Mr. Gary Gill
Director
Office of Environmental
Quality Control
Central Pacific Plaza
220 South King Street, 4th Floor
Honolulu, Hawaii 96813

Dear Mr. Gill:

Subject: Final Environmental Assessment and Finding of No Significant Impact for Mililani Intermediate School Facilities for a New School TMK 9-5-02:por. 01

The Department of Accounting and General Services did not receive any comments during the 30-day public comment period which began on June 8, 1996. The agency has determined that this project will not have significant environmental effect and has issued a finding of no significant impact. Please publish this notice in the July 23, 1996 OEQC Bulletin.

We have enclosed a completed OEQC Bulletin Publication Form and four copies of the final EA. If there are any questions, please have your staff call Mr. Ralph Morita of the Planning Branch at 586-0486.

GORDON MATSUOKA

State Public Works Engineer

Very truly Yours,

OVERVIEW

This Environmental Assessment (EA) has been prepared for the Mililani Intermediate School in compliance with the provisions of Hawaii Revised Statutes (HRS) Chapter 343 and Sections 11-200-14 through 11-200-18 of Title 11, Department of Health, Chapter 200, Environmental Impact Statement Rules.

As required by the Rules, this EA describes the following elements of the proposed project: 1) the technical, economic, social, cultural and environmental characteristics of the project; 2) the affected environment; 3) a summary of impacts and alternatives considered that would meet project objectives; 4) the mitigation measures proposed; 5) significance of environmental impacts; and, 6) determination.

Written comments and responses received in early consultation with various agencies can be found in Appendix F.

PROJECT SUMMARY

Project Name:

Mililani Intermediate School

Applicant:

Department of Accounting and General Services (DAGS)

Division of Public Works, State of Hawaii

Area:

Tax Map Key

Approximate

9-5-02: 1 (Por)

<u>Acres</u> 15.5*

*Includes 0.5 acre slope area.

Existing Use:

The subject parcel is currently vacant.

Proposed Use:

Middle School Grades 6 - 8. All proposed classrooms and other school buildings will fit into the 15 acre campus site except for the play fields which are located in the adjacent 12+ acre City park site

planned for joint use.

State Land Use District:

Urban

Central Oahu

Action Requested:

Use of State Funds

Approving Agency:

Governor, State of Hawaii

CHAPTER 205, HAWAII REVISED STATUTES (HRS)

Chapter 205, Hawaii Revised Statutes (HRS), establishes the State Land Use Commission (LUC) and gives this body the authority to designate all lands in the State as Urban, Rural, Agricultural, or Conservation District lands. Land use decisions within Urban District lands are generally left to the counties to control in accordance with local General Plans and zoning ordinances. As such, the entire subject property is located within the State Urban District, but land uses on the property are controlled by the City's Development Plan and Land Use Ordinance. Consequently, no action from the State Land Use Commission is required to implement development of the proposed Mililani Intermediate School.

ENVIRONMENTAL IMPACT STATEMENTS (CHAPTER 343, HRS)

In accordance with the State of Hawaii's Environmental Impact Statement Law, Chapter 343, HRS, there are Agency actions applicable to new development which trigger the environmental review process. One of these is the use of State lands and/or funds, and is the "trigger" applicable to the proposed project authorizing compliance with Chapter 343, HRS, in accordance with Section 11-200-5 (b) and (c). A Final Environmental Impact Statement was completed in February, 1987 for the Mililani Mauka Residential Community, which included a school site as a primary component of the master plan.

Because Chapter 343, HRS is applicable to the project, this EA has been prepared to identify whether "significant environmental effects" will result from project development. According to the Department of Health Rules which are governed by Chapter 343, HRS implementation, if "significant environmental effects" are not identified by an Environmental Assessment, preparation of a full Environmental Impact Statement is exempted, and a "negative declaration" of significant environmental effects is issued by the Accepting Authority. Otherwise, a Notice of Preparation is issued and processing of a full Environmental Impact Statement is required.

1.0 IDENTIFICATION OF PROPOSING AGENCY

The subject property is presently owned in fee by Castle and Cooke. However, the landowner has agreed to transfer the fee interest to the State for the purpose of developing the proposed educational facilities (see Appendix E). As such, the State Department of Accounting and General Services Division of Public Works is the proposing agency for the project.

To identify the appropriate uses for the property, a master plan was prepared by Castle and Cooke for Mililani Mauka in 1987. This master plan (with minor revisions) is also reflected by the existing Central Oahu Development Plan Land Use Map. As such, the proposed Middle School is consistent with public and private development plans for Mililani Mauka. The mailing address and primary contact person for the proposing agency is:

Mr. Ralph Morita, Planning Branch
Division of Public Works
State of Hawaii
Department of Accounting and General Services
P.O. Box 119
Honolulu, Hawaii 96810

2.0 IDENTIFICATION OF ACCEPTING AUTHORITY

In accordance with Subchapter 4, Section 11-200-4, Hawaii Administrative Rules, "the Governor or an authorized representative," is the Accepting Authority "whenever an action proposes the use of state lands or the use of state funds or, whenever a state agency proposes an action within section 11-200-6(b)." Therefore, the governor or an authorized representative, as applicable, will be the Accepting Authority for the Mililani Intermediate School Environmental Assessment.

3.0 IDENTIFICATION OF AGENCIES CONSULTED

Consulted agencies or agencies which provided information in the preparation of this environmental assessment include the following:

State

.

Department of Accounting and General Services
Department of Agriculture
State Land Use Commission
Department of Education
Department of Health
Office of State Planning

City

Department of Land Utilization
Planning Department
Department of Transportation Services
Department of Parks and Recreation
Department of Public Works
Board of Water Supply
Fire Department

Federal
U.S.D.A. Soil Conservation Service

<u>Citizen Groups and Individuals</u> Mililani School Community Based Management (SCBM) Group Design Charette Process Participants (1/21/96 - 3/1/96)

4.0 GENERAL DESCRIPTION OF THE ACTION'S TECHNICAL, ECONOMIC, SOCIAL, CULTURAL AND ENVIRONMENTAL CHARACTERISTICS

4.1 Technical Characteristics

4.1.1 Description of the Subject Property

The site is comprised of approximately 15.5 acres of land (including a 0.5 acre slope easement), located between the future Kuaoa Street (60' Right of Way) and Lehiwa Drive (56' Right of Way) in Mililani Mauka (see Figure 1). A field survey has been conducted to identify the precise project boundaries and acreage (see Figure 2). As depicted in the Visual Analysis (Figures 6a to 6b), the subject property is presently vacant and used temporarily for the staging of construction equipment.

The project site is surrounded by the growing Mililani Mauka community. Surrounding land uses consist of planned multi-family and park/open space areas, and a small portion of single family residential development makai of Lehiwa Drive. A 12± acre community park is also planned for a parcel between Kuaoa Street and Lehiwa Drive located along the Wahiawa edge of the subject property. Existing or planned public facilities included in the vicinity (Mililani Mauka) include a fire station, elementary school(s), park and ride facility, and a district park.

The site has been extensively graded to make it flat to gently sloping except for a small portion of the property's edge along Lehiwa Drive. For the most part, views from the site are primarily toward the Koolau and Waianae mountain ranges and toward the adjacent ravine.

Existing views from multi-family residential areas up-slope from the site have been considered during the preparation of the project master plan. All parcels within Mililani Mauka Phase 2 have been zoned to reflect the corresponding development plan land use designations.

4.1.2 Project Objectives

To address the educational needs of the growing Mililani Mauka community, the proposed Intermediate School reflects the land uses originally proposed for this area by the Mililani Mauka Master Plan. The Mililani Mauka Master Plan has identified the centrally located subject parcel for the proposed use and established a pattern of compatible land uses surrounding the property reflecting a future urbanized residential community. Need for the project is clearly demonstrated

MILILANI INTERMEDIATE SCHOOL

C View from within school site looking toward the Waianae Mountain Range, Haleiwa, and the future Kuaoa Street. Site is essentially vacant with no agricultural activity.

D Note slope condition and distant roof tops of new residential development approaching subject property. Distant views are of Makakilo looking toward the Ewa Plain.

FIGURE 6b
VISUAL ANALYSIS
MILILANI INTERMEDIATE SCHOOL

by the growing population and continued expansion of Mililani Mauka and the lack of suitable existing facilities.

Mililani Intermediate School will be a year-round multi-track school. Three tracks of 675 students per track will comprise the total school enrollment of 2025 students. However, the design enrollment for the school facilities will accommodate two tracks, 1350 students, at any given time (See Section 4.1.4. Project Summary Description).

Project Phasing

. .:

. 1

Tentative plans cal! for a two phased development schedule with the first phase to be completed by September 1998. Funding for the first phase of construction is estimated at approximately \$18.0 million, with an overall appropriation of 20.0 million.(see Appendix G).

Phase one consists of site preparation (i.e. grading), "House E", the media center/exploratorium (shell and fit out of 2nd floor), cafeteria and kitchen (no music/or counselor facilities in Phase 1), the administration building, central plant, both entries with bus drop-off and parking lot, play courts, and fire lanes.

Phase two includes construction of Houses F and G, completion of the first floor center/exploratorium, and completion of the music and counselors facilities adjacent to the cafeteria. Phase two is scheduled to be completed the following year.

As such, the proposed school is centrally located to planned residential development. Proposed facilities will accommodate the latest "state of the art" facilities within separate buildings specifically designed for the uses proposed in the project description.

The program elements and project objectives of the proposed Mililani Intermediate School were identified by a School Community Based Management (SCBM) committee. Members from each of the area's the six Mililani complex schools were invited to participate in the committee. Subcommittees were formed to focus on technology, interdisciplinary teaming, advisor/advisee program, year round scheduling, and exploratory/co-curricular programs. The findings of the subcommittees formed a basis for the program recommendations reflected in the proposed site plan which was developed through a Design Charette Process as herein described.

4.1.3 Overview of the Charette Process

As educators and school administrators have developed new teaching philosophies to best benefit the current day student body, it has become apparent that educational facilities will also need to evolve. The design of Mililani Intermediate School will be based on an emerging Middle School concept which aims at encouraging integrated learning among sixth, seventh and eighth graders.

At the onset of the charette, the steering committee representing the Mililani complex SCBM group was elected to become decision makers for this project. Prior to the start of the charette process, the SCBM met for one year to research and develop a Middle School program to be implemented at this school. Subsequently, Kajioka Okada Yamachi Architects was selected to design this school in conjunction with the Steering Committee and the community. Architects from The Orcutt/Winslow Partnership, a firm based in Arizona which specializes in school design, were brought on board as consultants as well as to facilitate the charette process.

Development Program

The charette began with a large group meeting involving teachers, administrators, students and community members focusing their discussions on learning concepts and general curriculum goals.

The primary goal of the first charette meeting was to provide a forum in which a multitude of ideas and concepts could be addressed and from which an overriding educational philosophy could be developed. In this initial meeting, Arizona consultants Paul Winslow and Chuck Hill led the group in a series of brainstorming exercises in which smaller groups considered a variety of learning options. By the end of the first day session the groups had ultimately developed educational models which represented their primary educational values.

The charette process continued with the Steering Committee and the Design Team meeting daily for one week. Necessary decisions that would dictate some of the design decisions became priority. Consequently the Steering Committee was urged to decide upon the preferred student body and staff organization of the school as well as the school's primary educational objectives. Following each day's meeting, the Design Team met to strategize the next day's plans as well as to discuss and develop a number of schemes that could be considered by the Steering Committee. Starting from lists of ideas and pages of sketches at the beginning of the first week, the Steering Committee in cooperation with the Design Team began to refine an educational model that best reflected their teaching philosophies.

In review of the schemes that were presented each day, certain fundamental educational concepts continued to emerge. One was that the organization of the school should be based on the "house" concept to create a sense of community and belonging among the students. Another was that exploratory, hands-on opportunities for learning should be central to the campus and to the students' learning experiences.

During the first week, the site and site issues were also introduced. The group was given the opportunity to become familiar with the characteristics of the site and also to become aware of the site constraints. Throughout the week, consultants were brought in to aid the group in making design decisions based on school and site requirements. DAGS Central Services Division, Student Transportation Services Branch Chief, George Okano, and Ben Gorospe from the State Department Transportation on Persons with Disabilities, informed the committee of the bus

transportation requirements of the facility and the accessibility requirements of the site respectively. Given the realities of the site, the committee began to gear themselves towards a more site specific discussion by the middle of the week.

With consideration to these discussions, the Design Team developed six site specific schemes from which the Steering Committee was asked to create an optimal scheme to present at the first presentation meeting to the community.

Community Presentations

The first presentation was held at Mililani High School on January 25, 1996. Members of the Steering Committee and the Design Team presented the organizational scheme for the school that they had agreed upon, as well as an explanation of what the process had been during the last week. The discussion was then opened up for questions from the community and all comments were noted and recorded to be considered during the next phase of the charette.

Following this meeting, the Design Team was given a week to further organize and refine the existing scheme as well as to begin discussion on general building goals. During Phase 2 of the charette, which began on February 5th, the Design Team along with the Steering Committee began to brainstorm on specific building goals.

As in Phase 1 of the charette, the Design Team met each evening to review the day's discussion and to develop more refined schemes to present the next day. Phase 2 of the charette, however, was more focused on specific building requirements and space needs. Functional relationships between buildings and especially between spaces within buildings became a determining factor in the development of the building schemes.

At this stage of the process, the Design Team also became concerned with developing a preliminary space program that addressed the program space allotments as dictated by the DOE Facilities Branch. Moreover, during Phase 2 of the charette, phasing requirements also became a critical issue especially after the preliminary cost estimate was prepared. Consequently, the committee was forced to make decisions on which facilities were necessary for the school to function when it opened in 1998 based on the fixed first increment budget.

