ago

I have been a visitor to this location and it is perfect just the way it is!

Ladellus Sanches 5 days ago

To keep Hawaii beautiful, and to protect our sea life.

Cyndi Wong 6 days ago

Weima ma Kikon. This sacred place is the birthplace of Kaniakoaohi, King Kanehahua III legend reigning monarch of Hawaii and should be preserved for generations to come. Please preserve Keanah Bay E milimaha i kua'aina kapa. Mahalo

Terr Yoshinaga 7 days ago

Problem: Kanehahua Schools wants Keanah Bay to become a Bungalow Resort. This is a VERY small bay. The Resort will have 105 rooms that means 200+ more people in this small area. This will have serious negative impacts on the bay like more pollution, traffic congestion, negatively affect the endangered species there and more!

Ron Dinal 1 week ago

Ron Dinal

Kathleen Dalton 1 week ago

Turning this into a resort will lead to overcrowding, congestion, pollution and environmental and social problems unneeded by the area to flourish and sustain life respectfully!

0

Jared Binkert 1 week ago

this project is very environmentally destructive and bad for our climate.

0

Report

Fran coopi 1 week ago

The Keanah Bay should be protected as is. Keanah Bay should not be developed for the preservation of the peninsula. It would be the most of the many units for the same reason were put in such a small place. It would ruin the beauty of the bay and the habitat for the birds that live here for the benefit of all of us. In 1920 the government was established. Its main purpose was to protect the land from being sold to the people and animals who leave. We don't want it. traffic, and trash. Government is here to serve the community not promote a business that cause repurable harm to the people and animals who leave. We don't want it.

0

Report

Karen Keiryon 2 weeks ago

I believe that preserving the bay is absolutely vital — this project does and do this. It will also add to traffic and increase noise for those with condos in the area.

0

Jennifer Lund2 weeks ago

Enough is enough. Short term financial gain is not worth it. Environmental Impact: Pollution Risk. Developments pollute nearby waters both during and after construction. Endangered Species: Habitat for Federally protected green sea turtles and endangered monk seals. Development will threaten these species due to pollution and human disturbance. Golf Course Runoff: Golf course pesticides and fertilizers lead to harmful algae blooms, killing coral and marine life. The removal of the reef acts as a natural filter that will allow golf course runoff to pollute the Bay. Increased Human Activity: More people visiting the bay will increase pollution and human activity. Water Pollution: Construction and increased human activity will disrupt marine life, particularly octopus. Stormwater Runoff: Development will increase impervious surfaces, leading to higher stormwater runoff and pollution. Sea Level Rise: Pollutants in runoff can lead to toxic sea foam affecting air quality and marine health. Scientific Evidence: NOAA & Other Studies: Phobos Decline: Pollutants from runoff kill plankton, crucial for many species, leading to ecosystem collapse. Algae Blooms: Pollution runoff causes algae blooms, smothering coral reefs and killing marine life. Ecosystem Research: Studies show significant negative impacts on marine ecosystems from development-related runoff. Legal Concerns: Endangered Species Act: Development violates the act's mandate to conserve habitats for endangered species. Hawaii Conservation Law: Local statutes require concentration of judgments against life and their ecosystems. Conservation/Markake: Federal conservation needs. Inadequate Infrastructure: Existing infrastructure cannot support additional strain from a large resort development. Waste Management: Big Island's landfill is nearing capacity and new developments will exacerbate waste issues. Water Crisis: Ongoing drought and water contamination issues make additional strain from new developments unsustainable. Power Conservation: Big Island's power plant is aging and inefficient. Existing infrastructure cannot support additional strain from a large resort development. Waste Management: Big Island's landfill is nearing capacity and new developments will exacerbate waste issues. Hawaiian Islands: Existing research shows developments lead to severe degradation of coral reefs and marine life. Global Examples: Similar coastal developments worldwide have resulted in long-term environmental damage. Community Impact: Local Use: Kaulaou Bay is a popular spot for local activities such as boating, fishing, canoeing, paddle boarding, snorkeling, manta night dives, surfing, and swimming. Tourist Impact: Increased tourist activity will further degrade natural resources and disturb local wildlife. Economic Considerations: Reliance on Tourism: Long-Term Costs: Environmental degradation will lead to long-term economic costs, outweighing short-term development gains. Conclusion: Long-Term Impact: Allowing the bungalow resort will permanently alter and likely destroy Kaulaou Bay's ecosystem. Conservation Priority: Emphasis on conserving the bay as a natural habitat for endangered species and marine life. Community Responsibility: Uge decision-makers to consider the long-term environmental, economic, and community impacts before approving the development.

## Summary of the Water Quality Research from Kahalu'u Bay, Hawai'i Island: Tidal Flows, Recreation Water Indicator Bacteria, and Nutrient Fluxes

R.H. Bennett Ph.D.<sup>1</sup>, and K. M. Clark<sup>2</sup>

The Kahalu'u Bay Education Center (a program of The Kohala Center) actively strives to inform visitors and the community about the protection and conservation of the bay's marine ecosystem. A group of committed volunteers and staff provide daily, on-site educational programs. Similarly, they have collected scientific data about the bay for over a decade. This trove of data is priceless. It tells us much about the interaction of the ocean with the adjacent urban lands. Except for the marine waters of Kaloko Honokōhau National Historical Park, no other maritime site in Kona has been studied so thoroughly and for so long.

The data from Kahalu'u Bay gave rise to three technical research reports. They are:

- I. Tidal Influence on Temperature and Salinity
- II. Elevated Kahalu'u Bay Enterococci Associated with Large Tidal Flux
- III. Kahalu'u Bay Nutrient Trends 2009 to 2019

The purpose of this summary is to provide an easy-to-understand synopsis of the three technical reports to enable the community to "see below sea level" so that we may be better informed of the best stewardship of our nearshore waters.

### I. Tidal and Ground Water Influence on Bay Waters

The mountains above Kailua Kona are blessed with abundant rainfall. Some sites get over 70 inches of rain per year. Yet there are no rivers or streams. On the Hilo side of the island, there are over 200 streams. So, in Kona, where does all that water go? It percolates quickly through the fractured lava rock and forms a fresh groundwater lens that floats upon the seawater that permeates the island. From there, fresh groundwater flows toward the shore. It includes a nearshore subterranean estuary (STE). In the estuary, groundwater and seawater mix under the forces of tidal action. Four times a day, the tides rise and fall. During the Spring Tides, massive tidal fluxes of over two feet push and pull on the estuary with great force.

Groundwater eventually discharges along the coast as a cold mixture of fresh water and recirculated seawater. For those that swim in the ocean, encountering cold spots is inevitable. For snorkelers, these surface cold spots can have hazy visibility. This is a refraction caused by the incomplete mixing of seawater and groundwater. The fresher water is less dense and floats on the ocean surface in many locations.

### Glossary

Impaired Waters

Impaired Waters

Definition  
Waterbodies are waterbodies not fully supporting their designated uses under the Clean Water Act.

