DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

South Kona

Hilo

My additional comment:

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, January 6, 2020 7:50:05 PM

Aloha Mr. Sakoda,

My name is Jordy Jones and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

South Kohala

My additional comment: Reef fish belong in reefs. You know this. Collectors know this.

Everyone knows this. Human greed is consuming the world. This is a chance to change. Do it. Now. Stop the collecting. For the fishes.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: drjordyjones@gmail.com

From: [Tracy Jones](#)

Cc: jim.lynn@kigates.com; [VanDeWalle, Terry](#)
Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 5:21:49 PM

Aloha Mr. Sakoda,

My name is Tracy Jones and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

I am also concerned about the fact that this is an unregulated activity. Collection of tropical fish from our waters should be a band activity. Tropical fish collection disrupts the natural cycle of the reef. The coral reefs are the oldest most complex diverse ecosystems on our planet.

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
Puna
Hilo

Hamakua
South Kohala

My additional comment: I am a marine biologist by education and a practicing attorney on Maui. The practice of tropical fish collecting for the aquarium trade should be a band activity. Unless there is sufficient oversight, regulation, reporting and study, we as a community should oppose the harvest. The trade is for profit and export and serves no important purpose to society. Please excuse any typos I'm submitting this on the phone. Thank you.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, January 7, 2020 4:58:40 PM

Aloha Mr. Sakoda,

My name is Dana Jones-Viering and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: The islands are a special place. If we keep removing natural species a downward spiral will continue. We are losing too many species of animals in the world to allow taking of inhabitants from their homes. This is absolutely, without question not acceptable.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA

review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 9:23:43 PM

Aloha Mr. Sakoda,

My name is Rhea Jose and I am a Part time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

Forcepsfish/Longnose butterflyfish

Achilles tang (paku ikui)

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: We should protect our reefs because if we continue to damage or negatively impact them, nature loses its pristine aspect. If we remove these species, we are disrupting the ecosystem. Us humans are also a part of the ecosystem meaning that it could be detrimental to us as well. There are so many efforts to preserve our environment and we should keep persisting on. This is just another problem added that we do not need.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, January 7, 2020 1:46:01 PM

Aloha Mr. Sakoda,

My name is Douglas Junkins and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:
All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kohala

My additional comment: I travel to Hawaii at least once per year to snorkel and scuba dive.

There has been a noticeable improvement on the number of reef fish seen in the last couple years, especially in Puako where I have been snorkeling for many year, but the reefs are still

under stress from coral bleaching and climate change. It seems incredibly short-sighted to

remove the ban on collection of reef fish at this time. Removing the ban will likely impact my desire to return to Hawaii and enjoy the fish in their native habitat.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Thursday, December 12, 2019 1:55:17 PM

Aloha Mr. Sakoda,

My name is Joy Kaaz and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

South Kohala

Unfamiliar with these reefs, but still concerned.

My additional comment: Our oceans and reefs are in serious danger from climate, including but not limited to warming ocean waters, acidification, coral bleaching, toxic pesticides, fertilizer and human and animal waste runoff and discharge, the impact of tourism. These fish are an important part of the web of life necessary to maintain the health of our reefs and ocean, and ultimately human survival. In light of all the current environmental threats to the safety and wellbeing of our oceans and planet, allowing the resumption of fish harvesting for personal aquariums is foolish and contributes to the continued degradation of our planet.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Margaret Kahoilua and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona

My additional comment: I am a Native Hawaiian, past Expedia Local Expert, member of The Coral Reef Alliance, Bail Bondsman, and a current participant on the Vibrant Hawaii Leadership Team. I am concerned w/the condition of our coral reefs. In September of 2019, I joined some guests on a snorkeling tour to Kealekekua Bay. My heart was broken by the vast difference/depletion of diversity among our reef fish. Given the fact that this area is a conservation area, it was surprising to observed the devastation. There are many factors already impacting the health of our local reefs. Allowing the collection/removal of our reef fish only exacerbates an existing crisis & may lead to the depletion of essential reef species.

Please ensure any decisions made regarding permits to collect fish are made with the sustainability of our coral reef ecosystems as TOP PRIORITY. Mahalo...

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 1:37:02 PM

Aloha Mr. Sakoda,

My name is Rebekah Kaufmann and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kohala

South Kohala

My additional comment: I have been diving the Kohala coast weekly for 20 years. The decline in healthy coral seen in the last few years is devastating and the only chance of recovery is to limit taking any unnecessary resources. The reefs need our herbivore fish more than ever to try to recover from coral loss caused by rising temperatures. Even exporting one reef fish is too many to spare!! While there are many factors in the reefs declining the taking of reef fish to export is one major contributor that could be easily stopped.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 13, 2019 4:18:47 AM

Aloha Mr. Sakoda,

My name is Kaimi Kaupiko and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species abundance is significantly reduced by aquarium collecting.
Communities of reef species are disrupted by aquarium collecting.
Marine life is threatened with local extinction
The real possibility that future generations may not encounter these species
DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.
70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.
Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.
Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: As a Native Hawaiian, we have fought long and hard to stop the trade in HAWAII. As we continue to fight for justice, we have stayed on the right side of and we continue to say that the cultural impacts are significant to us and our way of life. We worked hard that an EIS be done when the supreme court decision was made, and now with

this report we continue to stand in defiance of our claim and the lackluster work of DLNR to do their job within our community. Furthermore, PIJAC is a lobbying group for the commercial pet trade. PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on dire hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal. This sneak attack on Hawaii reefs has a comment period that spans Thanksgiving, Christmas and New Years. When the Hawaii Circuit Court ruled on this issue, in favor of the DLNR Director's discretion, that director was William Aila, aquarium collector. When the Intermediate Court of Appeals ruled for the aquarium trade, DLNR Director/Nature Conservancy Director Suzanne Case said, "It's been litigated!" She scoffed the Supreme Court ruling. She met with aquarium collectors to advise on speech and behavior in the legislative season. These meetings are in the public record. When the legislature passed Senate Bill 1240 to phase out the aquarium trade, Case prevailed again on Governor Ige to veto the bill. Ige knows nothing of ocean species or habitat. The Hawaii Supreme Court ruled that no further permits should be issued until Environmental Assessment, with injunctive relief to SHUT IT DOWN NOW! DLNR Director Suzanne Case trumped that ruling with permits are no longer required, for aquarium collecting. It takes only a commercial fishing license. Many Kona aquarium collectors never stopped collecting, with tacit support from Kona DAR and Hawaii DLNR. When an aq collector attacked a woman with a GoPro camera at Keawaiki, DLNR visited Kona to comfort the aquarium collectors. Now DLNR Director/TNC Director Emeritus Suzanne Case promotes the TNC agenda, deferring to Big Fishing. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes nearshore habitat and species. The vast majority of Hawaii people want the aquarium trade to end. And so do millions of visitors around the world, who hold Hawaii reefs in their hearts. Reef tourism supports many thousands more people, with revenue 400 (four hundred) times greater. Spirit and intent in the Supreme Court ruling are clear. The PIJAC PROMO piece claims a surge in recovery to justify a new wave of reef carnage. The PIJAC PROMO piece notes a catch limit on Achilles tangs of 5 per collector per day, down from 10 per day. Few people have seen 5 Achillies tangs in a single day in many years. This PIJAC Promo piece is not an environmental review but a commercial appeal to convert Hawaii reef species and habitat to money, to deny Hawaii and its people of iconic, endemic and economic treasures, to support a mainland amusement industry, to condemn reef wildlife in a vicious cycle of replacement. THAT is what the aquarium trade calls "sustainable." Enough! mahalo Kaimi N Kaupiko and Wilfred Kaupiko

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Thursday, December 5, 2019 11:44:53 AM

Aloha Mr. Sakoda,

My name is Bernadette Keeling and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: This is unnatural to our ecosystem and to our culture this needs to stop!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Sunday, January 5, 2020 6:17:53 PM

Aloha Mr. Sakoda,

My name is Phaethon Keeney and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

All reef species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

Hilo

South Kohala

My additional comment: Aloha, please, our reefs are stressed enough due to climate change, water pollution, golf course and construction runoff and so many other reasons, the 2 year break was a welcome change (it was so nice as yellow tang and others returned to our shores!) but we cannot afford to let the profit of a few individuals damage healthy reef ecosystems, the impact is greater than just the fish themselves, the web of life on these reefs is immensely complex and just a few factors can tip these systems into other states. Just this year the "heat blob" took a toll on West Hawaii reefs again, and there's more sure to follow, we need to do everything we can to protect these beautiful creatures which make Hawaii so unique and amazing and ensure a more abundant future for everyone. Hawaii's residents and visitors love those fish dearly and like "Finding Nemo" impacted us all, taking these beautiful creatures impacts us all. It's just awful trying to explain to the keiki how in the face of Climate Change

and so much environmental injustice that the decision-makers in Hawaii could possibly put the profit of a few over everyone else, please help us have a more inspirational conversation by deciding to continue the ban the aquarium trade on West Hawaii's reefs... big mahalos! :)

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Dennis Kent and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

All 40 White List species

Bandit Angelfish

Angelfishes

Achilles tang (paku ikui)

My specific concerns about those species include:

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Marine life is threatened with local extinction

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

My additional comment: As an employee of the airlines in the 70's, I saw the shipments of tropical fish coming in from Hawaii to the West Coast. The half starved, half dead fish that arrived were often rejected by the tropical fish dealers due to die off. They would leave them with the airlines to dispose of as no one wanted to pay to fly them back and they would most likely be dead by the time they arrived back in the islands. The Tropical Fish Industry pays nothing for the fish and as a result they have no respect for them alive or dead. This industry should be outlawed in Hawaii as they have shown themselves to be corrupt and without any concern for our treasured fish populations or the health of our reefs.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Date: Saturday, December 7, 2019 1:57:35 PM

Aloha Mr. Sakoda,

My name is Jeanie Kilgour and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment:

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: aloha@snominx.com

Date: Friday, December 6, 2019 11:48:19 AM

Aloha Mr. Sakoda,

My name is Kwi Kim and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

Forcepsfish/Longnose butterflyfish

Achilles tang (paku ikui)

My specific concerns about those species include:

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

South Kona

My additional comment:

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, January 7, 2020 12:25:19 PM

Aloha Mr. Sakoda,

My name is Brandon Kloth and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: The value of our environment is much more valuable than the value of the dollar.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Wednesday, December 4, 2019 10:22:34 PM

Aloha Mr. Sakoda,

My name is Loren Knappenberger and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

Achilles tang (paku ikui)

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Ka`u

My additional comment: The pakuikui is Kapu for my family to eat as it is reserved for Pele, our Aumakua(ancestor). Sad to see that they are being exploited for sale to tanks.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Saturday, January 4, 2020 10:23:02 PM

Aloha Mr. Sakoda,

My name is Risa Kuroda and I am a Part time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: The DEIS and the final EIS needs to fully address alternatives and explain why those alternatives are inadequate. It should also make clear why their proposed action is appropriate at the present time given that it has been ruled inappropriate previously. Failure to disclose the aforementioned points adequately for public review opens the DLNR to public citizen suits. Separately, DLNR should be more prudent in assessing long term financial and political impact to the State. Being transparent with the cost benefit analysis would mitigate public backlash. As a Hawaii resident, disappointment is an understatement

when our leaders sell out our natural resources. Its beauty is the one thing that keeps our economy going and gives physical dimension to our culture. To sell that so that richer people can put it in boxes to look at is shameful.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is C Lam and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: I was born and raised in the islands. Through I reside on the mainland, the preservation of this sea life is important to me and my family. Hawaii is such a unique place with unique wildlife both on land, sea and in the sky. Do NOT put profits before the preservation of this wildlife that could result in irreversible damage of the delicate balance of the environment. Think of the future generations and not short-term financial gain.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA

review, regardless of the method of take used.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: It is important to note that anything that can be done to save our reefs will help minimize the onshore impacts of climate change. All properties within a minimum of 10 feet above sea level will and are now being impacted by climate changes. Not only are we better off for all the fish species we preserve in their native habitat, we also preserve the beauty of our islands for our own pleasure and Hawaii remains a place tourists visit and provides a good deal of our economy. It's almost a virtuous cycle. The tropical fish aquarium

trade really needs to come to an end. Giving up aquariums in a home or office is a small sacrifice for people to pay in order to preserve our reefs, our ocean environment, and the many ocean side homes and businesses that are at risk. Mahalo for your kokua and understanding.
Sally J. Lambert

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 13, 2019 5:13:21 PM

Aloha Mr. Sakoda,

My name is Richard Layton and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

South Kohala

My additional comment: Kapoho tide pools, kona reefs, kohala reefs... each year there is less and less fish overfishing and now aquarium fish? There cannot be added distress on our oceans reef/marinelife systems. Its sad and heartbreaking to see the ocean slowly dying because of things like this, people who want to make money taking animals that dont belong in aquariums... This is one of thw many many things that makes hawaii unique... if you want to see fish go swimming in the ocean. Period

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, January 6, 2020 11:09:56 PM

Aloha Mr. Sakoda,

My name is Sandra Lee and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment:

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: sandyswings73@gmail.com

Aloha Mr. Sakoda,

My name is Katherine Lees and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: I snorkel several times a week in local Hawaii Waters and I am very concerned about the Marine life. a few collectors should not have the right to destroy the environment against the enjoyment of the rest of us. Kahaluu and other popular snorkel sites should be off limit for all types of collecting and fishing.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, December 10, 2019 11:43:25 PM

Aloha Mr. Sakoda,

My name is Francesca Leonetti and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

Ka`u

North Kohala

South Kohala

My additional comment: As a long time visitor to Hawaii's Islands, I believe fish should be left in their home in the ocean, not taken by humans to live in small tanks, often to the detriment of their health and lives. How would you like it if someone took you out of your natural environment and put you in a glass box for others to stare at? Stop the aquarium trade now.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Date: Tuesday, January 7, 2020 4:44:23 PM

Aloha Mr. Sakoda,

My name is Kristen Lesley and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

South Kona

Ka`u

Hilo

Hamakua

My additional comment: I am not familiar with what reefs are being used to harvest aquarium fish, but should that matter? My concern is we are exploiting these species for the entertainment of a handful of people. The reef ecosystem is so delicate, and should not be tampered with in any way.. at the very least we should NOT have a government that allows it, or profits from it. Couldn't we find other ways? Maybe sell mongoose as pets, or pigeons. Send them off to the mainland. Mainlanders are fascinated by all things Hawaii. I went to a pet shop in California that were buying Anoles from Hawaii and selling them as pets. Anoles are abundant, and their decline wouldn't have so much of an effect on our ecosystem as the reefs would. Please reconsider allowing fishermen to harvest reef fish. I hear that they use chemicals to stun the fish being harvested, and that ruins the coral. Fish should only be harvested for consumption, and for no other purpose.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is James Little and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Any type of reef creature.

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

South Kohala

My additional comment: There are plenty of Hawaiian reef fish in the pet trade already. More

real efforts should be on captive breeding of what's already in the pet trade, this disposable fish attitude is the real problem. I visited Hawaii with my wife and was very excited to see the reefs, I was very depressed by how terrible the reef conditions were in Hawaii, they looked barren, so barren in fact that I decided to not return to Hawaii again unless they take their ecosystems more seriously. The main driver of the Hawaiian economy is the eco tourism, once you destroy what makes Hawaii beautiful for such a short sighted financial gain, you will pay the price in lost tourism and revenue. Hawaii should look to Palau when it comes to their eco tourism mgmt. That's where I went for my next vacation instead of returning to Hawaii and they have the best reefs in the world, they know what they are doing and it shows.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Cc: jim.lynych@klgates.com; [VanDeWalle, Terry](#)
Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Thursday, January 2, 2020 11:50:12 AM

Aloha Mr. Sakoda,

My name is Sue Little and I am a Part time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

South Kohala

My additional comment: I snorkel swims several days per week. The loss of fish was tragically apparent after the aquarium collectors visited the bay, usually at night it seems. The populations are finally starting to improve but many types are still very limited. I want the personal collection numbers to be severely restricted too. Most fish taken die and it's a horrible business. Breed in captivity should be encouraged instead.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Sunday, December 15, 2019 10:21:22 PM

Aloha Mr. Sakoda,

My name is craig Lomnicki and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

Communities of reef species are disrupted by aquarium collecting.

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: Reef fish need to be reef fish not aquarium fish. Man should not disrupt the natural ecosystem just for his self pleasure. Many reef fish die in the collection,transport and display. We must remind ourselves as "Hawaiians" (Hawaiian is a state of mind that must be spread with our Aloha) that we are the stewards of our environment. If we can not show that responsibility here in Hawaii an island ecosystem how can we expect others to respect in the world that the natural world is important.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, December 17, 2019 3:56:11 PM

Aloha Mr. Sakoda,

My name is Bruce Lowrey and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: Mostly, I snorkel on my home reefs in South Maui. But I do get over to the Big Island from time to time, and it breaks my heart to see the declining biodiversity. The comeback of the yellow tang is encouraging, but by no means encouraging enough. It is obscene that our wildlife is being treated as a commodity for the enrichment of traders. At best, we are stewards of the creatures in the aina. We must protect them. At worst, we should at least coexist with them. None of us "owns" them. They must not be trafficked. I use this word advisedly--what's going on here (or what will go on here if the 2018 ban is lifted) is the moral equivalent of trafficking human beings. It has to stop, and stay stopped.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Any marine life

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: When I was young the colorful fish were abundant nearby the shoreline as I snorkled on the shallow reefs. Now there is hardly anything in the shallow reef area. Since I am not a strong swimmer going into deeper water is not an option.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Saturday, December 14, 2019 8:19:58 AM

Aloha Mr. Sakoda,

My name is Jolene Lushine and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: Please just leave things how they are in their natural habitat. This is unnecessary disruption to the ecosystem. We may never know the long term repercussions of our actions such as this in our own lifetimes. I used to live in Maui and thoroughly enjoyed everything the beautiful ocean had to offer.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 5:45:25 PM

Aloha Mr. Sakoda,

My name is Patty Machado and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
Hilo
Hamakua
South Kohala

My additional comment: We snorkel on a regular basis. We also bring our guests to the reefs. We are careful not to touch the coral and use sunscreen that doesn't harm the reefs. If we are taking care the DNLN should back us up! We had noticed that the fish in the reefs near the shore had really thinned out. During the last couple years they might have been increasing but we only really noticed it in the last 6 months. It is imperative that we protect the reefs. The global warming that is coming will stress the populations and it doesn't make sense to have a less robust start! It is also really wrong to put in a ban for local fishermen that the aquarium industry isn't subject to. I would hope that they could breed the fish on the mainland so that they don't ruin the wonderful reefs we have here.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, January 7, 2020 1:30:15 PM

Aloha Mr. Sakoda,

My name is Pamela Madden and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
All 40 White List species
Bandit Angelfish
Forcepsfish/Longnose butterflyfish
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Marine life is threatened with local extinction

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
South Kohala

My additional comment: I think without drastically improving DLNR's enforcement capabilities of the aquarium trade, resuming aquarium collection should not occur.

Realistically, there is zero enforcement of this industry. In my years of shore diving all along the Kona-Kohala coast (200+ dives) I have never seen an enforcement officer either on land or a boat, checking fish collectors catch (either aquarium collectors or spearfishermen). Plus, the volunteer reporting system so collectors only have to "self-report" how many fish they captured is woefully inadequate and ripe for corruption. A 2004 Division of Aquatic Resources (DAR) report has even acknowledged that there is no way to verify the accuracy of the data submitted. This same report also states that there are indications of underreporting. An effective DOCARE enforcement presence on the water and along the coastal areas is essential for long term sustainability of our marine resources. And since, enforcement officers can't open an aquarium collector's cooler to check what species, how many, and what size were obtained, currently there is no practical way to currently enforce this industry with our status quo enforcement procedures. At the 22nd Annual Hawaii Conservation Conference, a DLNR enforcement officer even publicly stated that his department did not have the financial ability to do its job properly since there are only 3-4 enforcement officers for all the West Hawaii

coastline, and they are supposed to take care of both land and sea issues. Furthermore, in another DLNR “State of the Reefs” report, it was noted that “removal of significant numbers of these aquarium collection species could result in an increase in algal growth due to a lack of grazers to keep the algae in check and a corresponding decrease in coral cover.” With all of the stressors that our reefs are currently experiencing (i.e. warming temperatures/bleaching, pollution, cesspools, increased visitor use, sunscreen chemicals etc.) stopping aquarium collection has an immediate and impactful preservation of the reefs. Another recommendation from the DLNR “Report of the Findings and Recommendations of Effectiveness of the West Hawaii Regional Fishery Management Area” is that DLNR should prioritize the adoption of the Hawaii Administrative Rule requiring a marine dealer report. This would allow for comprehensive verification of the aquarium dealer and collector catch reports to determine reporting accuracy. So until the State of Hawaii allocates more financial resources and personnel to properly regulate and enforce the aquarium trade, reopening the reefs to aquarium collection is premature and should not occur! Malama Aina.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

South Kohala

Unfamiliar with these reefs, but still concerned.

My additional comment: Aloha, In Africa and Asia it has become unthinkable and illegal to trade in either the following (live or dead) wildlife: Elephants, Tigers, Primates Rhinos ...AND MANY OTHER SPECIES. The international community has intervened and declared this practice of killing or extracting wildlife illegal. This kind of extraction is known by its common name: POACHING. Marine habitats are in jeopardy. The trade in aquarium species of fish is for a luxury market and in no way is connected to a traditional food source and is fundamentally unjustifiable. Now in 2020 is a time where it is critical for people and government officials everywhere in the world to act to protect creatures everywhere. This is not a time to make short term profit a higher consideration that the preservation of wild places and wild habitats. I regularly snorkel in Hawaii and have seen plenty of evidence of depleted marine environments. I'm aware of the coral death that is occurring and other signs that our marine environments are in distress. Further, my livelihood and the livelihood of many others in my community in East Hawaii relies upon the high value that visitors place on the beauty and eco-diversity of Hawaii and plentiful, healthy marine life. Any compromises to the health of our coastlines, reefs and beaches will come at a huge cost to our communities and our economy. Please do MORE to protect our reefs, not less. Genuine measures of protection would further include banning the sale of all non reef-safe sunscreen, introducing more measures to prevent run-off from golf courses and remediating marine pollution from septic tanks and industry. Please end all POACHING of marine life now and please act now to do more to protect marine habitats.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Thursday, December 12, 2019 1:59:55 PM

Aloha Mr. Sakoda,

My name is David Marshall and I am a Part time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

Hamakua

South Kohala

My additional comment: The reefs need a healthy balance of stable proper water temp., & fish, shellfish etc. to survive into the future! Any disruption of the natural balance of these extremely valuable reefs during this critical time of stress with widespread bleaching and other assaults on this ecosystem is not proper and DOES NOT support the science for overall reef health. The taking of reef fish for profit does not help, but instead hurts the Hawaiian people in the long term. The decline of the reefs and reef species will have a major negative effect on tourism & tourism dollars. I believe it is morally and ethically wrong to ignore the negative impacts and to try to extract VERY SHORT TERM PROFIT from the major long term disruption and damage of these harvesting activities, ignoring such things as success of reef fishing & subsistence gathering activities of the Native Hawaiian people & all Hawaiians & visitors. These aquarium fish harvesting activities will hurt ALL Hawaiian Residents and also people from all over the world who travel here to see the amazing and unique beauty of

Hawaii. They book charter boats, dive & glass bottom boats to see Healthy Reefs with an abundance of sea life! Hawaii visitors also support dive shops, snorkel gear and beach equip. rental stores, hotels & essentially all businesses across the islands! This proposed DLNR harvest plan is designed for short term greed & profit, while ignoring court decisions and the wishes of (DLNR's!!!) Hawaiian residents. I STRONGLY request that you abandon this damaging Aquarium Harvest Plan and follow the will of the courts and people of Hawaii!
Respectfully, Dave Marshall

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 5:57:44 PM

Aloha Mr. Sakoda,

My name is Marty Martins and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

Butterflyfishes

Surgeonfishes

Angelfishes

Forcepsfish/Longnose butterflyfish

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: I snorkel almost every day and have seen the effect of fish trapping over the years.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: mauihakuaina@gmail.com

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Wednesday, December 18, 2019 7:28:02 PM

Aloha Mr. Sakoda,

My name is Rita Massey and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: I live in South Maui and paddle and swim and snorkel in the area.

Over the years I have seen a great deal of degradation of the reef and major decline in the

number of fish. 20 years ago I would snorkel at Ulua reef in Wailea and see fish everywhere, such that they were all around and couldn't be avoided. Angel fish, tangs, parrot fish etc. Now

I see one or two fish here and there. Seldom do I see yellow tangs. Tourists spend a lot of money to come here and now there are so few fish for them to enjoy. How long can we keep

the tourists coming if the reefs are no longer viable? There is widespread bleaching of the reefs so I know all the animals are stressed as it is and they should not have any more. I say

NO taking of fish off the reefs. It is bad for the reefs and it is cruel to the fish.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

From: [Willa Mathison](#)
To: david.sakoda@hawaii.gov
Cc: jim.lynn@klgates.com; [VanDeWalle, Terry](#)
Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 1:32:41 PM

Aloha Mr. Sakoda,

My name is Willa Mathison and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Hilo

Unfamiliar with these reefs, but still concerned.