The second public presentation was held on February 9th in a forum similar to the first presentation. The Steering Committee and the Design Team presented to the community a schematic design for each building as well as a site plan, circulation diagrams, and a phasing diagram. The community again provided feedback and questioned certain aspects of the site and building plans that needed to be considered in the ensuing design phase.

Subsequent to this presentation, the Design Team spent two weeks further refining the building design. During this time, the architects met with the curriculum specialists to once again review the

space requirements in their areas. With this insight, the Design Team was able to rework the functional and space relationships for each building plan to result in more optimal opportunities for student learning. Some of the design decisions, however, were still determined by the need for the Design Team to adhere to the program spaces as required by the DOE Facilities and Support Services Branch. As a result, the preliminary space program as well as the preliminary cost estimate were updated.

During this time the architects met with the Building Department and Fire Department for preliminary plan reviews to see that the current plans met building codes and fire code requirements. The plans were also reviewed with the Department of Land Utilization with regard to zoning and building height restrictions.

Before the final presentation to the Mililani Community, the Design Team met with the Steering Committee for a final meeting to review the plans in progress. At this meeting, further refinements to the building plans were made. Each building was re-evaluated and space trade-offs were made when necessary.

The final presentation on February 29th marked the culmination of the Steering Committee's involvement in the charette process. Again, it was a team presentation made by the Steering Committee and the Design Team to the community. The community and the Steering Committee voiced their comments as the Design Team were to take their comments and begin the schematic design phase of this project.

Charette Summary Report

The Charette Summary Report is a detailed account of the charette process including daily meeting minutes, all presentation materials and pertinent consultant diagrams. The minutes record the charette exercises as well as comments and design decisions as they were made by the Design Team, the Steering Committee, and the Consultants. The design decisions have been summarized in the following Design Conclusions section of the report.

DESIGN CONCLUSIONS

SITE

The 15 acre campus site will be accessed by two entries, a student bus drop-off at the north boundary of the campus and the parent/staff parking at the south. A slope easement of approximately 0.5 acres is also located along the mauka edge of the site. At the front of the campus, the Administration building will be easily accessible and identifiable from the parent/staff parking. All facilities are designed and will be constructed in accordance with the Americans with Disabilities Act Accessibility Guidelines (ADAAG) and Hawaii Revised Statutes (HRS) Section 103-50, Design and Construction Requirements.

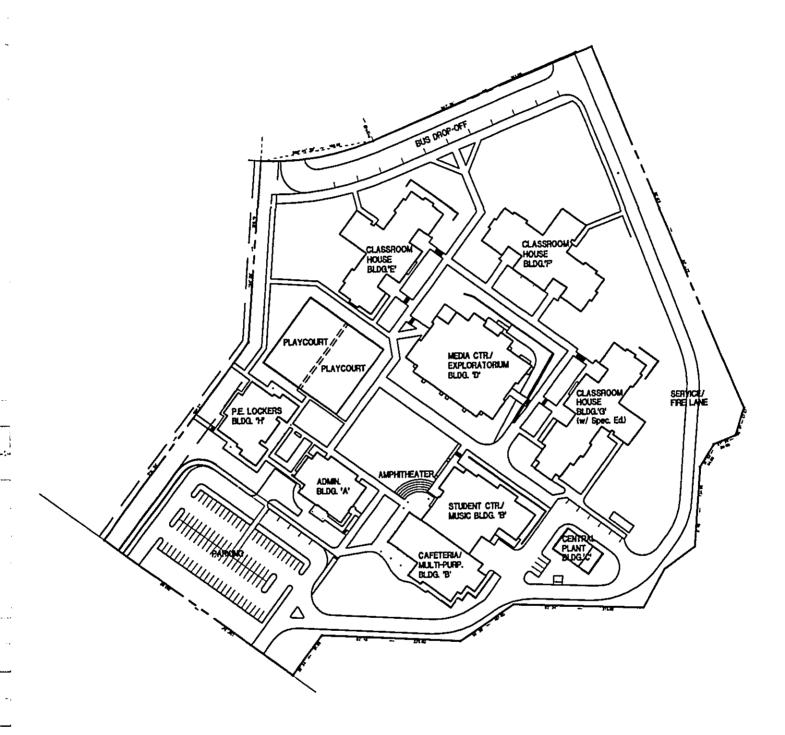

FIGURE 7
SITE PLAN
MILILANI INTERMEDIATE SCHOOL

Source: Kajioka Okada Yamachi Architects

Because the Cafeteria is also foreseen to be a frequently used community space, its location was also made convenient to the main public entry to the campus. The Music building has been integrated with the Cafeteria to permit easy sharing of the school's performance facilities which include a permanent stage adjacent to the dining area and an outdoor amphitheater. Because the exploratory curriculum is an emphasized component of the school's educational program, the Media Center/Exploratorium is located at the center of the campus. Classroom "houses" have been located around the Media Center/Exploratorium to allow all students direct access to this facility. The PE program will share the playfields on the neighboring park site and thus the facility has been located adjacent to the park. Courts have been designed on site to allow the school to have exclusive control of their use. Space for 12 portable classrooms has been earmarked in two locations on the north side of campus near the bus-drop off.

In addition to administration and student facilities, the campus will include a Central Plant. This would house the main equipment to support the A/C chilled water system, which will also produce hot water, and be located near the limits of the site to reduce the impacts of its noisy nature to the campus. The Central Plant has also been strategically placed near the Cafeteria facility in order to permit the joint-use of a service drive.

Pedestrians would enter the campus via a main public entrance off of Lehiwa Drive or by way of an equally well-designed entrance off Kuaoa Street at the north side of the campus. Once on campus, the primary circulation paths provide convenient access between the classroom "Houses" and the Media Center/Exploratorium. Pedestrian circulation paths will also be provided to the Administration building, Cafe/Music building, and to the PE building and out to the playfields.

Primary vehicular access to the campus will be via a bus drop-off at the Kuaoa Street entrance to the site and the parent/staff parking and drop-off area off of Lehiwa Drive. A service drive will enter off Lehiwa Drive and permit service vehicles convenient access to the Cafeteria facilities and the Central Plant. Disabled access will be accommodated by a handicapped drop-off which will allow easy access to primary campus circulation. Fire lanes have been provided for emergency vehicles to access the campus along the edge of the property (Figure 7).

Another main consideration in the development of the site plan was the use of exterior space for student social spaces. Thus, in addition to providing the students with an outdoor amphitheater, the campus will also offer a variety of gathering places where students can meet and socialize.

ADMINISTRATION

In order to accommodate any increased administrative requirements of a multi-track school, the administrative facilities, including general office space, Registrar's workroom, and conference rooms, have been slightly oversized. A PCNC (Parent Community Networking Center) room and public restrooms can be accessed even after office hours by a separate entry.

In order to allow students and faculty more convenient access to the Principal and Vice Principals, separate entrances have also been provided near their offices. The Principal's office maintains a clear view onto the center of the campus. Finally, to make the counselors' offices more approachable to the students, they have been moved out of the Administration building to the less formal Cafe/Music/Student Center.

CAFETERIA/MUSIC/STUDENT CENTER

The Cafeteria/Music/Student Center building will be built in two phases. During Increment 1, the dining and kitchen facilities will be built while the music and counseling portion of the building will be completed during Increment 2. The serving space was left flexible enough to allow the option of implementing a modified scramble serving system. A downsized dining area will have access to a view of the ocean and the Waianae mountains. The smaller dining area was a trade-off to allow an expanded music program which will include two full sized band rooms, a choral/orchestra room, and a keyboard room.

Because of the need to downsize the dining room, ample outdoor seating areas and covered lanais will be provided. An outdoor amphitheater as well as an indoor permanent stage adjacent to the dining area will be available to accommodate musical or drama performances.

The last component of the Cafe/Music building is the integration of the counselors' offices and the SAC (Student Activities Center) into the design to truly make this building a Student Center.

MEDIA CENTER/EXPLORATORIUM

At the center of the school, there will be a two-story Media Center/Exploratorium foreseen to be the heart of the campus. At the first level, a variety of exploratory study opportunities will be available to students. The exploratory curriculum will be largely project-based and students will have the chance to learn in a diversity of lab facilities while working on their projects. Central to the Exploratorium space will be a raised project area with computer stations where students can work in groups or individually on their projects and have easy access to the various lab spaces. The square footage trade-off that was necessary to create this project space was resolved by slightly downsizing the adjacent lab spaces.

The Exploratorium will include two Science labs, a FCS (Family Consumer Sciences) space, two Tech Ed spaces, neither of which will require heavy machinery or a large dust collector, and an Art room. Also on the Exploratorium level will be a shared demonstration room where teachers can address a number of students at once or students can present projects to their peers.

Above the Exploratorium on the second floor will be the Library/Media Center. It will be entered by a bridge entrance from the higher portion of campus, or an open stair that relates the Media Center to the first floor Exploratorium. In general this will be a large flexible space to house the

book stacks and computer stations, and also to allow students to study individually or in groups. The two student conference rooms are divided with a movable partition so that the space can be joined and used as a larger meeting room or a video control room. The Media Center will also provide a video production room and computer terminals.

In addition to a workroom, teachers will be provided with a planning center to support the multitrack system and promote team planning for an integrated curriculum. The main media control room for the campus will be located in the Media Center and provide the distribution of campus communications and data services. However, one of the most outstanding features of the Media Center will be its view of the campus and out to the ocean and the Waianae mountain range permitted by its second floor location.

HOUSES

The general philosophy of the Middle School concept is reflected in the design of the "Houses". The campus will have three House buildings strategically located to have convenient access to the Media Center/Exploratorium. The decision to provide three Houses was based on the assumption that the students could be divided among the Houses by grade level or in the future allow an integration of the varying grade levels.

Initially one-story buildings, the Houses became two-story due to the limited site space. Each two-story House will be composed of fourteen general classrooms and will include a mid-level lab space and computer resource room to be equally accessed by both floors within the house. These shared spaces would encourage cooperative learning along with a sense of community and belonging among the students. Within each House, there will be one teacher planning room and lounge to accommodate all the teachers. This facility, which would provide each teacher (on and off-track) with a personal desk space, should foster team planning and integrated teaching. Adjacent to the open stairway, there is an open flex space that can be used for informal group meetings, small presentations, and displays.

Classrooms have been designed to allow two classrooms to be combined during joint class activities and also have been provided with breakout rooms to encourage advisor-advisee talks, teacher-student conferences, and small group meetings.

A double size classroom space has been attached to House "G" in order to accommodate the need for an FSC (Fully Self-Contained) classroom space on the campus. The location of the FSC space was chosen for its proximity to the handicapped drop-off, and its close relationship to the rest of the campus. Because of the need for OT and PT (Itinerant Services) to be close to the FSC room, the Itinerant Special Ed space will be integrated with the FSC facility. An office will also be provided to accommodate speech therapy requirements.

PHYSICAL FDUCATION (PE) LOCKER BUILDING

The PE facilities will be required to accommodate 340-360 students on each side during any given session of the school year. Two classrooms have been incorporated into the design of the PE building. A generous lanai has been provided off the main entrance of the building to function as a student holding area. Larger paved areas will also be allotted off the side exits of the PE building to allow holding areas directed towards the playfields. The PE offices allow direct supervision by the teachers into the locker rooms and students have been provided with individual showers to accommodate their need for privacy at this age.

4.1.4 Project Summary Description

All facilities are designed and will be constructed in accordance with the Americans with Disabilities Act Accessibility Guidelines (ADAAG) and Hawaii Revised Statutes (HRS) Section 103-50, Design and Construction Requirements. Site grading will also comply with ADAAG handicap access requirements in accordance with HRS, 103-50.

The concept includes a campus comprised of three classroom buildings, a centralized "media center/exploratorium", cafeteria/music building, a central chiller for air conditioning, an administration building, and a physical education building with 2 play courts. The exploratorium will also include home economics, business, and combined woods/metal shop.

Support facilities include bus parking and loading of Kuaoa Street, an 88 care parking lot with parent drop off area accessed by Lehiwa Drive, fire lanes, outdoor student areas, and miscellaneous site improvements such as retaining walls and sidewalks. The entire property is located adjacent to a community park, all within walking distance from planned residential areas proximate to the property. Infrastructure facilities to be expanded or improved include a drainage system, and water and wastewater systems, and electrical/communication systems. A brief description of the major land use elements of the Master Plan are presented below.

Land Use Summary

Based on the needs expressed by the Board of Education, Department of Education Facilities Branch, and community input, the following land use program was incorporated into the Mililani Mauka Middle School Master Plan, which represents approximately 65 percent open space as follows:

Land Use Program	Approximate Building
	Footprints (Sq Ft)
House E	17,660
House F	17,360
House G	19,150
Media/Exploratorium	24,100
Physical Education	8,530
Administration	7,140
Cafeteria/Music	26,190
Central Plant	2,180
Parking	66,000
Bus Drop-off	15,000
Courts	<u> 20,44</u> 0
Total:	223,750 <u>+</u> sq ft
Misc Open Space	429,650 <u>+</u> sq ft

^{*}The building footprint areas shown here are approximate only and to be used for general planning purposes.

Figure 7 depicts the project site plan of the major structures proposed.

The following is an approximate list of major approvals and permits required for development of the proposed Middle School. From the earliest stages of the planning process, the Department of Accounting and General Services and their design team has worked with all affected agencies to obtain their comments and necessary approvals of plans and specifications (Refer to Appendix F).