In the Kāhala'u Bay shore area, there are pronounced discrete locations where water flows can be seen, and the coolness is perceived. In other places, the brackish water is more diffuse. And yet, in some offshore sites, the cold brackish water emerges from the floor of the ocean. Most of all, water that does not evaporate flows into the sea one way or another. Water is almost a perfect solvent. A high number of things dissolve in it even though it may remain crystal clear. In the kitchen, we can dissolve a lot of salt or sugar in a glass of water without changing its appearance.

Figure 1. Kāhala'u Bay Shoreline Sample Sites

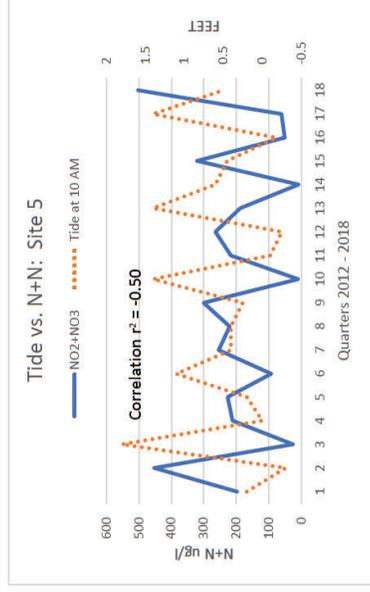

This site map of the bay shows where water samples are collected. Site one is where water flow at low tide can be seen. At low tide, the salinities at site 1 differed from the others. At high tide, the salinity of sites 1 - 4 was different from 5. This shows that water inflow can be very localized. We know that lava tubes and fractured rock can provide such a discrete conveyance.

Similarly, it should not be too hard to imagine how the flow of the tides can influence the

temperature of the nearshore water. Ocean water is warmer and more saline. Thus, a good high tide will render the nearshore water warmer and saltier. At a very low tide, the converse is also true.

Figure 2. The Influence of Tides on Nitrogen Concentration.

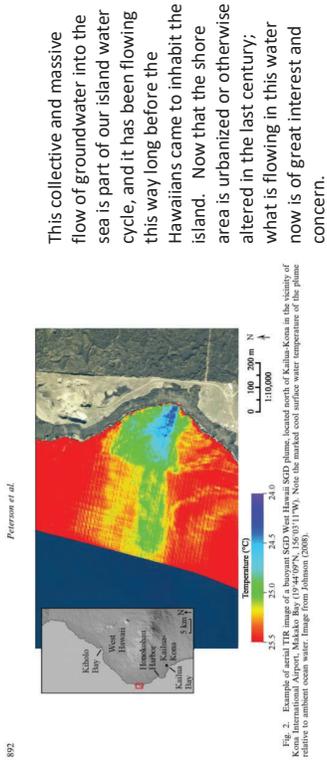

At low tide, groundwater flows increase, and salinity and temperature decrease quite dramatically. This suggests the volume of water flowing into the bay is massive. As shown in Figure 2., over a 4.5-year period, there is an inverse relationship between the tide level and the concentration of Nitrogen (N) measured as Nitrate and Nitrite. The effect is simply seawater, that is lower in Nitrogen (N) is diluting the higher N groundwater Nitrogen content. Thus, it is critical that tidal effects be accounted for in any monitoring of marine nitrogen. Accounting for groundwater Nitrogen concentrations flowing into near shore waters is a requirement of Hawai'i Administrative Rules when conducting water tests.<sup>3</sup>

UH researchers using some advanced chemistry with Radon isotopes, estimate for each mile of the Kona Coastline between one to three million gallons of groundwater flow into the sea per mile of coastline per day. On the Hilo side, the flow of water from the land can be seen in rivers and streams. On the Kona side, it is unseen but still vast in many submarine groundwater discharges.

One way we can see this flow is to use cameras that see temperature, called infra-red (IR). This IR photo was taken of a submarine groundwater discharge, just north of the Kona Airport. The cold, fresh water (shown by the cooler colors in the image) extends over 200 yards out to sea.

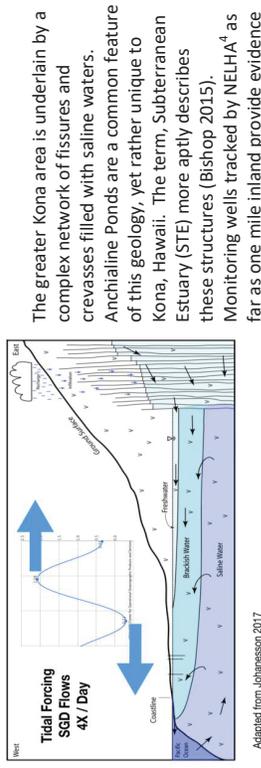

<sup>3</sup> Hawai'i Administrative Rules §11-54-6(B)

Figure 3. Thermal Image of a Prominent Submarine Groundwater Discharge. Adapted from Johnson (2008)

The take-home story in this section is that groundwater flows dramatically alter the nearshore ocean and it's easily detected and measured with simple instruments like a thermomometer or salinity meter. This will take on greater significance in Part II.

Figure 4. The Tidal Forces that Drive the Subterranean Estuary (STE) on the Kona Shore.

The greater Kona area is underlain by a complex network of fissures and crevasses filled with saline waters. Anchialine Ponds are a common feature of this geology, yet rather unique to Kona, Hawaii. The term, Subterranean Estuary (STE) more aptly describes these structures (Bishop 2015). Monitoring wells tracked by NELHA<sup>4</sup> as far as one mile inland provide evidence of seawater intrusion and water levels consistent with tidal action (Peterson 2009). This fact is largely unrecognized by the state as well as the community. The implications are profound. Marine waters of the Kona Coast communicate with ground water well inland and vice versa. Nonetheless, wastewater discharges to land in this region are likely to be impacting the waters of the coast and circumventing requirements for the regulation of such waste discharges to the waters of the United States.<sup>5</sup>

<sup>5</sup> *Cty. of Maui v. Haw. Wildlife Fund*, 140 S. Ct. 1462, 1476 (Apr. 23, 2020)

## II. Influence of Tides on the Recreation Safety Bacterial Water Quality Indicator

When the local news recently (Jan 8, 2019) reported several beaches on Oahu were closed due to elevated Enterococci (ENT) indicator bacteria, and Kahalu'u Bay was "Posted" by the Health Department of Hawai'i, at about the same time. These events raised curiosity. There had been no significant rain events on the islands, and no sewer spills to cause health department warnings. Instead, the warnings arose for beaches widely separated geographically and simply because the levels of ENT were elevated above the regulatory threshold.

The State Department of Health monitors the indicator bacteria Enterococci (ENT). The official belief was that ENT was a useful marker for fecal contamination. A lot of science has shown that it is not a valid indicator, nonetheless, it is still the official test (Boehm 2009). This ENT monitoring data is part of the Kahalu'u Bay collection. When the Bay was posted as contaminated in January, it generated posed a question. We were having colossal Spring Tides at the time. Could the tides have something to do with the bacteria levels? The bottom line is indeed they do. But how?