My additional comment: We are an elderly couple who have had the pleasure of observing Hawaii's fishes through snorkeling extensively on Oahu, Hawaii, Kauai and Molokai. We would like future generations to enjoy them as well. Through the years, we have watched the populations decline, which we believe to be the result of the aquarium collectors. Please don't let them continue to decimate populations. Even Hanauma Bay has been impacted, and that is a fish reserve.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 11:55:40 PM

Aloha Mr. Sakoda,

My name is Joel Matsunaga and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

Puna

Hilo

Hamakua

South Kohala

My additional comment: Kawaihae/South kohala stretch from kapakahi to the harbor has deteriorated so much in the last 10 years. Fish are far rarer!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, December 16, 2019 9:13:30 PM

Aloha Mr. Sakoda,

My name is Nancy Maupin and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

South Kohala

My additional comment: I snorkel frequently at Puako, Mauna Lani Beach Club, & 69. The bleaching events have stressed the reef and that puts strain on the ecosystem. There are definitely less fish at these reefs now than when I snorkeled them several years ago. Taking fish out of the ecosystem will further harm it. Our state is very dependent on tourism and much of that tourism takes place in the ocean. People visit here to see our beautiful reefs and the fish who populate them. Why risk the tourism that benefits so many for the few who benefit from the aquarium trade?

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

South Kohala

My additional comment: Tourist come to Hawai'i to see fish in the Ocean, that's good for our

economy . Why should the wild fish go to personal aquariums for profit. Growing up in Kona, I've noticed less and less fish! I don't see nearly as much fish as 30 years ago. I used to work next door to a Scuba Dive Shop. They told me that in the 1970's the Big Island had a yellow ring around it showing in pictures, taken from space. The Yellow ring was the tang fish. Please leave our wild fishes in the Ocean, for everyone to enjoy. Mahalo

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Denise Meechan and I am a Part time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

Butterflyfishes

All 40 White List species

Bandit Angelfish

My specific concerns about those species include:

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

South Kona

My additional comment: I live in Captain Cook and spend a lot of time scuba diving at local spots like Two Steps, Kealakekua Bay, Ka'ei Beach and other spots. I have been diving for 15 years and have just recently seen improved populations of the above fish and especially the yellow tang. To remove these fish from the endangered list and to allow them to be taken for aquariums will greatly harm the advances the species has made. They are important to the coral and to the other fish and plant life in the bays. Please consider keeping them protected!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

South Kohala

My additional comment: I have been an avid diver and snorkeler in West Hawaii since first visiting there in 2004. I have lived there now for three years. When I first visited, I wondered why there were abundant yellow tang in Kealekakua Bay but not elsewhere. I found out it was due in large part to the aquarium trade. I was once an aquarium hobbyist but after learning the destruction that live catching had, gave up my hobby. Allowing any live catching will mean open season. It will be extremely difficult, if not impossible to limit how much people catch and when they do this. Every day, I see people fishing in areas that are supposedly protected, with throw nets. In recent months, the numbers of Yellow Tang (and many other species) have increased along the coast and this is obviously due to the catching ban. While the conditions of the coral are still of grave concern, the fish count looks like it is bouncing back. Please do not reverse this gain. I have experience at many reefs, including Two Steps, Miloli'i, Kona Paradise, Mahukona Beach Park, Puako and many more.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
Puna
Hilo

My additional comment: When I visited my sister on the Big Island last year, I was dumbfounded but the significant decreased amounts of wildlife we saw! In the difference of 4 years, the same oceans my sister swam in and documented the amount of marine life all

around her. In any direction she was surrounded by vibrant fish of multiple species, sea turtles that would swim up to her, healthy full coral, and clear crystal waters. During whale season the beaches were covered. Now locals and tourists are concerned if the whales will come at all. I'm afraid that if we keep taking from the oceans, they're be nothing left to repopulate. Hawaii is a melting pot where multiple species come and thrive. For the benefits of education, beauty, and preserving the bountiful gift that has been given to the Hawaiian islands. We need to protect the marine life that's left. Thank you.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, January 6, 2020 9:41:02 AM

Aloha Mr. Sakoda,

My name is Mary Metcalf and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
South Kohala

My additional comment: I have been snorkeling the West Hawaii reefs since the late 1980's and have seen first hand the destruction of these reefs and the huge decline in fish population. It is a travesty that the aquarium collecting has been allowed and this harmful practice must not resume. The pace and extent of anthropogenic climate change is accelerating and aquarium fish collecting is just compounding the harmful effects to West Hawaii reefs. Our reefs must

be saved at all costs due to the enormous benefits they provide and reef fish are integral to their health.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Thursday, January 2, 2020 11:45:42 AM

Aloha Mr. Sakoda,

My name is Heather Metzler and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

South Kohala

My additional comment: I am an avid snorkeler. I have seen the extreme depletion of all types of marine life. The Aquarium trade doesn't need to add to the depletion.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: heddaj@yahoo.com

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, January 7, 2020 1:50:11 PM

Aloha Mr. Sakoda,

My name is d miller and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

Butterflyfishes

Angelfishes

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

My additional comment: The very survival of Hawaii's coral reefs is at stake. For years studies documented impacts to species taken for the aquarium pet trade. The most impacted species, including yellow tangs, certain butterflyfishes, and other rare native fishes, saw population declines ranging from 60% to 99% in the areas where they were taken

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

My additional comment: Since 2010 I have been a volunteer Reef teacher at Kahalu'u beach and have spoken to countless number of visitors about our fragile reef and the wonderful sea creatures living on and around it. The Aquarium fish industry care nothing about our coral reef or the marine life that it sustains. All they care about is filling their wallets with money and nothing about our economy and our environment. The Aquarium fish industry should be permanently banned from all Hawaiian water. Sincerely, Colleen Miyose-Wallis

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Unfamiliar with these reefs, but still concerned.

My additional comment: Our oceans are in serious peril. I have witnessed first hand the decimation of marine life and ocean ecosystems in the past 42 years of living, diving and open ocean swimming on Kauai and most of the other main Hawaiian Islands. All science is documenting that over extraction (i.e. fishing) is one of the top causes of degradation to reefs, and ocean health. It is time to wake up from the spell of greed and protect our ocean home--

the ocean is literally our life support system. The extraction of ocean wildlife for aquariums is inhumane, unsustainable and not pono! To help Hawaii's coral reefs recover from bleaching, we need to protect and maintain a healthy population of the herbivorous fish that are essential to reef ecosystems. A Coral Bleaching Recovery Plan prepared for the Department of Land and Natural Resources identified herbivore management as "critical to post-bleaching coral recovery in Hawaii." These fish are valuable in the wild because they keep algae from overgrowing recovering corals. Parrotfishes and surgeonfishes, in particular, are widely acknowledged for their importance in reef resilience and recovery. The report identified a prohibition on the take of herbivorous reef fish as one effective action to help in reef recovery. Please care for and protect marine life, ocean ecosystems and the future of our planet by banning aquarium fish collecting. "First live a compassionate life, then you will know" - Buddha

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Kristina Montoya and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Puna

Hilo

My additional comment: The aquarium fish trade has proven to be detrimental to Hawaiian reefs. With increased threats from ocean acidification and temperature rise, it is our duty to protect an already vulnerable asset. Do not let the greed and interests of a few dictate the future of the our reefs for future generations.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Saturday, December 14, 2019 1:31:34 AM

Aloha Mr. Sakoda,

My name is Blake Moore and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: I have personally witnessed the decline of fish since arriving in Hawaii 18 years ago. You don't need to be a scientist to see the depletion of reef fish in Hawaii. Our fish are worth far more to visitors and residents alike than the economic gain by allowing fish collection. Please don't allow this incredibly destructive practice to return to Hawaii's coastlines

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

Hamakua

South Kohala

My additional comment: I think the the "proof is in the pudding" as the saying goes. Statistics show fish collection has a significant impact to the the decline of several species and is on opposition of the states objectives in the 30/30 goals. Let's save the reefs, the marine life, and the beauty of our island by continuing to disallow the collection of any all fish for aquariums.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 8:32:47 PM

Aloha Mr. Sakoda,

My name is MARY MORRIS and I am a Part time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

South Kohala

My additional comment: I have snorkeled the Puako reef for forty years now. There has been such a decline in fish population. There were hardly any yellow tang a few years ago and this year we all noticed that there were finally some large schools of yellow tang once again. (20 to 30 in a school). Please don't let the aquarium trade back into South Kohala. I recall seeing several men collecting at Paniau in years gone by, and there is no-one to enforce the limit, so they take as many as they can get and hope not too many of them die. So sad, so wasteful. I am also concerned about the decline in Hawaiian day octopus, there were a number of them last year, now we see certain people coming every day up and down the reef and removing the octopus. I am not sure what they do with them, if they eat them or use them as bait, but there need to be restrictions on the number of octopus that can be taken per day. They are going to decimate that population!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, January 7, 2020 4:40:54 PM

Aloha Mr. Sakoda,

My name is Shelley Muneoka and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: The aquarium trade is a frivolous use when compared to the cultural significance ecological services these fish provide to the reef. It is inexcusable that future generations may not know these animals or what a thriving reef system looks like for someone's hobby or profit. These fish, particularly pakukui and kole are eaten at special occasions and are important to the social/cultural fabric of Hawai'i communities. In a moment where our planet is facing catastrophic changes on the land and in the sea, we can't afford to remove animals en masse for the simple pleasure of collectors. The proof is in just one year of

ban -- stopping the aquarium trade take of these species will lead to improved fishstocks, a safety net for food security and self-sufficiency that Hawai'i desperately needs.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

Puna

Hilo

My additional comment: Aloha, I am an avid snorkeler, underwater photographer and I snorkels every chance I get. Over the last 6 years I have watched many coral populations along the Kona coast die due to climate change and a warming ocean. These corals that are stressed need every fish they can to help keep them clean of the onslaught of ever growing algae. It does not make any sense to sell these fish for novelty pets so a few people can make a buck. These islands make money from tourist dollars, people come here to see these essential, beautiful, native fish. Last night I read the passage below on an underwater photography guide for travelers to Kona and it made me very sad. "Hawaiian Fish Life Some people report that the aquarium trade has taken its toll on the fish life here, and the reef fish around Kona do tend to be on the smaller side. However, there are still plenty of fish to see, especially on the less-dived sites south of Kona." The word is out. Fish collection takes it's toll. Please leave the aquarium collection ban in place and move to stop the collection of reef fish in all of Hawaii.

This does not line up with the pono practices of caring for the 'aina in Hawaii. You would never sell a I'iwi or Nene to a pet store, these fish are our native wildlife as well, and they deserve protection. Mahalo Jason Murray Small business owner and Kailua Kona Resident

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Kaikea Nakachi and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
No Hawaiian fish should be taken for aquariums

My specific concerns about those species include:

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
South Kohala

My additional comment: The aquarium trade goes against every practice Hawaiians have done for centuries. The fish are fellow Hawaiians, and they have been allowed to be stabbed, starved, and shipped off to foreign lands where the few surviving fish are used for decoration. How disrespectful and wasteful. Protect our resources, protect our identity as a healthy Hawaii. We need our reefs to be as healthy as possible if we are going to weather the effects of climate change in the coming years. This extractive practice has NO place in Hawaii.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: Many spots I've dove over the years I've seen huge depletion of all species of fish. Puako if we'd like to get into specifics.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Saturday, January 4, 2020 5:35:36 PM

Aloha Mr. Sakoda,

My name is Jeff Nance and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

Bandit Angelfish

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

My additional comment: My wife and I are both Master Scuba Instructors as well as teaching Technical diving here on Oahu for just over 20years. We have worked all sides of Oahu and the other islands too. We have seen the decline of several species, (Bandits, Reticulated Butterflies, Harlequin Shrimp and many others. This was more than a full time job for us. In addition I was the Dive Master for the Nature Conservancy on Palmyra and worked with several top marine scientists and my wife has BS in Marine Bio. We have a keen understanding of the marine habitat here. We have also witnessed the practices of the Aquarium trade. In short it is not sustainable, however eco tourism can be sustainable and depends on maintaining the health and diversity of the reefs. Please don't buckle under pressure from the aquarium trade, we cannot get the fish back once gone. Mahalo, Jeff & Melanie Nance

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Derek Nelson and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala

My additional comment: Unreal that this is even being considered again. Our reefs are being damaged by so many other influences. We can not allow fish to be taken, further damaging this fragile ecosystem.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Jesse Nordwall and I am a Part time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: I have noticed a rapid decline in the marine life especially the Yellow Tang as I snorkel at Richardson's Beach in Hilo, as well as Two Step in Kona, and the

Honokohau Harbor. In the wild, yellow tang travel alone or in loose schools, and spawn around the time of the full moon. Yellow tang are group spawners, so it is extremely difficult to breed them in captivity. Only since 2015 have researchers managed to keep a group of juvenile yellow tang alive past the larval stage. Yellow tang are also the cleaners and help sea turtles keep their shells clean, allowing the turtles to glide through the water better. With the continual removal of such species from the reefs, this not only poses a risk of the decline of Tang population in the area, but also pose serious danger to other marine life and the health of the coral reef as well. I believe enforcing stricter rules and regulations will not only benefit the local marine life and coral reefs, but also will also put Hawaii in the forefront of environmental preservation and rejuvenation. Environmental preservation and rejuvenation is still a sunrise market. Lets show the world that Hawaii stands for the land and the sea.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Larry O'Brien and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

The real possibility that future generations may not encounter these species

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: I'm a frequent diver on the reefs from North Kona to Miloli'i.

Anyone who has been in the water over the past several years can attest to the devastating damage of the 2015 bleaching event. This year's event was not as dramatic, but set back the recovery. It is established that herbivore populations are a critical part of the recovery from bleaching. (For instance,

<https://www.frontiersin.org/articles/10.3389/fmars.2019.00557/full#h6>). The health of our reefs, and their economic impact, will only face greater stress in the coming years and decades. The cost of climate change is real, and that includes having to make management decisions that impact extraction and exploitation. That is the reality we face and that our elected officials and public servants must act upon.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

South Kohala

Unfamiliar with these reefs, but still concerned.

My additional comment: we need to preserve all the native tropical fish population for maintaining biodiversity in its natural state so we, our children and their children will continue enjoying them and their beauty in their natural environment, not in aquarium tanks.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, January 6, 2020 11:46:37 PM

Aloha Mr. Sakoda,

My name is Michael Olson and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

Marine life is threatened with local extinction

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: We can't spare any fish for pets. We can't spare any for any reason. Our reefs are at risk of death. Not now.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: archticat@gmail.com

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 5:30:02 PM

Aloha Mr. Sakoda,

My name is Perry Olson and I am a Part time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
South Kohala

My additional comment: With the current West Hawaii ban now in place, it is very apparent that the fish populations are returning and the reefs environment is improving. These fish are a treasures of the Hawaiian ocean, and there is absolutely no reason why Aquarium harvesting should ever be permitted. All marine biologists that we have spoken with adamantly agree.

The DLNR is not watching out for Hawaii in any way by allowing reef fish to be taken commercially.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Kirah Orian and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Puna

Hilo

Hamakua

My additional comment: Some members of my family are fishermen and divers. Over the past 20 years, we have noticed a steady decline of fish. Reefs that once thrived are now almost bare. Some reefs are now over grown with invasive algae. "Aquarium fish" play an essential role in the marine life ecosystem. This balance must not be compromised. Scientists predict (and have noticed) that with a decline in fish populations: (1) coral bleaching will continue to

drastically rise, (2) complex food chains will continue to remain imbalanced, (3) by 2048 almost all our fish will be driven to extinction/over harvested, and (4) our oceans will be infested with jellyfish. We must unite and fight for healthy reefs and high biodiversity. We must fight for the principles of “aloha ‘aina,” which sustains life on Earth. We have the power to bring about a positive change- we need to use it!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, December 31, 2019 3:41:47 PM

Aloha Mr. Sakoda,

My name is Jamie Pardau and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

South Kohala

My additional comment: According to an article in West Hawaii Today (Dec 31,2019) the USGS stated that Hawaiian coral reefs are valued at \$863 million dollars per year. Removing the fish from our reefs that help maintain a healthy balance is short-sighted. Pawai is an area that demonstrates the deterioration of our reef system due to multiple stressors. Without the herbivores to keep a check on the alga, this would be even worse than it is.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: In the past 6 decades that I have fished, picked limu, gone squidding and snorkeling around the various reefs of our pae aina the decimation of our reefs and fish population is truly appalling. The aquarium trade no longer has a legitimate place when it comes to Hawaiian waters and should have no legitimate standing. Hawaiian fish belong in Hawaiian waters and should not be kidnapped for profit in order to be sold to rich collectors. The earth and the oceans and all the creatures that reside within are already in great peril. No changes should even be considered regarding opening West Hawaii reefs for such a repugnant purpose, and certainly not for another 15-20 years. Allowing the interests of business to rule over our collective responsibility to protect our unique environment and all the creatures within is wrong.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Date: Friday, December 6, 2019 1:16:46 AM

Aloha Mr. Sakoda,

My name is Monica Patterson and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: As an avid fish/aquarium keeper, I will say that the same joys of saltwater aquariums can be found in the freshwater hobby. There is no reason to take from our precious oceans. The reefs of Maui I've swam amongst as a child, that once held hues of vibrant orange corals and schools of adorable yellow tang and gorgeous angelfish plucking food from the rocks have been reduced to an empty wasteland of white and brown death. The changes are drastic, and occurred so quickly. We need our fish and we need our reefs; what we don't need are aquariums in our home, and this is coming from someone who has many

freshwater tanks and absolutely loves them.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Robert Pecoraro and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

Butterflyfishes

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

Hilo

South Kohala

My additional comment: I have been diving Hawaii's reefs for over 20 years. First as a visitor, and now as a full time resident. One of the reasons that I chose Hawaii Island as tourist, and now as my home, is the beautiful reefs and abundant fish life. As a diver, I have personally seen the impact of tropical fish collecting over those 20 plus years. I have seen destroyed coral heads, where Harlequin Shrimp once lived. I have seen dwindling numbers of "high priced" fish, such as Flame Angelfish and Dragon Morays. I have seen the decline in the number of herbivores, such as Yellow Tangs and Achilles Tangs. On the flip side, I have also seen the increase in fish species in those areas that have been protected from tropical fish collection. The no take zones along the Kona Coast have had significant increases in fish mass, since the protections went into place. I have also noticed increases in reef fish since the ban on fish

collection went into affect last year. I dive mostly along the Kona Coast, from Kawaihae down to Kona Paradise, but I occasionally get one to the Hilo side. I think that collection of tropical fish for personal aquariums is selfish and wasteful. Many fish die in transport and their lifespans are severely decreased due to stress. They belong on the reefs where they live for the enjoyment of all visitors and residents. I have nothing against tropical fish aquariums, but fish should be bred in captivity for those purposes. Captive breeding produces less stressed and healthier fish. I am aware that some fish do not breed or are difficult to breed in captivity, but aquarium keepers should just do without those particular fish.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, January 7, 2020 7:52:05 AM

Aloha Mr. Sakoda,

My name is Alisha Pekor and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

Butterflyfishes

Surgeonfishes

All 40 White List species

Bandit Angelfish

Angelfishes

Forcepsfish/Longnose butterflyfish

kole

Achilles tang (paku ikui)

All herbivores

Really, any species at this point that is not already being bred in captivity

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

Ka`u

Puna

Hilo

My additional comment: My family has been traveling to Hawaii for years, we practice leave no trace and only take pictures and memories. I think it is important for future visits / locals to be able to enjoy nature and get the same feeling of awe that I have. However, more importantly, I think it is vital that we let creatures live where they are meant to live - zoos and

aquariums have their time and place however I cannot see a real reason to disrupt nature and an animals freedom just because someone wants to look at a pretty fish in their home.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Patty Peters and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

South Kohala

My additional comment: This cannot be allowed. The reefs are barely hanging on and until there are more preserves put into place to ensure specie biodiversity (at least 30% of each island) the recovery will be incredibly hard. The recovery I am speaking of is the fact that Managment and reinforcement of laws and regulation for offshore operation specific to the DLNR are NOT enforced. It may as well be 200 collectors out there because once the flood

gates are open our state Management does not manage. We are already seeing endangered species of shark offshore being shot, tortured, dismembered and killed. Specific to the Oceanic White Tip shark. But never not once have we seen a single DLNR or other Management boats/eyes out to check on fishing operations. It is ignorant to think they would even show up in the daily to ensure aquarium trade was being respectful to ensure the health of a future reef. Kona specifically is losing it's draw and it could be one of the most beautiful calm places for tourists to interact with the ocean and it's inhabitants. While only "14" aquarium trade companies exploit and take the reef for personal profit the whole state could make much more money on our tour industry if we maintain and build a better reason to come here.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 1:35:20 PM

Aloha Mr. Sakoda,

My name is Erin Pinto and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: I am extremely disappointed that this issue is coming up again. It was already determined that the aquarium industry is decimating reef fish and needs to be stopped.

It is hypocritical for DLNR to go around killing land animals that they say harm the reef ecosystem, only to propose another harm to the reef ecosystem.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 5:27:08 PM

Aloha Mr. Sakoda,

My name is Louise Priest and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: I am a scuba diver instructor. I have seen the adverse effects of fish collection. I have seen attacks on fish monitors by the collectors. The beneficial effect of the ban will be reversed if you allow collecting. Scuba divers will only come if the fish are there. You risk losing a huge revenue stream for the benefit of a few suspect collectors. This makes no economic sense. You'll get more revenue from divers if you keep the ban

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 1:40:06 PM

Aloha Mr. Sakoda,

My name is Mary Quinn and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: Thirty years ago I began diving on Maui. I remember thinking that diving off the shores of Makena was like diving in an aquarium. I moved away from the islands for a while and when I returned and again began diving on Maui, I was shocked at the lack of fish, and especially at the lack of brightly colored fish. This was due to incredible overfishing by the aquarium trade. I think it is a travesty that we allowed this to happen, and having seen this decimation, that our DLNR would even consider allowing aquarium collecting again. It is almost unthinkable.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: maryquinn2@mac.com

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Sunday, December 22, 2019 8:58:18 PM

Aloha Mr. Sakoda,

My name is Erica Rainhart and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Hilo
South Kohala

My additional comment: Lanikai & Kailua easily accessible to snorkelers & divers show sparse inner reef fishes; coral communities depletion is obvious! Including the proximity to urban chemicals/toxins - stream & river deposited onto all coastlines!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, January 6, 2020 11:03:26 AM

Aloha Mr. Sakoda,

My name is ANNIE REISEWITZ and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: If DLNR reopens West Hawaii reefs to the aquarium trade, nothing in the DEIS would prevent them from collecting every day and taking even more. Hawaii can't afford to waste these fish! Experts predict that climate change will cause 70% of Hawaii's coral reefs to die by 2050 without major policy changes. This summer DLNR asked the public to stop taking the algae-eating fish necessary for Hawaii's coral reefs to survive. But the pet trade wants DLNR to allow their aquarium collectors to take unlimited numbers of those same important species. Stantec, the company responsible for this DEIS has a long history of ignoring environmental risks and disrespecting citizen voices. Take for example the Keystone Pipeline, a project greenlit by Stantec as "environmentally sound" that has since been plagued with large oil spills, including one last month that leaked 383,000 gallons of oil into wetlands.

Their 490 page DEIS similarly concludes aquarium collecting causes no significant impact to Hawaii's unique natural, socioeconomic or cultural resources. They do so by claiming that aquarium trade operations would take just 1% - 2% of the entire island-wide populations of the species they target (see page 2 of the DEIS Executive Summary), though nothing would prevent the trade from taking every last one of the species they want from any of the reefs that would reopen to them along the majority of West Hawaii's coastline.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Saturday, December 7, 2019 3:32:18 PM

Aloha Mr. Sakoda,

My name is Jean Riley and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

All 40 White List species

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

My additional comment: When we first came to the Big Island of Hawaii as visitors, about 10 years ago, we were so impressed by the variety of fish we saw in various places on the island. We were surprised to find out that these numbers were significantly smaller than Hawaii had experienced before harvesting of fish for the aquarium trade was allowed. We moved to the island a few years later. Over the last couple of years, in particular, we've noticed a distinct downturn in the amount of fish--particularly yellow tangs--visible in the waters around the Big Island. And this was WITH protections in place. We need to take care of the fish we have, before it gets any worse. The aquarium trade needs to find another place to vandalize...or better yet, stop the aquarium trade altogether.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA

review, regardless of the method of take used.