Permit or Approval	Authority
Environmental Assessment	Governor
Subdivision Approval	City and County of Honolulu, Department of
	Public Works
Building/Grading Permit	Building Dept./Public Works
NPDES	State Department of Health
ight Waiver Request	City and County of Honolulu, Department of
	Land Utilization

Construction of the proposed school will begin upon completion of final construction plans and after the applicable subdivision and grading permits are issued. Construction phasing of the school will be within the first year following approval of all applicable land use entitlements and permits.

4.1.5 Infrastructure Improvements

All internal circulation, drainage, water, wastewater, electrical, and communication infrastructure will be funded by the State. The main Hawaiian Electric Company transmission line will be located underground along Lehiwa Street mitigating any potential adverse impacts to the site. Off-site infrastructure improvements are in place or will be provided by the developers of Mililani Mauka. Preliminary on-site infrastructure and site improvement costs are estimated at approximately \$7.0 million in 1996 dollars.

Engineering and architectural studies have been conducted to determine on-site drainage, traffic, and electrical/communication requirements. Off-site improvements such as water and wastewater capacity, electrical/communication, and roadway system improvements have been determined during the master planning process for Mililani Mauka and are in place to accommodate the proposed middle school development. As such, all off-site infrastructure is adequate and available for development of the proposed facility and no additional studies to identify off-site infrastructure improvements are required. Connections to water and wastewater facilities will be confirmed at the appropriate time in the approval and permitting process.

4.2 Economic Characteristics

4.2.1 Property Values of Existing Homes

According to the Real Property Tax Assessment Office, assessments are based upon primarily two broad factors: 1) the "neighborhood" in which the land is located; and 2) the fair market value of the land. Depending on the value of surrounding homes, development on adjacent properties may have a positive effect on surrounding land values relative to the existing vacant status of the property. Generally, close proximity to schools will enhance the property values of existing homes due to the premium paid by families with school age children. As such, property values should generally improve upon completion of the proposed Mililani Middle School.

4.2.2 Funding

Funding for the first phase of the proposed Mililani Middle School has been appropriated at \$18.0 million. The total appropriation from the Legislature was for \$20.0 million.

4.3 Social Characteristics

According to the City's 2010 population projections for Oahu, the 2010 population of Oahu is projected at 1,012,080, the Primary Urban Center at 489,141 (48.3 percent), Ewa at 102,578 (10.1 percent), and Central Oahu at 172,428 (17 percent). Based on these projections and the absence of residential development planned for the property, the Mililani Intermediate School will not facilitate new population growth in the area, but it will address a critical social need through the development

of educational facilities. Consequently, the Middle School will provide a necessary public facility in support of future residential development planned for surrounding properties.

4.4 Cultural Characteristics

The project site is located in Mililani Mauka, a residential area that began as part of Mililani, a master planned community established in the 1960s. During the late 1980's, development of the Mililani Mauka community began after many years as a pineapple producing area. During the agricultural period, the area was extensively modified and altered from its natural condition. As such, the property does not contain cultural remains, plants or animals of traditional Hawaiian gathering value, and is not currently used for cultural or religious practices. Consequently, the site does not contain significant cultural values or resources. Construction of the proposed school facilities, however, will provide new opportunities for cultural education, awareness and activities to take place.

4.5 Environmental Characteristics

In general, the subject property is not located in an environmentally sensitive zone such as floodplain, tsunami zone, erosion prone area, geologically hazardous land, estuary, coastal water, or area of sensitive flora and fauna habitat. Although the property does contain soils suitable for productive agriculture, agricultural use is not suitable within an existing urban area planned for residential land uses. Dust, noise, and use of pesticides and herbicides associated with agricultural land may not be compatible with adjoining land uses without severe restrictions on their use.

The primary environmental characteristics of concern to the community are the air and noise impacts typically associated with new urban development on lands adjacent to existing residential development. As such, mitigation measures will be necessary during construction to reduce potential air and noise impacts on adjacent properties. After construction, the design and configuration of new structures must reflect the surrounding residential community, views, circulation, open areas and security measures required to support the growing population in the area.

4.5.1 Aesthetics

The Mililani Intermediate School has been designed to integrate the proposed land uses into the planned Mililani Mauka community by integrating the site plan in recognition to adjoining land uses. For example, because the subject property is situated between a gulch and a community park, the site plan has located proposed physical educational facilities adjacent to the park. Along the gulch, a roadway and landscape buffer and planned chain-link fence will establish a physical separation from the steep slopes of the gulch. The bus drop-off and parking area are located adjacent to Kuaoa Street and Lehiwa Drive respectively, permitting a desired building setback from roadways which would mitigate potential noise and safety concerns.

Building architecture and heights have been designed to complement the surrounding land uses and other existing buildings located within the Mililani Mauka community. All applicable design guidelines and design criteria established by the Mililani community and Department of Education respectively have been addressed during the design process and will be reflected in the building architecture.

4.5.2 Traffic

According to the "Traffic Impact Study; Mililani Town Master Plan, Parsons, Brinkerhoff, Quade and Douglas, Inc. May 1984, the proposed Mililani Mauka schools will generate 13.1 trips/day/employee. Assuming approximately 70 employees, this equates to approximately 917 trips generated/day. Trip generation calculated on a per/student basis is provided in "Trip Generation" 5th Edition, Institute of Transportation Engineers (ITE), 1991, which estimates 1.09 trips per student/day. Based on the design enrollment of 675 to 1,350 students (1 to 2 tracks at any given time), the Mililani Intermediate School would generate approximately 735 to 1471 trips per day depending on the attendance level for that day. Therefore, the estimate of 917 trips provided in the Traffic Impact Study appears within this range.

To mitigate the potential traffic impacts that could be generated by the proposed project, the layout and design of the proposed site plan was coordinated with the City's Department of Transportation Services (DTS). According to DTS, the access from Kuaoa Street is acceptable provided that a standard dropped driveway wide enough to accommodate bus turning movements is provided. Location of the driveways should be coordinated with the Mililani Mauka community and a one-way counter-clockwise circulation pattern should be implemented. Internal travel lanes should be wide enough to accommodate two travel lanes for buses and appropriate signage is also necessary.

Similarly, the access from Lehiwa Drive is also acceptable. A standard dropped driveway should be constructed with east and west driveways one-way in and out, respectively. Appropriate signage is also required. DTS has no objections to the student drop-off area, turnaround area, and fire lane through and within the school site.

Because Kuaoa Street and Lehiwa Drive are not presently complete, a temporary access will be provided by the partial construction of Lehiwa Drive up to the proposed access locations. As phase two is developed and the Mililani Mauka community achieves build-out, Kuaoa Street will also be extended to provide the proposed bus drop-off area with access.

4.5.3 Water Quality

According to the State Department of Health, the Mililani Mauka community is located above the State's Underground Injection Control line. As such, the underlying groundwater is considered a potential source of potable water. Surface water quality will be maintained through a program of soil erosion control measures, Best Management Practices (BMP) during project construction.

5.0 SUMMARY DESCRIPTION OF THE AFFECTED ENVIRONMENT

5.1 Climate

The average annual rainfall of the area is approximately 40 to 50 inches. Near the mauka boundary of Mililani Mauka, the average annual rainfall is approximately 70 inches per year. Daytime summer temperatures average between a low of 66 degrees and a high of 82 degrees. Winter temperatures average between a low of 60 degrees and 75 degrees during daytime hours. These climatic conditions are important in determining design features such as the need for covered walkways, use of air conditioning, and orientation of buildings.

5.2 Geology/Topography

The topography has generally moderate slopes that reach up to 6 percent in some portions of the parcel. No significant geological or topographical physical features are present on the property. During rough grading of the site and during development of supporting infrastructure, the original topography, vegetation, and soils were significantly modified or removed (see Figure 1).

5.3 Soil Classification

There have been three soil suitability studies prepared for Hawaii whose principal focus has been on describing the physical attributes of soils for development and the relative agricultural productivity. These three soil suitability studies are: the Detailed Land Classification, the Soil Conservation Service Soil Survey, and the Agricultural Lands of Importance to the State of Hawaii. Although the subject property has been significantly altered by previous development, the following description of original soils is being provided as baseline information that may be of value for engineering and construction purposes.

5.3.1 Detailed Land Classification

The *Detailed Land Classification* (1965 through 1972) series was produced by the Land Study Bureau (LSB) of the University of Hawaii for each island. This series of reports were produced with the intention of developing a land inventory and productivity evaluation based on statewide "standards" of crop yields and levels of management.

The LSB land classification is a synthesis of the information found in the 1955 Soil Survey for the Territory of Hawaii as well as several other sources for data on geology, topography, climate, water

University of Hawaii, Department of Geography, Atlas of Hawaii, Second Edition, Honolulu: University of Hawaii Press, 1983

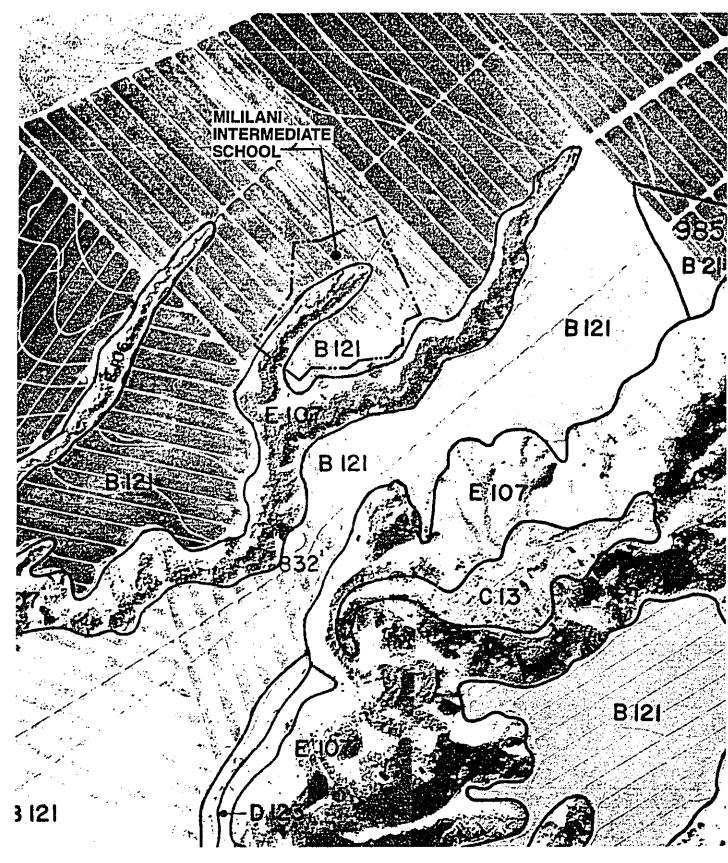

FIGURE 8 **DETAILED LAND CLASSIFICATION**MILILANI INTERMEDIATE SCHOOL

Source: Land Study Bureau, University of Hawaii - State of Hawaii, December 1972

resources and crops. The LSB classification system groups lands into homogeneous units called Land Types, describes their condition and environment, delineates the areas on aerial photo base maps, rates the lands on their overall quality (productivity) in relation to other land, and appraises their performance under selected alternative agricultural crops. The productivity evaluations were based on statewide standards of crop yields and levels of management at the time the classification was made.

As shown on Figure 8, the Subject property is designated as "B" by the Land Study Bureau and is considered good for agricultural purposes. It is non-stony, clay properties are non-expanding, drainage is good, and slopes are between 0 percent and 10 percent.

5.3.2 Soil Conservation Service Soil Survey

The Soil Conservation Service Report of 1972² series for each island was prepared by the U.S. Department of Agriculture Soil Conservation Service (SCS) and the University of Hawaii Agricultural Experiment Station. These reports are patterned after a soil classification procedure adapted for nationwide, uniform application. Soil types are ranked according to their suitability for most kinds of crops and characteristics applicable to development.

As shown on Figure 9, the original soils characteristic of the subject property are Leilehua silty clay (LeB) with slopes of 2 to 6 percent. A representative profile of the surface layer is dark reddish-brown silty clay about 12 inches thick. The subsoil is approximately 36 inches thick, is dark reddish-brown and dusky-red silty clay and clay that has subangular blocky structure. Permeability is moderately rapid, runoff is slow, and the erosion hazard is slight.

Although this Soil Conservation Service soil description is useful in determining the fundamental characteristics of soils, the extensive disruption of the soil column, mixing, and compaction of the soils has likely altered the drainage and permeability characteristics described.

5.3.3 Agricultural Lands of Importance to the State of Hawaii

The Agricultural Lands of Importance to the State of Hawaii (ALISH) (1977) system was also prepared for the entire state, based on criteria established by the Soil Conservation Service. "Prime Agricultural Land" is defined as "...land best suited for the production of food, feed, forage, and fiber crops. Two other classes of land used by the ALISH system are "Unique Agricultural Land" and "Other Important Agricultural Land". Both describe successively less productive soils. The entire 15 acre site has been designated as "Prime" agricultural land by the ALISH system. These lands are considered to have the soil quality, growing season, and moisture supply needed to produce a

sustained yield of crops economically when treated and managed according to modern farming methods.³ (refer to Figure 10).

5.4 Flood and Drainage

The Federal Emergency Management Agency Flood Insurance Rate Map (FIRM) of March 4, 1987⁴, identifies the parcel as within "Zone X" which is defined as areas outside of the 500-year flood plain. As such, none of the subject property is subject to floods which may impact the design and/or location of project structures or improvements.

5.5 Flora

Because the entire subject property has previously been extensively modified by the agricultural grading and construction of the temporary construction facilities, all of the original flora characteristic of the area has been replaced with introduced scrub vegetation (see Appendix A). As illustrated by the Visual Analysis, existing site conditions do not indicate any significant or endangered flora resources. As such, the implementation of the proposed master plan will not have a significant impact on botanical resources.