The ENT bacteria are common to land and water sources even where there is no fecal matter at all. They grow in wet places like culverts, compost piles, drainpipes, and wetlands. From there they flow into the sea, and they make a home there too. They can be found floating in the seawater, and that is where the state measures them. But more critically, they live and grow in wet beach sand above and below water level. Many times, more ENT can be found in the beach sand than in the water above.

Figure 5. How Tidal Circulation at the Shore Conveys Indicator Bacteria to the Water Column (Lee 2017)

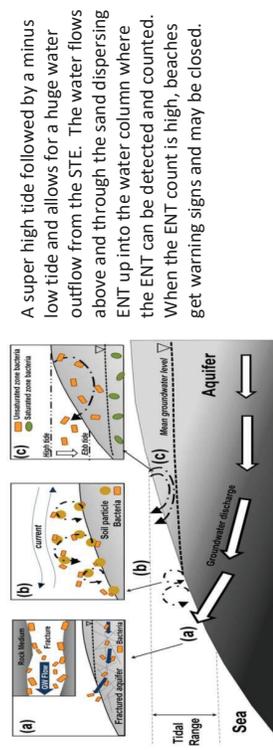

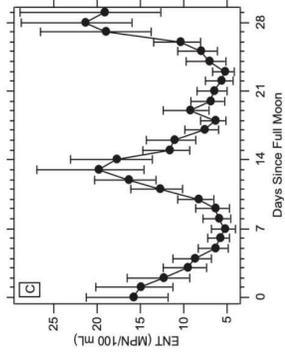

Figure 6. Lunar – Tidal Influence on Marine Water Enterococci (Boehm 2005)

This graph shows the ENT count and the moon cycle. Fourteen days after a full moon are the astronomical Spring Tides and associated rise in the ENT. This tidal force literally stirs things up.

There remains a distinct possibility that elevated ENT counts are often an artifact of the tide cycle at the time of sampling. This bias likely triggers official warnings where there is no apparent health risk events like sewage spills or flooding.

However, given that the region near Kahalu'u Bay is not served by sewer and most homes have utilized cesspits for decades, sewage components may be conveyed to the ocean by groundwater. Microbiologists have documented the presence of human virus in seawater when the ENT is low or absent. The need for a better risk indicator is great. Stable chemical indicators of sewage such as Sucralose (Bennett 2021) and an MRI diagnostic marker (Johannesson 2017) show promise in wastewater tracking research conducted in Hawaii Island.

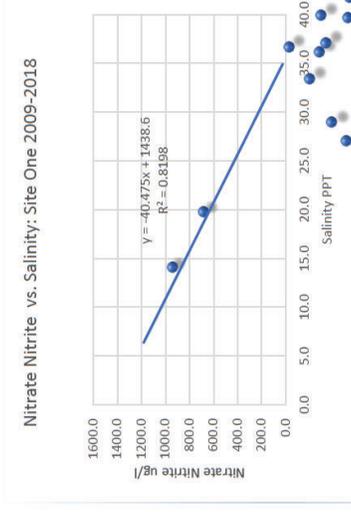

The real good news about the safety of recreation water in Hawaii is the sun. The intense midday UV sunlight penetrates clear water and kills microbes in a matter of hours. We shall see, however, in the next section, clear ocean water is less common these days.

### III. The Nutrients Nitrogen and Phosphorus in Nearshore Groundwater<sup>6</sup>

It is well established that brackish groundwater flowing in discrete and diffuse STE is abundant in the nutrient's nitrogen and phosphorus. According to University of Hawai'i researchers, wherever there is cold STE water flows, elevated nutrients are present (Johnson 2008). These flows result in thousands of pounds of the nutrients being conveyed daily to the nearshore waters. Tropical water ecosystems are naturally low in nutrients (De Goeij 2013), and yet corals have adaptations to these conditions. Unfortunately, decades of human derived nutrients in the ocean nourish algal biomass expansion to the detriment of the corals.

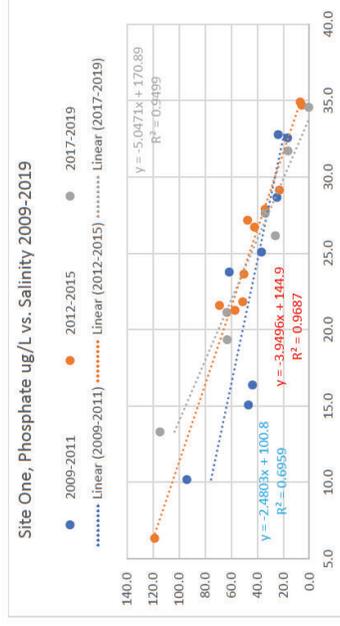

<sup>6</sup> All nutrient analysis performed by the certified laboratory at NELHA

Figure 7. Nitrate-Nitrite Relationship to Salinity

This graph looks complicated, but it's not. Let's interpret. The line says, when sea water is saltier there is less N in it. Conversely, the fresher the water the higher N is there. Taken over 10 years in many locations in the bay and from other Kona Coast sites, this pattern is very consistent. Simply, it means the elevated N source is from the land and not from groundwater and not from the sea.

Figure 8. Phosphate Relationship to Salinity

This chart looks even more complicated, but it is just three sets of years P plotted against salinity. It shows a very similar relationship as the N chart. Yet here we are looking at a ten-year period in three phases. It answers the question, are things changing over time? For both N and P there is no evidence of a time trend. The nutrient concentrations in groundwater are staying about the same.

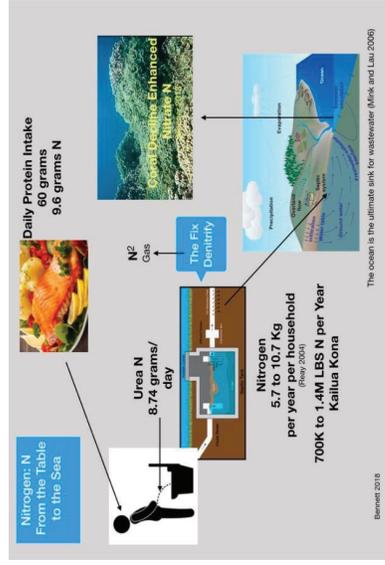

Just as for salinity and temperature in the first report, tidal action dilutes the groundwater and hence the N concentration (Fig. 2). Thus, if one was trying to say there is no problem or a lesser problem, the sample would be collected at the highest tide to get the lowest N level. In all future work, we must account for the tidal effect on nutrient concentration in nearshore waters.

A very large mass of the nutrients, N, and P, flow into the ocean for almost the entire Kona Coastline. Some have conveniently wanted to say the N and the P are natural, meaning this system was here before humans. While it is true, the mass of nutrients was far, far less as there was little importation of nutrients other than through fish consumption.

Given that, what is the reason for the large mass of nutrients? We are! A lot of research on this island and others shows very clearly that the N and P are from human activity. We say the elevated nutrients are anthropogenic, or human-associated. This includes the fertilizers imported and dispersed in landscape and agriculture. Yet the largest single source is the human diet and the nutrients we excrete daily.