Date: Thursday, December 5, 2019 7:32:59 AM

Aloha Mr. Sakoda,

My name is Francine Roby and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: Progress was being made-- I don't understand undoing that.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: francineroby@gmail.com

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Wednesday, December 4, 2019 1:38:07 PM

Aloha Mr. Sakoda,

My name is James Rodriguez and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
ALL Hawaiian near shore species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Hamakua

South Kohala

My additional comment: For our reef to thrive all evolved species are a vital contribution to it

health. Over abundance of a type means an imbalance needing to be normalized. Removal of a single fish or organism prevents balance. NO TAKE is best plan. KAPU entire reef system for healthy recovery.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is James Rodrigues and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: Haunauma bay is a prime example of protecting reef near shore

resources. Hawaii's reef and marine resources need protection to insure reef health as the ecosystem is dependent on each species living in balance. NO Reef Resources exploitation

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Date: Friday, December 13, 2019 9:47:56 PM

Aloha Mr. Sakoda,

My name is Georgia Rogers and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
All others

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Puna
Hilo
South Kohala

My additional comment: Two step used to be proclaimed the world's best ay for snorkeling and scuba diving because of the biodiversity found on the reefs. People used to come from all

over the world to see it. We need to keep our fish here in the oceans where they belong, so residents can enjoy them and where they attract more visitors to boost the local economy. Letting aquarium dealers take them to line their own pockets with profits

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Dominic Romer Romer and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
Hilo
South Kohala

My additional comment: The ornamental fish trade has no place in Hawaii. It is no different than trophy hunting. The health of the reef depends on these fish. Once they are gone there is no coming back. The fish and the reefs in Hawaii are for the people of Hawaii. Not a fishtank

in Ohio. Money should be spent on breeding captive fish, not stealing from Hawaii's ecosystem.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Date: Tuesday, January 7, 2020 2:32:27 PM

Aloha Mr. Sakoda,

My name is Mike Rude and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
All reef fish

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
South Kohala

My additional comment: I'm a scuba instructor, I work in the ocean every day. People come to Hawaii to enjoy the ocean and see beautiful tropical fish. Eco-tourism is ever growing, but with no bright and beautiful reef fish (such as Tangs and all other herbivores) the reef will be

dead, which means less people will travel to Hawaii to enjoy it. Commercial aquarium fishing will bring irreversible damage to already harmed reef and its habitants. The riches of Hawai'i are in the ocean, please don't let them to be taken away. Especially knowing that about 80% of collected reef fish dies during the process and never makes it to aquarium.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, January 3, 2020 9:17:15 PM

Aloha Mr. Sakoda,

My name is Shannon Rudolph and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Hilo

South Kohala

My additional comment: Aloha, There is NO reason in the world we should be allowing private companies to exploit Hawai'i's natural resources! Virtual aquariums are all the rage now and you can't even tell the difference between real or cyber. Too many real fish die in transit. Save our fish for residents and for our visitors, to view in the wild. I have lived on the Kona Coast for 32 years - and it seems every year, our reef fish are fewer & fewer. The aquarium industry must end. I am a 37 year resident of Hawai'i Island. Mahalo, Shannon Rudolph - Holualoa

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: Aloha kakou, the changes occurring in the ocean due to continued fossil fuel burning pose a major threat to our reefs and the life that depend on it. Now more than ever, we need to focus on promoting healthy fish stocks who can clean the coral. The increasing coral die offs and subsequent overwhelming by invasive algae have been shown to be worse where there were lower numbers of herbivores. Areas that had more herbivores had healthy reefs. As it stands now, it is projected that we will lose 70-90% of our coral if we reach the Paris Climate Accord goals by 2100 (1.5 degree Celcius increase). It appears we will

not reach that goal, so face the potential of 99% coral dieoff by 2100 with 2.0 degree Celcius increase. We are on track to reach 3-14 degree Celcius increase by 2100 according to various sources. At 6 degree Celcius increase marine photosynthesis becomes jeopardized threatening to cut off the world's main oxygen supply. Considering the imminent threats we face, it is imperative we protect the remaining fish to clean the reefs and keep them healthy as well as increase the gene pool for nature to select survivors. Abundant fish and coral are also vital to continuing the tourist economy which comes here to see beautiful nature, not a robbed and depleted landscape. Mahalo for your consideration.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Siena Schaar and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
Hamakua

My additional comment: As a Hawai'i based biologist and environmental manager, I have become increasingly concerned and disturbed by the decreasing reef fish populations across the Main Hawaiian Islands, especially on the Kona coast of Hawai'i Island. I have watched as this trade has decimated reefs and left them desolate, all for huge profit margins that are

leaving the State. I am concerned that very little cultural assessment was utilized in this DEIS, and believe that more effort should be made to include pertinent cultural importance of herbivorous reef species that are common in this trade, especially Kole. The unequal social equity aspect of this fishery is also extremely disturbing...Hawai'i is essentially allowing our resources to be depleted all for the profit of a handful of collectors - this is not an environmentally or economically sustainable fishery and I will continue to oppose this fishery and the proposed measures of this DEIS. From an economists perspective, there are many more costs to this fishery than there are benefits. I encourage the State to conserve and protect, rather than continue to allow the exploitation of our very fragile nearshore reef environments that will become even more depleted in coming years due to global climate change and associated effects.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, December 17, 2019 12:23:25 PM

Aloha Mr. Sakoda,

My name is Mark Schacht and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: The 490 page DEIS by the aquarium trade industry concludes that aquarium collecting causes no significant impact to Hawaii's unique natural, socioeconomic or cultural resources. It does so by claiming that aquarium trade operations would take just 1% - 2% of the entire island-wide populations of the species they target (see page 2 of the DEIS Executive Summary), though nothing would prevent the trade from taking every last one of the species they want from any of the reefs that would reopen to them along the majority of

West Hawaii's coastline.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 10:42:24 AM

Aloha Mr. Sakoda,

My name is Lisa Schattenburg-Raymond and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: Our ocean and reefs are in such a fragile state, they cannot withstand further degradation. On Maui the coral bleaching is shocking. We must to our utmost to protect all these species and keep their habitats balanced.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Victoria Schroeder and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: I'm gonna be honest, I don't like the ocean that much, it makes me nervous but I respect it. And the fish are important, and honestly everything in the oceans. For the economy, it provides a gain with the tourist industry who come to see the fish. It keeps balance in the oceans that rely on these fish for food and control the populations of whatever they eat. These fish are beautiful and colorful and shouldn't be trapped in cages just for people to show off. I'm worried because the world needs beautiful fish for a hopeful future, and watching these animals disappear and die because of humans leaves me feeling hopeless that the world is doomed to become a wasteland. Also I'm doing this instead of studying for my

exam and am thus feeling reckless. Fuck rich people who're just going to kill the fish anyway because they don't know anything except that they can get away with anything.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Cc: jim.lynn@klgates.com; [VanDeWalle, Terry](mailto:VanDeWalle.Terry@hawaii.gov)
Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, January 6, 2020 11:14:14 PM

Aloha Mr. Sakoda,

My name is Angel Seery and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Morays, inverts, anything stolen off of the reef

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: When you have to start going deeper and deeper to find beautiful endemic fish species, it's incredibly disheartening. You know that anything that tries to settle and grow up in the shallows will be picked off the reef never to see home again. Everything that was once there is now gone. Flame angels are some of the most striking fish. Knowing that a small fish has had such bad experiences with divers that it cowers in between crevices is

like watching someone with post dramatic stress syndrome. Please put an end to this.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: I travel yearly to dive Hawaiian reefs and have done so for 18 years. During this time I have noticed a big drop in fish species, particularly yellow tang. Last summer I was diving on the Aggressor and failed to see a single school of yellow tang in all of my 22 dives all along the north and south kona coasts...it was so sad. Please stop this aquarium trade madness!!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Lisa Sigler and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: We have been visiting Hawaii island for 27 years. The livelihood of this island is dependent on tourism and tourists want to see fish. We have snorkeled and Kahalu'u Bay for years and have seen fish populations reduce and recover. This is due to more education about caring for the coral and the reduction of pet fishing. We implore regulators to protect his ocean and its wildlife over commercial interests.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Thursday, December 5, 2019 1:00:18 AM

Aloha Mr. Sakoda,

My name is Rachel Silverman and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Many species are taken and not reported

My specific concerns about those species include:

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Puna

Hilo

South Kohala

My additional comment: I have been swimming and snorkeling with my husband and daughter on our beautiful coral reefs, in the last six years we have seen two major bleaching events in Hawaii. More than 80% of cauliflower coral colonies have died due to warmer temperatures caused by climate change. The White List fish species are all dependent on the health of the

reef as it is their birthplace, nursery, and home. Just as the fish depend on the coral, the coral depends on the fish to help fight off the ever encroaching algae. We have seen the reef habitat for the fish, that this DEIS proposes we start collecting again, shrink and contract. The reef needs a healthy balance and right now there are so many factors that are impacting it that it would be harmful to the continued efforts to protect these vital habitats in West Hawaii. Our main industry is tourism, and harming this potential revenue stream for the benefit of a small number of people actually in Hawaii is inappropriate and reckless. Please leave the aquarium fish collection ban in place and protect these vulnerable resources for our communities and keiki! Mahalo, Rachel

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Thursday, December 12, 2019 4:25:42 PM

Aloha Mr. Sakoda,

My name is Pamela Small and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Dragon Wrasse, wrasse, Gobies,

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
South Kohala

My additional comment: Dear Councilmembers: I want to be very clear that I oppose ANY and ALL aquarium collection in the state of Hawaii, not just the Big Island (which is where I live). I scuba dive extensively and know what the reefs looked like when I was young (beautiful and abundant), as I aged (so depleted that I stopped diving Hawaii waters), and the past year (on the road to recovery with keiki fish finally making an appearance). If you were to allow collecting in West Hawaii waters to begin again, it would be devastating to our reefs and underwater ecosystem. I would also like to point out that since the laws changed to stop collecting in West Hawaii the collectors have NOT STOPPED collecting. They just moved

their operations to the EAST SIDE of Hawaii Island where they take unlimited amounts with NO PERMITS. They then truck their takes to the west side to ship to the mainland. I have watched this happen in a local industrial area. The ban needs to be island wide. As the collectors cry and claim that their livelihoods have been effected by the West side laws, they strip the east side of its fish. This aquarium collection is an embarrassment to Hawaii. The biggest appeal of the island is the ocean and the activities of the ocean. Once the fish are gone and reefs are dead, Hawaii will have very little to offer tourists and ocean lovers alike. Stop this abysmal aquarium collection trade. It's time to shut them down for good. Sincerely,
Pamela Small Kamuela

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Linda Smisko and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

South Kona

My additional comment: I have been in the water at Kahalulu and Two Step for the past 20 years as a annual visitor to Hawaii. This past September I noticed a decline in fish at both sites as well a Captain Cooks. I assumed it had to do with the warm waters and bleaching of the coral. I can't imagine that removing more fish would be advantageous to our already deteriorating ecosystem that is so vital and beautiful to the island. Please don't let more fish be removed. Leave them where they belong and are needed.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA

review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, December 16, 2019 1:50:43 AM

Aloha Mr. Sakoda,

My name is Robert Smith and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Hilo

Hamakua

My additional comment: I have been snorkeling for 20 year in Hawaii, mostly on the North Shore of Oahu and South Kihei. And I go most every day. It's absurd to think that we have excess fish for someone to harvest and sell at a profit. You really have to hunt around to find fish and rarely do you see large schools of fish. I live in Hawaii and pay the taxes so I don't like what is natural here to be taken from me for someone to sell. Who ever entertained this notion should be removed from their position and leave the state.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Donita Sparks and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Puna
Hilo

My additional comment: With all due respect, what in the world are you thinking? Please protect the reefs and their inhabitants from the aquarium trade - a selfish, ego based business. I am a frequent tourist to the Big Island and the reef fish are less bountiful every time I visit. Wildlife belongs in the wild. PROTECT OUR REEFS! Thank you, but why is this issue still

coming up? Do the right thing or I'll SPEND MY VACATION DOLLARS ELSEWHERE.
Donita Sparks

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, January 6, 2020 1:07:07 AM

Aloha Mr. Sakoda,

My name is Jennifer Stabrylla and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: I am an ocean swimmer, and personally witnessed aquarium collectors literally vacuuming up reef fish. The reefs were nearly barren, and it was such a relief when the taking of fish for aquariums was banned, and the populations started building back up. Let's not destroy this again! Also, there is little or no "official" presence to monitor these takers, and they have proven themselves not trustworthy. Keep the ban.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment:

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: rickswitzar@hotmail.com

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Sunday, January 5, 2020 6:40:40 PM

Aloha Mr. Sakoda,

My name is Michael Tada and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Angelfishes
Forcepsfish/Longnose butterflyfish
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

South Kohala

Unfamiliar with these reefs, but still concerned.

My additional comment: I worry about our coral reefs in and around Waikiki Beach.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Date: Monday, December 9, 2019 1:30:58 PM

Aloha Mr. Sakoda,

My name is Kimberly Ann Takata and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Bandit Angelfish

My specific concerns about those species include:

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: Taking fishes for aquarium use is causing harm to our reef, and water. Fishes are meant to be in the ocean/fresh water because that's where their habitat is. Hawaii was one of the best places to be until state started turning our Island into a more tourist attraction. I believe tourists would like to see the natural beauty of this state, it has so much more to offer than expensive hotels and stores. Let's keep our fishes where they belong.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: I am a saltwater reef owner. But I am more concerned about the health of the wild species. You must remember that fish in aquariums are in a more balanced and healthy environment than the wild with the state of our oceans these days. That being said, if wild caught fish are harder to get and therefore more expensive the chances of encouraging captive breeding are greatly increased. Then of course as the "pet" fish become more expensive, the amount of poaching will increase. I think that you need to put a limit on the folks who can take pet fish and also need a limit on the number of fish they can take. There are other reefs in the world that could follow the example that you set.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
Puna
Hilo
South Kohala

My additional comment: This is a no brainer! Our planet is dying because of Capitalism. We, as humans, need to stop trading our ecosystems for money! My solace, temple, peace is found whilst communing with our underwater friends that live in the reefs. Snorkeling and ocean activities are a huge reason why I make my home in Hawaii. Global Climate Change has wreaked havoc on our reefs; the least we can do is leave the fish in their natural habitat so that

they have a chance to continue creating healthy ecosystems in our oceans. The planet's survival depends upon our interrelationships of species--flora, fish, and fauna. PLEASE CHOOSE LIFE OVER THE AQUARIUM TRADE!! PLEASE KEEP THE BAN ON CAPTURING OUR TROPICAL REEF FISH. Aloha, and Mahalo for your time

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Date: Saturday, January 4, 2020 11:54:26 AM

Aloha Mr. Sakoda,

My name is Corine Tilson and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Coral

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
Puna
Hilo
Hamakua
South Kohala
Unfamiliar with these reefs, but still concerned.

My additional comment: Aquarium trade has no business in Hawaii. Aloha Aina will prevail. The reef is already being raped by toxic golf course run off, navy sonar blasts, etc. STEALING these fish from their environment is a disgusting crime, and should not be allowed or profited from!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 6:32:46 PM

Aloha Mr. Sakoda,

My name is Richard Tilton and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: To have the DLNR ignore the need to preserve our reef fish populations is to ignore their principle reason for being. I want to see hard data, scientifically gathered, to show the long term effects of the aquarium trade. If collecting is ever re-instituted, meaningful regulations need to be implemented, with collecting allowed at certain times and places. I'm also curious: What's in it for Hawaii when collectors sell to the aquarium trade? Seems like it's pretty easy money, with no benefit to us.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 3:24:58 PM

Aloha Mr. Sakoda,

My name is Vivian Toellner and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
Puffer Fish

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

Puna

Hilo

South Kohala

My additional comment: Aloha, I have snorkeled all around the Big Island of Hawai'i and am saddened to see NO Puffer fish. Just now a google of Puffer fish Hawaii, brought the first choice of selling for \$50.99 <https://www.saltwaterfish.com/product-hawaiian-spotted-puffer>. So Sad selling off Hawaii's natural resources is the main concern of our DLNR government.

Conservation is the wise use of our natural resources. We should only sell what we have a great overabundance of....and we DO NOT have an overabundance of reef fish. DLNR should be in the job of PROTECTION, not exploitation of Hawaii. Most sincerely. Vivian Toellner, Animal Advocate, Voter, Land Owner, Taxpayer.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: Before the 2018 ban, the aquarium trade in West Hawaii took nearly two times more fish than were taken by all food fishers, combined. The 14 aquarium collectors who want the reefs reopened, accounted for nearly of 80% of that take according to the DEIS, though they engaged in fish collecting just three days per week. If they get their way, and DLNR accepts this DEIS, nothing will prevent them from taking even more fish, and causing even more harm to Hawaii's threatened coral reefs. Since the 2018 ban, there are more fish on

West Hawaii reefs than there have been in decades. Don't cave into the aquarium trade!!!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Wednesday, December 4, 2019 10:19:54 PM

Aloha Mr. Sakoda,

My name is Mikal Torgerson and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

All 40 White List species

Bandit Angelfish

Angelfishes

Forcepsfish/Longnose butterflyfish

Achilles tang (paku ikui)

All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Hilo

My additional comment: I am a professional SCUBA diver and an aquarium enthusiast.

Aquariums should rely on captive breeding programs for their stock given the delicate balance of the marine ecosystem.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: Mikal@architex.com

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, December 31, 2019 6:07:27 PM

Aloha Mr. Sakoda,

My name is Claire Trester and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

My additional comment: I'm a distance swimmer. I live in North Kohala, my swims include the coast North of Kawaihae to the old Coast Guard Station, in N. Kohala. I've been a Big Island resident for 35 years. I have personally seen the impacts of Aquarium Collectors and climate change on the reefs I swim over. The massive coral bleaching events the past 5 to 7 years have been stunningly noticeable with the die back of what was once healthy coral with an abundance of reef inhabitants. It's unconscionable to allow 14 Aquarium Collectors to restart

their efforts to take from OUR REEFS, fish that are OUR STATE TREASURES. Especially at a time when OUR Reefs are under major stress loads from over fishing, rising Ocean temperature, Ocean Acidification. This is not Pono. OUR REEFS AND REEF FISH ARE NOT FOR SALE. THEY BELONG TO THE PEOPLE OF HAWAII, AND ARE A Natural MARINE STATE TREASURE. more revenue can be created keeping these delicate ecosystems intact for future generations. Now is the time to think about the "Long Game Plan". For way too many years The State of Hawaii has made decisions based on short term gain. THIS IS OUR LAST CHANCE TO SAVE OUR REEFS AND THEIR INHABITANTS. Malama Pono.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, December 10, 2019 1:00:43 AM

Aloha Mr. Sakoda,

My name is Mary True and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
Hilo
South Kohala

My additional comment: I have lived in Hawaii for 15 years and don't find the snorkeling that good here due to the lack of fish and varieties of fish, but I still do it frequently and enjoy every minute of it. The fact that aquarium collecting is even allowed on the island of Hawaii is

shocking. The fish populations and varieties are barely acceptable at this point. Why on Earth would you allow the tropical fish population to be further decimated? It feels like a few people making money destroying the natural beauty for all the rest of all. That is the black heart of capitalism. I used to snorkel at the BioReserve, but now I mostly snorkel at Richardsons, Ho`okena Two Step, Ka`alu`u, 69, and Mahukona where I am told by the kapuna that the waters were once yellow with tangs. Not any more. Please save the fish and recreational snorkeling on the islands.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Cc: jim.lynn@klgates.com; [VanDeWalle, Terry](#)
Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 3:50:05 AM

Aloha Mr. Sakoda,

My name is Carrie Trujillo and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs

Butterflyfishes

Surgeonfishes

All 40 White List species

Bandit Angelfish

Angelfishes

Forcepsfish/Longnose butterflyfish

kole

Achilles tang (paku ikui)

All herbivores

Losing the grazers and herbivores create a domino effect that also lessens the prevalence of other species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: As a marine naturalist, I don't understand how hard data can be ignored. You can't dispute facts and the fact is that taking these fish off the reef destroyed the ecosystem's entire balance, threatening the longevity of the reefs, and potentially causing catastrophic, irreversible effects.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Lisen Twigg-Smith and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
South Kohala

My additional comment: I am an ocean swimmer--have been swimming for over thirty years along the Kona coast. I've tragically witnessed diminishing populations of our reef fish and have been relieved that action was taken to protect the fish. I'm now horrified to learn that protections could be removed. To sacrifice such an important resource, so special to our

islands, to a handful of greedy, heartless fish collectors is unimaginable. Please, let's be wiser than this.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Tuesday, January 7, 2020 2:42:50 AM

Aloha Mr. Sakoda,

My name is Jules Ung and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Any Hawaiian reef fish

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: What's Happening Now With The Unnatural Decline Of Hawai'I's Fishes, They Keep Our Oceans Alive And The Coral Depletion Is Also Another Scary Fact. Please Keep Hawai'I's Fishes Life In Hawai'I Their Home.!!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Sunday, December 8, 2019 5:18:19 PM

Aloha Mr. Sakoda,

My name is Antonitaa Villa and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment:

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Saturday, December 7, 2019 1:33:55 AM

Aloha Mr. Sakoda,

My name is Suzanne Villeneuve and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
North Kohala
Hilo
South Kohala

My additional comment: I swim every day at Mahukona and I really enjoy watching all the different species of fish. It is cruel and unnatural to take the fish for pets in aquarium. Leave the fish in their natural habitat, where they belong, please.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Date: Friday, December 6, 2019 1:45:18 PM

Aloha Mr. Sakoda,

My name is Doreen Virtue and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Flame Angel Fish

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

South Kohala

My additional comment: As a long time scuba diver in Hawaii, I hear the scuba divers on the boats always talk about the diminishing fish in Hawaii, and how they will take vacations in

Mexico and Asia instead because they want to see fish while scuba diving on vacation.
Allowing the aquarium collectors will affect tourism to Hawaii.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

North Kohala

Puna

Hilo

Hamakua

My additional comment: 5 out of 95 individual said there would not be any negative impact on cultural resources made by the aquarium trade industry. That is ludacris! This looks like another rubber stamp project like so many others in our beloved Hawaii nei including most recent Mauna Kea. If this passes it will be another tax payer funded court process. A'ole!!!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

My additional comment: Mile marker 4 off Ali'I in Kona has no fish anymore. Compared to ten years ago when there were plenty of tang and other reef fishes. I recently dove this site for the first time in 2 years and was pleasantly surprised at the amount of juvenile fish. I can see the positive impact on all of our Kona side reefs of the ban on aquarium fishing. We now have juvenile fish on our reefs again. To continue to allow aquarium fishing is to allow the genocide of the tang reef fish. Don't be that legislator that allows the extension of our endemic fish for profit!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Annie Walton-Teter and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:
All 40 White List species

My specific concerns about those species include:
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.
Marine life is threatened with local extinction

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):
Unfamiliar with these reefs, but still concerned.

My additional comment: Mostly, I snorkel When visiting my family in South Maui. But I do get over to the Big Island from time to time, and it breaks my heart to see the declining biodiversity. The comeback of the yellow tang is encouraging, but by no means encouraging enough. It is obscene that our wildlife is being treated as a commodity for the enrichment of traders. At best, we are stewards of the creatures in the aina. At best, we can protect them. At worst, we should at least coexist with them. None of us "owns" them. They must not be trafficked. I use this word advisedly--what's going on here (or what will go on here if the 2018 ban is lifted) is the moral equivalent of trafficking human beings. It has to stop, and stay stopped. A huge mahalo from California .

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u

My additional comment: I have been Scuba diving the reefs in west Hawaii for over 10 years. In that time I've seen significant decline in reef fish (yellow tang, clown fish, butterfly etc). When the ban went into effect the hope was that some of these species could recover. It's just recently that I've noticed an increase in their numbers. To issue these licenses now would end whatever repopulation is currently taking place. As a recently retired concierge at a Kona resort I have seen over the years what snorkeling means to the visitors to Hawaii island. The damage to our local economy as the fish populations decline are hard to measure. The decline I've experienced over the last 10 years has been dramatic. Understanding that this is due to multiple factors (water temperatures rising, pollution) we need to protect the area we can control such as allowing the reef fish to recover. I would welcome the chance to give testimony in person as I have first hand knowledge of the situation particularly on the reefs surrounding Milolii where a large collection operation stopped operations 2 years ago. Mahalo James Ward 808-895-9656

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: The fact that this is even being considered is sickening and I will be voting against anyone who tries to push this through.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Wednesday, December 11, 2019 7:18:03 PM

Aloha Mr. Sakoda,

My name is Sheryl Weinstein and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

South Kohala

My additional comment: Please, please ban the Reef Rapers from collecting fish in Big Island waters!!! As a scuba diver & ocean conservationist I have witnessed the fish collector's work—and certain species are permanently depleted from the reef. Please maintain the ban!!!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Sunday, December 15, 2019 8:29:28 PM

Aloha Mr. Sakoda,

My name is Madolin Wells and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

South Kona

My additional comment: This is wrong. It is a crime against nature. The resurgence of fish populations after the 2018 ban is cause for celebration - but NOT for taking the abundance of nature for granted and going back to business as usual. It is also a crime against Hawai'i's DLNR regulations that shockingly flouts Hawai'i Supreme Court ruling. I urge the DLNR to withdraw consideration of reopening the reefs to outside exploitation, or the highest bidder - whatever the case may be. No amount of money can buy back species that have gone extinct. One million species overall are currently under dire threat of extinction, the consequences of

which are incomprehensible - unknown until it's too late. Thank you for your consideration.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, January 6, 2020 12:22:34 PM

Aloha Mr. Sakoda,

My name is Jeanne Wheeler and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

All 40 White List species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Unfamiliar with these reefs, but still concerned.

My additional comment: I'm most familiar with the fish in waters in/around Kealahou Bay & Punalu'u Beach Park areas.... I feel it's extremely important to protect our reefs & fishes for local enjoyment & for tourists who pay substantial \$ to come marvel at - when they are diminished, it'll be just yet another disappointment in their expensive trip/vacation. Word gets out fast these days re such situations! A far better idea would be to foster a captive fish & live-coral breeding industry - along the lines of the Kona seahorse farm.... It's safer for all the species involved - including humans who are reluctant to swim/snorkel, but would love to visit such a facility!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 12:54:44 AM

Aloha Mr. Sakoda,

My name is James Whillck and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.
Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

South Kohala

My additional comment: As a diver I am starting to see animals that haven't been seen in many years (dragon eels as an example). The value to Hawaii far exceeds the small value of taking these animals for display.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Laurel Whillock and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Dart fishes, esp. Fire Dartfish

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
South Kohala

My additional comment: I'm an avid recreational SCUBA diver. My first dive in Hawaii was in 1990 off the Kona Coast. In the ensuing 30 years I have been dismayed and disappointed to see the once vibrant tropical reef fish populations of the West side of the Big Island slowly diminish. Where I once saw large schools of yellow tang, only small, isolated populations

remained. Then, in the last two years, since aquarium fish collecting has been illegal, I've seen the yellow tang, and many other species collected for the aquarium trade, begin to replenish themselves. This replenishment is especially critical now as the coral reefs are in dire need of any, and all, assistance to return to a semblance of the health that is essential to the marine life of Hawaii. Allowing fish collecting for the aquarium industry to resume at this critical point in the midst of the ecological disaster the Hawaiian islands have recently experienced with coral bleaching and increasing water temperatures is not just short sighted, it can set a course for a bleak future. The greed of a few cannot be allowed to jeopardize the health and well being of Hawaii's fragile marine ecosystem. Please do not allow aquarium fish collecting to resume!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Helen White and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
South Kohala

My additional comment: I snorkel most days of the week up and down the Kohala coast and have done for the past 5 years. I am so familiar with Mahukona I have created a fish map of where certain fish can be regularly found. I have not witnessed any major increase in fish numbers since the ban. It would be a very sad day for all of us who enjoy the presence of the

many varieties to have them depleted or made extinct. The aquarium industry needs to invest in their own breeding programs rather than limitlessly raiding our reefs.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Sunday, December 8, 2019 6:33:49 PM

Aloha Mr. Sakoda,

My name is Carole Wiedmeyer and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
South Kohala

My additional comment: Wild animals should not be pets. The reefs are under tremendous stress from climate change, overfishing and pollution, and we should do everything we can to ease the situation, not worsen it.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is linda willaby and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Puna
Hilo
South Kohala

My additional comment: I snorkel regularly off the Puna coast, not just right at the shoreline, but further out too. I have seen fewer and fewer fish in my 11 years of living here. We must do all we can to protect our reef fish from greedy aquarium collectors. I am pretty much against private aquariums. People can watch a digital display of pretty reef fish without contributing to their demise and future extinction.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Sunday, December 8, 2019 9:44:25 PM

Aloha Mr. Sakoda,

My name is Susan Wilson and I am a Visitor/non-resident/concerned citizen. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

My additional comment: I have been diving along the Kona Coast for over 20 years, was a full-time resident for 12 years and had noticed a dramatic decline in fish over the years, especially those targeted by fish collectors. In my opinion, fish collecting ranks right up there with sport hunting for elephants and giraffes. If the DNLNR is considering reopening Hawaii reefs to fish collecting again, someone needs to take a look at whose hand is in whose pocket!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

North Kohala

Hilo

Hamakua

Unfamiliar with these reefs, but still concerned.