During and after project buildout, the proposed landscape plan will establish a much more diverse assortment of flora species than is currently present on the property. In addition to the aesthetic values created by the new landscaping, its diversity will also contribute to the establishment of new habitat for birds and other animals. As such, no mitigation measures are necessary.

5.6 Fauna

Fauna on the property is primarily comprised of the typical assortment of feral mammals including cats, dogs, and mongoose often found in most urban areas of Oahu. Because the entire subject property has previously been extensively modified by agricultural cultivation, construction activities, and urban development, the native fauna habitats of the area have been previously replaced by agricultural activities and urban environment. Therefore, there are no known endangered or other threatened animal species or their habitats associated with the subject property (see Appendix A).

5.7 Air Quality

Regional and local climate, together with the type and amount of human activity, generally dictate the air quality at a given location. According to the Atlas of Hawaii, air quality in the area of the subject property is generally good. In terms of particulate matter, there are approximately 40 micrograms per cubic meter of suspended particulates on a 12-hour daytime average. In terms of carbon monoxide, the maximum concentration for any one hour period was found to be between 20 and 30 milligrams per cubic meter⁵. Fugitive dust from human activities and emissions from vehicular traffic represent the only significant sources of potential air quality impact relative to the subject property at the present time.

In general, air quality in Hawaii is excellent due to the predominant northeast trade winds, although some localized conditions, such as heavy traffic at intersections can negatively impact air quality. Within Mililani Mauka, the transportation system and projected traffic levels generated by the project, are not expected to significantly alter air quality in the area from current conditions. In addition, the close proximity of residential development to the proposed educational facilities is likely to encourage many pedestrian or bicycle users as an alternative to vehicular transportation.

To ensure that air quality continues to be high, both Federal and State standards have been established to identify ambient air quality and potential changes as they may occur in the future. At present, six parameters are regulated including: 1) particulate matter; 2) sulfur dioxide; 3) nitrogen dioxide; 4) carbon monoxide; 5) ozone; and 6) lead. Hawaii's standards are more stringent than comparable national limits except for sulfur dioxide.

It is possible that during construction, short-term air quality in the area may be impacted by exhausts generated from construction equipment and fugitive dust emissions during project grading. Therefore, best management practices will be employed to ensure that soil erosion control measures mitigate the impact of both water and air borne emissions of silt and dust.

Fugitive dust control can be accomplished by a watering program, covering open-bodied trucks, paving of parking areas, and establishment of landscaping to lower the potential for fugitive dust emission. Other short-term impacts from construction vehicle emissions and increased traffic should be insignificant. Similarly, no significant long-term air quality impacts are anticipated after project construction is completed.

University of Hawaii, Department of Geography, Atlas of Hawaii, Second Edition, Honolulu: University of Hawaii Press, 1983, pp. 67-68

5.8 Noise

Noise quality of the area is dominated by distant noise traffic emanating from the H-2 Freeway, occasional aircraft noise, sounds typical of residential areas, construction noise from adjoining properties, and naturally occurring sounds (i.e. birds and wind).

Typical noise standards for residential areas are shown on Table 2.

TABLE 2

EXTERIOR NOISE EXPOSURE CLASSIFICATION (RESIDENTIAL LAND USE)

Noise Exposure	Day-Night	Equivalent Sound	Federal (1)
Class	Sound Level	Level	Standard
Minimal	Not Exceeding	Not Exceeding	Unconditionally
Exposure	55 Ldn	55 Leq	Acceptable
Moderate	Above 55 Ldn	Above 55 Leq	(2)
Exposure	But Not Above	But Not Above	Acceptable
	65 Ldn	65 Leg	
Significant	Above 65 Ldn	Above 65 Leq	Normally
Exposure	But Not Above	But Not Above	Unacceptable
_	75 Ldn	75 Leg	
Severe	Above 75 Ldn	Above 75 Leg	Unacceptable
Exposure			

- Note: (1) Federal Housing Administration, Veterans Administration, Department of Defense, and Department of Transportation.
 - (2) FHWA uses the Leq instead of the Ldn descriptor. For planning purposes, both are equivalent if: (a) heavy trucks do not exceed 10 percent of total traffic flow in vehicles per 24 hours, and (b) traffic between 10:00 PM and 7:00 AM does not exceed 15 percent of average daily traffic flow in vehicles per 24 hours.

Short-term noise may impact off-site areas during the initial construction phase emanating from onsite grading activities and movement of construction vehicles. Construction activities would be limited to daytime hours and comply with all applicable noise control regulations of the City and County of Honolulu and State of Hawaii. The use of noise suppression equipment on construction vehicles and construction curfew periods are required under the State Department of Health (DOH) noise regulations. Construction equipment will utilize required mufflers and be shut off when not operated. After construction, potential project related noise impacts are primarily limited to localized noise generated by increased traffic volume, construction activity noise, and student noise typically associated with outdoor activities.

5.9 Visual Attributes

Existing views of the property are dominated by built features, the distant Koolau and Waianae Mountain Ranges, and Kipapa Gulch. As such, no specific or predominate natural features are visually associated with the subject property except for Kipapa Gulch. Views into Kipapa Gulch are available at some locations, however, existing vegetation and proposed landscaping will be utilized to establish a visual and safety buffer along the edge of the Gulch.

5.10 Historical/Archaeological and Cultural Sites

Due to the extensive grading and other modifications conducted on the property (Figure 6) for agricultural purposes, fill, and stockpiling of construction material, no significant archaeological or cultural sites are known to exist on the subject property. This was confirmed in the Final Environmental Impact Statement, February, 1987, prepared for Mililani Mauka. The only potentially significant sites in the area are the Waikakalaua and Kipapa Gulches where various battles between invading chiefs from neighboring islands took place. Kipapa Gulch also was the site of Heiau o Umi and agricultural terraces. No sites were identified on the subject property.

The Archaeological Report (Appendix B) concludes, "if any structural remains of an archaeological or historical nature ever existed on the subject property (sic. Mililani Mauka), pineapple cultivation has long since erased any such evidence. There thus is no archaeological reason why the development of Mililani Town cannot proceed as planned."

During any development activity involving the extensive modification of the land surface, there is always the possibility, however remote, that previously unknown or unexpected subsurface cultural features, deposits or burials might be encountered. Therefore, should any archaeologically significant features be uncovered during construction, immediate archaeological consultation will be sought with the Department of Land and Natural Resources in accordance with applicable regulations.

5.11 Public Services and Facilities

5.11.1 Access

Access to the parcel is provided primarily from Kuaoa Street and Lehiwa Drive. These internal roadways have been planned and designed to accommodate the existing and future transportation needs of the Mililani Mauka community, which also assumed development of the subject property as a school site. As such, no improvements to the existing and planned roadway system are required

except for onsite driveways connecting with the bus drop-off facility on Kuaoa Street and the parking lot adjacent to Lehiwa Drive.

5.11.2 Potable Water

According to the Mililani Town Water Master Plan (revised December 1995), the proposed educational uses located within Zone 1b (subject Mililani Middle School and proposed Elementary School), will require an average of approximately 0.438 mgd of potable water compared to a average of 4.098 mgd of potable water required for Mililani Mauka upon project buildout. This consumption rate assumed a fire flow rate of 2,000 gpm at a 2 hour duration (see Appendix D). According to the Department of Land and Natural Resources, daily consumption guidelines for schools on Oahu are 4,000 gallons/acre and 60 gallons/student. These guidelines equate to a consumption rate of 62,000 gallons/day and 81,000 gallons/day respectively, for a total daily consumption of approximately 143,000 gallons/day.

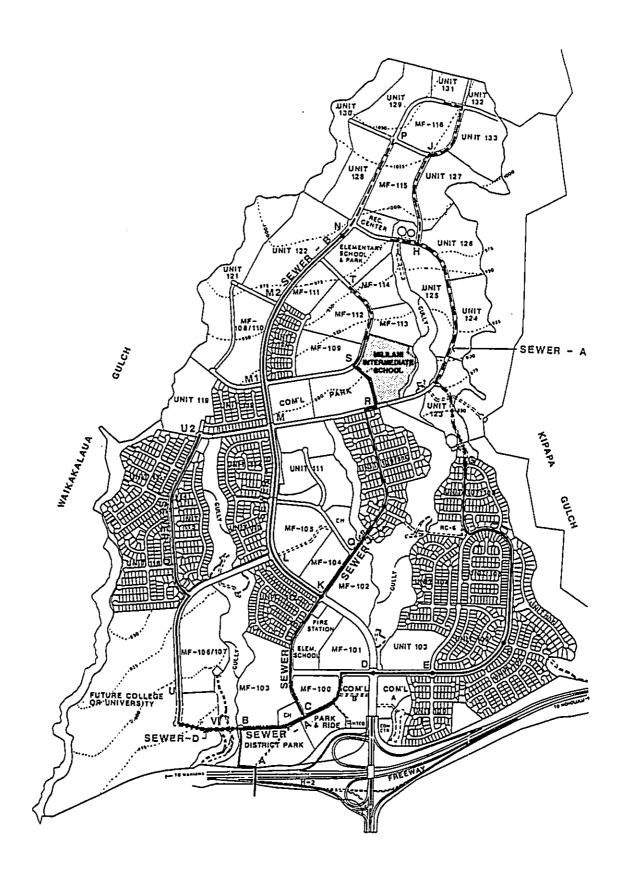

As indicated the proposed schools in Mililani Mauka will consume approximately 10 percent of the total projected potable water demand in Mililani Mauka at project buildout. However, the subject school site at this location has long been an element of the Mililani Mauka Master Plan. Therefore, the potable water demand for schools has long been included in the planning and design of the Mililani Mauka potable water system.

The water system for Mililani Mauka consists of existing Deepwells 9 & 10 and the existing wells 5 & 6 at the 865 elevation. Proposed wells 11 & 12 are also planned as a source located proximate to Deepwells 9 & 10. There are also four water reservoirs with a total storage capacity of 6.5 mg.

Based on the planned potable water demand at Mililani Mauka and the relatively low water requirements projected for the proposed Middle School, the water source, storage, and distribution facilities required to service the project are adequate and have been planned to accommodate the potable water needs of the proposed project.

5.11.3 Wastewater

According to the wastewater master plan prepared for Mililani Mauka, the proposed project will require the collection, treatment, and disposal of wastewater in accordance with applicable regulations of the Department of Wastewater Management (see Appendix C). Sewage capacity will be contingent on submittal and approval of a "Sewer Connection Application" form to project whether flows are within capacity and permit limitations of all affected infrastructure. According to the wastewater master plan, the peak flow generated by the proposed facility is approximately 1.32 mgd. Average wastewater flows, however, are projected at 0.331 mgd.

LEGEND

EXISTING SEWER OR UNDER CONSTRUCTION

FUTURE SEWERS

FIGURE 11 **SEWER MASTER PLAN** MILILANI INTERMEDIATE SCHOOL

Wastewater Collection

Current wastewater collection lines (Figure 11) accessible to the subject property consists of a 12 inch line located between the proposed school site and community park. This line crosses Lehiwa Drive and ultimately connects to a 15 inch line and then a 18 inch line near the Mililani Mauka Elementary School. These existing wastewater collection lines gravity flow ultimately toward the Honoulululi Wastewater Treatment Plant (WWTP) located at Ewa where wastewater from Central Oahu is treated.

Wastewater Treatment

The present capacity of the Honouliuli WWTP is approximately 38 mgd. Available capacity is allocated by the City on a "first come, first serve" basis. However, a 13 mgd expansion of the facility is scheduled to be completed by December 1996. With this expansion and other improvements to the Waipahu Waste Water Pump Station and the Mililani Diversion Line Relief, preliminary estimates indicate that the Honouliuli WWTP will have sufficient capacity to accommodate the proposed project.

Effluent Disposal

Treated effluent from the Honouliuli WWTP is currently discharged via deep ocean outfall. This method of disposal will not be significantly impacted by development of the proposed project. Because a school inherently brings children into outdoor landscaped areas and the lack of treatment facilities proximate to the school site, the use of treated effluent for irrigation purposes is not planned.

5.11.4 Drainage

As with any new development, control of drainage during and after project construction is critical in protecting the quality of surface runoff and mitigating the potential impacts of off-site runoff on down-slope properties.

During construction, exposed soils and the establishment of impermeable surfaces (i.e. roofs, parking areas, etc.) can potentially concentrate surface flows into the exposed soils areas. This can increase the suspension of soil in the water and create off-site siltation in receiving waters. Similarly, off-site surface flows after construction must be controlled to retain water on-site, permit recharge of groundwater, and regulate the volume and velocity of discharged water. Therefore, during construction, best management practices will be employed to control the quantity and quality of runoff. Because the graded area will exceed 5 acres, a National Pollutant Discharge Elimination System (NPDES) permit will be required from the State Department of Health which would review and approve the best management practices proposed.

The NPDES program is administered by the Clean Water Branch of the State Department of Health (DOH). According to the NPDES regulations, a drainage plan and Best Management Practices (BNP) Plan to detail the measures to be taken to minimize soil erosion and discharge of pollutants into receiving water is required. The BMP describes the site and proposed construction activities and schedule. Soil erosion control mitigation measures must be in place before grading begins to minimize the exposure time of cleared areas and stabilizing techniques. Erosion control measures must be checked once a week and after periods of rainfall. A notice of intent must be issued to the DOH 90 days prior to construction activities.