For example, protein-rich foods contain much more N than starchy foods and vegetables. The proteins get absorbed and ultimately broken down and the nitrogen is excreted in the urine as urea. Leave urine in the bowl for a day and the bacteria break it down and form ammonia with its distinctive odor. In the environment, bacteria convert ammonia to nitrate. It is the same nitrate found in a bag of lawn fertilizer.

Figure 9. A Simple Mass Balance for Human Dietary Nitrogen Marine Impact

This fertilizer in the sea has the same effect as it does on your lawn. Instead of grass growing, the microscopic green plant microbes called phytoplankton grow and in high numbers make the

water shades of cloudy green. This growth absorbs sunlight making the natural UV disinfection of seawater less effective. Ecosystem research from Kaneohe Bay demonstrates that wastewater N in the bay has an additive effect with increased temperature to cause greater coral bleaching (Tanaka 2013).

Figure 10. Nitrogen Mass Dependent on Ground Water Flow Volume

Lastly, it is not sufficient just to know the concentration of the nutrient flowing into the bay as it tells us nothing of the mass or pounds in the flow. Thus, we must know or estimate the volume of the flow so that we can calculate the mass of nutrients delivered to the sea from the STE.

The blue arrows represent the same nutrient yet at very different flow volumes. The total mass of N, reaching the bay and impacting the ecosystem is very different. Where currents move and mix these nutrients to the open ocean, adverse impacts are less likely.

However, in protected embayments like Kahu'u, the transport and mixing is much less and the impact on the local ecosystem is more significant.

Think of it this way. A little soy sauce on food gives it just the right salt taste, but add a quarter cup of soy sauce on food and it becomes horribly salty. The salt in the soy is at the same concentration; there was simply more salt.

In the bay, we cannot alter the volume of water flowing in, just like we cannot stop a river. So, we need to employ the tools that reduce the concentration of N and P discharged to groundwater.

The people of Long Island NY, Cape Cod MA, and coastal Florida have severely polluted their estuaries from Septic Systems. The environmental and economic consequences are monumental. The residents put their collective shoulders to the wheel and financed solutions research. That research demonstrated a simple technique that removes the nutrients in human wastewater by over 90%. The states are implementing the "Layer Cake-Nitrogen Reducing Biosystem leach field. Kona can do this too. The consequences of "kicking the can down the road" will be dire. Sustainable Hawai'i must be our goal.

For over 35 years, Dr. Bennett has worked in the environmental science field where the land meets the water. From Tomales Bay CA, to New South Wales Australia to the Big Island wherever there are people and oceans there are huge challenges. A resident of Kona since 1999, he serves as Na Mako O Ke Kai (eyes of the sea) for the Kona Coast Waterkeeper-Waiwai Oia Ohana.

#### Acknowledgments

Special appreciation goes out to Cindi Punihaole Kennedy, the founding director of The Kohala Center's Kaha'u Bay Education Center, and Marine Stewardship and Education Specialist Kathleen Clark. Together with many volunteers, they have collected high-quality data since 2009. The data is the basis of the three reports and this summary. Also extending appreciation to the former UH researcher James M. Bishop for his assistance in understanding the hydrology of Hawai'i Island and the review of the manuscripts.

COMMENTS REGARDING:

Draft Environmental Impact Statement (DEIS)  
for the Kamehameha Schools Keauhou Bay Management Plan  
Keauhou, Hawai'i Island, Hawai'i

Richard H. Bennett MS, PhD  
Applied Life Sciences LLC

The following comments pertain specifically to water quality issues affecting Keauhou Bay. The draft EIS does not address these nor accounts for the fact that the State and the EPA list Keauhou Bay as an Impaired Water Body under section 303 D of the Clean Water Act (CWA). That law requires that impacts to the Bay be mitigated and that further impairment does not occur. This requirement under the law has not been met. Any development in the watershed needs to be conducted by a careful evaluation of this fact. Under the law, remediation begins by conducting a Total Maximum Daily Loading study known as a TMDL. The Bay is listed as impaired for exceeding the limits for turbidity. Turbidity has several causes in near-shore waters, such as runoff water with fine sediments and phytoplankton. Our research shows that turbidity is a problem in Keauhou Bay in the absence of surf events. The turbidity is also due to the overgrowth of marine phytoplankton. Our studies show that turbidity declines along a line moving offshore. The inner Bay has very poor circulation and is where most sediments and other factors causing turbidity arise. Phytoplankton grow in response to increased temperature and nutrient loading in the Bay. The lack of adequate circulation amplifies the problem.

The photo was taken in the summer of 2007 in response to concerns about the greening of Keauhou Bay. The brand name on the canoe paddle is not legible. (photo credit Bennett).

Figure 1. Nine-month summary of turbidity data for the Bay.

(Bennett 2002)

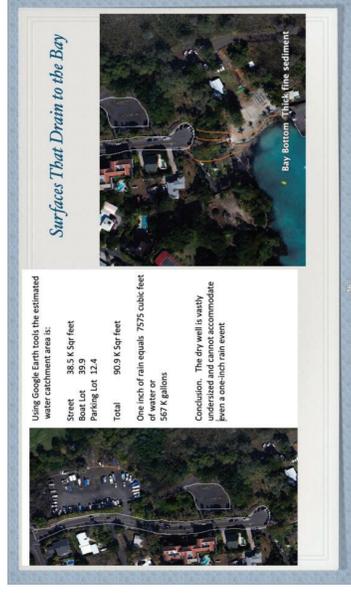

The nine-month summary chart above shows that turbidity is worse at the shoreline and decreases non-linearly in waters offshore. The slight rise in turbidity at 250 meters may be more of a phytoplankton effect than sediment.

The DEIS makes the following statement regarding groundwater.

*Due to the low frequency of substantial rainfall and high permeability of the soils throughout the Project in this area, surface runoff generally does not occur in the typical rainfall occurrence. Runoff either percolates into the underlying groundwater or evaporates into the atmosphere. There are no drainage reports or calculations on file with the County of Hawai'i or DOT for the adjacent public roadways or surrounding developed properties. However, existing stormwater runoff peak flow estimates for the three (3) drainage basins within the Project Area are presented in Table 4-4.*

The draft EIS fails to account for surface water runoff from Kamehameha III Road. At the Bayside terminus of the road is a dry well. It is typically loaded with sediment and unable to handle the storm flows that come down the length of the road. Thereafter, water overflows the curb and goes down the driveways and the slope into the Bay. As it does, it picks up considerable sediment and delivers it to the near-shore waters, increasing the turbidity problem (Fig 3).

Figure 2. Rain catchment area and water volume estimate.

(Bennett 2002)

As calculated above, a one-inch rain can produce over five hundred thousand gallons of water, with most of the flow eroding fine sediments as it enters the Bay (Figure 3). The County of Hawai'i was made aware of this dry well failure four years ago. Some of this water comes off of Kamehameha Schools land.

The DEIS statement that rainwater percolates to groundwater suggests groundwater is the terminus and the water does not flow to the sea. For at least 25 years, it was the position of the State that groundwater under the land does not communicate with the sea. Considerable research, such as Kneee (2010), Dulai (2020), Peterson (2009), and others, shows that the State's policy is specious and not science-based. The State's anchialine system is a subterranean estuary (Bishop 2015). Consequently, the DEIS must reconsider the implication that the local groundwater is an inconsequential endpoint for fresh and waste water flows. A recent US Supreme Court decision held that wastewater disposal to the nearshore groundwater without the necessary permit was a violation of the CWA (see footnote page 7).