My additional comment:

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: Kauakeaw@yahoo.com

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 13, 2019 2:25:20 AM

Aloha Mr. Sakoda,

My name is Mark Winters and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Angelfishes
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

Hilo

My additional comment:

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, December 9, 2019 7:53:03 PM

Aloha Mr. Sakoda,

My name is Anita Wintner and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
All endemic species

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Ka`u

South Kohala

My additional comment: I am extremely concerned that even after the Hawaii Supreme Court ruled against new licenses sold and the shutdown of AQ collecting that the head of DLNR and the Attorney General failed to enforce the law and help AQ collectors get around the law.

Why do we make laws that are not enforced?!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Date: Sunday, December 8, 2019 3:16:38 PM

Aloha Mr. Sakoda,

My name is Linda Wright and I am a Part time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
Bandit Angelfish
Forcepsfish/Longnose butterflyfish

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala

My additional comment: In the thirty years I have been snorkeling and SCUBA diving in Hawaii I have seen an abrupt decline in marine life in the waters of Hawaii. In the past I was so entranced by the bounty of life as I stepped into the water. Now I find myself struggling to find fish on any given reef. This crisis is accelerated by the dangerous policy of blindly allowing the aquarium trade to be their own watchdog. More human greed is driving our own extinction. When the oceans die, we die. Sincerely, Linda Wright

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA

review, regardless of the method of take used.

Aloha Mr. Sakoda,

My name is Jim Wyban and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores
Yellow tangs

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
North Kohala
Puna
Hilo

My additional comment: I have swam in Kailua Bay for 35 years and have seen devastation of collectors. Barely any Yellow Tangs when I used to see huge schools. I say aquarium trade

collecting wild fish from our reefs is not sustainable and should be stopped. They should only use Aquaculture fish for mainland aquaria. That would stimulate an industry. Instead they do the easy thing - steal from the commons. Not cool.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: Living in Oahu's, as a resident for over 30 years I've seen yellow tangs populations decrease significantly not to mention other fish that I just don't get to see much now days! Not only fish are being depleted it's also cause more species to come around because of it. The more they take the more it destroys our natural living shores that was once abundant but due to the hobby had now killed most of our shore around. It's looking more and more like a deserted reef out there as I see this as I dive and spear fish on a weekly basis. So I'm always in the water!

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Monday, January 6, 2020 8:49:48 AM

Aloha Mr. Sakoda,

My name is Nathan Yuen and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona
South Kona
Ka`u
North Kohala
Puna
Hilo
Hamakua
South Kohala

My additional comment: The aquarium trade kills many of the fish it catches in Hawaiian waters. Even when fish make it to their ultimate destination the mortality rate is high. This is an extremely wasteful trade that should be regulated by the State of Hawaii. Strict limits needs to be placed on fish catchers and they trade must be regulated.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No

Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: 808nateyuen@gmail.com

Subject: Comments on Draft Environmental Impact Statement for Commercial Aquarium Collecting in West Hawaii
Date: Friday, December 6, 2019 9:18:32 PM

Aloha Mr. Sakoda,

My name is Dawn Zierk and I am a Full time HI resident. I am concerned about the impacts of the aquarium trade on the following species:

Yellow tangs
Butterflyfishes
Surgeonfishes
All 40 White List species
Bandit Angelfish
Angelfishes
Forcepsfish/Longnose butterflyfish
kole
Achilles tang (paku ikui)
All herbivores

My specific concerns about those species include:

The natural beauty of coral reefs is diminished by aquarium collecting.

Species once depleted by the trade are now returning. We should continue, not reverse, this trend.

Species abundance is significantly reduced by aquarium collecting.

Communities of reef species are disrupted by aquarium collecting.

Marine life is threatened with local extinction

The real possibility that future generations may not encounter these species

DLNR estimated the time to assess populations/set take limits for 40 species taken by the aquarium trade at 10-15 years. The DEIS proposes zero limits.

Scientists and DLNR have urged Hawaii residents to stop taking herbivores. Making an exception for aquarium collectors is wrong.

70% of Hawaii's reefs are projected to die within 20 years unless major changes are made.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

My additional comment: For the past 30 years, I've been swimming and snorkeling at Makalawena, Kua Bay, Kukio beach, Kaupulehu, Anaeho'omalua Bay, 49 Black Sand, Waialea, Hapuna, and Mauna Kea. There used to be so many more fish... Since the "Try Wait" period began, I've definitely noticed more baby fish, more octopus, and a healthier looking reef overall. Please, protect the reefs of Hawaii and allow them to thrive with a diverse fish population. The tourist industry will suffer if we have hardly any fish left on our reefs, but more importantly the world will suffer, since there are potentially many cures for human

ailments in the biodiversity found in coral reefs.

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

Hawaii will pay a terrible price for shipping out these fish as disposable "pets" for the luxury saltwater aquarium hobby.

Hawaii needs these fish more than ever before. Taking them for personal aquariums outside Hawaii is wasteful.

I believe some or all of the species identified above have been impacted on reefs I am familiar with in the following Hawaii Island district(s):

North Kona

South Kona

Hamakua

My additional comment: The marine preserve at Kealakekua Bay is familiar to me and I have snorkeled there many times over a period of 25 years...I have also explored the reefs at other locations along the Kona coast...It is essential that these reefs are preserved. The aquarium trade is destructive to reefs and harmful for the fish so captured. Let's be real about our reefs and stop that trade...

I urge DLNR to reject the Limited Permit Issuance (preferred) alternative, to select the No Action alternative and to require all aquarium collecting, statewide, to undergo proper HEPA review, regardless of the method of take used.

I can be reached at: jackmzimmerman@gmail.com

Comments and Applicant Responses to Website Template – West Hawaii Aquarium Fishery Survey

Commenter	State/ Location	Date Received	Comment	Response
West Hawaii Aquarium Fishery Survey Template; each commenter could select any or all of these items	n/a	n/a	I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).	Your comment has been forwarded to the decision makers.
West Hawaii Aquarium Fishery Survey Template; each commenter could select any or all of these items	n/a	n/a	1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.	Your comment has been forwarded to the decision makers.
West Hawaii Aquarium Fishery Survey Template; each commenter could select any or all of these items	n/a	n/a	2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.	Your comment has been forwarded to the decision makers.
West Hawaii Aquarium Fishery Survey Template; each commenter could select any or all of these items	n/a	n/a	3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.	Your comment has been forwarded to the decision makers.
West Hawaii Aquarium Fishery Survey Template; each commenter could select any or all of these items	n/a	n/a	4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.	Your comment has been forwarded to the decision makers.
West Hawaii Aquarium Fishery Survey Template; each commenter could select any or all of these items	n/a	n/a	5. The proposed action is an overall reduction in take over the pre-ban alternative.	Your comment has been forwarded to the decision makers.
West Hawaii Aquarium Fishery Survey Template; each commenter could select any or all of these items	n/a	n/a	6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.	Your comment has been forwarded to the decision makers.
West Hawaii Aquarium Fishery	n/a	n/a	7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".	Your comment has been forwarded to the decision makers.

Survey Template; each commenter could select any or all of these items				
West Hawaii Aquarium Fishery Survey Template; each commenter could select any or all of these items	n/a	n/a	8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.	Your comment has been forwarded to the decision makers.
West Hawaii Aquarium Fishery Survey Template; each commenter could select any or all of these items	n/a	n/a	9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.	Your comment has been forwarded to the decision makers.

Chris Buerner	CA	1/7/2020	This fishery, managed, studied, and proven sustainable for decades is one of the best models of ornamental fisheries worldwide. The State of Hawaii should be proud to manage fisheries, whether food or ornamental, successfully. It seems that increasing animal rights activism has created an environment where policy is being shaped not by good science, but rather as a result of sensationalism, and unfortunately as a result of the dissemination of misinformation and outright falsehoods. It was determined that a comprehensive Environmental Impact Study be produced, it seems that has been done in good faith, and it appears that the data and conclusions contained therein point to the fact that fish populations of the key target species are healthy and stable, and that the fishery, as has been determined repeatedly over a long period of time, continues to be very sustainable.	Your comment has been forwarded to the decision makers.

Bruce Carlson	HI	12/20/2019	As stated above, this fishery is the most thoroughly researched inshore coral reef fishery in the world. Excellent life history data on the prime species are available in the scientific literature and demonstrate why these species, with high fecundity and year-long spawning periods, can continue to replenish themselves under the current levels of fishing. This is a demonstrably sustainable fishery and has been so for decades.	Your comment has been forwarded to the decision makers.

Isaac Croas	OH	12/16/2019	Commercial harvesting in a sustained manner is critical. Bringing these fish to other parts of the world and showing their majestic nature allows for everyone to be aware of how vital and potentially fragile these ecosystems can be. By allowing these fish to travel the world, you allow us to bring Hawaii and it's customs and cultures into our homes. This is an important part of any education process and is vitally important in maintaining, nurturing, and cultivating vibrant reef systems.	Your comment has been forwarded to the decision makers.
Philip D'Agostino	NY	12/16/2019	See above comments (template format)

Michael Domeier	HI	12/16/2019	See Appendix C for a copy of this comment. Relevant template comments are provided at the beginning of this table.	Responses are provided to template comments at the beginning of this table.
Michael Domeier	HI	12/16/2019	As an active researcher with a Ph.D. in coral reef fish ecology, I can say with 100% certainty that the aquarium fishery proposed for West Hawaii is sustainable, while also allowing people a means to make a living. The fishery is targeting very recently recruited juveniles that have a very high natural mortality rate; in other words, a majority of the individuals collected would not survive the next 3-months in any event. The state's own data, collected by DLNR, demonstrate that this fishery is healthy and viable.	Your comment has been forwarded to the decision makers.
Audrey Dunleavy	NJ	1/7/2020	See Appendix C for a copy of this comment. Relevant template comments are provided at the beginning of this table.	Responses are provided to template comments at the beginning of this table.

Matthew Duren	FL	1/7/2020	Ornamental fish collection in Hawaii has been shown to be sustainable based on fish population trends being nearly identical in fished areas vs non. Providing too few areas for responsible fishing in Hawaii will cause a black market for the aquarium industry, including more fish being collected in ways that are significantly less environmentally friendly in other parts of the world, including collection by cyanide.	Your comment has been forwarded to the decision makers.

			more research into captive breeding programs. The ability to maintain a sustainable fishery will fuel captive breeding programs that can help repopulate other reefs while also supplying the aquarium industry. I do believe that worldwide our reefs are in trouble and that we should do everything we can to raise awareness about reef environments while also learning how to maintain these organisms artificially so they can be preserved for future generations. When people see the beauty of ornamental fish for aquariums it brings them closer to the cause of preserving this natural wonder with sustainable practices that are responsibly managed.	
Joseph Genero	VA	12/16/2019	See Appendix C for a copy of this comment. Relevant template comments are provided at the beginning of this table.	Responses are provided to template comments at the beginning of this table.
Joseph Genero	VA	12/16/2019	Please allow collection of fish in Hawaii again. The fisherman really respect the waters and the fish and will collect responsibly. Thank you	Your comment has been forwarded to the decision makers.

Josh Haber	Canada	12/19/2019	I think the fishery needs to reopen, it's been proven time and time again that it's sustainable. Funny that these fish can be taken out of the ocean for food and that's no issue, but aquarium owners who can provide a fish with a happy habitat for decades and put a fish in a position to actually out live the average lifespan in the wild are a danger to the environment.	Your comment has been forwarded to the decision makers.

Les Kaufman	MA	12/20/2019	<p>I am a marine conservation biologist, expert on coral reef fishes, who has worked extensively in the Pacific, including the main islands of Hawaii. As the PI of a large research grant on marine managed areas, I funded a study of the Fish Replenishment Areas along the Kona coast that provided a portion of the evidence that the aquarium industry can be and indeed had been a sustainable fishery. Therefore, on the basis of this and much other evidence, I support the reopening of the fishery. I am familiar with the opposition to the fishery and find the arguments supporting this position to be inconsistent with the body of evidence. In addition, as an admirer of the native Hawaiian culture and relationship with the sea, opposition to the aquarium fishery on the grounds that it is disrespectful to Hawaii or dangerous to the future of Hawaiian coral reefs strikes me as both false and offensive, a position endorsed by friends of mine who are active in the resurgence of interest in the Hawaiian culture and way of life. Given the immense pressures bearing down on Hawaiian ecosystems from anthropogenic climate change, poorly regulated fishing, and coastal development- all clearly unsustainable in their current manifestations- closely regulated aquarium fish collecting is an activity whose ultimate impacts are likely to be positive, not negative. It supports livelihoods, celebrates and shares Hawaii's environmental legacy, and when properly managed is not at all in conflict with the enjoyment of Hawaii's marine life in their natural context through snorkeling and diving. Meanwhile the abovementioned factors pose looming existential threats. A plan for the aquarium industry in Hawaii should be crafted that explores the ideal way for this kind of enterprise to develop and mature, with a goal of achieving the highest truly sustainable volume commensurate with demand. It is important to underscore that "sustainable" in this context does not mean the traditional definition in antiquated fisheries science where one half the population or biomass is exploited. Rather, the sustainability of collecting for the aquarium trade should leave enough fishes and other organisms still on the reef to ensure that the system as a whole is self-sustaining and able to deliver the full suite of ecosystem services of which it is capable and on which people depend. Doing so is entirely consistent with a carefully and closely managed aquarium trade at the level proposed for the reopening fo this fishery. In addition, in order to assure that Hawaii's coral reefs survive, Hawaii must support, with every fiber of its being, efforts to battle climate change and to keep the global average temperature from rising</p>	Your comment has been forwarded to the decision makers.

Matt Pedersen	MN	1/7/2020	The subject of Hawaii's aquarium fishery has been something I've followed for over a decade now. I have submitted public commentary most every time attempts have been made to shutter the fishery. I was asked to personally weigh in once again, otherwise, I would have likely remained silent as the data and science alone should be all that is needed to settle this matter in favor of the fishery. My background as an aquarist of over 37 years, a globally-recognized award-winning aquarist and marine fish breeder, and active leader in the advancement of the art and science of aquarium keeping and captive propagation, gives me a unique perspective from which to comment. As a sportfisherman, I'm well aware of the role that state agencies play when tasked with the mandate to manage natural resources, whether a tiny trout stream a mile from my house, or the delicate balance of salmon and alewife populations in the Great Lakes. Given my understanding of these practices, I firmly believe Hawaii's marine aquarium fishery, managed by DAR / DLNR, was already an unparalleled example of excellent fisheries management. However, well-	Your comment has been forwarded to the decision makers.

			<p>funded antiaquarium activists have used emotional arguments and outright misinformation to urge the state of Hawaii to close this fishery for over a decade, and yet their attempts have been consistently rejected on the basis of data and science. In this regard, the very fact that we are here, today, jumping through endless hurdles to reopen a legal and successful fishery, is an utter waste of resources and capital, all because of a single court ruling that flew in the face of common sense, however well-intentioned or reasoned the judge may have felt when overturning lower court rulings. No thought was given to the data, no respect given to the state agencies charged with collecting and managing the data, only a capitulation to anti-aquarium activists who sought any and every manner possible to shut down this legal, well-managed fishery, on emotional grounds. The fact remains today that a relatively small industry had been shuttered for 2 years now all, with untold economic losses, and great expense incurred to defend already well-proven science and data. As an aquarist and scientist, the statements and arguments made by those whom oppose this fishery are without merit, and often are actually outright lies used to incite people into blindly accepting, and then regurgitating, baseless allegations and concerns. I find it rather ironic that those who oppose the harvest of Acanthurus achilles, the Achilles Tang, for aquarium purposes (where it will generate up to \$300 per fish at the end retail level), will gladly turn a blind eye to spearfishing that same fish and selling it for \$4.99/lb in a local food market. Such a disconnect cuts to the very core of their mission; this isn't about concern over whether the aquarium fishery was sustainable (it IS and was already demonstrated to be prior), this battle has been purely about people keeping fish in aquariums. In terms of coral reef management and any fishery there, what happens to a fish after it is harvested is irrelevant. The fish is no longer in the ecosystem. All that matters, from a fishery standpoint, is how that removal impacts the system. The decades of data overwhelmingly supported that Hawaii's fishery was responsive, wellmanaged, and sustainable, long before any environmental assessment or impact statement was prepared. The state is not tasked with legislating the morality of aquarium keeping. No, the state and its agencies are tasked with oversight of the state's natural resources. While I am aware that current proposals proffer limited access to the fishery with just 14 permits, given the historic data collected by the nonpartisan state agency tasked with managing this resource, I don't believe this recommendation is even necessary...I think it's just one of many "capitulations" and "compromises" that Hawaii's aquarium fishermen have felt pressured to make when in fact that data never suggested that they even need to make these sacrifices. I think it's time the state stood up for the fishermen, and the management agencies who made this fishery what it was....until it was shuttered. I believe the decision</p>

Commenter	State/ Location	Date Received	Comment	Response
			regarding the number of permits, and the management of the fishery, be returned expressly to the qualified biologists who were asked to manage the fishery successfully and did just that. Given the never-ending attacks on this fishery, and the repeated data that removes any doubts, that the fishermen and the DLNR be granted a reprieve from future attacks. As we have seen, that debate over the past decade has been far from fair. The fishermen and the DLNR had to defend themselves successfully each and every time they were attacked with a bevy of emotional arguments and misinformation...it only took one "win" for those opposed to shut down an entire industry. As such, the debate was incredibly stacked in favor of those who wished to impose their personal morality and ethics upon everyone else through the government. I am aware that there has been an active campaign to collect as many anti-aquarium trade comments as possible by those behind these and other past attempts to shutter the trade. The aquarium hobby, and trade, has effectively avoided flooding the government with such superfluous commentary. I ask that those reviewing all the submitted commentary, charged with rendering a decision, understand that it is the QUALITY of the commentary, and not the quantity, that matter. The decision to reopen Hawaii's marine aquarium fishery is not a high school student body election, where whomever rabble rouses the most mindless followers wins. No, this is 100% a question of sound science and fisheries management practices. I believe, based on historical data, that to shutter this fishery was a mistake and an insult to the fisheries managers, and that it should be reopened without further delay.

Matthew Runo	CA	12/16/2019	While protecting the Hawaiian reefs is of the utmost importance, one way that can be done is by gathering money and promoting the aquarium hobby - which brings Hawaiian species to people around the world where children and adults alike can learn to appreciate and value the natural resources of the reefs. Having this fishery under regulation and allowing this limited number of collectors access is a great way to both protect the species that inhabit the waters and also promote the Hawaiian reefs to the world. Anchor Sarslow	MN	12/19/2019	It is really a good idea to manage resources rather than ban their use. There are many examples nationally as well as worldwide. Not only are the animals better served being managed, but also against the effects of non-management. Examples include runaway populations and loss of other unintended populations due to lack of a management system. Banning has served almost nobody, including the incomes of people on the economic side of this.	Your comment has been forwarded to the decision makers.

Dan Sheets	ID	12/16/2019	Not only is this sustainable, but opening the fishery encourages more people to get educated and involved with protecting these types of resources. By encouraging this industry, greater awareness will develop and side markets will grow that could address other issues that plague different aspects of sustainable fishing.	Your comment has been forwarded to the decision makers.

Milton Terazono	HI	12/13/2019	It is my opinion that the DLNR's adoption of the Draft Environmental Impact Statement (DEIS) analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area is justified and warranted. The reasons why the fishery should be re-opened in West Hawai'i are that current data, current fish populations and historical catch information collected for the DEIS indicate that the fishery is indeed sustainable. Further more, the two shut down period has affected several aquarium fishery businesses in West Hawaii in a negative way by putting people out of work. Thank you for allowing me to offer my comments on this matter.	Your comment has been forwarded to the decision makers.
Sean Terazono	HI	12/25/2019	See Appendix C for a copy of this comment. Relevant template comments are provided at the beginning of this table.	Responses are provided to template comments at the beginning of this table.

Michael Wand	CA	1/7/2020	UH Manoa Alumni, Microbiology, 2009. Have scuba dived every island in Hawai'i, along with much of the world, with great love for our oceans and fish. Hawaii has always had best practices and the most sustainable fisheries, and I support reopening these sites for aquatic collection use. Safe, sustainable, and responsible collection and later care and keep of just a sliver of our oceans and reefs inspire children, our next generation, and people, and I believe have a strong positive net effect towards educating and demonstrating the importance and beauty of these animals to the world, and help to bring environmental concerns such as climate change and its effects on the reef into more people that may not otherwise have as much perspective.	Your comment has been forwarded to the decision makers.

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Tuesday, January 7, 2020 7:49:28 PM

This survey was submitted at 1:48:20am GMT on 01/08/2020

Aloha Mr. Sakoda,

My name is Joshua Ables and I am a resident of Dallas, TEXAS.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at joshua_ables@hotmail.com

4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at eea60@hotmail.com

This survey was submitted at 8:05:04pm GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Katy Adams and I am a resident of Tulsa, OKLAHOMA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Tuesday, January 7, 2020 10:35:05 PM

This survey was submitted at 4:33:53am GMT on 01/08/2020

Aloha Mr. Sakoda,

My name is Lisa Badach and I am a resident of Vernon, BC.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at ajpet@shaw.ca

2. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
3. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
4. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
5. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
6. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

This survey was submitted at 7:40:52pm GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Jeff Birch and I am a resident of Canada, .

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Tuesday, January 7, 2020 3:36:32 PM

This survey was submitted at 9:35:16pm GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is G L Brown and I am a resident of Ada, MICHIGAN.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

A great piece of work

Aloha Mr. Sakoda,

My name is Chris Buerner and I am a resident of California, .

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

This fishery, managed, studied, and proven sustainable for decades is one of the best models of ornamental fisheries worldwide. The State of Hawaii should be proud to manage fisheries, whether food or ornamental, successfully. It seems that increasing animal rights activism has created an environment where policy is being shaped not by good science, but rather as a result of sensationalism, and unfortunately as a result of the dissemination of misinformation and outright falsehoods. It was determined that a comprehensive Environmental Impact Study be produced, it seems that has been done in good faith, and it appears that the data and conclusions contained therein point to the fact that fish populations of the key target species are healthy and stable, and that the fishery, as has been determined repeatedly over a

long period of time, continues to be very sustainable.

This survey was submitted at 6:36:06am GMT on 12/20/2019

Aloha Mr. Sakoda,

My name is Bruce Carlson and I am a resident of Ewa Beach, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

As stated above, this fishery is the most thoroughly researched inshore coral reef fishery in the world. Excellent life history data on the prime species are available in the scientific literature and demonstrate why these species, with high fecundity and year-long spawning periods, can continue to replenish themselves under the current levels of fishing. This is a demonstrably sustainable fishery and has been so for decades.

Aloha Mr. Sakoda,

My name is Scott Carr and I am a resident of BALA CYNWYD, .

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at caquariumsmail@aol.com

3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

This survey was submitted at 11:44:44pm GMT on 12/16/2019

Aloha Mr. Sakoda,

My name is Pierson Connors and I am a resident of Boulder, COLORADO.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The proposed action is an overall reduction in take over the pre-ban alternative.
5. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.

This survey was submitted at 10:24:19pm GMT on 12/16/2019

Aloha Mr. Sakoda,

My name is Isaac Croas and I am a resident of Olmsted Falls, OH.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

Commercial harvesting in a sustained manner is critical. Bringing these fish to other parts of the world and showing their majestic nature allows for everyone to be aware of how vital and potentially fragile these ecosystems can be. By allowing these fish to travel the world, you allow us to bring Hawaii and it's customs and cultures into our homes. This is an important part of any education process and is vitally important in maintaining, nurturing, and cultivating vibrant reef systems.

7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:
A managed fisheries is a healthy fisheries.

Date: Monday, December 16, 2019 6:50:21 PM

This survey was submitted at 12:49:14am GMT on 12/17/2019

Aloha Mr. Sakoda,

My name is Tiki Defever and I am a resident of Kona, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:
It's time to listen to science, not deliberate misinformation!