Based on the amount of impermeable surfaces created by the proposed land uses, on-site and/or off-site drainage improvements to control the discharge of surface water will be developed to control the total off-site runoff after construction. Systems to control the quantity of quality of surface runoff will be designed in accordance with applicable City and State regulations. These include temporary wind screens, on-site water retention basins, establishment of groundcover, erosion control fabric, and landscaping (with automatic irrigation system) soon after initial grading is complete. Frequent watering will be implemented to mitigate emission of fugitive dust.

5.11.5 Schools

The public schools closest to the project site are the Kipapa Elementary School and Mililani Waena Elementary School on Kipapa Drive, Mililani Uka Elementary School on Kuahelani Avenue, Mililani Mauka Elementary School on Makaikai Street, and Mililani High School on Meheula Parkway. In addition, there is an undeveloped second elementary school site in Mililani Mauka. There is presently no middle or intermediate school in Mililani.

The proposed Mililani Intermediate School will not stimulate or increase the number students on Oahu, but respond to the need for additional educational facilities within the growing Mililani community. As such, children who would attend the Mililani Intermediate School are generally not students new to the Department of Education system as they already attend schools elsewhere within the State school system.

According to the State Department of Education's enrollment projections prepared for the Mililani Mauka EIS, two new elementary schools and one new intermediate (middle) school would be required to accommodate the projected residential development. Consequently, these facilities have been incorporated into the Mililani Mauka master plan. In addition, the Department of Accounting and General Services has been working closely with the State Department of Education to ensure that the educational needs of the community are adequately addressed as the project achieves build-out.

5.11.6 Parks and Recreation

The Department of Accounting and General Services has met with representatives of the City Department of Parks and Recreation (DPR), the State Department of Education (DOE), and the current landowner (Castle & Cooke), to discuss the potential joint use of the adjoining community park for recreational purposes.

According to DPR, the community park can be utilized for school purposes, however, provisions must be made to also accommodate the recreational needs of the general public. This will be achieved through scheduling of physical education classes to ensure that the community park is available to the general public on a predetermined basis. However, the development of the park must be completed prior to the opening of the school. The landowner will develop the open playfields within the park (approximately 4 acres) in time for the school opening under the condition that DOE maintains the open playfields until such time the landowner turns over the park site to the Department of Parks and Recreation, City and County of Honolulu. Provisions for recreation improvements and facilities (including parking) will be determined by the landowner and City and County of Honolulu Department of Parks and Recreation.

Other on-site facilities for active recreation, such as basketball courts, will also be available for student use which will reduce the overall use of the community park facilities.

In its present condition, the subject property provides no public recreational opportunities. However, with development of the proposed school and associated recreational facilities, the overall inventory of available recreational opportunities will be enhanced, thereby improving the efficient use of proposed recreational facilities.

5.11.7 Police

The District's police protection services are provided by officers from the Wahiawa Police Station located off California Avenue. This area is part of the Honolulu Police Department's Second District. Due to the location of the subject school site, response time is relatively prompt. In addition, the school will augment the City's police force with campus security guards as applicable.

As with any higher intensity land use, there will be an occasional and unavoidable demand for police protection services. The Department of Accounting and General Services will coordinate closely with the Police department to anticipate project implementation and phasing to permit adequate planning and advance notice of project completion.

Design of the facility will ensure that the proposed campus plan and design features implement appropriate lighting and other security measures. These include security gates and barriers, and other security devices and management practices.

5.11.8 Fire

There are two fire stations that will provide fire protection services to the proposed Mililani Intermediate School. The closest fire station is planned for a site adjacent to the Mililani Mauka Elementary School on Makaikai Street, which will have primary responsibility for fire protection in the area. A second fire station, Mililani Engine Company 36, is located near the intersection of Kuahelani Avenue and Kamehameha Highway in Mililani located approximately 1.5 miles from the proposed school site. As such, response times in case of emergency are relatively prompt and the combined capacity of the two fire stations will provide adequate fire protection capability. Access for emergency vehicles shall conform to applicable fire and building codes.

6.0 IDENTIFICATION AND SUMMARY OF IMPACTS AND ALTERNATIVES CONSIDERED

In compliance with the provisions of Title 11. Department of Health, Chapter 200, Environmental Impact Statement Rules, Section 11-200-10, the considered alternatives to the proposed Middle School are limited to those that would allow the educational objectives of the project to be met, while minimizing potential adverse environmental impacts. The alternatives must also realistically address the project's economic limitations while also responding to the surrounding residential land uses that could be impacted by the project.

6.1 The Preferred Alternative

Although the final layout and configuration of the proposed site plan may be refined through the engineering design process and preparation of construction drawings, the proposed plan is considered to be the "best" from program requirement, land use planning, and fiscal impact perspectives. Its phased development will ensure that the long range use of the property contributes socially to the community's educational needs as the population of Mililani Mauka grows in the future.

The preferred alternative has been judged superior due to the efficient use of the property proximate to existing and future residential and recreational development planned for Mililani Mauka. Those environmental impacts that do occur can be mitigated by the installation of appropriate infrastructure improvements and implementation of best management practices during project construction. Use of physical buffers (i.e. landscaping, roadways, topography, etc.), have been incorporated into the site plan to integrate the project into the surrounding community's land uses.

In addition, by separating the major components of the school into buildings specifically designed to accommodate specific functions, the project development can be easily phased as funding and community need warrants.

6.2 "No-Action Alternative"

The "no-action" alternative would not be consistent with stated governmental policies of establishing new educational opportunities for the growing community that reflect the latest research into innovative educational techniques. In addition, the site would remain under-utilized while existing schools in the area would become over-crowded, negatively impacting their ability to provide quality education.

Sale of the property "as is" to private interests would require its eventual development due to the economic value of a large land parcel (with high development potential) located within an existing urban area. The site's close proximity to existing and planned residential land uses limits its suitability for agricultural, commercial, or industrial land uses, and would not be consistent with the master plan for Mililani Mauka. Residential development of the site is feasible, however, the need to provide educational opportunities for the residents of Mililani Mauka would be further exacerbated.

6.3 Increase the Capacity of Existing Schools

Without development of the proposed middle school, existing schools would require substantial expansion of facilities including land, buildings, and recreational facilities. However, a significant expansion of this kind would likely be disruptive to existing educational programs, costly, and inferior to the preferred alternative from a location perspective. In either case, land for expansion or a new site is necessary to accommodate the growth in projected enrollment.

In addition, renovation of existing schools would not provide the opportunity to master plan a new campus which incorporates the latest technology and separation of structures that may be utilized for uses incompatible with classrooms (i.e. classrooms and administration mixed with music, cafeteria, and physical education areas). Therefore, this alternative was rejected since there is no clear benefit relative to the preferred alternative.

6.4 Summary of Impacts

The potential impacts associated with the proposed middle school are not unique, but are typical of most development projects encompassing a 15-acre site. Similarly, higher intensity land uses would likely result in greater impacts, thereby requiring additional or more extensive mitigative measures.

With any development, air and noise impacts will occur, and additional demands on existing electrical/communication, water, and wastewater infrastructure systems will result. However, these impacts will also occur as the population of Oahu increases and as new educational facilities are developed at other locations. Therefore, the need to educate Oahu's citizens will exist with or without the project.

Project development will also require the use of public funds, expansion of the State's educational system, and police and fire protection services. These increased costs, however, will be paid to the state and city governments. Increased property tax revenues associated with improved residential development will be paid to the City and increased income/excise taxes paid to the State as the population of Mililani continues to grow in the future. Consequently, the project is an essential public service that will support future residential development and be funded over time by tax revenues.

It should be noted that the major environmental impacts related to the project's design and site plan, can be mitigated by the implementation of best management practices during construction to control soil erosion. Other impacts that could result after construction, such as noise and traffic, may be generated if outdoor events at the amphitheater or large outdoor gatherings occur. However, these impacts will be mitigated through adherence to State noise control regulations and through the design of buildings which incorporate sound attenuation measures. Traffic impacts will be mitigated through further coordination the Department of Transportation Services to ensure that ingress and egress to the property are appropriately designed.

Consequently, no significant environmental effects will result from the development of the subject property provided appropriate mitigation measures are employed throughout the construction period and during project operation.

7.0 PROPOSED MITIGATION MEASURES

As indicated above, few potential adverse impacts to the area are expected to result from implementation of the proposed site plan. Short-term impacts will result in the initial construction phase which will require on-site grading, trenching, and movement of vehicles within the project site. These activities will generate localized noise and dust during construction periods. Mitigation measures to minimize adverse air quality will include frequent watering of unpaved roads and construction areas, dust screens, and mulching and planting of ground cover and other vegetation as soon as possible after construction. Construction activities will be limited to daytime hours and comply with all applicable noise control regulations of the City and Department of Health.

Long-term impacts from the development will produce increased pedestrian traffic from teachers, administrative staff, and students. Potential noise from students talking, recreational activities, and the outdoor amphitheater will occur, however, these are expected to create only minimal impacts that may affect only the adjacent properties, (i.e. community park, Kipapa Gulch, and residents of the multi-family area mauka of the property) during periods when the school is in operation.

Visually, the property will also be altered from the vacant and unused condition, to become a significant architectural element in the urban landscape. In addition to the architectural structures, the project's landscape architecture will integrate the project into the surrounding residential setting.

The proposed project is not expected to have any impact on the micro climate of the project area or region. Planned structures would not be tall enough to significantly effect existing wind patterns; and new landscaping will not significantly effect temperature, although some localized cooling can be expected to result from the establishment of landscaping. No specific or predominate natural feature will be visually impacted by the development of the project site.

Recommended mitigation measures include the following:

Short term:

- _ Frequent watering during construction to maintain dust control.
- _ Grassing of swales and sodding as soon as practicable once grading has been completed.
- Wind screening as appropriate to limit fugitive dust.
- Restrict use of construction equipment to daylight hours to reduce noise impacts.
- Establishment of on-site drainage retention basins during construction to mitigate soil erosion and off-site runoff.

Long term:

- Establishment of appropriate landscaping to aesthetically integrate the site plan into the surrounding neighborhood.
- Where appropriate, create landscape buffers to reduce noise and glare adjacent to residential areas, especially along parking areas.
- Use of appropriate engineering, design and construction measures to ensure adequate drainage and irrigation of the site.
- Construct transportation roadway, parking and loading zone improvements in accordance with Department of Transportation Services to mitigate traffic generated by the proposed school.
- Incorporate an extensive system of walkways and bikeways to encourage pedestrian and bicycle use.
- Coordinate use of adjoining recreational facilities to minimize potential conflicts with other park users.

Incorporate topography into building design to take advantage of grade separation and integrate buildings into existing landforms.

8.0 SIGNIFICANCE CRITERIA

According to the Department of Health Rules (11-200-12), an applicant or agency must determine whether an action may have a significant impact on the environment, including all phases of the project, its expected consequences both primary and secondary, its cumulative impact with other projects, and its short-term and long-term effects. In making the determination, the Rules establish "Significance Criteria" to be used as a basis for identifying whether significant environmental impact will occur. According to the Rules, an action shall be determined to have a significant impacts on the environment if it meets any one of the following criteria:

Involves a loss or destruction of any natural or cultural resources;

<u>Comment</u>: The proposed project will not significantly impact scenic views of the ocean or any ridgelines from heavily traveled roadways in the area. Although the Koolau Mountains will form a backdrop from Lehiwa Drive, the project's architecture will reflect the surrounding land forms and other existing architecture in Mililani Mauka. The visual character of the area will change from the vacant condition to landscaped urban uses compatible with surrounding residential land uses. Presently, the subject property is not landscaped or otherwise improved.

Development of the project drainage system will follow design standards of the City to ensure controlled conveyance and discharge of storm runoff, and control of soil erosion to enhance the protection of water quality.

The property is not subject to coastal-related flooding. In addition, the subject property is located outside of the City's Special Management Area (SMA). As such, no significant coastal resources or views are impacted by development of the property.

As previously noted, no significant flora, fauna, or archaeological or historical sites are known to exist on the subject property, and none will be impacted by the proposed project. Should any archaeologically significant artifacts, bones, or other indicators of previous on-site activity be uncovered during the construction phases of development, their treatment will be conducted in strict compliance with the requirements of the Department of Land and Natural Resources.

Curtails the range of beneficial uses of the environment;

<u>Comment:</u> Although the subject property was previously used for agricultural production, the planned urbanization of Mililani Mauka (with construction of the proposed school), will

curtail the use of the property for agricultural purposes. However, the true "natural environment" associated with the property has already been curtailed by many years of agricultural activity. Consequently, returning the site to a natural environmental condition is not practical from a planning, environmental, or economic perspective.

Conflicts with the State's long-term goals or guidelines as expressed in Chapter 344, HRS;

<u>Comment:</u> Development of the proposed Mililani Intermediate School is consistent with the Environmental Policies established in Chapter 344, HRS. These guidelines promote developments that do not negatively impact the environment, nor conflict with the State's environmental goals. As the Mililani Mauka project has received approvals from the State Land Use Commission and other state agencies, the project's consistency with Chapter 344, HRS has previously been confirmed by the State.

Substantially affects the economic or social welfare of the community or state;

Comment: The proposed project will significantly contribute to the social welfare of Oahu's future population by providing school age children with the opportunity to attend school in a high quality educational environment proximate to their residences and prevent existing schools from over population. Surrounding land use patterns will not be negatively or significantly altered, nor will unplanned population growth or its distribution be stimulated. Development of the project will implement a primary component of the master plan approved for Mililani Mauka.

Consequently, development of the project will provide residents with a high quality living environment, centered around a neighborhood school. This harmonious relationship between home and the educational facilities proposed will significantly improve the quality of life for many residents, demonstrating a positive economic and social impact affecting the community.