Figure 3. Stormwater and sediment flow into the Bay.

The photos suggest considerable sediment erosion into the Bay.

Nutrient Degradation and Impairment of the Bay.

The draft EIS does not account for the elevated levels of nutrients in the Bay. Again, our research shows that nitrogen and phosphorus exceed state standards. Unlike other locations, it is unfortunate that the Hawai'i Department of Health fails to measure these nutrients in the Bay. Thus, conducting a nutrient analysis of the Bay waters was necessary. That analysis is provided below.

Table 1. Nutrient analysis along transects over three quarters of 2019

Note: The NELHA Lab has multiple certifications, including the State Department of Health

None of the nutrient values for water collected as shown above met state standards. The elevated nutrients in the Keaunohi Bay watershed come from various sources. A common misconception is that fertilizers applied to private properties and the local golf course are the significant sources. However, research shows that nutrient leaching from the Mauna Kea and Keaunohi golf courses is minor compared to the nearby homes on Puako Drive (Dialer 2011). The likely source is the myriad cesspools in the watershed. Some homes on the North peninsula of the Bay are connected to sewers, but most homes are not.

The elevated levels of ammonia suggest a water connection to fresh sources of animal and human waste. Ammonia in marine water is quickly converted to nitrate. Our data also shows the nitrogen and phosphorus levels exceed state standards for the Bay. Had the State collected this data, the EPA would declare water impairment from these nutrients. These elevated nutrients can cause the seasonal "greening" of the marine waters (Smith 2020).

The draft EIS makes no mention of nutrient pollution issues and implies that all new developments will be connected to the sewer line that transmits raw sewage to the Heeia wastewater treatment plant. The treated wastewater containing most of the nutrients in human waste is conveyed to the golf course to irrigate the golf course. It is not known the extent to which those nutrients leech into the groundwater and the Bay. It is also not known how much more water the golf course will utilize in the future.

Several residences and perhaps some commercial facilities in the proposed development area use cesspools or septic systems for human waste management. The impact on the Bay is significant and needs to be described and mitigated. However, this problem is not mentioned in

the DEIS. It is more than advisable that the Project connect all waste systems to the regional sewer.

It is well established that sewer lines leak, which is a function of many factors such as piping class and age (Rutch 2006). In the project area, some sewer lines are quite old. One such line on the East shore of the Bay broke during a significant tidal event. The DEIS does not account for sewer line leakage or the risk from extreme tidal events. This problem needs to be evaluated, and where sewer lines are at risk and need to be replaced by resilient lines such as High-Density Polyethylene (HDPE).

Figure 4. Nitrogen (delta N 15) signatures along the Keauhou Region shoreline

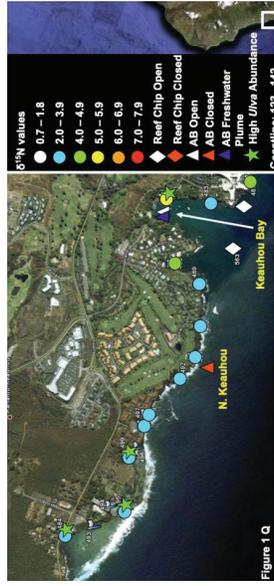

Figure 1 Q (Dallier 2011)

#### Nitrogen Signatures in the Keauhou Area

The magnitude of the delta N 15 value indicates the greater contribution of human (animal) waste nitrogen. Raw sewage water is currently conveyed from the hotel at the Bay to the Heeia Wastewater Treatment Plant (HWWTP). The Secondary treated wastewater (WW) is provided to the local golf course for irrigation. How much water the golf course needs or could utilize is unknown. Casual observation of the course suggests that it is under-irrigated. Nutrients in the WW are not removed but beneficial to the grass. Delta N 15 data indicates that the golf course contributes negligible human (animal) nitrogen to the near-shore waters.

In contrast, the Delta N 15 values are higher in the Bay proper. The source is likely human waste from cesspools in the immediate region. Less than half of the homes are connected to sewer. It is imperative that the DEIS account for these sources and provide sewer design criteria for all new developments to be connected to the HWWTP.

Figure 5. Non-permitted wastewater discharge to the Bay

Some years ago, federal funds were provided to upgrade the Bay boat launch facilities. Before the upgrade, boat wash water flowed over the surface and into the Bay. A dry well was installed, and it drained to surface water only a few feet below the drain. Boat wash water is potable water. The wash water contains fish liquids, blood, and particulate fish waste. This wastewater may be a source of ammonia in the Bay. Washed bilge water often contains oil products. The data in Figure 5 is from the wash water surface drain at Honokohau Harbor.

Since it is obvious this wash water flows into the Bay in the groundwater, the State should have applied for an NPDES permit. Such a permit is required for any ocean discharge of wastewater, especially in waters known to be Impaired under the CWA. This requirement has been affirmed by the Supreme Court<sup>1</sup>.

#### Conclusions

The surface water and groundwater flows from the proposed development and those in the upper watershed need to be considered to ensure that further degradation of this impaired water body does not occur. This is referred to herein as a TMDL. Given the environmental ethics of Kamehameha Schools and the legal history of the Public Trust Doctrine of the State Constitution<sup>2</sup>, we suggest that these environmental impacts described above be studied for the project design and mitigated.

<sup>1</sup> County of Maui, *Hawaii v. Hawaii Wildlife Fund*, 140 S. Ct. 1462, 590 U.S. 165, 206 L. Ed. 2d 640 (2020).

<sup>2</sup> *Kelly v. 1250 Oceanside Partners*, 140 P.3d 985, 111 Haw. 205 (2006).

Keauhou Bay is a small bay inlet on Hawai'i Island and, as such, is subject to much more degradation than the open shore area of West Hawai'i. As such, the Bay requires special protections.

Sincerely,

/s/ R.H. Bennett MS, PhD, President

Yellow Category

Aloha,  
Thank you for your comments concerning the Keaouhou Bay Management Plan, Draft Environmental Impact Statement. Your comments have been received and administratively recorded.

Comments received during the 45-day public comment period will be reproduced in the Final Environmental Impact Statement, and substantive comments addressed.

Your feedback will be forwarded to the County of Hawai'i, State of Hawai'i, and our planning consultant, G70. If you have already copied these parties on your email, please note that we will **not** be forwarding a duplicate copy.

We appreciate your involvement and contribution to the environmental review process. Your input is invaluable in helping us develop a management plan that reflects the needs and concerns of our community.

Thank you once again for your engagement and commitment to the future of Keaouhou Bay.

Mahalo,

The Keaouhou Bay Project Team

**CAUTION: This email is from an outside sender. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

Dear County of Hawai'i Planning,

This is my revised letter with scientific proof that developments have caused serious damage to the Hawaiian Islands coastline, and if you allow a Bungalow Resort to be built in Keaouhou Bay by Kamehameha Schools, you will be causing Keaouhou Bay to be several polluted for years to come. It will never be the same again!