Date: Monday, December 16, 2019 1:13:53 PM

This survey was submitted at 7:12:31pm GMT on 12/16/2019

Aloha Mr. Sakoda,

My name is Michael Domeier and I am a resident of Kailua Kona, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

As an active researcher with a Ph.D. in coral reef fish ecology, I can say with 100% certainty that the aquarium fishery proposed for West Hawaii is sustainable, while also allowing people a means to make a living. The fishery is targeting very recently recruited juveniles that have a very high natural mortality rate; in other words, a majority of the individuals collected would not survive the next 3-months in any event. The state's own data, collected by DLNR, demonstrate that this fishery is healthy and viable.

This survey was submitted at 1:19:38pm GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Matthew Duren and I am a resident of Tampa, FL.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

Ornamental fish collection in Hawaii has been shown to be sustainable based on fish population trends being nearly identical in fished areas vs non. Providing too few areas for responsible fishing in Hawaii will cause a black market for the aquarium industry, including more fish being collected in ways that are significantly less environmentally friendly in other parts of the world, including collection by cyanide.

2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at rfamilton@windstream.net

Date: Monday, January 6, 2020 9:45:39 PM

This survey was submitted at 3:44:30am GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Randy Frnley and I am a resident of Aiea,Hi 96701, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

7. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

Emotional and political issues have no place in resource management issues.

Science has proven again and again, that the aquarium fishery does not threaten the populations of reef dogs in West Hawaii.

This survey was submitted at 1:21:42pm GMT on 12/20/2019

Aloha Mr. Sakoda,

My name is Scott Gardner and I am a resident of Birmingham, AL.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

Additionally, I would like to state the following:

I don't support fish collection unless it's going toward captive breeding efforts.

I can be reached at tuffy22222@gmail.com

This survey was submitted at 5:16:53pm GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Tyler Garrett and I am a resident of Cottonwood, CA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at tylergarrett70@yahoo.com

Aloha Mr. Sakoda,

My name is Alex Gawura and I am a resident of North Aurora, ILLINOIS.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

I believe that a sustainable well managed fishery not only benefits the economy but also helps to build environmental awareness of our coral reefs. Artificial reefs maintained in aquariums today might be looked at as simply a hobby but it has also fostered an economy and demand for more research into captive breeding programs. The ability to maintain a sustainable fishery will fuel captive breeding programs that can help repopulate other reefs while also supplying the aquarium industry. I do believe that worldwide our reefs are in trouble and that we should do everything we can to raise awareness about reef environments while also learning how to maintain these organisms artificially so they can be preserved for future generations. When people see the beauty of ornamental fish for aquariums it brings them closer to the

cause of preserving this natural wonder with sustainable practices that are responsibly managed.

My name is Tommaso Guarino and I am a resident of Jamesburg, NEW JERSEY.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at guarinot@kean.edu

Aloha Mr. Sakoda,

My name is Josh Haber and I am a resident of Calgary, ALBERTA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

I think the fishery needs to reopen, it's been proven time and time again that it's sustainable. Funny that these fish can be taken out of the ocean for food and that's no issue, but aquarium owners who can provide a fish with a happy habitat for decades and put a fish in a position to actually out live the average lifespan in the wild are a danger to the environment.

9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

We own an aquarium maintenance company in Columbus, OH & our clients who love their saltwater fish are more aware and active in protecting the ocean because of their fish. As well as anyone who see's their set-up. So banning Hawaiian fish will only make them unaware of the beauty that you are trying to protect.

Aloha Mr. Sakoda,

My name is Mayumi Hirata and I am a resident of Waipahu, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at mayumi910@aol.com

3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at ek@imuaeak

This survey was submitted at 10:30:06pm GMT on 01/05/2020

Aloha Mr. Sakoda,

My name is Kapono Kahele-bishop and I am a resident of Milolii, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Aloha Mr. Sakoda,

My name is Kapono Kaluhiokalani and I am a resident of Laie, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

The data is proof that the aquarium fishery is sustainable. With continuous careful monitoring and reasonable regulation, the fishery can thrive and continue to provide.

Date: Friday, December 20, 2019 7:57:32 PM

This survey was submitted at 1:56:23am GMT on 12/21/2019

Aloha Mr. Sakoda,

My name is Les Kaufman and I am a resident of Massachusetts, .

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
2. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
3. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
4. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

I am a marine conservation biologist, expert on coral reef fishes, who has worked extensively in the Pacific, including the main islands of Hawaii. As the PI of a large research grant on marine managed areas, I funded a study of the Fish Replenishment Areas along the Kona coast that provided a portion of the evidence that the aquarium industry can be and indeed had been a sustainable fishery. Therefore, on the basis of this and much other evidence, I support the reopening of the fishery. I am familiar with the opposition to the fishery and find the arguments supporting this position to be inconsistent with the body of evidence. In addition, as an admirer of the native Hawaiian culture and relationship with the sea, opposition to the aquarium fishery on the grounds that it is disrespectful to Hawaii or dangerous to the future of Hawaiian coral reefs strikes me as both false and offensive, a position endorsed by friends of mine who are active in the resurgence of interest in the Hawaiian culture and way of life. Given the immense pressures bearing down on Hawaiian ecosystems from anthropogenic climate change, poorly regulated fishing, and coastal development- all clearly unsustainable in their current manifestations- closely regulated aquarium fish collecting is an activity whose ultimate impacts are likely to be positive, not negative. It supports livelihoods, celebrates and shares Hawaii's environmental legacy, and when properly managed is not at all in conflict with the enjoyment of Hawaii's marine life in their natural context through snorkeling and diving. Meanwhile the above-mentioned factors pose looming existential threats. A plan for the aquarium industry in Hawaii should be crafted that explores the ideal way for this kind of enterprise to

develop and mature, with a goal of achieving the highest truly sustainable volume commensurate with demand. It is important to underscore that "sustainable" in this context does not mean the traditional definition in antiquated fisheries science where one half the population or biomass is exploited. Rather, the sustainability of collecting for the aquarium trade should leave enough fishes and other organisms still on the reef to ensure that the system as a whole is self-sustaining and able to deliver the full suite of ecosystem services of which it is capable and on which people depend. Doing so is entirely consistent with a carefully and closely managed aquarium trade at the level proposed for the reopening fo this fishery. In addition, in order to assure that Hawaii's coral reefs survive, Hawaii must support, with every fiber of its being, efforts to battle climate change and to keep the global average temperature from rising more than two degrees Celsius. The majesty of this task dwarfs concerns about the aquarium fishery, and failure in this regard entirely moots debate as to the pluses and minuses of allowing the collection of reef dwelling creatures for home aquaria.

Date: Tuesday, January 7, 2020 12:21:12 AM

This survey was submitted at 6:20:02am GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Paul Kimsel and I am a resident of Waianae, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at kimselpaul@yahoo.com

9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

Lived on Big Island for over 25 years. The fish on the reef now are just as plentiful as they were in 1979. It is a crying shame that dive charters are under no control to protect the reefs. Have personally observed large oil slicks surrounding dive boats due to lotions on people. They have been seen harassing turtles and monk seals and disposing of waste into the ocean. Tropical fish collectors take extreme care to protect the reefs, their source of income.

Date: Tuesday, December 17, 2019 6:43:09 PM

This survey was submitted at 12:42:02am GMT on 12/18/2019

Aloha Mr. Sakoda,

My name is Stephen Krajeski and I am a resident of Bridgewater, MA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at SKrajeski@gmail.com

Date: Sunday, December 15, 2019 8:34:09 PM

This survey was submitted at 2:32am GMT on 12/16/2019

Aloha Mr. Sakoda,

My name is Keynin Kretz and I am a resident of 96816, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

I have seen the research and evidence for both sides of this environmental issue. DLNR with fish catch reports have shown that this industry of fishing is sustainable. Both sides need to work together and keep it sustainable. Environmentalists, fishermen and DNLR need to have meetings and keep all fishing sustainable for all future generations!

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Friday, December 27, 2019 2:46:12 PM

This survey was submitted at 8:28:12pm GMT on 12/27/2019

Aloha Mr. Sakoda,

My name is Alsworth Lee and I am a resident of Kailua Kona, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at alsworthlee@gmail.com

Date: Tuesday, January 7, 2020 1:00:04 PM

This survey was submitted at 6:58:40pm GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Auden Lujan and I am a resident of Odessa, TEXAS.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at audenlujan@ymail.com

Aloha Mr. Sakoda,

My name is John Maloney and I am a resident of Port Saint Lucie, FL.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

Additionally, I would like to state the following:

Limiting it to 14 licenses isn't about sustainability, it is probably about creating a cartel around those license holders. Bag limits would address sustainability concerns. Ask those 14 give up their licenses to 14 other fisherman and you will see what I mean.

7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Date: Monday, January 6, 2020 7:21:49 PM

This survey was submitted at 1:20:38am GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Matt Messer and I am a resident of Gastonia, NORTH CAROLINA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

Aloha, Essentially this is a choice of; 1. Accepting the 20 year Hawaii State studies of the Aquarium fishery, their monitoring, and professional scientific interpretation of the data which shows the sustainability of the Aquarium Fishery; Or 2. Alternately accepting layman opinions that oppose the aquarium fishery and their untrained interpretation of the data over and above the scientific community.

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Sunday, December 15, 2019 7:53:44 PM

This survey was submitted at 1:52am GMT on 12/16/2019

Aloha Mr. Sakoda,

My name is Ronda Navalta and I am a resident of Nueva Vizcaya, Philippines, .

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Tuesday, January 7, 2020 1:32:30 AM

This survey was submitted at 7:31:19am GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Matt Pedersen and I am a resident of Duluth, MINNESOTA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.

Additionally, I would like to state the following:

The subject of Hawaii's aquarium fishery has been something I've followed for over a decade now. I have submitted public commentary most every time attempts have been made to shutter the fishery. I was asked to personally weigh in once again, otherwise, I would have likely remained silent as the data and science alone should be all that is needed to settle this matter in favor of the fishery. My background as an aquarist of over 37 years, a globally-recognized award-winning aquarist and marine fish breeder, and active leader in the advancement of the art and science of aquarium keeping and captive propagation, gives me a unique perspective from which to comment. As a sportfisherman, I'm well aware of the role that state agencies play when tasked with the mandate to manage natural resources, whether a tiny trout stream a mile from my house, or the delicate balance of salmon and alewife populations in the Great Lakes. Given my understanding of these practices, I firmly believe Hawaii's marine aquarium fishery, managed by DAR / DLNR, was already an unparalleled example of excellent fisheries management. However, well-funded anti-aquarium activists have used emotional arguments and outright misinformation to urge the state of Hawaii to close this fishery for over a decade, and yet their attempts have been consistently rejected on the basis of data and science. In this regard, the very fact that we are here, today, jumping through endless hurdles to reopen a legal and successful fishery, is an utter waste of resources and capital, all because of a single court ruling that flew in the face of common sense, however well-intentioned or reasoned the judge may have felt when overturning lower court rulings. No thought was given to the data, no respect given to the state agencies charged with collecting

and managing the data, only a capitulation to anti-aquarium activists who sought any and every manner possible to shut down this legal, well-managed fishery, on emotional grounds. The fact remains today that a relatively small industry had been shuttered for 2 years now all, with untold economic losses, and great expense incurred to defend already well-proven science and data. As an aquarist and scientist, the statements and arguments made by those whom oppose this fishery are without merit, and often are actually outright lies used to incite people into blindly accepting, and then regurgitating, baseless allegations and concerns. I find it rather ironic that those who oppose the harvest of *Acanthurus achilles*, the Achilles Tang, for aquarium purposes (where it will generate up to \$300 per fish at the end retail level), will gladly turn a blind eye to spearfishing that same fish and selling it for \$4.99/lb in a local food market. Such a disconnect cuts to the very core of their mission; this isn't about concern over whether the aquarium fishery was sustainable (it IS and was already demonstrated to be prior), this battle has been purely about people keeping fish in aquariums. In terms of coral reef management and any fishery there, what happens to a fish after it is harvested is irrelevant. The fish is no longer in the ecosystem. All that matters, from a fishery standpoint, is how that removal impacts the system. The decades of data overwhelmingly supported that Hawaii's fishery was responsive, well-managed, and sustainable, long before any environmental assessment or impact statement was prepared. The state is not tasked with legislating the morality of aquarium keeping. No, the state and its agencies are tasked with oversight of the state's natural resources. While I am aware that current proposals proffer limited access to the fishery with just 14 permits, given the historic data collected by the nonpartisan state agency tasked with managing this resource, I don't believe this recommendation is even necessary...I think it's just one of many "capitulations" and "compromises" that Hawaii's aquarium fishermen have felt pressured to make when in fact that data never suggested that they even need to make these sacrifices. I think it's time the state stood up for the fishermen, and the management agencies who made this fishery what it was....until it was shuttered. I believe the decision regarding the number of permits, and the management of the fishery, be returned expressly to the qualified biologists who were asked to manage the fishery successfully and did just that. Given the never-ending attacks on this fishery, and the repeated data that removes any doubts, that the fishermen and the DLNR be granted a reprieve from future attacks. As we have seen, that debate over the past decade has been far from fair. The fishermen and the DLNR had to defend themselves successfully each and every time they were attacked with a bevy of emotional arguments and misinformation...it only took one "win" for those opposed to shut down an entire industry. As such, the debate was incredibly stacked in favor of those who wished to impose their personal morality and ethics upon everyone else through the government. I am aware that there has been an active campaign to collect as many anti-aquarium trade comments as possible by those behind these and other past attempts to shutter the trade. The aquarium hobby, and trade, has effectively avoided flooding the government with such superfluous commentary. I ask that those reviewing all the submitted commentary, charged with rendering a decision, understand that it is the QUALITY of the commentary, and not the quantity, that matter. The decision to reopen Hawaii's marine aquarium fishery is not a high school student body election, where whomever rabble rouses the most mindless followers wins. No, this is 100% a question of sound science and fisheries management

practices. I believe, based on historical data, that to shutter this fishery was a mistake and an insult to the fisheries managers, and that it should be reopened without further delay.

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Tuesday, January 7, 2020 8:00:40 AM

This survey was submitted at 1:59:23pm GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is FIDEL PEREZ and I am a resident of Miami Beach, FLORIDA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

The Hawaii tropical fish is a big part of the salt aquarium business trade. This business properly manage is sustainable and feeds and supports a lot of families all over the world.

6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at Sales@bennystropicalfish.com

This survey was submitted at 2:08:49am GMT on 01/08/2020

Aloha Mr. Sakoda,

My name is Branden Rakita and I am a resident of Colorado Springs, COLORADO.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Tuesday, January 7, 2020 12:59:05 PM

This survey was submitted at 6:57:59pm GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Robin Roy and I am a resident of Lewisville, TX.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Date: Monday, December 16, 2019 10:26:07 PM

This survey was submitted at 4:25:00am GMT on 12/17/2019

Aloha Mr. Sakoda,

My name is Matthew Runo and I am a resident of Whittier, CALIFORNIA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
3. The proposed action is an overall reduction in take over the pre-ban alternative.
4. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
5. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
6. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
7. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

While protecting the Hawaiian reefs is of the utmost importance, one way that can be done is by gathering money and promoting the aquarium hobby - which brings Hawaiian species to people around the world where children and adults alike can learn to appreciate and value the natural resources of the reefs. Having this fishery under regulation and allowing this limited number of collectors access is a great way to both protect the species that inhabit the waters and also promote the Hawaiian reefs to the world.

9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

It is really a good idea to manage resources rather than ban their use. There are many examples nationally as well as worldwide. Not only are the animals better served being managed, but also against the effects of non-management. Examples include runaway populations and loss of other unintended populations due to lack of a management system. Banning has served almost nobody, including the incomes of people on the economic side of this.

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Sunday, December 29, 2019 4:14:25 PM

This survey was submitted at 10:13:16pm GMT on 12/29/2019

Aloha Mr. Sakoda,

My name is Michael Schwartz and I am a resident of Roanoke, TEXAS.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

This survey was submitted at 7:49:28pm GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Richard Serfass and I am a resident of Davison, MI.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

being involved not only in the pet industry but also in the forestry industry in michigan I applaud hawaii's action to protect the ocean enviroment. i also realize that as long as the fisheries industry proceeds in a sustainable manner we should be able to coexist with other groups who are trying to protect the enviroment. Thank you for the opportunity to express our opinions.

9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

Not only is this sustainable, but opening the fishery encourages more people to get educated and involved with protecting these types of resources. By encouraging this industry, greater awareness will develop and side markets will grow that could address other issues that plague different aspects of sustainable fishing.

6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

This survey was submitted at 1:23:50am GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is Marc Silverman and I am a resident of Merrick, NY.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Aloha Mr. Sakoda,

My name is Wayne Sugiyama and I am a resident of Honolulu, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

This survey was submitted at 5:46am GMT on 12/14/2019

Aloha Mr. Sakoda,

My name is Milton Terazono and I am a resident of Captain Cook, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

It is my opinion that the DLNR's adoption of the Draft Environmental Impact Statement (DEIS) analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area is justified and warranted. The reasons why the fishery should be re-opened in West Hawai'i are that current data, current fish populations and historical catch information collected for the DEIS indicate that the fishery is indeed sustainable. Further more, the two shut down period has affected several aquarium fishery businesses in West Hawaii in a negative way by putting people out of work. Thank you for allowing me to offer my comments on this matter.

Subject: Web Form: West Hawaii Aquarium Fishery Survey
Date: Wednesday, December 25, 2019 12:33:24 AM

This survey was submitted at 6:32:13am GMT on 12/25/2019

Aloha Mr. Sakoda,

My name is Tristin Terazono and I am a resident of Kealahou, Hawaii.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at Tristintaigaterazono@gmail.com

Date: Tuesday, January 7, 2020 5:46:14 AM

This survey was submitted at 11:45:03am GMT on 01/07/2020

Aloha Mr. Sakoda,

My name is RICHARD TERRELL and I am a resident of Monroeville, PENNSYLVANIA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
3. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
4. The proposed action is an overall reduction in take over the pre-ban alternative.
5. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
6. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
7. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

As a marine biologist who had visited the beautiful Hawaiian Islands I share the desire top piece and project the unique biodiversity of their waters. But sustainable use creates more incentive to do so for the fishermen and their families as the environment is their livelihood.

Aloha Mr. Sakoda,

My name is Kealani Tirona and I am a resident of OCEANSIDE, CA.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at krtirona@att.net

Aloha Mr. Sakoda,

My name is Richard Townsend and I am a resident of Arlington Heights, IL.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

I believe that more permits could be issued without a significant impact to the health of the fisheries. Most aquarium fishers understand and know the importance of a healthy fish population.

5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

There is only one clear evidence-based choice : to accept DEIS, which is based upon a rigorous data collection and monitoring protocol spanning several decades. The alternative is emotionally driven and motivated and does not have any supporting scientific basis.

I can be reached at c.wabnitz@oceans.ubc.ca

This survey was submitted at 12:11:15am GMT on 12/18/2019

Aloha Mr. Sakoda,

My name is Sarah Wachtl and I am a resident of Milwaukee, WI.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

Additionally, I would like to state the following:

UH Manoa Alumni, Microbiology, 2009. Have scuba dived every island in Hawai'i, along with much of the world, with great love for our oceans and fish. Hawaii has always had best practices and the most sustainable fisheries, and I support reopening these sites for aquatic collection use. Safe, sustainable, and responsible collection and later care and keep of just a sliver of our oceans and reefs inspire children, our next generation, and people, and I believe have a strong positive net effect towards educating and demonstrating the importance and beauty of these animals to the world, and help to bring environmental concerns such as climate change and its effects on the reef into more people that may not otherwise have as much perspective.

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA).

1. I believe that it fully analyzes all of the potential impacts the 14 West Hawaii aquarium fishery may have on the environment under each of the alternatives.
2. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA.
3. The West Hawaii aquarium fishery is one of the best managed fisheries in the State of Hawaii, and in fact the world.
4. The West Hawaii Fishery Management Area was developed with significant input from all parties, including the environmental community as well as Native Hawaiians.
5. The proposed action is an overall reduction in take over the pre-ban alternative.
6. I request that additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.
7. Reducing landed catch via approving only the 14 permits proposed is a practical approach to address "no limits".
8. By issuing 14 permits, the fishermen can easily self-police as they know who is permitted to legally fish.
9. The limitation on the number of permits also assists DOCARE/enforcement as they will easily know who is legally allowed to fish by the limited number of boats which are registered.

I can be reached at twiatr2001@yahoo.com

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Adrian R. Fourie	N/A	1/6/2020	<p>Extinction is forever—it’s that simple. It’s my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It’s a devastating commercial enterprise that trashes near-shore habitat and species. Don’t export Hawaii reef wildlife to feed the mainland aquarium trade.</p> <p>Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It’s truly heart-breaking. Many factors conspire in this tragedy. Maybe we can’t combat global warming locally. But we bloody well can put a stop to aquarium collecting.</p> <p>The so-called “Environmental Review” consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii’s DLNR (to that department’s shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.</p> <p>But where is the traders’ credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii’s taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,</p> <p>PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.</p> <p>I implore you to do the right thing</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS was prepared using the best available science. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC’s Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/</p>
Alan Breese	HI	1/5/2020	<p>As a fairly recent home owner on Maui, I do not understand allowing the local reefs to be harvested of fish with very little benefit to the Hawaiian islands and the Hawaiians. The Islands’ main industry is tourism and this needs to be protected. Most tourists enjoy snorkeling and scuba diving to see the local colorful fish population. Loss of numbers and varieties of fish could negatively impact the tourism industry.</p> <p>It’s my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS was prepared using the best available science. The Preferred Alternative is issuance of 10 permits for the WHRFMA. No permits would be issued for Maui under any of the alternatives evaluated in the EIS.</p> <p>PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC’s Mission is to represent the</p>

			<p>aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.</p> <p>But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic wellbeing depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists, PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.</p> <p>I implore you to ban aquarium collecting in Hawaii.</p>	<p>experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/</p>
Alan Luken	FL	1/6/2020	<p>On behalf of Segrest Inc, I am emailing you to express our support for DLNR's adoption of the draft Environmental Impact Statement which analyzes the issuing of Commercial Aquarium Permits for the West Hawaii Regional Fishery Management Area. We believe that the draft EIS has fully and completely analyzed all of the potential impacts of the Hawaii aquarium fishery. In the draft EIS, measures are proposed that would further help avoid and minimize what are already insignificant impacts on fish species and the environment in the West Hawaii Regional Fishery Management Area. Researchers and scientists have consistently determined that the Hawaii aquarium fishery is one the best managed near shore fisheries in the world. This conclusion has been backed by data from the DLNR. In order to develop a management strategy for the West Hawaii Regional Fishery Management Area, input from native Hawaiians and the environmental community has been used. We fully support the DLNR resuming the issuance of permits for aquarium fishing in the West Hawaii Regional Fishery Management Area.</p>	<p>Your comment has been forwarded to the decision makers.</p>
Alexandra Riggle	N/A	1/7/2020	<p>One of the most memorable experiences of my life was snorkeling in the Kapoho tide pools on the Big Island. The tide pools are gone now-- not because of human exploitation, but due to natural forces. The aquarium industry, by contrast, takes Hawaii's native fishes and turns them into toys for aquarium hobbyists and a profit center for businesses. This is wrong.</p>	<p>Your comment has been forwarded to the decision makers.</p>

			<p>Even with take restrictions, people can and will break the rules. This planet is facing unprecedented environmental crises, including the loss of coral reefs. Hawaii can't afford to let the aquarium industry plunder its reefs.</p> <p>Hawaii's fishes need and deserve real legal protection. They should be left in the wild.</p> <p>Please do the right thing and help create real, substantive protection for Hawaii's treasures.</p>	
Ali Manesh	HI	1/7/2020	<p>My name is Ali and my wife and I moved to the island of Hawaii about two years ago. The driving motivation for us to leave our corporate jobs behind and move here was to learn from the Hawaiian's peoples' perspective and relationship with nature to help us reconnect with the land and the natural resources that the island has to offer. So I was a bit dismayed when I learned that there was a push to reinstate the practice of catching fish from the ocean waters here to place in aquariums. I'm sure that you've received many comments regarding the potential impact that this type of activity can have on natural and cultural resources so I want to bring up the unjustified idea that we as men feel that we have the right to capture and remove any living beings from their homes solely for the purpose of our enjoyment and profit, even if some try to disguise it as for educational purposes. It's one thing, although almost just as appalling, that we've become ok with breeding various animals in captivity to accommodate a very inhuman pet industry. But the thought of capturing creatures who have known nothing but freedom in the beautiful open waters of Hawaii and to all of a sudden place them in small closures to be transported and placed in even smaller closures for our enjoyment is just heart wrenching for me. Regardless of what your views on animals may be and whether they can feel emotions like fear and sadness, do you honestly feel that we should have the right to remove and displace any free roaming beings from their natural habitats for our enjoyment?</p> <p>I feel that this is not only a cultural and environmental issue but also an important moral issue. We need to be honest with ourselves and re-evaluate how we view the vast natural beauty that surrounds us and our place within that environment. Do we want to see ourselves living in balance and harmony within this place that we all call home or do we view ourselves as more important than the other creatures around us and therefor giving us the right to remove and displace any creatures that we see fit?</p> <p>Since moving here, my wife and I have learned much about the idea of kuleana, particularly when it comes to the land and natural resources. Im sure that you and your colleagues at DLNR will agree that it is everyone's kuleana to appreciate and protect what is here. And I hope</p>	Your comment has been forwarded to the decision makers.