Substantially affects public health

Comment: Although the public (nearby residences) may potentially be impacted by air, noise, and water quality impacts, those affects on public health that do occur will be insignificant or not detectable, especially when weighed against the positive economic, social, and quality of life aspects associated with new educational facilities which create a positive impact for the community.

Involves substantial secondary effects, such as population changes or effects on public facilities;

Comment: Existing and planned large-scale housing development projects within Mililani Mauka will establish a population requiring creation of new public and private facilities and services. As the overall population of Mililani Mauka grows in the future, the educational facility improvements proposed will become a primary component of a viable community. However, the proposed project will not in itself generate new population growth, but responds to the need for educational facilities and creation of new employment opportunities, both during and after construction. These jobs will provide temporary construction employment and permanent operational employment for instructors, management, and maintenance personnel.

Because the proposed school represents the implementation of the master plan for Mililani Mauka, the required infrastructure is in place, available, or scheduled for construction. As such, no significant infrastructure required for the project has not already been designed and planned during the review and approval process for Mililani Mauka.

Involves a substantial degradation of environmental quality;

1.4

1300

Comment: The proposed Middle School will replace the existing vacant condition of the property with the "urban" structures and landscaping associated with the school campus. This will mitigate the visual impact of the development as viewed from outside the site while the overall design will complement background vistas and surrounding land uses. There will be no substantial degradation of environmental quality, but the existing environmental setting will change from the present condition. With development of the new educational facilities, greater access to the property will be established allowing for new visual opportunities which previously did not exist when the property was used for agricultural production.

Is individually limited but cumulatively has considerable effect on the environment, or involves a commitment to larger actions;

<u>Comment</u>: By planning now to meet the future needs of the community, the Mililani Intermediate School is consistent with the existing and planned urban character of the neighborhood. None of the proposed uses will obstruct existing views or be visually incompatible with the surrounding character of existing and planned development. The larger action associated with development of Mililani Mauka has been previously approved by City and State regulatory agencies.

Substantially affects a rare, threatened or endangered species or its habitat;

<u>Comment:</u> There are no known rare, threatened or endangered species or habitats associated with the subject property, or the implementation of the Mililani Mauka master plan. The diversity of the existing habitat will be enhanced with urban landscaping as compared to the low habitat diversity associated with pineapple production.

Detrimentally affects air or water quality or ambient noise levels;

<u>Comment</u> - The quality of surface runoff will be maintained by the establishment of on-site retention basins during the construction phases of development to permit the retention of silt that could be suspended in surface runoff. After development, retention areas will serve the same function to control runoff and facilitate recharge of groundwater. Protection of groundwater resources will be enhanced by a centralized sewage collection, treatment, and disposal system.

Similarly, air quality will be controlled during construction by frequent watering, establishment of ground cover, and wind screens as applicable. After construction, soils will not be exposed, as compared to agricultural land use, thereby reducing the potential soil erosion from wind.

Ambient noise levels will increase relative to the present vacant condition due to the sounds of people talking, vehicles, and sounds associated with outdoor recreational activities. However, this change in noise level is not harmful or unusual since it is typical of most residential and educational land use development.

Affects or is likely to suffer damage by being located in an environmentally sensitive area, such as a flood plain, tsunami zone, beach, erosion prone area, geologically hazardous land, estuary, freshwater area, or coastal waters.

Comment: Development of the subject school site, which is located in the middle of the island, will not affect nor suffer damage by location near or on an environmentally sensitive area, such as a flood plain, tsunami zone, beach, erosion prone area, geologically hazardous land, estuary, freshwater area, or coastal waters. Development of the property is compatible with the above criteria by implementing a critical element of a master planned community's social support system on a site suitable for the land uses proposed. The physical character of the subject property has been previously disturbed by agricultural activities associated with pineapple production and urban land uses associated with the development of Mililani Mauka. As such, the property no longer reflects a "natural environment". Shoreline, valleys, or ridges will not be impacted by the project.

Substantially affects scenic vistas and viewplanes identified in County or State plans or studies.

<u>Comment:</u> The proposed facilities will not substantially affect State or County recognized viewplanes or vistas. Existing views from the area are of built features, the distant Koolau and Waianae Mountain Ranges, and Kipapa Gulch. No specific or predominate natural features are visually associated with the subject property.

The proposed project will not significantly impact scenic views of the ocean or any ridgelines from heavily traveled roadways in the area. Although the Koolau Mountains will form a backdrop from Lehiwa Drive, the project's architecture will reflect the surrounding land forms and other existing architecture in Mililani Mauka. The visual character of the area will change from the vacant condition to landscaped urban uses compatible with surrounding residential land uses. Presently, the subject property is not landscaped or otherwise improved. Under the proposed development, existing vegetation and proposed landscaping will be utilized to enhance the area and establish a visual and safety buffer along the edge of Kipapa Gulch.

Building architecture and heights have been designed to complement the surrounding land uses and other existing buildings located within Mililani Mauka. All applicable design guidelines and design criteria established by the Mililani community and Department of Education respectively have been addressed during the design process and will be reflected in the building architecture as applicable.

Requires substantial energy consumption.

Comment: The proposed Mililani Middle School facilities follow the Hawaii State Model Energy Code in all aspects of design. The campus design incorporates a central plant that is more energy efficient in cooling building interiors than utilizing individual units for each building. In addition, the use of natural lighting, ventilation, and planned open space areas were considered in the architectural designs.

9.0 DETERMINATION

The location of the subject property reflects a logical opportunity for development of a school in an area master planned for intensive residential development. In addition, infrastructure improvements have been provided in a manner reflecting existing and planned land use patterns consistent with the Mililani Mauka master plan. Therefore, the size, scale, and location of the project adjacent to existing residential land uses will not significantly impact the surrounding community, but support a critical element of the Mililani Mauka master plan. Consequently, the applicant has determined that no significant environmental affects will result from development of the proposed project and that preparation of an Environmental Impact Statement (EIS) will not be required.

Prepared for:

HELBER, HASTERT, YAN HORN & KINDEL

August 1985

Terestrial fidea & faura survey Proposed Miliani-Mauka Project, island of o'abd

INTRODUCTION.

The study area consists of approximately 1,200 sores of land, presently coned Agriculture, located mauka of Milliani Town, 'Exa District, island of O'ahu. The majority of the land is in pineapple cultivation; sore or less undisturbed vegetation can be found in the two smaller guiches which run almost the length of the study area and on the peripheries of the study area.

Much of the existing vegetation on the study area would be removed or destroyed for the proposed housing development, however, these developed areas would be primarily on those lands already in cultivation. The vegetation in the two smaller guich areas will be preserved and incorporated into a park, Jogging paths are included in the park plans. The vegetation on the peripheries is either on steep alopes or in forest reserve and will not be affected by construction activities.

A survey to assess the florm and fauna of the study area was conducted on 10 August 1985. A walk-through survey method was used. Access into the study area was by unpaved, dirt roads which run throughout the pineapple fields. Notes on the major vegetation types as well as species identification were made in the field. Species which could not be positively identified in the field were collected for later detarmination in the laboratory and herbarium. Notes were also made on the vertebrate fauna encountered during the survey.

TABLE 1

Bird Species Occurring in the Milliani-Mauka Study Area

Paully	Species (Beientific name/Common name)	Status
Columbidae	Btreptopelia chinensia chinensia Bpotted dove, laca-necked dove	
	Geopolia striata striata Barred dove	٨.
Pycnopotidae	Pychonotus cafer Red-vented bulbul	
Sturnidae	Acridotheres tristis tristis Common mynah	
Zosteropidae	Zosterops Japonica Japonica Japanese vhite-eye	. .
Fingillidae	Cardinalis cardinalis Cardinal	. 14
	Carpodacus mexicanus frontalis House finch, papaya bird	
Phasianidas	Phasianus colchique Mug-pecked phaseant	

Y = Foreign. Introduced into Havail by man.

rarely foraging in these areas --- the fields have few weeky species to provide an adequate seed source.

The barred (Geopelia striata) and spotted (Streptopelia chinensia) doves were the most frequently encountered birds. The red-vented bulbil (Prenonotus cafer) was commonly observed feading on ripe guava fruits in the gulch areas.

Mammals = 'The only endemic Mavailan land mammal is the Havailan hoary
but (<u>Lasiurus einereus semotus</u>). It is not known to occur in this type
of habitat (touich 1969),

Baveral introduced species of manuals are probably present in the study area, although they were not observed during this survey. These species include small manuals such as the roof rat (<u>Rattus rattus</u>), Polynesian rat (<u>Rattus emilans</u>), house mouse (<u>Hus musculus</u>), and small Indian mongoose (<u>Herpestes auropunctatus</u>). A number of ripe guava fruit appeared to have been gnaved. A few feral cats (<u>Yelis catis</u>) may also be present in the study area.

Burnany

No endangered bird or marmal species were observed in the study eres. It is highly unlikely that they would occur here as the habitat has been greatly disturbed and modified.

All of the species found in the study area are introduced and some are serious posts to mand and his cultivated crops.

MILILANI INTERMEDIATE SCHOOL

APPENDIX B

ARCHAEOLOGICAL STUDY

Chiniago Inc.

Archeological Consulting

1040-B SMITH STREET • HONOLULU, HAWAII 96817 • TELEPHONE: (808) 521-2785

July 15, 1985

Hr. Mark Hastert Helber, Hastert, Van Horn and Kimure 2222 Kalaksua Avenue Sulte 1507 Honolulu, Hawmil 96815

Dear Hr. Hastert:

We have completed our literature search and archaeological reconnaissance survey of the area to be developed as the final phase of Hillani Town. Our fieldwork consisted of a brief pesettlan inspection of the area now planted in pineapple and somewhat more intensive pedestrian inspections of the two shallow quiches located on the property. No evidence of archaeological or historical remians was located during this fieldwork.

The literature search included inspection of Handy's The [1933], Sterling and Summers' Sites of Oahu [1976], old maps of file at the State of Hawail Survey Office, site maps on file at the State of Hawail Survey Office, site maps on file at the State Historic Preservation Office, and reports and publications in the Hawailan collection of the University of Hawaila, The literature search revealed a legend referring to Walkkalaua and Kipapa Gulches, quoted in McAllister's 1933 study Archaeology of Dahu:

"Site 132, Walkekeleus and Kipapa gulches. According to Formander Walkekeleum is the place where the invading chiefs from Hawail ast Mailikukehi, moi of Oshu, in battie:

The fight continued from there to Kipepe Guich. The invaders were thoroughly defeated, and the guich is said to have been literally paved with the corpses of the slain, and received lits name 'Kipapa' from this circuastance. Punhalus was slain on the field which bears his name, the fugitives were pursued as far as Walmano, and the head of Hilo was cut off and carried in triumph to Honoullul, and stuck up at a place still called Poo-Hilo."

Also, McAllister recorded two sites in Kipape Gulch;

"Site 130. Womula haisu, on the Honolulu side of Kipapa Gulch just showe Heisu o Umi, to which it is said to be a companion structure. The site is now covered with cane.

"Site 131. Heimu o Umi, was just northeast of the government road in the bottom of Kipapa Guich on the slight elevation at the foot of the pall on the Honolulu side. The level alevation can still be seen, though planted in

Handy's 1940 The Hawaiian Planter gives the following on

"It is said that terraces formerly existed on the flats in Kipapa Guich for at least 2 miles upstream above its junction with Walkele, Wild tares grow in abundance in upper Kipapa Guich."

In conclusion, if any structural reasins of an archaeological or historical nature ever existed on the subject property, pineapple cultivation has long since erased any such evidence. There thus is no archaeological reason why the development of Hilliani Town cannot proceed as planned.

If you have any questions, piemse do not hesitate to con-

Sincerely yours,

MILILANI INTERMEDIATE SCHOOL

Mr. Robert W. Lau EDP Hawaii Inc. 1164 Bishop Street, Suite 1515 Honolulu, Hawaii 96813

Dear Mr. Lau:

Subject: Mililani Mauka Sewer Master Plan, dated November 1995

We have reviewed and approve the subject sewer master plan. This statement shall not be construed as confirmation of sewage capacity reservation. Sewage capacity reservation is contingent on submittal and approval of a "Sewer Connection Application" form. Approval of this form is granted to projects with flows within capacity and permit limitations in all affected infrastructure. These infrastructure include, but are not limited to, the sewer lines, the Waipahu Wastewater Pump Station (WWPS), the Honouliuli Wastewater Treatment Plant (WWTP), and the Barbers Point Outfall. Additionally, Pearl City WWPS will be affected if the hydraulic pressure from Waipahu WWPS increases significantly. The Waipahu WWPS and the Pearl City WWPS both feed into the same West Loch Dual Force Mains.

Currently, we cannot accommodate all of Mililani Mauka due to limitations at the Honouliuli WWTP, the Waipahu WWPS, the Mililani Effluent Sewer Line, and the Mililani Offsite Sewer Line. The Honouliuli WWTP 1A-Secondary Treatment (13 mgd) project, the Waipahu WWPS Mod. Phase 2 project, and the Mililani Diversion Line Relief project are being funded by the Department's Capital Improvement Program to overcome some of these limitations. These projects are tentatively scheduled to be completed in December 1996, October 1996, and May 2001, respectively.

If you have any questions, please contact Ms. Tessa Yuen of the Division of Planning and Service Control at 523-4956.