Please, Do NOT risk polluting the water in Keaouhou Bay by allowing Kamehameha Schools to develop their bungalow resort project, because it is scientifically proven that developments will ALWAYS have rain runoff that will pollute nearby waters constantly during development and after.

Please, read the Scientific articles below written by NOAA, National Oceanic and Atmospheric Administration and other professional organizations, that prove that developments have ALWAYS polluted the water in every coastal development area.

The coral all over Hawai'i has had extremely high mortality rates, due to developments near ocean areas throughout the years, and development in Keaouhou Bay will be devastating to the coral, reef fish, and all Aquatic Life there, and even the Manta Rays that go there to eat zooplankton from the Manta Ray tours at night, and they eat it during the day in that area as well because they need to eat 5 times their body weight in zooplankton daily. Please see the cited information below.

"SO, HOW MUCH PLANKTON DOES YOUR AVERAGE MANTA RAY EAT? 19,200,000. Nineteen million two hundred thousand, give or take a few thousand.

That is the number of plankton pieces a ten-foot manta ray must consume weekly to stay alive."

The above information was taken from Manta Ray Advocates <https://mantarayadvocates.com/how-much-plankton-do-mantas-eat/>

If you allow this bay to be development you will be allowing all types of marine life to die and there is NO WAY to stop this from happening because polluted runoff rain water from developments can't be fully stopped. It is what has happened in ALL coastal developments.

Please read the Scientific proof below.

Reason #1 It's Been Proven Developments Severely Pollute Nearby Waters

Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Coral Bleaching is occurring more frequently in Hawai'i. Across the Hawaiian Archipelago, coral bleaching has increased in frequency and severity since 1996. The last major bleaching event in 2014-2015 had catastrophic impacts state-wide..."

This was the third major bleaching episode in Hawai'i over the last 6 years. The frequency of these events is unprecedented in the archipelago. NOAA scientists and partners have determined that the key drivers of the bleaching were environmental factors (such as heat stress, depth, and surface light) and human impacts (sewage effluent and urban run-off) " <https://www.fisheries.noaa.gov/feature-story/cautionary-tale-2019-coral-bleaching-event-bleaching-event-hawaii#:~:text=Coral%20bleaching%20is%20occurring%20more,had%20catastrophic%20impacts%20state%2Dwide.>

This article is by the Coral Reef Alliance here in Hawaii: "An ecosystem under threat Hawaii's reefs face major global and local threats including climate change, overfishing, and sediment and nutrient pollution caused by sewage and stormwater runoff..."

When it rains, flash floods carry stormwater and large amounts of sediment downstream to the ocean. Just offshore, once-thriving coral reefs are now struggling to survive." <https://coral.org/en/wherewe-work/hawaiian-islands/#~:text=Hawaii%20reefs%20face%20major%20global,into%20Hawaii%20waterways%20every%20day>.

This article states that runoff is a leading source in coral degradation. Article by National Oceanic and Atmospheric Administration, AKA NOAA, "Land-based sources of pollution are a leading cause of coral reef degradation in the Main Hawaiian Islands. Water quality is impacted by urban runoff, failing sewage systems, unpaved roads, farms, land clearing, and development." [https://www.coris.noaa.gov/monitoring/status\\_report/docs/Hawaii\\_status\\_report\\_forweb.pdf](https://www.coris.noaa.gov/monitoring/status_report/docs/Hawaii_status_report_forweb.pdf)

This article is a Research Article by PLOS ONE and their motto is, "We're driving change in research integrity and publication ethics." This is some of their article information, "Coral taxonomy and local stressors drive bleaching prevalence across the Hawaiian Archipelago in 2019..."

We found little evidence for acclimation by reefs to thermal stress in the main Hawaiian Islands. Moreover, our findings illustrate how detrimental effects of local anthropogenic stressors, such as tourism and urban runoff, may be exacerbated under high thermal stress. In light of the forecasted increase in severity and frequency of bleaching events, future mitigation of both local and global stressors is a high priority for the future of corals in Hawaii." <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0269068>

The Chesapeake Bay has a foundation that is trying to save it due to runoff pollution that was caused by developments, and the Chesapeake Bay is a lot bigger than Keauhou Bay. If it's being drastically hurt by runoff water from developments, Keauhou Bay waters won't stand a chance if development above the bay is allowed because this bay is very small.

This Article is by the Chesapeake Bay Foundation, Saving a National Treasure states, "...runoff is a significant source of harmful nitrogen pollution that continues to grow..."

As rainwater and snowmelt run off our streets, parking lots, lawns, and other surfaces, they pick up pet waste, pesticides, fertilizer, oil, and other contaminants. If the draining water doesn't evaporate or soak into the ground where it can be filtered, it flushes straight into local creeks, rivers, and the Chesapeake Bay, adversely affecting water quality and aquatic life.

Only 10 to 20 percent of rain that falls in forests, fields, and other natural areas runs off, with the rest absorbed by soil and plants, where it is filtered before reaching aquifers or

local waterways. (Right now Keauhou Bay has a lot of trees and is very natural, this is what helps stop runoff.) By contrast, close to 100 percent of the rain that falls on concrete and other hard surfaces produces runoff. One inch of rain falling on an acre of hardened surface produces 27,000 gallons of runoff.

Stormwater runoff pollution threatens Chesapeake Bay and its rivers and streams...Polluted runoff is one of the most harmful sources of pollution to the Bay and its waters. And much of it starts right in the urban and suburban neighborhoods where we live." <https://www.cbf.org/issues/polluted-runoff/index.html#:~:text=Besides%20carrying%20pollutants%20that%20harm,them%20a%20placed%20in%20jeopardy>.

If that is what runoff is doing to the Chesapeake Bay, the effects of runoff will be even more devastating to Keauhou Bay because it is so much smaller than the Chesapeake Bay.

Coral reefs are known to be highly negatively impacted by developments because, "Impacts from land-based sources of pollution including coastal development,...can impede coral growth and reproduction, disrupt overall ecological function, and cause disease and mortality in sensitive species." <https://oceanservice.noaa.gov/facts/coral-pollution.html#:~:text=Impacts%20from%20land%20based%20sources,and%20mortality%20in%20sensitive%20species>.

Article by Environmental Evidence, "Coastal development and runoff lead to sedimentation, which directly impacts coral recruitment, growth, mortality, and ecosystem services that coral reefs provide." <https://environmentalevidencejournal.biomedcentral.com/articles/10.1186/s13750-020-00200-0#:~:text=Coastal%20development%20and%20runoff%20lead,services%20that%20coral%20reefs%20provide>.

Developments can't fully stop polluting because runoff is from rain during development and after. Article by NOAA, "One of the most significant threats to reefs is pollution. Land-based runoff and pollution discharges can result from dredging, coastal development...This runoff may contain sediments, nutrients, chemicals, insecticides, oil and debris.

When some pollutants enter the water, nutrient levels can increase, promoting the rapid growth of algae and other organisms that can smother coral." [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,organisms%20that%20can%20smother%20corals).