Commenter	State/ Location	Date Received	Comment	Response
			that you also agree with me that removing and displacing any creatures from their homes simple for our enjoyment and benefit definitely does not fit anywhere within the concept of kuleana. I appreciate but certainly don't envy the tough decisions that you and your colleagues have to make from time to time. Thank you for taking the time to read and consider my comment on this particular issue.	
Aliaska Brozen	N/A	1/6/2020	I am outraged by the decimation of our fish. How dare you allow businesses to come here and take our sea life? This is wrong on so many levels: this is their home and it is traumatic for them to be captured & transported. And did you know that fish are sentient beings? They have emotions & have families... And a good many of them never make it to their destination having died along the way. Not to mention the damage to our tourist industry here on Maui. AND also, coral reefs and fish have a symbiotic relationship: coral reefs supply a home to the fish...& an algae food source...and w/out the fish eating the algae there would be overgrowth, preventing coral larvae from settling down to grow up...adding to the destruction of our reefs...just one of the forces that are attacking them, including global warming & pollution. So it would be totally irresponsible & negligent & inhumane... (not to mention greedy -someone must be making money off this insane deal), to allow this theft to happen.	Your comment has been forwarded to the decision makers. A discussion on post-collection mortality has been added to Section 5.4.2 of the EIS. The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.
Amanda Cash	N/A	1/3/2020	Hawaii is my favorite vacation destination. I was very alarmed at the lack of beautiful wildlife during a recent snorkeling trip off the coast of Maui. It was vastly different compared to years past. I vehemently oppose aquarium collecting in Hawaii! This is destroying our reefs!	Your comment has been forwarded to the decision makers. The Preferred Alternative is issuance of 10 permits for the WHRFMA. No permits would be issued for Maui under any of the alternatives evaluated in the EIS.
Andrew John Bevolov IV	N/A	1/7/2020	I came across a public notice bringing light to policies concerning the removal of native fish from reefs in Hawaii for the aquarium trade which recommended contacting this email to urge that limitations on the policy be put in place. The Pet Industry Joint Advisory Council has apparently said that whatever extent of collection of these animals would only have a negligible impact on the ecosystem, but this is clearly a dismissal of the practically inevitable consequences virtually unrestricted collection will have. This is not a matter to take lightly simply at the first claim that it is "harmless".	Your comment has been forwarded to the decision makers. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period. The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
				collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.
Angela Huntemer	HI	1/7/2020	<p>DLNR made a serious mistake in engaging the Pet Industry Joint Advisory Council to assess the environmental impacts of the aquarium trade in Hawaii. It was a huge mistake to engage a lobbying group for the commercial pet trade and not a professional group dedicated to the study of coral reef ecosystems. This grave miscalculation has unfortunately left the Department susceptible to contested cases and even more. This is a shame because I am personally a huge supporter of the mission of DLNR and truly appreciate some of the heroic efforts made by some of your employees. This particular issue has, as far as I can see, not been given the important consideration it deserved. An anthropocentric view point has regrettably obscured what is the duty of DLNR and all of us that are fortunate enough to call Hawaii home. Frankly, the "livelihoods" of wildlife collectors are not an environmental impact. Livelihoods, are, by their own definition, a business impact. The few people employed in the taking of wildlife from our reefs are well equipped with material, skills, technology and experience to be able to repurpose themselves to a more positive "livelihood" related to the ocean. That is the "win win" solution here. Arguments of an educational value to privately held aquariums are false. Animals in tanks and cages engage in very little of their natural behavior and what is the educational value of that? As a teacher I can confidently tell you - none.</p> <p>There are obviously reasons why the Supreme Court closed the taking of wildlife from our reefs. We should be following in the footsteps of forward thinking jurisdictions such as Palau and ban commercial fishing or harvesting of any kind, in our territorial waters. We do not allow the taking of coral, why would it be OK to take other animals from the reef? In an era of overfishing, ocean warming, sea level rise, changing currents, habitats, and acidification why would we allow any more stressors to our reefs? Any taking of reef wildlife out of their habitat to die, without reproducing is an impact that cannot be entertained in 2020.</p>	Your comment has been forwarded to the decision makers.

Commenter	State/ Location	Date Received	Comment	Response
			<p>I have reviewed many EISs over the years. Many are poor efforts. Nearly all comments are routinely "dealt with". However, this particular EIS egregiously disregards the importance of the diverse array of animals that would be affected by their trafficking to isolation tanks (if they survive long enough to get to them). The results of this "review" are not only biased and inadequate, the whole document is largely irrelevant and misses the point completely. The removal of wildlife from coral reefs to be sold as decorations has no place in Hawaiian culture or ecosystems.</p>	
Angelina Misseri	HI	1/6/2020	<p>My name is Angelina Misseri, I have had the privilege to live, work, and most importantly, grow infinite respect and appreciation for the Big Island for 6+ years. Those of us that call the island home have sadly seen the massive decline in marine life. Between the Black Water run off along the West Coast of Hawaii Island, chemical spraying along the coastlines to keep golf courses green and weed free and the recent coral bleaching, our reefs are in disrepair.</p> <p>I am writing to respectfully inform you, I STRONGLY oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish. I understand that some would argue that this would provide some jobs, but what about those of us that already work in the industry, and our past, present and future visitors. It seems very short sighted to not consider how you are impacting all our current ocean operators that take people out to see our natural underwater wonderworld.</p> <p>Permitting 14 more companies to collect Hawaii's Tropical Fish for entertainment and take them from Hawaii's Reefs is counter-productive. We need to find 14 more companies willing to put their efforts towards rejuvenating the reef, giving back to it; not taking more precious life from it. We tell our visitors to enjoy Hawaii here, don't take the lava rocks, the shells, the multi-colored sands from our beaches, why would you condone this? Our oceans are dependent on people like yourself to do what is Pono. Please choose to do the right thing, our community will be watching and the future generations are depending on you to aloha 'āina. I urge you to take action to protect our precious reef and life systems here in Hawaii.</p> <p>Thank you for taking the time to read my comments.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>
Anne Allison	N/A	1/5/2020	<p>Extinction is forever—it's that simple.</p> <p>It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS was prepared using the best available science. 			environmental community input has been used to develop the management strategy for the WHRFMA. I support DLNR resuming the issuance of permits for aquarium fishing in the WHRFMA.	
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	The Pet Industry Joint Advisory Council submitted a Draft Environmental Impact Statement (DEIS) to the State of Hawai'i Office of Environmental Quality Control on their analysis of the ecological and cultural impacts of reissuing aquarium collection permits for West Hawai'i Island. Our review focuses on the scientific integrity and validity of data and conclusions provided in the DEIS as it pertains to West Hawai'i. We address three particular subject areas in Parts (I) Hawai'i ocean climate, (II) Fish resource trends and reporting, and (III) Coral reef damage.	Your comment has been forwarded to the decision makers.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Part I: A new ocean climate regime in the Hawaiian Islands renders the historical fish data collected by NOAA and State of Hawai'i Division of Aquatic Resources (DAR) scientifically unpredictable of the reef ecosystem in 2020 or into the future. NOAA and DAR fish count data span only one marine heatwave in 2014-2015, and the response of the ecosystem continues to evolve and is in strong disequilibrium. Subsequent marine heatwaves such as the 2019 event will continue to repeat, negatively impacting coral, fish and invertebrate communities, and these heatwaves will be increasing in frequency to near-annual events by 2035. A pivotal issue determining the ability of Hawai'i's coral reefs to persist in the new ocean climate rests in the abundance and diversity of the herbivore fish community under repeat heatwaves. Herbivore fish are primary determinants of reef algal cover, which competes directly with slow-growing corals for space during and between marine heatwaves. Reef science demonstrates that the probability of a marine heatwave generating a shift from coral to algal dominated reef is reduced to 20% - a key target threshold for management - at an herbivore fish biomass level of 250 kg per hectare. As of 2018, 74% of shallow coral reefs of West Hawai'i are near or below this threshold, and the biomass of deeper portions of the reef are insufficiently known. Beyond marine heatwaves, West Hawai'i development has rapidly expanded over the past two decades, resulting in numerous additional stressors to the reef ecosystem. A recent study of the shallow water fishery of West Hawai'i indicated that the two main sources of resource fish decline from 2008 to 2018 are nitrogen-rich effluent and commercial fishing. West Hawai'i's reefs are not well	<p>Your comment has been forwarded to the decision makers.</p> <p>It is unclear why historic collection numbers would no longer be relevant for predicting future trends, even in light of climate change, particularly due to the time period for the analysis (5 years). This is also why the EIS uses the most recent population data available (2016 populations; CREP 2018) and the most recent population trend data (DAR 2019a) in the analysis. In addition, Aquarium Permits are only valid for 1 year and must be renewed each year. Presumably the DNLR will evaluate renewal of permits each year and if conditions warrant the agency has the discretion not renew permits, thereby allowing it to react to changing conditions.</p> <p>As stated in the EIS, the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.</p>

			prepared for repeated marine heatwaves from an herbivore fish standpoint.	
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Part II: The DEIS utilizes two different datasets to estimate fish populations along the west coast of Hawai'i Island: (i) Division of Aquatic Resources (DAR) West Hawai'i Aquarium Project (WHAP) surveys and (ii) NOAA Coral Reef Monitoring Program (CREP) surveys. The WHAP data are not spatially representative of West Hawai'i because they are not taken from randomly selected sites. The majority of the WHAP survey sites lie within geographically-limited marine managed areas and thus these surveys do not accurately represent fish populations across all of West Hawai'i. The DEIS report bases the majority of its estimations using the WHAP surveys, even while acknowledging that the CREP data would be more representative. The DEIS should present both datasets similarly to understand if the same trends in fish populations seen at the WHAP longterm monitoring sites also agree with the island-wide CREP surveys. Our analysis suggests that the WHAP and CREP data tell different stories of aquarium fish trends over time, including weakening fish population trends in CREP compared to those reported for WHAP by the DEIS. Meanwhile, another State of Hawai'i DAR report indicates major declines in fish abundance, ranging from a small relative decline in Yellow Tang (-9%) to an enormous decline in Achilles Tang (-97%). Additionally, State of Hawai'i DAR monitoring of shallow water reefs show major declines of certain herbivore fish species from 2008 to 2018.	<p>Your comment has been forwarded to the decision makers.</p> <p>The limitations of WHAP and CREP survey methods are described in Section 4.4.7 of the EIS. All population impact assessments are conducted using the CREP population estimates, though Appendix B has been added to the FEIS to provide the impacts of collection on WHAP Open Area populations for comparison.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>Additionally, as stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. Additionally, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui.</p>
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel	HI	1/3/2020	The DEIS uses invalid estimates of percent catch from the aquarium trade to evaluate the impacts of alternative actions. In particular, the DEIS claims that percent catch should be based on islandwide population estimates for each species by citing evidence for habitat connectivity between protected and open fishing areas around all of Hawai'i Island. This is incorrect, and past studies using drifters, larval sampling, genetic analysis, and oceanographic modeling indicate high local retention of larvae, and juvenile and adult fish populations, in	<p>Your comment has been forwarded to the decision makers.</p> <p>While the FEIS maintains that the CREP population offer the best estimate to analyze impacts, the impact of collection on the WHAP Open Area populations, where collection would be occurring under the Preferred Alternative, has been added as Appendix B of the FEIS for comparison purposes.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Carlson, Roberta Martin and Christopher Balzotti)			West Hawai'i. As a result of this major error in the DEIS, the reported percent catch is erroneously low. It should be based on relevant West Hawaii Regional Fishery Management Area sub-populations considering the realistic home ranges of each species, not on island-wide populations.	
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Part III: The DEIS makes several broad and unsubstantiated claims that aquarium collection does not negatively impact the reef ecosystem. A key question is whether or not aquarium fish collectors make physical contact with the reef via their equipment and their bodily movement. Reports from the public and the conservation community, combined with our own in-situ observations, broadly point to common and persistent issues of aquarium collector contact with the reef. The DEIS makes no recommendation to provide third-party oversight of collector activities, and goes as far as to suggest that there is no impact from collection on corals or reef structure. Physical, biological, and chemical damage needs to be documented and prevented. Prevention is the only scientifically sound pathway, either by strong in-situ oversight of the industry or via banning of collections.	Your comment has been forwarded to the decision makers. The EIS cites Tissot and Hallacher (2003), who statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	INTRODUCTION On November 12, 2019, the Pet Industry Joint Advisory Council submitted a Draft Environmental Impact Statement (DEIS) to the State of Hawai'i Office of Environmental Quality Control on their analysis of the ecological and cultural impacts of reissuing aquarium (AQ) collection permits for West Hawai'i Island. Our review focuses on the scientific integrity and validity of data and conclusions provided in the DEIS as it pertains to West Hawai'i, defined as the area spanning the west or leeward side Districts of N. and S. Kohala, N. and S. Kona, and Ka'u. We do not address cultural issues in our review of the DEIS. Our investigation of the DEIS content required the focus and expertise of a panel of marine ecologists and biologists with a collective experience on West Hawai'i reef ecosystems of more than 50 person-years. Our review presented here is limited to three particular subject areas, two of which are directly addressed in the DEIS, and one that was not addressed in the document. These subject areas are organized into Parts (I) Hawai'i ocean climate, (II) Fish resource trends and reporting, and (III) Coral reef damage.	Your comment has been forwarded to the decision makers. All three subject areas are addressed in the EIS. Climate change is addressed in Section 5.4.3.5. Fish resource trends and reporting are addressed throughout the document, and specifically in Section 5.4 and in Tables 5-4 and 5-8. Coral reef damage is discussed in Section 5.4.1.2 under "Reef Habitat".
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna	HI	1/3/2020	PART I: HAWAI'I OCEAN CLIMATE IN 2020 AND BEYOND Like many regions of the world, the Hawaiian Islands have entered a new ocean climate regime that is less favorable to coral reefs as a whole. As a result, building resilient coral reefs must be a focal point for resource management to give reefs the best chance for persistence. One of the major limitations of the DEIS rests in its narrow analysis of the West Hawai'i coral reef ecosystem.	Your comment has been forwarded to the decision makers.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)			Spanning a distance of about 180 km of coastline, the reef is extremely heterogeneous in terms of benthic substrate, coral cover, habitat condition, fish abundances, and accessibility by fishers. These issues alone raise serious concerns about the critically important limitations of an environmental impact study based solely on fish counts.	
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Adding the new ocean climate regime to the natural complexity of the West Hawai'i reef, historical fish data alone are not predictive of the reef ecosystem in 2020 or into the future, whether exposed to aquarium collection or not. Hawaiian reef ecosystems are part of the new ocean climate system that continues to rapidly expand in the Pacific and worldwide. In 2014 and 2015, the Main Hawaiian Islands underwent their first major system-wide ocean climate event, called a marine heatwave, that caused increased water temperatures resulting in large-scale coral bleaching and impacts on fish and invertebrate populations (Bahr et al. 2017; Couch et al. 2017). About half of the corals that bleached in 2015 ultimately died and became algal covered (Kramer et al. 2016). The 2019 marine heatwave again engulfed the Hawaiian Islands, causing up to 50% coral bleaching in some areas, and an average of 10% mortality in West Hawai'i (ASU GDCS 2019). Marine heatwaves are the new norm, and will be increasing in intensity and/or frequency in the years to come (Frolicher et al. 2018), putting enormous additional stress on coral reefs of Hawai'i.	Your comment has been forwarded to the decision makers. Data in the EIS include population trend data that spanned the 2014/2015 bleaching events. These events were also discussed in Section 5.4 of the EIS. The cumulative impacts of future climate change are discussed in Section 5.4.3.5 of the EIS.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Ocean temperature in West Hawai'i is projected to increase as a result of climate change. By the middle of the century, average monthly sea surface temperature will be ~1°C (1.8°F) warmer than present-day, and for about 6 months of the year will be warmer than the present-day summertime maximum (27°C; 80.6°F). This increase in ocean temperature is projected to influence the frequency and severity of coral bleaching. For example, severe bleaching is projected to occur on an annual basis in West Hawai'i beginning as early as 2035 (van Hooijdonk et al. 2016).	Your comment has been forwarded to the decision makers. The cumulative impacts of future climate change are discussed in Section 5.4.3.5 of the EIS.
ASU Center for Global Discovery and Conservation Science (Gregory	HI	1/3/2020	A pivotal issue determining the ability of Hawai'i's coral reefs to persist in the new ocean climate rests in the abundance and diversity of the herbivore fish community. Herbivore fish are primary determinants of reef algal cover, which competes directly with slow-growing corals for space. Regular marine heatwaves not only cause coral bleaching and mortality, they also promote algal growth that colonizes dead coral	Your comment has been forwarded to the decision makers. It is acknowledged that herbivore conservation is important; however, please note that as stated in the EIS the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been

Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)			and responds well to increased water temperature (Jessen et al., 2013; Graham et al., 2015). Herbivore fish biomass and diversity have become important combaters of algal growth during and between marine heatwave events.	no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). These trends occurred even with the pressure of commercial aquarium collection, which was occurring over the same time period.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	<p>In a scientifically-acclaimed global analysis and synthesis, Graham et al. (2015) found that the probability of a reef switching from a coral-dominated to an algal-dominated system was more than 50% when herbivore fish biomass dropped below 100 kg per hectare. Importantly, the probability of a regime shift from coral to algal domination decreased to 20% - a key target threshold for management – at an herbivore fish biomass level of 250 kg per hectare (Figure 1).</p> <p>Based on the State of Hawai'i Division of Aquatic Resources shallow water fish survey data, current herbivore biomass levels vary enormously along the coast of West Hawai'i (Figure 2). Among 72 sites included in this 2018 survey, 21% are near or below the super-critical 100 kg per hectare threshold for a 50:50 chance of coral-to-algal domination caused by a marine heatwave.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>A review of Figure 2 from the commenter showed 30 Open Areas analyzed for herbivore biomass, of which 17 were above the 250 kg per hectare level (57%), 12 were within 100 and 250 kg per hectares (40%), and 1 was below the 100 kg per hectare level (3%). Compared to the 23 areas closed only the aquarium fishing (i.e., all other types of fishing are allowed), 13 were above 250 kg per hectare (57%), 9 were within 100 and 250 kg per hectare (39%), and 1 was below 100 kg per hectare (4%). Therefore based on the data provided by the commenters, it does not appear that areas open to commercial aquarium collection are any more at risk of having a lower herbivore biomass.</p>
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Approximately 64% of sites are currently near or below the critical 250 kg per hectare threshold for a 20% chance of coral-to-algal change from a marine heatwave. Only 19 of 72 sites (26%) are well above this guiding 250 kg per hectare minimum for good herbivore fish management. Numerous countries and jurisdictions are using the 250 kg threshold as the target for increasing reef resilience in the new ocean climate. However, West Hawai'i's reefs are not currently in such a state and are not well prepared for repeated marine heatwaves from an herbivore fish standpoint.	Your comment has been forwarded to the decision makers.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson,	HI	1/3/2020	Beyond marine heatwaves, development in West Hawai'i has rapidly expanded over the past two decades, resulting in numerous additional stressors to the reef ecosystem (Gove et al. 2019). These include nitrogen-rich effluent from both commercial and non-commercial wastewater discharge and over-fishing. In 2017, West Hawai'i released a total of 680 million gallons of effluent per year and a total of 400,000 pounds of nitrogen per year (Gove et al. 2019). A recent study of the shallow water fishery indicated that the two main sources of resource fish decline from 2008	<p>Your comment has been forwarded to the decision makers.</p> <p>The DAR (2019a) reported that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Roberta Martin and Christopher Balzotti)			to 2018 (including four species on the aquarium White List) are nitrogen-rich effluent from onshore disposal sites and commercial fishing. Importantly, non-commercial fishing was not correlated with observed long-term declines in fish biomass in shallow water habitats (Foo et al. in review; available upon request). Only commercial fishing was statistically linked to herbivore fish declines.	fishing for all but one species, indicating that aquarium collection is not driving the decline. The commenter mentions an unpublished paper (Foo et al.), but it is not mentioned whether this analysis included commercial aquarium collection, or only other forms of commercial fishing (i.e., food fishing). The EIS relied on publicly-available data and literature available at the time of publication.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	In accounting for the new ocean climate regime with an increasing number of regional stressors, it has become clear that a new approach to the management of coral reefs in West Hawai'i, including the interactive role of herbivore fish and corals, is paramount to their near- and longterm survival. Whether the aquarium industry can guarantee that herbivore fish biomass levels remain above the critical 250 kg per hectare threshold is highly unlikely, but such levels of management will be needed moving forward to ensure that West Hawai'i reefs remain intact and biologically productive.	Your comment has been forwarded to the decision makers.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	PART II: FISH RESOURCE TRENDS AND REPORTING Assessment based on inadequate data coverage of West Hawai'i The DEIS utilizes two different datasets to estimate fish populations along the west coast of Hawai'i Island: (i) Division of Aquatic Resources (DAR) West Hawai'i Aquarium Project (WHAP) surveys and (ii) NOAA Coral Reef Monitoring Program (CREP) surveys, which we will refer to as WHAP and CREP to distinguish between the two survey types. The WHAP surveys represent the same 25 study sites surveyed annually from 1999 to 2018. These WHAP sites were originally established to monitor different protection levels – Marine Protected Area (MPA), Fish Replenishment Area (FRA), and Open or unprotected – in order to determine the effectiveness of protected areas on aquarium fish species. The WHAP data are not spatially representative of West Hawai'i because they are not taken from randomly selected sites. In fact, the majority of the survey sites lie within marine managed areas and thus WHAP surveys likely do not accurately represent fish populations across all of West Hawai'i, especially since FRAs and MPAs have very limited coverage (Figure 3, which is Figure 4 in the DEIS, page 79). The CREP data, on the other hand, represent randomly distributed fish surveys of Hawai'i Island, with 257 survey locations measured between 2010 and 2016. To ensure better representation of fish populations across West Hawai'i, both datasets	Your comment has been forwarded to the decision makers. The WHAP and CREP surveys are described in Section 4.4.7 of the EIS. The WHAP data used in the EIS come from all three types of areas (open areas, FRAs and MPAs), but the population data are restricted to the Open Areas. Both datasets are used in the analysis for the EIS: WHAP data to discuss population trends and CREP data for analyzing impacts on populations. In addition, while the FEIS maintains that the CREP population offer the best estimate to analyze impacts, the impact of collection on the WHAP Open Area populations, where collection would be occurring, has been added as Appendix B of the FEIS for comparison purposes.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			should be considered equally. A strength of the WHAP surveys is that, because they are permanently monitored sites, the data can be used to track changes over time, but the fact that the data from these sites are not representative of West Hawai'i is not discussed in the DEIS. A comparison of the WHAP and CREP data is essential to document the ecological status of fish populations of West Hawai'i and needs to be included in the DEIS.	
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	The DEIS report bases the majority of its estimations using the WHAP surveys, even while acknowledging in the executive summary of the report that the CREP data are more representative: "Both data sets are presented and analyzed in this DEIS. However, due to the larger spatial coverage and greater range of depths surveyed by CREP, these data are a better estimator of island-wide fish population size, and therefore serve as the primary basis for the impact analysis in this DEIS." Herein lies the first problem with the data cited in the DEIS: The authors acknowledge the shortcomings of the WHAP surveys yet base the estimations and justifications for aquarium fishing limits mainly on the WHAP surveys.	Your comment has been forwarded to the decision makers. Conclusions regarding population impacts in the EIS are based the CREP population estimates. WHAP data are used for population trends. In addition, while the FEIS maintains that the CREP population offer the best estimate to analyze impacts, the impact of collection on the WHAP Open Area populations, where collection would be occurring, has been added as Appendix B of the FEIS for comparison purposes.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	The DEIS presents the trends in fish biomass for the WHAP permanent monitoring sites, summarized as percentage increases and decreases in fish biomass between the start and end of the monitoring time (Table 1, which is Table 5-4 in the DEIS, page 99). On the other hand, the DEIS only reports 2016 CREP surveys for each aquarium fish species, although surveys from 2010 to 2018 do exist and were available to the DEIS authors. The DEIS should present both datasets similarly to understand if the same trends in fish populations seen at the WHAP long-term monitoring sites also agree with the island-wide CREP surveys.	Your comment has been forwarded to the decision makers. As noted by the commenter earlier in their report, "a strength of the WHAP surveys is that, because they are permanently monitored sites, the data can be used to track changes over time". Thus, these data were used to analyze population trend data. At the time of the data request, the only population data provided to the Applicant by CREP were the 2016 population estimates. Population estimates from other years were not provided.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and	HI	1/3/2020	Presented here in Figure 4 and Table 2, we have calculated the average number of aquarium species counted across surveys for each year of CREP data to facilitate the comparison with the WHAP data that was left out of the DEIS. Comparing Table 1 (Table 5-4 from the DEIS), and Table 2 provided here, CREP data show moderate overall changes in fish abundance, as well as important decreases in species abundances, which directly contradicts results from the WHAP data alone, which show mostly large fish abundance increases in protected areas. The DEIS had equal access to the CREP data yet decided not to provide these summaries. It appears that the DEIS data have been targeted to show only large increases in fish biomass.	Your comment has been forwarded to the decision makers. The analysis presented by the commenters is not useful without a test of statistical significance, which the WHAP data provide, indicating whether changes in abundance are significant or not. Without a test of significance or inclusion of confidence intervals, it is impossible to tell whether these estimates are actually changing from year to year. Additionally, as stated above, the only population data available to the Applicant by CREP at the time of the data request were the 2016