Very truly yours,

FELIX B. LIMTIACO Director

SEWER MASTER PLAN

FOR

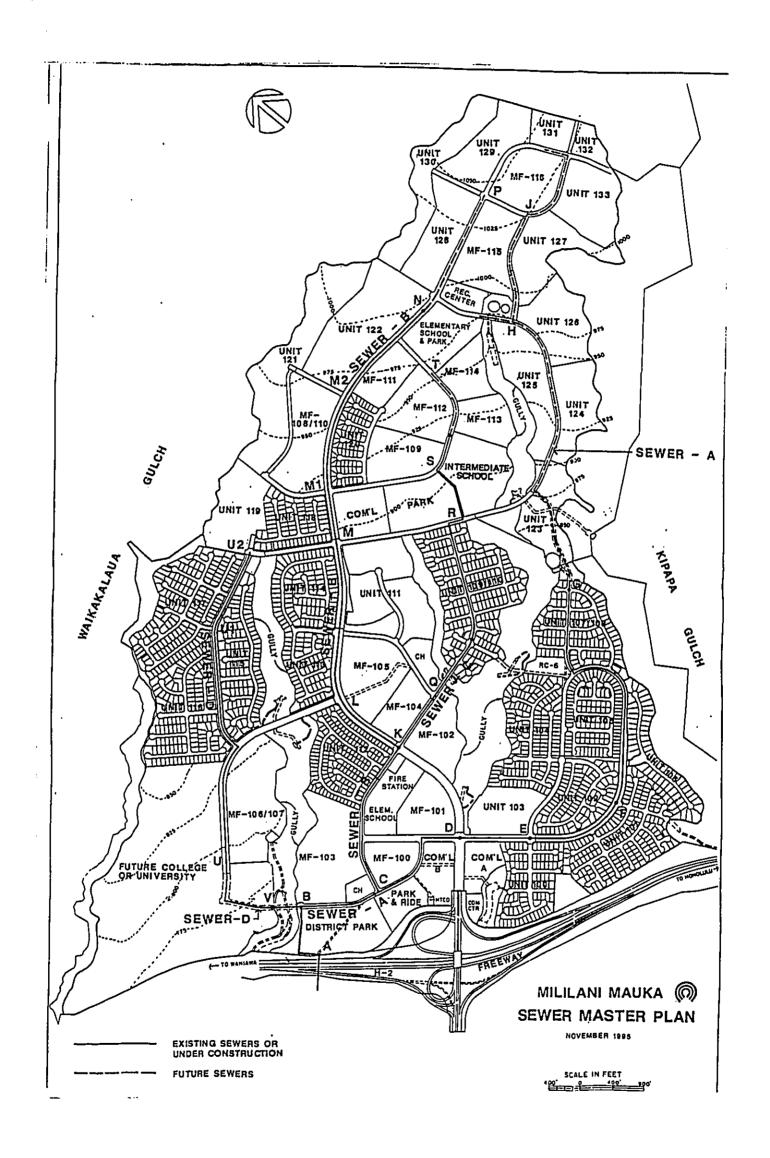

MILILANI MAUKA

The following is an updated Sewer Master Plan for the Mililani Mauka Development which supersedes the previously approved Sewer Master Plan prepared by EDP Hawaii Inc. and dated October, 1992.

The master plan has been revised to show the existing developments and trunk sewers that have been completed, or are under construction. The sewer flow calculations for these existing developments have also been updated.

Future trunk sewers to service proposed future developments are also shown on the master plan with estimated wastewater flows for the ultimate development updated herein.

The sewer from Mililani Mauka connects into an existing trunk sewer makai of the H-2 Freeway. Based on the "Mililani Trunk Sewer Adequacy Study" prepared by M&E Pacific, Inc. (dated January 1986), this makai trunk sewer has adequate capacity to accommodate the wastewater flows estimated for the ultimate Mililani Mauka Development.

INTRODUCTION

Mililani Town is located in Central Oahu on the Schofield Plateau between Kipapa Gulch and Waipio Valley. Mililani Town, as ultimately planned, is divided into the three water service zones shown on Figure 1: zone 1 (elevation 765 to 1,050 feet), zone 2 (elevation 585 to 765 feet), and zone 3 (below elevation 585 feet).

Development of Mililani Town to date has been completed in areas makai of the H-2 freeway, within water zones 2 and 3.

Future development is planned for the 1,200 acres of zone 1 (zone 1a 477 acre, zone 1b 723 acre), also referred to as Mililani Mauka in this report. The proposed development north of the H-2 freeway will ultimately consist of single family units, apartment and retirement units, schools, churches, commercial areas, parks and a University of Hawaii West Oahu campus with provisions for related facilities.

Additional water supply facilities will be required to service the proposed developments in Mililani Town. It is the intent of this water master plan to address the following items:

Water Zones 2 and 3:

Identify the water sources installed for water zones 2 and 3.

Water Needs for Water Zone 1:

- a. Estimate the water requirements for zone 1.
- Identify potential water supply sources and storage requirements for zone 1.
- c. Establish an overall transmission system for zone 1.

WATER MASTER PLAN FOR WATER ZONES 2 AND 3

A water master plan for water zones 2 and 3 has been previously approved by the Board of Water Supply (BWS) in 1977. The water sources and storage facilities for zones 2 and 3 are --

- 1. Sources. A total of eight wells, each with a capacity of 2 MGD.
 - a. Existing sources 8 wells
 - 1) Four wells (nos. 1 to 4 Mililani Wells No. I) have been installed at the existing deepwell facility located just mauka of the H-2 freeway (see Figure 1). One unit functions as a standby.
 - 2) Two wells (nos. 5 and 6 Mililani Wells No. II) have been installed at the existing 2.0 MG 865-foot reservoir site.
 - 3) Two wells (nos. 7 and 8 Mililani Wells No. III) have been installed at the existing 1.0 MG 685-foot reservoir site.
- Existing Storage Facilities
 - a. Zone 2. 2.0 MG reservoir at spillway elevation 865 feet.
 - b. Zone 3. 1.0 MG reservoir at spillway 685 feet.

The existing water supply system for zones 2 and 3 includes a deepwell pumping facility, a well site at the 865-foot reservoir, a well site at the existing 685-foot reservoir and two reservoirs with 2.0 and 1.0 MG capacities, which serve zone 2 and zone 3, respectively. The system also includes a transmission and distribution pipe network.

Eight proposed wells in the master plan are operating as supply sources in the existing makai water system. The development of the remaining deepwell (Well No. 8) has just been completed.

The average daily consumption of Mililani Town are as follows 3.33 MGD (Zone 2) and 0.90 MGD (Zone 3). Table 1 shows the evaluation of water demands and well capacities.

The development of well no. 8 is designed to improve the overall water system in Mililani Town. The supply from well no. 8 will serve most of zone 3, with an average daily demand of 0.90 MGD (see Table 2). The, the overall performance and reliability of the makai water system will improve with the development of well no. 8 as it will be used as a standby unit for well no. 7.

WATER MASTER PLAN FOR WATER ZONE 1

Introduction

The water master plan for zone 1 is discussed in three sections: 1) design criteria; 2) projected water requirements and; 3) plan for new sources of supply, storage reservoirs and transmission system. Plan for on-site distribution pipelines for Mililani Mauka will be submitted separately at the appropriate time.

Design Criteria

Water zone 1 is divided into the two service subzones shown on Figure 1. Zone 1a consists of the service area above elevation 894 feet. Zone 1b consists of the remaining lower service areas of zone 1. The future water requirements and the planned water supply system for each subzone are based on the Water System Standards, City and County of Honolulu, Board of Water Supply (BWS). The applied design criteria for consumption rate, fire flow, pipeline size, reservoir storage, and demand factors are listed in Table 3.

Water Requirements

BWS consumption rates were used to Predict the water demands for zone 1 presented in Tables 1, 2 and 4 and Exhibit A. Table 1 lists the expected water demands and well capacities, and Table 2 shows the projected water requirements for Mililani Town. The distribution of average daily demand listed in Table 4 for the individual parcels shown in Exhibit A was used in the hydraulic analysis of zone 1 water supply system. Appendix A presents the hydraulic calculations of the proposed Mililani Mauka water supply system.

Source and Storage Facilities Requirements for Water Zone 1

A proposed plan to meet the future water requirements for zone 1 is presented in this section. The proposed water supply source, storage facilities, and transmission system are designed based on the Water System Standards, BWS, for dedication to that agency.

A new deepwell pumping facility to supply zone 1 is located 0.43 miles from the 1,150-foot reservoir site (see Figure 1). The deepwell pumping station (Mililani Wells No. IV) will consist of three deepwells plus one standby unit (nos. 9 to 12). The wells will be spaced approximately 100 feet apart, and a 1,750 gpm line shaft turbine pump will be installed at each well. The water quality test results show no need for water treatment at this time. The following items shall be installed in or adjacent to the control building.

- 1. Well water level indicator recorder and accessories
- 2. Flow indicator-record-totalizer
- 3. Electrical power and control devices
- 4. Chlorination equipment

- 5. Toilet facilities
- 6. Flow tubes and appurtenances
- 7. Discharge piping

The first of two reservoirs totaling 3.0 MG (1.5 MG each) has been constructed within the 1,150-foot reservoir site. Both reservoirs will serve zone 1a. The second reservoir will be phased into the water system when water needs for zone 1a show the need for additional storage volume. Two reservoirs at spillway elevation 1,150 feet are planned to minimize the construction costs in the mountainous terrain above Mililani Mauka.

Zone 1b is served by two reservoirs (2.0 MG and 1.5 MG) at spillway elevation 994 feet with a total capacity of 3.5 MG. Initially, water will be supplied to these reservoirs from the booster pump station located near the existing 865-foot reservoir. Any supply over demand for zones 2 and 3 would be pumped from the existing 865-foot reservoir to the 994-foot reservoirs serving zone 1b. As Mililani Mauka is developed, well no. 6 will be used as a source of water for zone 1b rather than as a standby unit for zones 2 and 3. The water from well no. 6 as well as the supply over demand for zones 2 and 3 would be pumped from the existing 865-foot reservoir to the 994-foot reservoirs. Eventually, water would also be supplied to the 994-foot reservoirs from well nos. 9 thru 12 at Mililani Well No. IV Station.

SUMMARY

The major facilities presented in this water master plan are as follows:

1. Source Development for Water Zones 2 and 3

Service Area

Water Zone 3

TABLE 3

WATER CONSUMPTION GUIDELINES AND SIZING FACTORS

A. CONSUMPTION RATE - per day

Land Use	
Single Family - Residential	Average Daily Demand
	500 gal/unit
Multi-Family - Residential	400 gal/unit
Retirement - Residential	400 gal/unit
Transit Facility, Schools, Parks, Churches, Pacreation Centers, Community Association Planting (CAP)	4,000 gal/acre
Commercial	
DEMAND FACTOR	3,000 gal/acre

B. DEMAND FACTOR

Maximum Daily Demand = 1.5 x Average Daily Demand

Peak Hour Demand = 3.0 x Average Daily Demand

C. FIRE FLOW

Land Use	Fire Flow	Duration
Single Family - Residential	1,000 gpm	1 hour
Multi-Family - Residential	1,500 gpm	1 hour
Schools Small Commercial Centers	2,000 gpm	2 hours

D. PIPELINE SIZE

- Pipeline shall be sized for peak hour flow with a minimum residual pressure of 40 psi and maximum velocity in the main of 6 feet per second.
- Pipeline shall be sized for maximum day flow plus fire flow with a residual of 20 psi at the critical fire hydrant.

E. RESERVOIR STORAGE

- Reservoir volume shall satisfy maximum daily demand, without inflow.
- Reservoir volume shall satisfy maximum daily demand plus fire flow for duration of fire, with inflow.

LAND DEDICATION CORRESPONDENCE

Castle & Cooke Homes Hawaii, Inc.

P.O. Rox 2780, Honolulu, Hawall 45803

January 11, 1995

Mr. Alfred K. Suga Assistant Superintendent Department of Education State of Hawaii P. O. Box 2360 Honolulu, Hawaii 96804

Dear Mr. Suga:

SUBJECT: Mililani Mauka Intermediate School Site

Enclosed as requested are three (3) prints of a metes and bounds map of the proposed Mililani Mauka Intermediate School site for your use in master planning and engineering. Castle & Cooke Homes Hawaii, Inc. is willing to dedicate this parcel of land provided that it be used for the proposed intermediate school.

Please note that the topographic information on the map was obtained prior to construction in the immediate area and may have been altered.

Should you need any information that would facilitate your master planning effort and coordination with our development please contact Alan Arakawa at 548-4869.

Very truly yours,

CASTLE & COOKE HOMES HAWAII, INC.

Wallace S. Miyahira

President

PLANNING BRANCH

TO: Mr. Laster Lat (528-4696) City A County of Monolulu Pent of Parks & Recreation PAX NO. 588-4767 FROM: Mr. Ralmh Morita A.A.

DATE: DATE: January 22, 1998 SUBJECT: Proposed Miliani Intermediate School: Joint-Use Adressent for Parking Lot and Open Playfields

588-0486

DAGS JOB NO. 12-15-0915 (page 1 of 3)

ITEMS TRANSMITTED AS CHRORED BELOW:

TOTAL NO. OF PAGES INCL. THIS PAGE:

As requested. IXI For your information. IXX For approval,

Originals ____ will xxx will not be sailed.

Pursuant to the proposed Mililani Intermediate School project, DAGS has the following understandings related to the County park site adjacent to the proposed intermediate school site:

- Castle & Cooke (subdivision developer) has not yet dedicated the lands to the County for the park site.
- The Dept of Parks & Recreation (DPR) expects to develop the park site but can not request for any appropriations until the land has been turned over to the County,
- Currently, there is no agreement between the State and the County regarding joint-use of the park site adjacent to the proposed intermediate school site.