Another article by NOAA, "Coral reefs also are affected by leaking fuels, anti-fouling paints and coatings, and other chemicals that enter the water..." (All of those are show up in every development project.)

Among the most damaging pollutants on coral reefs is sediment, which can remain suspended in the water or be deposited on the coral surface (i.e., turbidity and sedimentation, respectively) and can contain toxicants, pathogens, and nutrients, all of which impact coral growth, recruitment, and survival" [https://oceanservice.noaa.gov/education/tutorial\\_corals/coral09\\_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.](https://oceanservice.noaa.gov/education/tutorial_corals/coral09_humanthreats.html#:~:text=This%20runoff%20may%20contain%20sediments,into%20the%20atmosphere%20within%20days.)

Reason #2 It's Been Proven Resort Developments KILL Marine Life

The manta rays go to Keauhou Bay every night to eat zooplankton and if you allow this development that WILL have runoff water, you WILL be causing zooplankton to be seriously affected because as this article by MarinBIO states, "Zooplankton are also sensitive to their environment and like phytoplankton—a change in zooplankton concentration can indicate a subtle environmental change. Zooplankton are highly responsive to nutrient levels, temperatures, pollution, food that is not nutritious, levels of light, and increases in [predation](#). As well as providing an essential link in the marine food chain (which is an understatement), the diversity of species, amount of biomass and abundance of zooplankton communities can be used to determine the health of an ecosystem..."

Here is another article that proves runoff from development in this area will hurt and kill plankton, by **Frontiers in Marine Science**, "**Effects of an experimental terrestrial runoff on the components of the plankton food web in a Mediterranean coastal lagoon**" The main result observed in the present study was that the effects of the simulated terrestrial runoff spread along the plankton food web, significantly affecting all trophic levels of the natural plankton community studied. This occurred in a relatively short time considering that the experiment lasted less than three weeks. The lower light availability in the terrestrial runoff treatment compared to the control resulted in a net decrease of approximately one-third of Chl-*a* concentration and phytoplankton abundance over the entire experiment." <https://www.frontiersin.org/journals/marine-science/articles/10.3389/fmars.2023.1200757/full>

"Zooplankton are also affected by levels of pH, heavy metals, calcium, and aluminum. Nutrients like nitrogen and phosphorus will affect the prey of zooplankton (like algae, protozoa and bacteria), indirectly affecting zooplankton survival. Scientists are still putting together pieces of the zooplankton puzzle. Some questions include how nutrient levels found in algae can influence the growth and behavior of zooplankton. Another question important to marine and human life is how toxins and pollution will affect this crucial link in the food chain" This information is in article by MarineBIO. <https://www.marinebio.org/creatures/zooplankton/#:~:text=Zooplankton%20are%20also%20sensitive%20to,light%2C%20and%20increases%20in%20predation.>

Here is a research article by Environmental Research Laboratory, United States Environmental Protection Agency that discusses, "Toxic Effects of Pollutants on Plankton" There are four main sources of aquatic pollution: industrial wastes, municipal wastes, agricultural run-off, and accidental spillage. Non-point sources, such as automobile exhausts, add appreciable amounts of pollutants to air that may enter

aquatic systems in rainfall or dry fall-out. These sources add pesticides, heavy metals, oil, petroleum products, and a large number of organic and inorganic compounds to water. Lakes and oceans serve as sinks for many pollutants. Plankton comprise a large portion of the living matter in natural waters and function in biogeochemical cycles. They are affected by pollutants, transfer them to sediments and other organisms, and function in their biological transformation." [https://scope.dge.carnegiescience.edu/SCOPE\\_12/SCOPE\\_12\\_3\\_6\\_chapter12\\_257-274.pdf](https://scope.dge.carnegiescience.edu/SCOPE_12/SCOPE_12_3_6_chapter12_257-274.pdf)

The above articles show that development of Keauhou Bay WILL hurt plankton life in the area because of the pollutant runoff that WILL happen during the development and after, and if this happens this could cause the manta ray food source to disappear and that will be devastating for the manta rays eating habits, as well as cause the manta rays to not show up in this area, in turn taking away many lively hoods from locals on the island that depend on the manta ray tour for their income.

Reason #3 It's Been Proven an Increase in Human Population Destroys Coral Reefs

If a Bungalow Resort is allowed to be built in Keauhou Bay, it will forsure bring a serious increase in human traffic. "Easily visible trends in human population dynamics combined with well-established and tested ecological theory give a clear, intuitive, yet quantifiable guide to the severity of survival challenges faced by coral reefs. Management challenges and required actions can be clearly shown and, contrary to frequent claims, no scientific ambiguity exists with regards to the serious threat posed to coral reefs by humankind's continued numerical increase." This is in the article by National Library of Medicine National center for Biotechnology Information PubMed. <https://pubmed.ncbi.nlm.nih.gov/33293007/#:~:text=Denser%20coastal%20populations%20and%20greater,to%20more%20runoff%20and%20siltation.>

This article is by ABC NEWS, "This is how tourists are destroying coral reefs in Hawaii The less people at a certain site, the more coral there are, the research found. The millions of tourists who flock to the shores of Hawaii every year are wreaking havoc on its natural environment -- especially the coral reefs, which are at risk all over the world, a new study said. The most popular coral reefs on the Hawaiian islands are likely being degraded by the very visitors they attract, according to a study published Monday in *Nature Sustainability*." <https://abcnews.go.com/US/hawaiian-coral-reefs-degrading-popular-tourist-sites-scientists/story?id=96308858#:~:text=The%20less%20people%20at%20a,there%20are%2C%20the%20research%20found.&text=The%20millions%20of%20tourists%20who,world%2C%20a%20new%20study%20said.>

Why allow this resort to be developed, you will be destroying the coral reefs in the bay because this bay is extremely small and used by a lot of locals already for fishing, canoeing, swimming, snorkeling, paddle boarding, surfing, boating...it can't afford more use by many thousands more people yearly.

If you allow Keauhou Bay to be developed there will be a higher population in the bay and that will hurt the coral in the bay as well, because it's known that, "Denser coastal

populations and greater wealth will lead to reef degradation by coastal construction. Denser populations inland will lead to more runoff and siltation. Effects of human perturbations can be explored with metapopulation theory since they translate to increases in patch-mortality and decreases in patch-colonization (= regeneration). All such changes will result in a habitat with overall fewer settled patches, so fewer live reefs." This information was taken from Science Direct <https://www.sciencedirect.com/science/article/abs/pii/S0065288120300328#:~:text=Aquaculture%20will%20alleviate%20some%20fishing,to%20more%20runoff%20and%20siltation.>