Comments and Applicant Responses to All Other Comments Received on the DEIS

Christopher Balzotti)				population estimates. Population estimates from other years were not provided.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Note also from Figure 4 that there exists enormous variation in annual patterns of fish abundance. It would be more appropriate for the DEIS to consider annual trends rather than differences between the start and end of surveys, to assess whether long-term increases or decreases in fish populations occur or not.	Your comment has been forwarded to the decision makers. The analysis presented by the commenters is not useful without a test of statistical significance, which the WHAP data provide, indicating whether changes in abundance are significant or not. Without a test of significance or inclusion of confidence intervals, it is impossible to tell whether these estimates are actually changing from year to year.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	There is also a multitude of reports of West Hawai'i fish biomass provided by the Division of Aquatic Resources, available online at https://dlnr.hawaii.gov/dar/reports/ . For example, one report by Walsh et al. (2018) presents the continued, long-term decline of coral reef biota and associated fauna at key sites in West Hawai'i. This report notes major declines in fish abundance between the two survey periods, ranging from a slight relative decline in Yellow Tang (-9%) to an enormous decline in Achilles Tang (-97%); Both are two key aquarium fish species. The report also includes information on aquarium fish abundance. Table 3 below (Table 6 in Walsh et al. 2018) shows major declines for most aquarium fish species. Here, the top ten most collected aquarium fishes declined at both sites, except for Yellow Tang, and that aquarium fishing likely contributed to these declines. It is also stated that additional aquarium fish species are not included because of extremely low abundance and the inability to make any meaningful conclusions on changes in abundance over time.	Your comment has been forwarded to the decision makers. The Walsh et al. (2018) report that the commenter cites does state that 8 of the top 10 most collected aquarium species have declined at the two study sites. However, it also goes on to point out that both study areas in the report were protected from commercial aquarium collection with a varying duration, that 8 of the top 10 most common resource fish species (i.e., food fishes) also declined, and that 7 of the top 10 fish species not targeted for food or aquarium purposes also declined.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and	HI	1/3/2020	Shallow water resource fish surveys from 2008 to 2018 conducted by DAR include four aquarium species. These data show very different trends in aquarium species population dynamics, all with much less biomass in 2018 in comparison to 2008 (Figure 5). As also seen in Figure 4, annual trends differ greatly, and whether a population is increasing or decreasing depends on which years are being compared. As discussed earlier, we advocate for the inclusion of annual trends in the DEIS to determine truly whether a species is increasing or decreasing over time.	Your comment has been forwarded to the decision makers. Population trend data are included in the EIS, but are limited to the 1999/2000 to 2017/2018 range, as that is considered most representative of the current conditions in the WHRFMA, since it coincides with the creation of the WHRFMA and the resulting regulations that have been put in place. Analyzing trends for populations that occurred prior to some of the existing regulations (FRAs, MPAs, etc) is not relevant, as all of these regulations positively impact populations would continue under any of the alternatives under consideration.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Christopher Balzotti)				The data presented in Figure 5 of the comment again do not have confidence intervals, which makes not possible to determine if differences in abundance between years is statistically significant. The DAR (2019a) reported that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Changes in aquarium fish populations differ between survey types, locality, and by which years are compared. We have presented two other datasets that show contrasting patterns to those presented in the DEIS. The DEIS should provide summaries of population dynamics for both CREP and WHAP data, as well as an analysis to assess whether individual species agree in the annual population trends observed across both datasets. It is crucially important to assess whether the WHAP long-term surveys at the 25 permanent monitoring sites show the same population patterns as those reported in CREP surveys. This will be key to determining whether the effects of an aquarium ban have only been effective locally, or across all of west Hawai'i.	Your comment has been forwarded to the decision makers.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	If aquarium fish species show both a clear increase in abundance through WHAP's different management systems and also increases in abundance in the CREP surveys, an alternative to the proposed aquarium fishing plan could be a greatly reduced White List with strict limits on catch of certain fish species. If no data or not enough data exist, a species should not be included in the white list.	Your comment has been forwarded to the decision makers.
ASU Center for Global Discovery and Conservation Science	HI	1/3/2020	Fish populations are extremely variable in time and space depending on reef rugosity, depth, temperature, currents as well as population dynamics such as season, mortality and recruitment. Consideration of the full body of scientific literature available for West Hawai'i and then a systematic analysis is needed, instead of basing catch limits on 25	Your comment has been forwarded to the decision makers.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
(Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)			sites across the west coast. Cherry-picking scientific findings to support aquarium fishing will, in the end, lead to poor outcomes for the most extensive reef system in Hawai'i.	
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Assumption of connectivity of fish populations across West Hawai'i The DEIS uses invalid estimates of percent catch from the aquarium trade to evaluate the impacts of alternative actions. In particular, the DEIS claims that percent catch (Table 4, which is Table 5-11 from the DEIS) should be based on island-wide population estimates for each species because "There is evidence for connectivity between FRAs and Open Areas around the island of Hawai'i (Christie et al. 2010)." This is incorrect: while neighboring FRAs and Open Areas may display high connectivity, the entire island of Hawai'i does not, and limited connectivity exists between East and West Hawai'i. The DEIS misinterprets Christie et al. (2010), which demonstrates connectivity across South/West Hawai'i. Past studies using drifters, larval sampling, genetic analysis, and oceanographic modeling indicate high local retention of larvae in West Hawai'i (Christie et al. 2010; Lobel 2011; Vaz et al. 2013). Critically, and as a result of this major error in the DEIS, the report's percent catch is erroneously low. It should be based on relevant West Hawaii Regional Fishery Management Area sub-populations considering the realistic home ranges of each species, not on island-wide populations.	Your comment has been forwarded to the decision makers. The language in the EIS regarding the Christie et al. (2010) paper has been edited to clarify. While the FEIS maintains that the CREP population offer the best estimate to analyze impacts, the impact of collection on the WHAP Open Area populations, where collection would be occurring, has been added as Appendix B of the FEIS for compariso purposes. In addition, the population trend data used in the EIS is specific to the WHRFMA.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	The DEIS also fails to consider that connectivity between FRAs and Open Areas is not absolute. Some areas are more connected than others based on the strength and direction of ocean hydrodynamics (Vaz et al. 2013). Additionally, the DEIS does not mention where fishing will be allowed—if fishing occurs in "upstream" areas that are sources of fish larvae for downstream reefs, this can heavily deplete downstream fish stocks across large areas (Crowder et al. 2000). Lastly, referring back to Figure 2, we can see great variability across the different MPA types and across all of West Hawai'i. The DEIS assumption that fish connectivity is high is flawed.	Your comment has been forwarded to the decision makers. As stated throughout the EIS, commercial aquarium collection in the WHRFMA will only occur within the "Open Areas" under any of the alternatives under consideration. Figure 1 of the EIS shows the marine managed areas where collection would not be allowed.
ASU Center for Global Discovery and Conservation	HI	1/3/2020	To evaluate the Preferred Alternative, the DEIS compares its aforementioned, invalid percent catch estimates to a study by Ochavillo and Hodgson (2006) that itemized Total Allowable Catch for reef fish species in the Philippines—species that do not correspond to	Your comment has been forwarded to the decision makers. The sustainable thresholds provided by Ochavillo and Hodgson (2006) represent the best available science regarding sustainable harvest of

Commenter	State/ Location	Date Received	Comment	Response
Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)			Hawai'i's target aquarium species. However, Total Allowable Catch must always be based on the unique growth and mortality rates and reproductive traits of target species, in this case, for those in West Hawai'i, not on non-target species in a distant region. It is an irresponsible false equivalency to base wide-reaching policy decisions on "rules of thumb" for non-target species. In sum, a complete evaluation of the life histories and sustainable catch limits of West Hawai'i's target species should underlie this DEIS, weighed against percent catch of relevant, connected populations.	species with simialar life histories to those harvested in Hawai'i, as specific thresholds for the 40 White List Species (or for Hawai'i) are not available. Nevertheless, as concluded in the EIS, collection under the Preferred Alternative is below 2% for all 38 of the White List Species for which population estimates are available, and therefore below the lower limit set by Ochavillo and Hodgson (2006).
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Data analysis is incomplete and insufficient to support DEIS recommendation In addition to the lack of and bias-selected data cited in the DEIS, the only statistical analysis presented are simple t-tests. The DEIS makes major claims and states multiple times that commercial aquarium fishing is not driving a decline in fish biomass or coral cover. However, the DEIS fails to back up these claims with statistically valid analyses. The DEIS fails to account for confounding variables, biases, tests of the strength and direction of relationships – critical factors that are not captured by bar and line graphs. For example, a generalized linear mixed model considering the abundance of specific aquarium fish species, and the collection of aquarium fish (with year and site as random factors), would show more conclusively whether aquarium fishing impacts fish abundance.	Your comment has been forwarded to the decision makers. The analysis on population trend data was conducted by the DAR, and is cited as such throughout the EIS. The Applicant does not have this raw data in order to conduct an independent analysis such as a generalized linear mixed model.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	The DEIS biases its selection and use of data to very specific indicators of fish biomass, particularly from Gove et al. (2019) – a comprehensive report on West Hawai'i. Specifically, the DEIS states from this report that herbivore biomass increased more in open areas than in FRAs (page 116, 139, 140 of DEIS). However, this was not a significant finding (J. Gove, NOAA, Pers. Comm., Gove et al. 2019) and is one of the instances that the DEIS vacillates between using statistical significance to support their messaging in some cases and then dismisses statistical significance in other instances.	Your comment has been forwarded to the decision makers. The EIS specifically states in Section 5.4 that the change has not been significant, but that there is an increasing trend.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	Most importantly, if we examine the fish indicators from Gove et al. (2019), specifically Total Fish Abundance, Total Fish Biomass, Mean Adult Fish Length, and Juvenile Yellow Tang, each indicator had significant increases that were greater in FRAs compared to Open Areas from 2003 – 2017. This directly contradicts what was stated in the DEIS to support their statement that aquarium fishing does not impact fish abundance. These data that were specifically ignored from Gove et al. (2019) strongly contradict the	Your comment has been forwarded to the decision makers. The commenter suggests that four indicators are significantly greater in FRAs compared to Open Areas. However, based on Table 2-2 of Gove et al. (2019), that is incorrect. Total fish abundance and total fish biomass were not statistically different. The only fish indicators in Gove et al. (2019) that were significant between FRAs compared to Open Areas were adult fish length (11.8% longer fish in FRAs

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Carlson, Roberta Martin and Christopher Balzotti)			argument that aquarium fish collection had no impact on the fish community.	compared to Open Areas), juvenile Yellow Tang (90.2% more in FRAs compared to Open Areas), and species richness (which was 9.5% less in FRAs compared to Open Areas).
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	A failure to utilize other highly-available datasets for Hawai'i will result in inaccurate estimates of fish populations upon which the DEIS bases its claims. Misrepresentation and selective use of science is dangerous and has the potential to harm Hawaiian ecosystems. These very basic tenets of scientific analysis have not been considered properly in the DEIS.	Your comment has been forwarded to the decision makers.
ASU Center for Global Discovery and Conservation Science (Gregory Asner, Shawna Foo, Rachel Carlson, Roberta Martin and Christopher Balzotti)	HI	1/3/2020	<p>III. CORAL REEF DAMAGE</p> <p>The DEIS makes several broad and unsubstantiated claims that aquarium collection does not negatively impact the reef ecosystem. However, a large body of scientific study indicates that making contact with the reef, especially its corals, generates major negative impacts on all aspects of reef condition (Rubec et al. 2001; Barclay and Berkes, 2017; Nichols et al. 2018; Gove et al. 2019). The question then becomes whether or not aquarium fish collectors make physical contact with the reef via their equipment and their bodily movement.</p> <p>Reports from the public and the conservation community broadly point to common and persistent issues of aquarium collector contact with the reef. Our scientific observations of areas frequented by collectors also indicate areas of increased smashed coral, "troughing" for mesh fencing, staking, and finning. Hard data are challenging to generate since the aquarium industry maintains a semi-clandestine culture and does not offer opportunities for third-party oversight. Nonetheless, numerous photos have been taken of aquarium collector methods in West Hawai'i, which reveal divers making direct contact with live corals. The photos below provide a few examples taken from West Hawai'i embayments.</p> <p>The DEIS makes no recommendations regarding third-party oversight of collector activities, and goes as far as to suggest that there is no impact from collection on corals or reef structure. Physical, biological,</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The commenters cite anecdotal "reports from the public and the conservation community". The EIS cites Tissot and Hallacher (2003), who statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference. However, language has been added to the EIS to stating that "it is possible that coral could be inadvertently damaged by an anchor or during collection".</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			and chemical damage needs to be documented and prevented. Mitigation of reef damage after it occurs has proven to be both financially prohibitive or ecologically unviable (Jokiel and Naughton 2001). Prevention is the only scientifically and financially sound pathway, either by strong in-situ oversight of the industry or via banning of collections.	
Barbara Steinberg	N/A	1/5/2020	Here are some of my children and adult students art to back my opposition to the aquarium trade . I sent my opposition email minutes ago and now I'm sending this art work under separate cover	Your comment has been forwarded to the decision makers.
Barbara Steinberg	HI	1/5/2020	I am a maui resident for 35 years and a voter that long . I oppose the aquarium trade. For 10 years I've taught animal kindness club art class to children age 6-16 and they always paint Hawaii's tropical fish and we all oppose the aquarium trade for future of Hawaii and future generations.	Your comment has been forwarded to the decision makers. The Preferred Alternative is issuance of 10 permits for the WHRFMA. No permits would be issued for Maui under any of the alternatives evaluated in the EIS.
Beth Hird	HI	1/5/2020	Extinction is forever—it's that simple. It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade. Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting. The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood. But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists, PIJAC was recently in the news for lobbying Congress on puppy mills,	Your comment has been forwarded to the decision makers. The EIS was prepared using the best available science. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline. PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC's Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/

			<p>because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal. I implore you to do the right thing</p>	
Beth McDermott	HI	11/25/2019	<p>I write in firm opposition to any new aquarium fishing permits being issued for West Oahu [commenter sent a correction that they meant West Hawai'i].</p> <ol style="list-style-type: none"> 1. CLIMATE CHANGE Our islands just saw another serious bleaching event this summer which persisted with warmer than average ocean temps through the fall and winter. This is expected to continue and worsen in the years ahead. Our reefs are struggling under unprecedented pressure right now, and for the foreseeable future, with global warming ramping up bleaching, ocean acidification, and more frequent and intense storms. This is not the time to be taking fish off our reefs, fish that contribute to keeping our reefs healthy. 2. OVERTOURISM Our reefs also suffer from overtourism, with record numbers of tourists trampling our reefs, and coating and killing our reefs with toxic sunscreens. While some bans have been enacted on wearing sunscreens with ingredients like oxybenzone that we know cause damage, most visitors arrive with their own sunscreen and have no awareness of any ban. More people in the water means more harm to our fish and corals. 3. OCEAN PLASTIC Recent reports revealed that even the tiniest fish are consuming masses of plastic waste, micro plastics that mimic plankton and other foods. Their health and survival are now endangered in ways we can't foresee yet. 14 commercial fishers out grabbing fish, causing stress and upsetting feeding patterns is not what our marine keiki need right now. 4. LACK OF ENFORCEMENT You can set all the bag limits you want, for yellow tang or other species, Fact is the state has proven unable to enforce these limits. Aquarium fishing often happens on weekends or at night when no one is watching. I've spoken personally to commercial aquarium fishers who told me they intentionally go out at night to avoid scrutiny. Without the capacity to enforce limits a permit becomes essentially permission to raid our reefs. 5. NOT A NEED Aquarium fishing takes fish purely for decoration, The vast majority of these fish die in transport and./ or have their lives cut short swimming endlessly in tanks that poorly replicate their ecosystem or meet their needs. These fish are not providing sustenance to families that survive on fish for food. This is purely for fun. With all the stress our fish are under now commercial aquarium fishing seems to me the place to cut back. Researchers are learning to 	Your comment has been forwarded to the decision makers.

			<p>between the collector’s interest and the coral reefs that supports their trade is key to the long term success of the aquarium trade. Proper limits need to be set and enforced. One option would be to have the state give out, or sell, a preset number of “AQ fish catch certificates” (like tax stamps on alcohol and cigarettes). These certificates could be given to the collectors monthly that specify what and how many organisms can be collected and shipped off island . This is a simple and easy to implement system that allows them to collect and earn a living and while creating a “managed” fishery. Compliance is critical to the success of any program, and this system facilitates enforcement. Your agency could task the shipping entities to ensure every shipment has a “AQ fish catch certificate” before they can accept and ship them. Large fines for allowing noncompliant shipments should keep the shippers in line. Since there are only a few companies that ship fish the burden on the state would be manageable.</p> <p>I would suggest waiting two years to develop the “AQ fish catch certificate” program. This would give the corals some time to recover from the recent bleaching event. Our corals health depend on those same aquarium trade fish to recuperate and stay healthy. This year they are so stressed now, and we expect another bleaching event next summer. Our fear is if the coral losses any of the herbivores that keep them alive in the next year, the chances are high we will lose all our coral. They really need another 2 years to be safe. Without the corals to house, feed and act as nurseries , the aquarium fish will be endangered. Giving the ecosystem two years more years to stabilize, and time to establish a responsible and business friendly program, will result in Then an acceptable equilibrium between collectors and the reef that supports the fish of their trade, and all stakeholders win.</p> <p>Thank you for considering this as an option. Please feel free to contact use with questions or assistance in building this program,</p>	
Bob Curran	N/A	1/7/2020	Being a past Dive Charter operator, I may be biased. What is Hawaii thinking by still allowing fish collection in 2020? Look around the world. Even 3rd world countries have buoy anchorage systems in place and don't allow fish collection. Please help protect what's left.	Your comment has been forwarded to the decision makers.
Bob Flatt	N/A	12/13/2019	<p>1) The EIS contains disingenuous use of averages. For example "% of their overall island of Hawaii populations", the sample population size is arbitrary, why not local (collection area) populations (that would look overly extractive) or Pacific populations (that would look obviously misleading).</p> <p>2) The EIS contains disingenuous use of generalities "minimal impacts on populations in general". Nicely hiding that aquarium collecting is an economic activity biased towards higher priced (less common) species. The decimation of uncommon species does indeed have little short term impact on the population in general, but destroys species</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the FEIS maintains that the CREP population offers the best estimate to analyze impacts, the impact of collection on the WHAP Open Area populations, where collection would be occurring under the Preferred Alternative, has been added as Appendix B of the FEIS for comparison purposes.</p>

			<p>diversity - a key indicator of ecosystem health.</p> <p>3) As a society we try to limit anthropogenic stresses on the reef, such as pollution. It would be inconsistent to allow an anthropogenic stress such as fish collection. If a polluter said the pollution is only 1% of what they could pollute we would not accept this as a justification, if a fish collector says it is 1% of what they could collect we should not treat this as a justification.</p> <p>4) No Aquarium Permits is the only practical solution.</p>	
Bobbie Best	HI	1/6/2020	<p>Aloha Mr. Sakoda, The aquarium trade is being protected by DLNR at the expense of the reef species and habitat around our islands. Please discontinue this practice immediately. This is for the environment, tourists, locals & being pono.</p> <p>People are watching closely and will not relent on this issue!</p>	Your comment has been forwarded to the decision makers.
Bruce Cohen	N/A	1/7/2020	<p>Please. Do not allow our reef fish to be removed for commercial fishing interests. They are our precious resource and belong to all of us who call the islands home. Visitors want to see them as well. Healthy and abundant. The fish they desire can be found nearby uninhabited islands as well. They should go there.</p>	Your comment has been forwarded to the decision makers.
Carol Lynn Anderson	NC	1/7/2020	<p>As you are probably aware, The Pet Industry Joint Advisory Council has submitted an environmental impact statement "surmis[ing that] the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem"! I am aghast at that statement - when everywhere we have continued to prove that our "use" of the wild has ended miserably and not just for them- but for US too. According to what I read, "Hawaii is expected to lose 70% of their coral reefs in the next couple of decades. There is not time nor reasonable cause for the aquarium industrysponsored justifications for raiding the reefs.</p> <p>Your native fishes and reefs deserve effective legal protection, and should be left wild. Please do all and everything you can to ensure that legal protection is given to this majestic area and its inhabitants.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The commenter incorrectly states that the EIS surmises "that the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem". The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative</p>

Commenter	State/ Location	Date Received	Comment	Response
				would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.
Charles Humphrey	HI	1/7/2020	<p>I am writing this letter to oppose the aquarium fishing trade in West Hawai'i.</p> <p>For many years of my life I kept marine fish as pets and also worked at a fish store which specialized in marine corals and fish. I can tell you from first hand experience that most of the fish that are shipped off the reefs die premature deaths. Even if the fish survive the shipment process, many are not adequately cared for by the individuals that buy them.</p> <p>I do support marine fish and coral aquaculture which has made many break throughs in recent years. It is my belief that the marine fish and coral industry needs to move in this direction and create jobs through aquaculture and not through harvesting wild marine fish and coral.</p> <p>As an avid snorkeler here in West Hawai'i, I can say without a doubt that the collection of marine fish species would have a deleterious impact on our coral reefs. As an example, a popular aquarium fish, Arothron meleagris, the spotted or guinea fowl puffer, doesn't appear in large numbers on our reefs. When my wife and I snorkel for a few hours over a reef we may see one. Should a commercial aquarium company remove that one puffer from the reef, it would leave a huge hole in that ecosystem. Each species plays a part and is integral to the health of the reef.</p> <p>My wife and I worked for Sea Shepherd Conservation Society and so we have seen this issue play out in many other countries around the globe. If Hawaii does not protect its reefs and the creatures that inhabit it, tourism will soon wane. I have snorkeled extensively in the Caribbean and I have seen coral reefs that have been devastated by overfishing and a lack of protection. Once the fish are gone, the corals suffer and the algae takes over. Once the algae takes over it becomes an alternate stable state, and the reef cannot recover.</p> <p>It is my sincere hope that no fish collection permits will be issued for West Hawai'i, or at any reef in the Hawaiian Island chain. Our reefs are delicate enough with the pressures of climate change, and removing key species from our reefs would only precipitate their demise.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>A discussion on post-collection mortality has been added to Section 5.4.2 of the EIS.</p> <p>The guinea fowl puffer is not one of the 40 species on the White List of species that can be collected under aquarium permits in the WHRFMA and is not proposed to be collected under any of the alternatives considered in the EIS.</p>
Charmaine Campbell	Canada	1/7/2020	Each species removed disrupt this ecosystem that is maintained by these species. Eventually, if there is no protection it will collapse The web of life is disrupted enough by ocean warming with coral reefs dying right now in Hawaii waters. The vanity of aquarium fish hunters collapsed many species in Amazonian waters This industry is fueled by ignorance, vanity. Capturing these species that are in Hawaii waters may bring a money flow to some, there is no value in captivity except	Your comment has been forwarded to the decision makers.

			for those who profit from this. Captivity, containment, and removal from waters where these species were born and adapted to subjects fish species to stress, for the ones that survive. removes the genetic pool from the natural environment. It will leave what reefs that are left in jeopardy and cause a collapse of the natural ecosystem which is valued much more for the natural beauty, even more than the aquarium trade. When you become aware of the biology and interdependence of these species remaining intact then you will understand that profiting by removing certain species will result in a serious impact on the entire ecosystem. and perhaps the eventual extinction of these species. It is disheartening to know that you support this in your position.	
Chris Mentzel	N/A	1/7/2020	The aquarium trade is being protected by DLNR at the expense of the reef species and habitat around our islands. Please discontinue this practice immediately. We are watching closely and will not relent on this issue!	Your comment has been forwarded to the decision makers.
Christina (last name not provided)	N/A	1/7/2020	I am writing to say that I think that working on repairing & building up healthy coral reefs is MUCH MORE important than supporting the aquarium fishing industry. If we continue to take and damage and not replenish then in the future this will be a moot point because we will have no reef or fish left. I do not think ANY aquarium collecting permits should be issued until our reefs ecosystem is fully replenished to a point of over abundance. Any taking before that point will be harmful. Thank you for taking time to read and consider this.	Your comment has been forwarded to the decision makers.
Christine Collins	N/A	1/6/2020	Please make protecting Hawaii's native fishes a priority and grant them the legal protection that they deserve. "Hawaii is expected to lose 70% of our coral reefs in the next couple of decades, so we don't have time for aquarium industry-sponsored justifications for raiding the reefs" - Maxx Phillips, Hawaii director with the Center for Biological Diversity.	Your comment has been forwarded to the decision makers.
Cindy Whitehawk	HI	1/8/2020	It took years of individuals concerted efforts to stop the raping of our ocean by the pet fish aquarium industry. I have only lived here 14 years and have witnessed the decrease in our reef fish. Please do not give in and re-open our waters to the aquarium fish trade.	Your comment has been forwarded to the decision makers. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.

Cindy Williams	HI	1/6/2020	As I witness the decline of beautiful fish in the Hawaiian waters over the last 2 decades, my belief is that the fish need your help. People who profit from this industry can have guppies and other fish that reproduce well and aren't wild-harvested. It is your hands to protect the beauty and diversity of our tropical fish, and I urge you to please help. The DLNR needs to be directed to care for and protect our national treasures and preserve the fish for future generations of kama'aina and tourists to enjoy. Please help!	Your comment has been forwarded to the decision makers. It is acknowledged that reefs face many threats and reef conservation is important; however, as stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time. In addition, Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.
Claudia Kane	HI	1/6/2020	I am writing to respectfully inform you, I oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish.	Your comment has been forwarded to the decision makers.
Connie Rohal	N/A	1/5/2020	<p>Most people of Hawaii, and the millions of people from around the world that visit our most unique and amazing state, are worried about the health and viability of our reefs.</p> <p>The reefs are suffering. There are many reasons why. Some are out of the control of one person to fix, but there is one reason that one person can affect, and that person is you.</p> <p>You are a smart man, Governor Ige, so you know I am talking about shutting down the aquarium trade people.</p> <p>Your constituents depend on you to do what is best for the state. To do what will ensure a healthy ocean for the livelihood of all who live here and also for those who spend millions and millions of dollars to come here and enjoy the biggest draw our state has to offer, our island reefs.</p> <p>I appeal to your love of the state and your desire to do the right thing, to stop the ravage of the reefs. The reefs will not survive without the fish and without the reefs our biggest tourist attraction will disappear along with the tourists.</p> <p>The state is not benefiting from the aquarium trade and it is not in our best interest.</p> <p>When the fish are gone, and the aquarium trades people you are working to protect move on to other Polynesian islands...when our reefs are dead and barren because the fish have been scooped up and shipped away, when tourism declines, and the livelihood of Hawaii's people is impacted, they will look to you and ask why you didn't stop it when you had the chance.</p> <p>This is your time Governor, to make a difference, to impact in a most</p>	Your comment has been forwarded to the decision makers.