If you do not receive legible copies of transmitted pages, please call:

Ph. No. (808) 586-0500 Fax No. (808) 586-0482

Proposed Mililani Intermediate School Joint-Use Agreement for Parking Lot and Open Playfields
DAGS Job No. 12-18-0916
(page 2 of 8)

Therefore, DAGS provides the following ogmments for DPR review

- Castle and Cooko (subdivision developer) is currently requesting that vehicular access to the proposed intermediate school site be limited primarily to the upper Phase 7 subdivision roadway (refer to attachment subdivision master plan map) because of the subdivision master plan map) because of the satioipated heavy subdivision traffic on the lower phase 5 subdivision roadway. However, the school frontage off the upper subdivision roadway is only about 500' and DAGS anticipates up to 1000' of frontage will be needed to adequately separate the bus traffic, student drop-off traffic, and school staff traffic. Therefore, DAGS requests DPS consideration of a joint-use afreement for a parking lot along the upper subdivision roadway (refer to attachment concentual plan); it is estimated about 500' and 50' with parking lot (assumes two langs of traffic flow yith parking stalls) or about 25,000 sf (about 0.5 acres) is needed from the 12 acre County park site.
- DAGS/DOE are currently undergoing a "charette" process to develop the program, master plan layout, and design guidelines for the subject intermediate school that is scheduled for a September 1998 opening (panding the availability of CIP construction funding in FY1997). Therefore, DAGS also requests DPR consideration of a inner to attachment concentual plan): about 400° by 1997 or 185,000 sf (about 4 acres) is needed from the last acres County mark site.

If you do not receive legible copies of transmitted pages, please call:

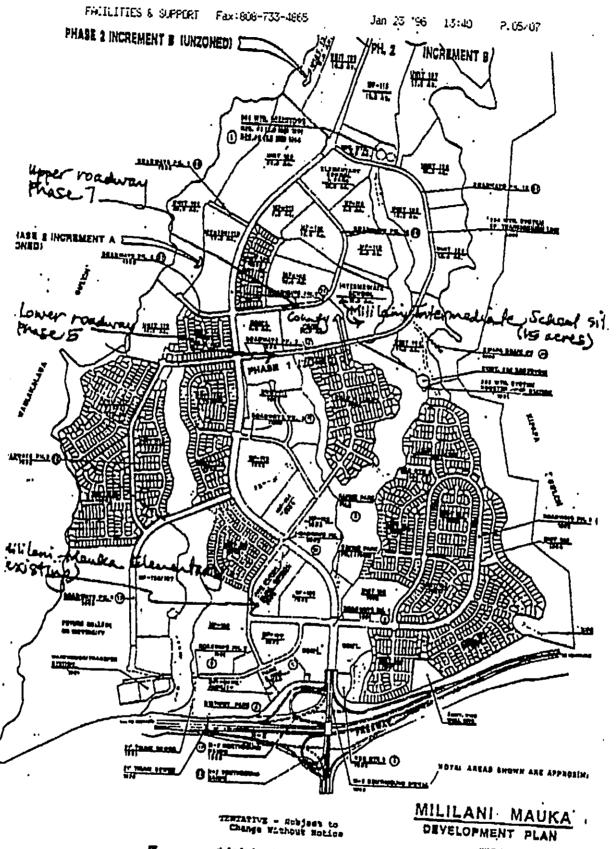

Ph. No. (808) 586-0500 Fax No. (808) 586-0482 Proposed Mililani Intermediate School Joint-Use Agreement for Parking Lot and Open Playfields DAGS Job No. 12-16-0916 (Page 3 of 3)

Please call me as soon as possible on the above mentioned items related to the proposed joint-use agreement because preliminary determinations can impact the "charactes" process that could significantly delay the subsduled school opening.

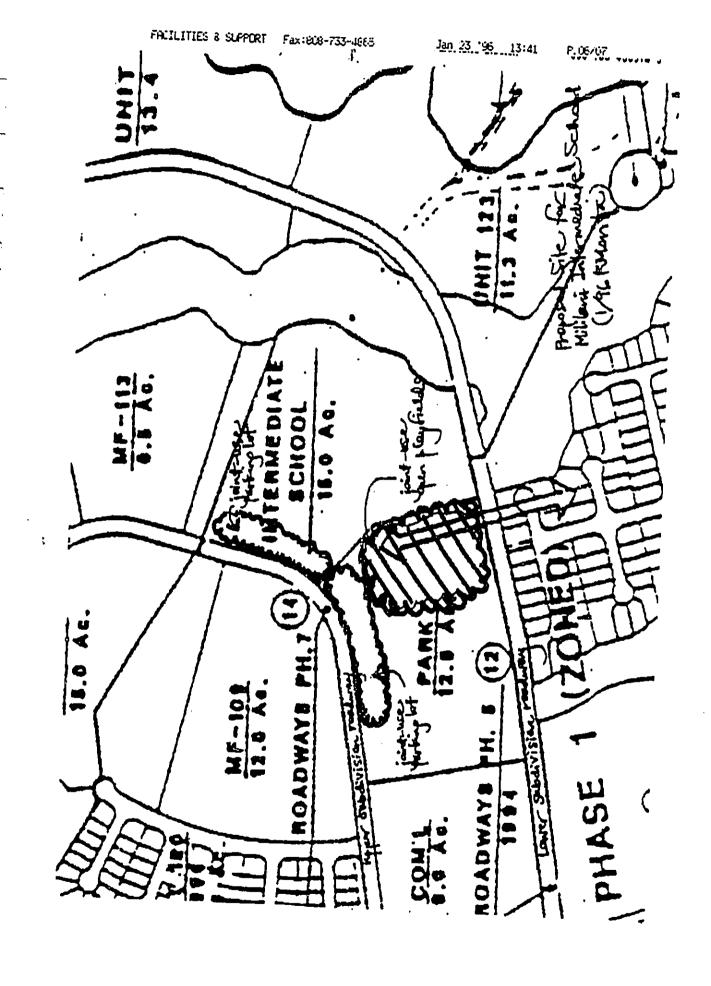

Waster Kobayaphi, PMB

Pursuant to the ongoing "charette" process to develop the program, master plan layout, and design guidelines for the subject school which is scheduled to open by September 1998 (pending availability of CIP construction funds in FY1997), DAGS needs Castle & Cooke (C&C) comments on the following issues:

1. DAGS estimates that up to 1000' of roadway frontage is needed to separate bus traffic. Student drop-off traffin.

needed to separate bus traffic, student drop-off traffic, and school staff traffic for the subject school site (based on similar situation for the new Kapas Intermediate School project). However, the proposed school site only has about CaO is currently requiring the State use for primary Phase 5 subdivision roadway that capital access to the school site (in lieu of the lower used by the residents).

2. Therefore, DAGS requests C&C consideration of the following slternatives to address traffic concerns related to the school site operations:

A. Providing 500' of additional roadway frontage off the upper Phase 7 subdivision roadway (1000' total); or B. Allowing vehicular access off both the upper and lower subdivision roadways.

Your immediate response to this natter is required because preliminary determinations can impact the "charette" process.

Pursuant to telephone discussions with Mr. George Okano of DAGS Central Services Division/Student Transportation Services Branch (831-6739), confirmation of the following preliminary determinations are provided for the subject school:

- 1. Based on input from DOE on the school design enrollment, the service area, "year round/multi-track" operations, and DAGS' bus scheduling considerations, it is estimated the bus loading requirements for the subject school are as follows:
 - A. 10-12 bus stalls for general student transportation.
 - B. 2-4 bus stalls for handicapped student transportation.
 - NOTE: It is estimated that each bus is about 46' long and needs about 100' turning radius.
- 2. Based on operational concerns from other existing schools, Mr. George Okano also requests the respective bus loading areas be separated.

SUBJECT: Mililani Intermediate School (New)

Master Plan/First Increment Coordination with

Department of Parks and Recreation (DPR)

DAGS Job No. 12-16-0916

DATE: January 31, 1996

WITH: Messrs. Jim Nakasone, Dan Takamatsu, Brian Suzuki,

Wilbert Ching and Lester Lai, Department of Parks and Recreation; Mr. Lester Chuck, DOE Facilities Branch; Mr. Alan Arakawa, Castle & Cooke; Messrs. Norman

Hayashida and Walter Kobayashi, DAGS Project Management

Branch; Mr. Ralph Morita, DAGS Planning Branch

The following comments summarize the January 31, 1996 meeting on the subject topic:

- DAGS Planning Branch requested the meeting to address the following issues related to development of the County park site adjacent to the proposed Mililani Intermediate School site:
 - Coordination for development of open playfield areas because pending availability of CIP construction funds, DAGS/DOE is trying to complete the first increment of a "year round/multi-track" intermediate school for a target September 1998 school opening (September 1999 at the latest) to address overcrowded conditions at up to twelve (12) existing schools in the Mililani service area:
 - Therefore, about 165,000 square feet (sf) of open playfields in the adjacent park site needs to be available for the proposed Mililani Intermediate School use by the school opening.

However, Castle & Cooke (C&C) is not able to (i.e. master plan, mass grade, grass and install the irrigation system) for the subject

KAJIOKA OKADA YAMACHI ARCHITECTS, INC.

intermediate school operations until at least the year 1999 or 2000 because C&C has already programmed its available resources to develop the District park site located elsewhere in the Mililani subdivision (per DPR requirements).

- B. Establishment of preliminary understandings related to a joint-use agreement specific for the proposed Mililani Intermediate School operations such as (limited to normal school hours throughout the year):
 - (1) Scheduled use of the open playfields.
 - (2) Relocation of paved playcourts from the school site and scheduled use.

NOTE: County park use of the intermediate school parking lots during non-school hours could also be considered.

- C. Planning and engineering coordination to:
 - (1) Establish elevations along the boundary between the school site and the park site to ensure the access path to the open playfields complies with ADA requirements.
 - (2) General location and/or orientation of the open playfields.
- 2. The determinations are summarized below:
 - A. DPR cannot request appropriations to design and construct any support facilities (parking lot, restrooms, paved playcourts, playground equipment, etc.) and/or maintenance of the adjacent park site until the parcel is turned over to the County by C&C (Note: C&C also needs to complete the master plan, mass grade, grass and irrigate the park site prior to turning over to the County):
 - (1) Therefore, DPR is not able to ensure the park site is available for the school's use in time for the target school opening.

Files Page 3

- (2) DPR is also not willing to consider the C&C proposal to develop the park site adjacent to the school site <u>before</u> development of the District park site because the District park site is expected to handle a much larger public demand (15 acres for the District park site vs. 12 acres for the park site adjacent to the subject school). It was also noted the State had expected the open playfields to be developed by others and had not programmed any project funding to develop the adjacent park site.
- B. Pursuant to an existing general agreement between the DOE and the City and County of Honolulu, DPR is willing to allow joint-use of the park's facilities for school use:
 - (1) Scheduled use of the open playfields is not expected to be a problem because of ongoing good working relationships with the Central District administration.
 - (2) However, scheduled use of the paved playcourts could create some operational conflicts (even if the State agreed to pay for their construction on the park site).
 - NOTE: Therefore, it was mutually agreed the school's paved playcourts should remain on the school site, with the general understanding that the school could request for use of other paved playcourts on the park site and the park could request for use of the paved playcourts on the school site.
 - (3) Use of the school parking lots for park operations is open for further discussions.
- C. C&C is willing to start master planning work for the park site adjacent to the school site:
 - (1) DAGS and C&C consultants can work together to establish the boundary elevations.

(2) C&C and PDR can work together to develop the master plan layout.

NOTE: DPR indicated willingness to consider locating the open playfields as near as possible to the school site.

SUBJECT:

Mililani Intermediate School (New),

MP/First Increment

Coordination with Castle & Cooke (C&C)

DAGS Job No. 12-16-0916

ATTENDED BY:

Mr. Ralph Morita, DAGS Planning Mr. Lester Chuck, Ms. Aileen Hokama, DOE Messrs. Alan Arakawa, Wally Hiroyama, C&C

The following comments summarize the February 2, 1996 meeting on the subject topic:

- DAGS Planning Branch requested the meeting to address the following issues:
 - a. Coordination for development of open playfields on the adjacent park site in time for the target September 1998 school opening date (pending the availability of CIP construction funds).
 - b. Coordination for extension of Kuaoa Street and Lehiwa Drive in time for the target school opening date.
 - c. Agreement on the shape and size of the proposed school site.
- 2. The following decisions resulted from the meeting:
 - a. C&C agreed to develop the open playfields (mass grade, grass and install irrigation system for about 165,000 square feet of open playfield space per the DOE's requirements) in time for the school opening under the condition the DOE maintains the open playfields until such time C&C turns over the park site to the Department of Parks and Recreation, City and County of DECEIVED

MAR 7 - 1996

KAJIOKA OKADA YAMACHI
ARCHITECTS, INC.

- C&C intends to complete extension of Kuaoa Street and Lehiwa Drive by 1999 or 2000 (subject to recovery of the housing market). Therefore, DAGS/DOE was asked to consider construction of temporary road extensions and/or get approval from the Department of Transportation Services, City and County of Honolulu to use only one of the driveway openings off Lehiwa Drive until Lehiwa Drive is extended. DAGS/DOE agreed to consider this request.
- Since DAGS/DOE could not justify the need to increase the size of the proposed school site (such as limiting the classroom buildings to only single story structures), it was mutually agreed:
 - C&C will develop a metes and bounds map, subdivide and dedicate 15 acres (with C&C slope easements moved out of the school property in its entirety) for the proposed school site to the State by the end of 1996 or prior to start of construction work.
 - (2) DAGS/DOE will develop an intermediate school facility that stays within the limits of the 15-acre site provided by C&C.