Another article by Nature Sustainability, "Coral reefs and coastal tourism in Hawaii Coral reefs are popular for their vibrant biodiversity. By combining web-scraped Instagram data from tourists and high-resolution live coral cover maps in Hawaii, we find that, regionally, coral reefs both attract and suffer from coastal tourism. Higher live coral cover attracts reef visitors, but that visitation contributes to subsequent reef degradation. Such feedback loops threaten the highest quality reefs, highlighting both their economic value and the need for effective conservation management." [https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing\\_token=wsakgQNhajHjAnWAq453tRgN0jAiwel9inR3ZotV0PyGzA5lc\\_H0Q1zCHNIP3ASnhcgKRY6\\_vkLPw49qbmBYoXSg3YIMgQIGBZsapdGUH701SILbu9x5P73xED4KxL4TosJlvgQ1a7ZR3rUbraxpodJd2AoNISmWsuX87JJEddpJ8OCJpX7ITJWdCFXvFKJIZYeNdCjJ3Sw\\_dnaUg5lZihcJPBDImmaHl5vgT5O%3D&tracking\\_referrer=abcnews.go.com](https://www.nature.com/articles/s41893-022-01021-4.epdf?sharing_token=wsakgQNhajHjAnWAq453tRgN0jAiwel9inR3ZotV0PyGzA5lc_H0Q1zCHNIP3ASnhcgKRY6_vkLPw49qbmBYoXSg3YIMgQIGBZsapdGUH701SILbu9x5P73xED4KxL4TosJlvgQ1a7ZR3rUbraxpodJd2AoNISmWsuX87JJEddpJ8OCJpX7ITJWdCFXvFKJIZYeNdCjJ3Sw_dnaUg5lZihcJPBDImmaHl5vgT5O%3D&tracking_referrer=abcnews.go.com)

Reason #4 a Resort Development WILL Increase Traffic on Already Severely Trafficed Roads The Big Island already has a serious problem with traffic on the island because of a lack of infrastructure that in places a bigger road can't be built due to cliffs on one side and homes on the other side.

Allowing another resort to be developed will bring more cars that will lead to a lot more traffic that the island can not handle, please read the articles below by different NEWS companies that prove this point.

This NEWS article by Hawaii News Now, "Report shows alarming surge in Hawaii Island traffic deaths The Hawaii Police Department's Traffic Services Section released a new report showing a dramatic increase in both major crashes and fatal accidents from last year.

The startling statistics show a dramatic increase in the number of year-over-year traffic fatalities on the island of Hawaii, revealing major crashes are up more than 12% and traffic fatalities are up more than 100%." Please watch their video on their link below because it is a professional report on Big Island traffic problems. <https://www.hawaiinewsnow.com/2024/05/18/new-report-shows-hawaii-island-traffic-fatalities-are-up-over-100-last-year/>

With more tourists comes more accidents, more traffic, and more traffic deaths. Please read this article by KHON 2 NEWS, "Hawaii Island has most traffic fatalities in state; This time last year Hawaii Island was at five traffic deaths, as of April 1, 2024, they're at 14.

Seven of which happened in the last two weeks...

Chief Moszkowicz said the police force is small compared to the size of the island and response times can take 15 to 20 minutes.

"We don't have the resources like in the small space of Oahu where you can saturate an area to control speeding, that just doesn't exist here," he added." <https://www.khon2.com/local-news/7-traffic-fatalities-for-hawaii-island-in-march/>

The traffic on Big Island has increased drastically and safety issues and infrastructure needs to be addressed before adding more resort developments.

Please read this article because what it says about Oahu is the same for Big Island. The traffic problems they talk about are the same issues here on Big Island, and this article also gives one Big Island example. "On the Big Island, the mayor had to issue an emergency order shutting down Waipio Valley Road due to overuse and poor prior maintenance." <https://www.civilbeat.org/2024/02/angry-over-island-traffic-jams-lets-talk-about-solutions/>

Please, watch the NEWS video from the link below on aerial footage in Hilo because the footage shown is the same thing that is happening on Aalii Drive and Queen K HWY, and for the same reasons.

There are 2 developments already on Aalii Dr. being built as of today, and more are scheduled for this road in the near future, and Aalii Dr. and Queen K HWY are the roads Kamehameha Schools Bungalow Resort will be using if approved and they are already seriously congested.

These roads have the exact same traffic congestion as Hilo, with the exact same problems. Traffic is extremely slow already.

The worry on Kona side is tsunami evacuations rather than lava evacuations, and in this kind of traffic, not everyone will be able to get to safer ground, especially if you allow another resort to be developed in this area when traffic is already at a crawl every week day and sometimes on weekends as well.

See the photo below that proves this point in Kona, and here is the NEWS article by KITV NEWS that talks about Hilo and the same thing is happening in Kona on the roads Kamehameha Schools wants to develop their resort, "Hawaii Island traffic jams could have safety impact. In the event of an evacuation, Mayor Mitch Roth acknowledges that will make the Traffic Jam up even worse. But says, he is working with The State on a solution." [https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article\\_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html](https://www.kitv.com/news/local/hawaii-island-traffic-jams-could-have-safety-impact/article_b06a5374-5a6a-11ed-8d23-8313ef8c4c19.html)

There was a crash on Aalii Dr. and when there is an accident on this road, it turns into only one lane that needs a flagger to help direction traffic, and that adds even more traffic to this already seriously congestion road, and Kamehameha Schools wants to add a resort on this road, and that will increase the traffic even more.

Here is the Island News video on the crash on Alii Dr. <https://www.youtube.com/watch?v=FQ5snPDjI8>

Please see from these articles that traffic on Big Island is deadly already and adding another resort will be devastating to the island.

Please read this Path article, HAWAII COUNTY'S VISION ZERO INITIATIVE

A motorcyclist is in critical condition after a collision with a car. A driver accidentally hits and kills a pedestrian. It seems that not a day goes by without the news reporting on a traffic crash on Hawaii'i Island.

"That's just Big Island traffic," is a common sentiment. But what if we didn't have to accept this endangerment of vehicle drivers, motorcyclists, and pedestrians as a way of life?"

This was taken from Path as well as The Law of the Splintered Paddle below <https://pathhawaii.org/hawaii-countys-vision-zero-initiative/>

### The Law of the Splintered Paddle

Hawaiian history tells us that young Kamehameha was once an aggressive chief. The story goes that the young chief even chased after two fishermen in a Puna fishing village. While pursuing them, his foot got stuck in a crevice, and one of the fishermen struck Kamehameha over the head with his paddle in defense, which splintered into pieces.

After the incident, Kamehameha recognized that it was wrong to misuse his power and learned compassion. Years later, Kamehameha declared a new law, "[K?n?wāi M?malahōe](#)," or "the Law of the Splintered Paddle." Meant to protect the innocent and vulnerable from unprovoked attacks, this law proclaimed that the defenseless (especially k?puna and keiki) across Hawai'i be able to sleep safely on the side of the road, unharmed.

The law provided for the safety of non-warriors during wartime and became the first written law of the Kingdom of Hawaii. After being added back in 1978, the law is part of Hawaii's State Constitution today.

It is symbolic of servant leadership, reinforcing the importance of:

- Caring for and serving one's people
- Knowing and doing what is pono (right)
- Standing for the principle that leadership privilege is earned
- Taking kuleana (responsibility) for those we serve
- Doing so with compassion, love, and respect

"We take that to mean that anyone who uses our roadways should be able to do so without fear of harm," explains Tina."