				1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.
Cyndy Urry	N/A	1/6/2020	<p>I was asked to write to you concerning fish collection in Hawaii. I thought that the ban on fish collecting was still in effect, but several people have contacted me saying that it was coming up for discussion again. Already? It hasn't been very long since the ban went into effect and it took years to get it passed. There must be some fish collectors pressuring someone to let them have free rein on our poor reefs. I am a longtime resident / scuba diver and I have seen a few more yellow tangs that were very much depleted just a couple of years ago. They are trying to come back but the numbers are still low. There are still so many endemic species that we don't even see anymore. We desperately need our algae eaters as with the coral bleaching we had this year (we really dodged a bullet with our rain we got that cooled the water temps just enough) . I swim, snorkel , and dive the whole west side of Hawaii Island (with several others) . Our waters here are the best in the state for scuba diving and snorkeling . People that are relying on the businesses around the waters are seeing less fish also. Please don't let a few greedy fish collectors ruin the reefs for everyone . We need at least 10 more years of untouched reefs to get back to our old Hawaii. There is poaching going on too and we realize that the DLNR can't be everywhere .</p> <p>We are so far removed from the rest of the world that we can't replenish our fish like they can in Indonesia . Help us save what we have because once it's gone, there's nothing at all we can do. If I can help you in any way , don't hesitate to call on me.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The October 2017 supreme court ruling was that a HEPA review needed to be completed before Aquarium Permits could be issued, not a permanent ban on commercial aquarium collection. This EIS is fulfilling that requirement for 10 Aquarium Permits.</p> <p>An analysis of the cumulative impact of poaching and underreporting has been added to the FEIS.</p>
Cynthia White	OH	12/18/2019	NOTE: Comments were omitted from email but the email subject line is: SUPPORT ENVIRONMENTAL IMPACT STATEMENT IN HAWAII and the email body includes 'Dear Terry Vandewalle' and ends with identification of commenter.	Your comment has been forwarded to the decision makers.
Dan Dolaptchieff	HI	1/8/2020	<p>Im a liscensed tropical fish collector. It unconstitutional for only 14 persons to fish that water in west hawaii, I have fished. On Big island for most of my 28 years here for tropical fish in west hawaii and on hilo side.</p> <p>My Boat shop burnt down in 2006 due to Mac. Nut opperation next door. I was diving west hi att. I had to sell my house and move to east side , it was all i could afford with my family.</p> <p>I was eagerly waiting for the west side to open so i could make a good living again. I could never afford to give the 14 guys 20 k to help with</p>	Your comment has been forwarded to the decision makers.

			<p>the lawsuit. I did give funds to PIJAC. (Im a disabled Veteran) I humbly request that the council looks at my situation and acts appropriately. U would be excluding many already liscensed trop divers allready Living and working on the big island. Not a very good situation. How can a small group of fisherman have exclusive rights to fish one area. What is the hawaian trop divers gonna say? Descrimination against hawaians?</p>	
Dan Lanterman	HI	12/2/2019	<p>Aloha. Please note my strong disapproval of any commercial reef fish collection in Hawaii. There is no justification in satisfying a very small minority (collectors) at the expense of the remaining residents of Hawaii, not to mention the ecological damage the collectors have done.</p>	Your comment has been forwarded to the decision makers.
Dan Lanterman	HI	12/2/2019	<p>Please note my strong disapproval of any commercial reef fish collection in Hawaii.</p>	Your comment has been forwarded to the decision makers.
Dan Swenson	N/A	1/7/2020	<p>Please, if it is in your power, do not go along with the commercial exploitation of this limited beautiful resource. I have lived here in West Hawaii for 15 years and have seen the drastic decline of reef fishes here. Please do not allow the decimation of this beautiful resource, for the financial benefit of the commercial fish industry. The fish count is just too low and too slow to recover from this kind of threat.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>
Dane Enos	N/A	1/7/2020	<p>Howz it aloha everyone my name is Dane many in the business know who I'm those new divers will know who I'm by the end of this evening.. Before we begin I'd like to bring the public's attention to exactly who these divers are and some of the pet shops that are buying these fish... Names: I've seen a lot of divers come and go...most leaving damaged reefs and pure destruction in their methods... Ahh the New divers This is where problems began and has changed our reefs forever. During my time or tenure as a collector I would consistently catch 200 to 400 yellow tangs several times a week. I've caught as many as 2000 yellow tangs in a day...I've caught tons of variety... for public knowledge variety is any fish but the yellow tangs... These numbers are excessive, alarming and frightening.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. Additionally, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui.</p>

				<p>fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>It is acknowledged that reefs face many threats and reef conservation is important; however, as stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time. In addition, Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.</p>
Danielle Kaleinani Bunnell	N/A	1/8/2020	<p>My name is Danielle Bunnell, and I have been a Captain and submarine pilot with Atlantis Adventures for 17 years. I see approximately 25 acres of reef several times a day as part of my job. We must do EVERYTHING POSSIBLE to protect this fragile resource for generations to come. I realize that our dive site has been in a protected area, and that no fish collection has been allowed there since the year 2000. Reef fish belong on the reef. It is very difficult to monitor the take from permitted activities. DLNR simply does not have the resources to oversee this program. Period. I see egregious behaviors on the water on a weekly basis that go unchecked due to lack of resources and personnel. This will be no different. I do support the traditional and cultural practices of subsistence fishing, but that certainly does not apply here. The only people benefiting are the ones with the permit. I respectfully request that we continue to ban reef fish collection from the Island of Hawaii. Thank you very much for your time and consideration.</p>	Your comment has been forwarded to the decision makers.
Darby L. Partner	HI	11/24/2019	<p>I strongly urge you NOT to allow the collecting and selling of West Hawaii's reef fish.</p> <p>The reef is in dire need of protection.</p> <p>A healthy reef is a huge money-maker in Hawaii as many tourists come to snorkel and view the coral and fish.</p> <p>However the reef is very unhealthy presently due to the recent high temperatures of the sea (climate change), pollution, sunscreens and other damaging aspects of human disrespect and lack of education and knowledge. Taking the reef fish will hurt the reef even more.</p> <p>A healthy reef is extremely important. The fish are an important part of the eco-system.</p> <p>The reef fish must be protected.</p> <p>Please malama our beautiful reefs!</p>	Your comment has been forwarded to the decision makers.

			<p>selfish enslavement of our fellow creatures who have an inherent right to live free in their habitat - all in the perpetual lust for dollars. This is the EXACT same barbaric ENSLAVEMENT scenario played out throughout human history: Capture the indigenous innocents, Destroy their connection with family, community, home, and steal their freedom, Force those innocents into inhumane conditions for the rest of their once beautiful - now brutally cruel, exploited lives, and IF they survive capture, packaging, transportation, wholesale and retail “sale” - End their lives enslaved in an unknown foreign containment. With Hawai’i’s history of colonization and stolen freedoms, lands and culture - does the reality of this cruelty - this theft and enslavement - not effect your conscience...? There is a very sick irony here. For too long, our standard EIS (and DEIS) protocols and process has looked at ONLY a narrow and limited number of “factors” upon which decisions are manipulated and rendered. Therefore, I formally ask that you correct this shortsighted error, and that the MORAL and ETHICAL DIMENSIONS AND CONSEQUENCES of this proposal, application, permit request, deliberation and decision NOW BE ADDED AND INCLUDED IN THIS EIS process and decision. Hope for human survival on our ailing earth will remain questionable at best until we recognize our past mistakes and our arrogantly presumed dominion mentality - and change our behavior. I can think of no better opportunity than now - this decision - to change our destructive course determining our collective future. We need gratitude and respect for the lives of all beings with whom we share our home, island, and planet - in this decision.</p>	
David O. Baldwin	HI	1/7/2020	No to tropical fishers. We need to recover not retreat. No no no!	Your comment has been forwarded to the decision makers.
Dawn Wallis	WA	1/6/2020	<p>Please re-open this sustainable fishery. I also request that any additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.</p>	Your comment has been forwarded to the decision makers.
Debye Leong	HI	1/6/2020	<p>Extinction is forever—it’s that simple. It’s my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It’s a devastating commercial enterprise that trashes near-shore habitat and species. Don’t export Hawaii reef wildlife to feed the mainland aquarium trade.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS was prepared using the best available science. 			<p>Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we bloody well can put a stop to aquarium collecting.</p> <p>The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.</p> <p>But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point.</p>	<p>impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>
Deirdra Rogers	CA	12/11/2019	<p>Dear David Sakoda, This so-called environmental review is actually a commercial appeal to convert Hawaii reef species and habitat to money, to deny Hawaii and its people of economic treasures, to support a mainland amusement industry, and to condemn reef wildlife in a vicious cycle of replacement.</p> <p>PIJAC is a lobbying group for the commercial pet trade . This Environmental Review is not relevant, not accurate, and not legal. When the Hawaii Circuit Court ruled on this issue, in favor of the DLNR Director's discretion, that director was William Aila, an aquarium collector. I see that as a conflict of interest. When the legislature passed Senate Bill 1240 to phase out the aquarium trade, DLNR Diretor Suzanne Case prevailed on Governor Ige to veto the bill. The Hawaii Supreme Court ruled that no further permits should be issued until Environmental Assessment, with injunctive relief to close it down. DLNR Director Suzanne Case trumped that ruling with: permits are no longer required, for aquarium collecting. It takes only a commercial fishing license. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes nearshore habitat and species. The vast majority of Hawaii people want the aquarium trade to end. And so do millions of visitors around the world, who travel to Hawaii to relish the reef kingdom.. Reef tourism supports many thousands more people, with revenue 400 (four hundred) times greater than the aquarium trade.</p> <p>This environmental review is a farce.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS was prepared using the best available science.</p>
Denise Boisvert	HI	12/18/2019	<p>Accepting the EIS with its obviously skewed manipulation of data in order to find 'no significant impact' would be an insult to all the Native Hawaiian cultural practitioners who oppose the permits for</p>	<p>Your comment has been forwarded to the decision makers.</p>

			<p>commercial reef fish collections.</p> <p>I am strongly OPPOSED to the Draft EIS for commercial reef fish collections because healthy reefs depend on the fish that live on them, and because commercial fishing of reef fish is a wasteful, destructive, and unnecessary industry.</p> <p>One has to wonder why those who wrote the EIS purposefully chose to manipulate the data, and what connection there may be to the proponents of such a destructive industry.</p> <p>Thank you for your kind consideration of rejecting the EIS.</p>	
DENZLER23 70 @twc.com	N/A	1/6/2020	No more permits to the fish collectors please.	Your comment has been forwarded to the decision makers.
Diane and Syd Marcus	N/A	1/6/2020	Native fishes must receive protection from the state. They are highly intelligent and sentient individuals and should be left wild.	Your comment has been forwarded to the decision makers.
Diane Ware	HI	1/6/2020	<p>I urge you not to side with the special interest industry over the welfare and rights of the Hawai'i people and reef fish.</p> <p>I first snorkeled in the islands before statehood and have visually noted the continued decline of reef fish until present. I am a concerned member and outings leader of the Sierra Club on Hawai'i island. We received numerous reports from members on coastal hiking, kayaking, and snorkeling outings that reef fish numbers were declining. We weren't sure why but in 2003 kayaking off Pebble beach a resident of the area advised us aquarium fish collectors were taking many fish. So much so that we weren't seeing them from land or in the water as abundantly as we had years before. The Gold Coast was gone. The beautiful under water view plane was gone. Subsistence fishing for native Hawaiians was impaired. Our Group supported a successful resolution by County Council asking the State to ban the trade in 2008. We have continued to support a ban on the trade and sponsored a program, 'Where Have All the Fishes Gone' one year ago. We met with Kaimi Kaupiko down in Miloli'i to learn how the trade affected his fishing village and were told they supported a ban. We snorkeled Honomolino, Puako, 2 step, and Papa Bay with Paul Cox. Rarely do we see more than 20-40 Tang at a time whereas we remember seeing large schools of Tang decades ago.</p>	Your comment has been forwarded to the decision makers.
Diane Ware	HI	1/6/2020	<p>We invited Mike Nakachi, Rene Umberger and Paul Cox to our program. Paul Cox showed photos of collectors damaging the reef, Mike Nakachi had me in tears as he spoke of the taking and selling of black coral and other species. This trade is unnecessary and profit based for a Pet industry mostly off island. It does not benefit local residents who have shown time and again they do not support the trade. It violates the Public Trust Doctrine, Article XI of the constitution and precautionary rule.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As described in Section 1.2.3.2, the collection of coral is illegal and would not be allowed under any of the alternatives under consideration.</p>

Diane Ware	HI	1/6/2020	<p>The trade is inhumane and violates Hawaii State Cruelty Statute: 711-1109 Cruelty to animals in the second degree. (1) A person commits the offense of cruelty to animals in the second degree if the person intentionally, knowingly, or recklessly:</p> <p>(a) Overdrives, overloads, tortures, torments, beats, causes substantial bodily injury to, or starves any animal, or causes the overdriving, overloading, torture, torment, beating, or starving of any animal;</p> <p>(b) Deprives a pet animal of necessary sustenance or causes such deprivation;</p> <p>(c) Mutilates, poisons, or kills without need any animal other than insects, vermin, or other pests; provided that the handling or extermination of any insect, vermin, or other pest is conducted in accordance with standard and acceptable pest control practices and all applicable laws and regulations.</p> <p>The trade as proposed in DEIS violates this statute. Is this why Stantec has made a disclaimer on the scope to exclude what happens to these creatures after caught? Truth is, many are brought up from reefs so quickly they suffer immediately. If their swim bladders are not punctured they can die. I suspect that is why they are found dead in trash cans (the 500 dead at the harbor). Several Hawaiians interviewed complain that they see bags of dead reef fish and this is not pono. We can ask what measures are taken to ensure fish are treated humanely. They are deprived of food at warehouses before shipping. Their fins are trimmed. Is the DOH and DLNR regulating care of fish? My sister is a vet tech and says they are susceptible to disease and handling by humans. If treated humanely maybe not so many would be taken. They are sentient beings, not a commodity. Sierra Club members met with Keith Dane from Humane Society USA. I notice plaintiffs are not named in DEIS</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The impacts of post-collection mortality have been added to Section 5.4.2 of the FEIS.</p>
Diane Ware	HI	1/6/2020	<p>d) For each of the 14 applicants, please note which collectors engage in the following practices in contradiction to HRS 711-1109: withholding of food (starvation) and for what period of time; flogging or puncturing of the swim bladder; cutting of spines or dorsal fins; body compression (squeezing animal to force out ejection of fecal matter</p>	<p>Your comment has been forwarded to the decision makers.</p>
Diane Ware	HI	1/6/2020	<p>DLNR has called for food fishers to reduce the take of herbivorous fish species but has remained silent on the hundreds of thousands of herbivorous animals the aquarium trade takes for commercial purposes.</p> <p>"except for bag limits for a limited number of species, nothing prohibits these collectors from taking every single fish from every single reef in the state," said Earthjustice attorney Kylie Wager Cruz.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>“It’s common sense that this level of unrestricted take can’t be sustainable.”</p>	<p>permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, the collection of “every fish and every marine creature” is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p> <p>In addition, as stated in the FEIS, the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.</p>
Diane Ware	HI	1/6/2020	<p>The DEIS was prepared by Iowa-based Stantec Consulting, the same consulting group that dismissed the protests of Native Americans and claimed that the Keystone Pipeline would similarly have minimal environmental impacts.</p> <p>“The DEIS is based on the false premise that aquarium collecting doesn’t impact fish populations on the reefs where the trade operates,” said Inga Gibson, policy director of Pono Advocacy.</p> <p>“Nothing could be further from the truth. This false premise lays the foundation for this extremely flawed study, and prevents DLNR from ultimately accepting the DEIS.”The DEIS skews data by comparing catch numbers to estimates for fish populations on the entire island and concludes that the trade would be taking just 1%, which misleadingly minimizes impacts to localized reef ecosystems.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The impacts of collection on WHAP Open Area population estimates have been added in Appendix B of the FEIS.</p>

Diane Ware	HI	1/6/2020	<p>For years, DLNR has allowed the trade to pillage Hawai'i's treasured coral reef wildlife, in violation of HEPA.</p> <p>The DEIS dismisses testimony from dozens of Native Hawaiian cultural practitioners, and instead summarily concludes that collection for the aquarium industry has no cultural impact as long as the populations of the reef animals are not substantially reduced from current numbers in spite of advocating for unlimited take of all but one fish, Achilles Tang.</p> <p>"We participated in this process in good faith, hoping for change by sharing our deeply personal, spiritual and cultural histories and concerns with this destructive trade. Instead, we've been slapped in the face—summarized into a one-liner that the trade has no significant cultural impact. The truth is, this industry harms our ability to gather the food we've relied on for generations, and it's time for the state to protect these resources from commercial exploitation," said Kaimi Kaupiko of Miloli'i.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The CIA completed a detailed analysis of cultural effects, and the complete report is provided in Appendix A of the EIS. The EIS summarized the conclusion of the CIA with regard to the impact of aquarium fishing. The rest of the cultural analysis is disclosed in Appendix A.</p>
Diane Ware (second submission)	HI	1/6/2020	<p>I urge DLNR not to accept the preferred alternative of the biased DEIS payed for by special interest industry trumping the welfare and rights of the Hawai'i people and reef fish.</p> <p>For years, DLNR has allowed the trade to pillage Hawai'i's treasured coral reef wildlife, in violation of HEPA. I am a simple person with a deep connection to nature who values the Hawaiian ecosystems. I have volunteered 25 years on numerous including Hakalau, Mauna Kea Forest Project's Palila critical habitat to HVNP and also Kiholo Bay fishpond with TNC to preserve and restore habitats for future generations.</p> <p>I first snorkeled in the islands before statehood and have visually noted the continued decline of reef fish until present. I am a concerned member and outings leader of the Sierra Club on Hawai'i island. We received numerous reports from members on coastal hiking, kayaking, and snorkeling outings that reef fish numbers were declining. We weren't sure why but in 2003 kayaking off Pebble beach a resident of the area advised us aquarium fish collectors were taking many fish. So much so that we weren't seeing them from land or in the water as abundantly as we had years before. The Gold Coast was gone. The beautiful under water view plane was gone. Subsistence fishing for native Hawaiians was impaired. Our Group supported a successful resolution by County Council asking the State to ban the</p>	<p>Your comment has been forwarded to the decision makers.</p>

			<p>trade in 2008. We have continued to support a ban on the trade and sponsored a program, 'Where Have All the Fishes Gone' one year ago. We met with Kaimi Kaupiko down in Miloli'i to learn how the trade affected his fishing village and were told they supported a ban. We snorkeled Honomolino, Puako, 2 step, and Papa Bay with Paul Cox. Rarely do we see more than 20-40 Tang at a time whereas we remember seeing large schools of Tang decades ago.</p>	
Diane Ware (second submission)	HI	1/6/2020	<p>We invited Mike Nakachi, Rene Umberger and Paul Cox to our program. Paul Cox showed photos of collectors damaging the reef, Mike Nakachi had me in tears as he spoke of the taking and selling of black coral and other species. This trade is unnecessary and profit based for a pet industry mostly off island. It does not benefit local residents who have shown time and again they do not support the trade. It is in conflict with the Public Trust Doctrine, Article XI of the constitution and precautionary rule.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As described in Section 1.2.3.2, the collection of coral is illegal and would not be allowed under any of the alternatives under consideration.</p>
Diane Ware (second submission)	HI	1/6/2020	<p>The trade is inhumane and violates Hawaii State Cruelty Statute: 711-1109 Cruelty to animals in the second degree. (1) A person commits the offense of cruelty to animals in the second degree if the person intentionally, knowingly, or recklessly:</p> <p>(a) Overdrives, overloads, tortures, torments, beats, causes substantial bodily injury to, or starves any animal, or causes the overdriving, overloading, torture, torment, beating, or starving of any animal;</p> <p>(b) Deprives a pet animal of necessary sustenance or causes such deprivation;</p> <p>(c) Mutilates, poisons, or kills without need any animal other than insects, vermin, or other pests; provided that the handling or extermination of any insect, vermin, or other pest is conducted in accordance with standard and acceptable pest control practices and all applicable laws and regulations.</p> <p>The trade violates this statute and looks the other way, not wanting to regulate just reap "socioeconomic benefits" touted in the DEIS. Is this why Stantec has made a disclaimer on the scope to exclude what happens to these creatures after caught? Truth is, many are brought up from reefs so quickly they suffer immediately. If their swim bladders are not punctured they can die. I suspect that is why they are found dead in trash cans (the 500 dead at the harbor). Several Hawaiians interviewed complain that they see bags of dead reef fish and this is not pono. What measures are taken to ensure fish are treated humanely? They are deprived of food at warehouses before shipping. Their fins are trimmed. Is the DOH and DLNR regulating care of fish? My sister is a vet tech and says they are susceptible to disease and handling by humans. If treated humanely maybe not so many would be taken. They are sentient beings, not a commodity. Sierra</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The impacts of post-collection mortality have been added to Section 5.4.2 of the FEIS.</p>

			Club members met with Keith Dane from Humane Society USA. I notice plaintiffs are not named in DEIS. Why?	
Diane Ware (second submission)	HI	1/6/2020	<p>DLNR has called for food fishers to reduce the take of herbivorous fish species but has remained silent on the hundreds of thousands of herbivorous animals the aquarium trade takes for commercial purposes.</p> <p>"Except for bag limits for a limited number of species, nothing prohibits these collectors from taking every single fish from every single reef in the state," said Earthjustice attorney Kylie Wager Cruz. "It's common sense that this level of unrestricted take can't be sustainable."</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, the collection of "every fish and every marine creature" is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p> <p>In addition, as stated in the FEIS, the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.</p>
Diane Ware (second submission)	HI	1/6/2020	The DEIS was prepared by Iowa-based Stantec Consulting, the same consulting group that dismissed the protests of Native Americans and claimed that the Keystone Pipeline would similarly have minimal environmental impacts. The most recent oil spill was over 300,000	<p>Your comment has been forwarded to the decision makers.</p> <p>The impacts of collection on WHAP Open Area population estimates have been added in Appendix B of the FEIS.</p>

			<p>gallons.</p> <p>The DEIS skews data by comparing catch numbers to estimates for fish populations on the entire island and concludes that the trade would be taking just 1%, which misleadingly minimizes impacts to localized reef.</p>	
Diane Ware (second submission)	HI	1/6/2020	<p>The DEIS dismisses testimony from dozens of Native Hawaiian cultural practitioners, and instead summarily concludes that collection for the aquarium industry has no cultural impact as long as the populations of the reef animals are not substantially reduced from current numbers in spite of advocating for unlimited take of all but one fish, Achilles Tang. Why should native Hawaiian fishers accept the diminished fish numbers after decades of the trade taking unlimited numbers of fish as a base line for sustainability? The cultural background provided is detailed and explains why Hawaiians have connections to places their ancestors frequented and fished. If that place is now diminished by the trade, they are deprived of the bounty their ancestors enjoyed. Thus the colonial overlordship of lands and ocean taken and regulated by the state continue to marginalize the people and the culture.</p> <p>“We participated in this process in good faith, hoping for change by sharing our deeply personal, spiritual and cultural histories and concerns with this destructive trade. Instead, we’ve been slapped in the face—summarized into a one-liner that the trade has no significant cultural impact. The truth is, this industry harms our ability to gather the food we’ve relied on for generations, and it’s time for the state to protect these resources from commercial exploitation,” said Kaimi Kaupiko of Miloli’i.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The CIA completed a detailed analysis of cultural effects, and the complete report is provided in Appendix A of the EIS. The EIS summarized the conclusion of the CIA with regard to the impact of aquarium fishing. The rest of the cultural analysis is disclosed in Appendix A.</p>
Diane Ware (second submission)	HI	1/6/2020	<p>Finally, I have a great interest in protecting anchialine pond habitats. One or two of the DEIS so called "Red Pond Shrimp" are now endangered (Vetericaris chaceorum and Procaris hawaiana). V. chaceorum is found in Ka'u. The DEIS claims no endangered species are collected. Why? There is no limit on take of shrimp and the numbers taken are a "guess" but likely over 20,000 per year. Do the chosen collectors know the difference between the species of 'opae? Are endangered species caught and how many? The Center for Biological Diversity has another current lawsuit against USFWS for not designating critical habitat for anchialine ponds in violation of ESA. According to the Ka'u Calender (December 2019) Maxx Phillips of BCD says "These special species are found nowhere else...so if they disappear from here they'll be lost forever. Anchialine pool shrimp and the rest of the group needed habitat protection years ago but there not getting it from the anti-wildlife Trump administration. Species with</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Red Pond Shrimp are not on the White List, and in addition, invertebrates can not be collected from the WHRFMA. In East Hawai'i, invertebrates can be collected, but do not require an Aquarium Permit. Therefore, collection of red Pond Shrimp is not anticipated to differ between alternatives, including the No Action Alternative.</p>

Commenter	State/ Location	Date Received	Comment	Response
			habitat protection are twice as likely to be in recovery as those without". Dr. Scott Nelson researcher from Auburn University spoke at After Dark in the Park, 2011, stating they have found Hawaiian endemic 'opae'ula world wide, and "...has also garnered the interest of aquarists and companies in the pet trade industry. Over the last few years, closed ecosystems containing these shrimp have been marketed under a variety of trademarked names in retail stores and on the World Wide Web...Thus, habitat destruction and modification, as well as the potential for over-harvesting, could ultimately lead to the extinction of some H. rubra populations." Quote is from Molecular Ecology.	
Diane Ware (second submission)	HI	1/6/2020	I have empathy for those who have depended on the trade for income as I was forced to change professions due to health concerns. There are many pono possibilities such as tours, monitoring reef and fish or removing invasives which I believe the state could do to improve and protect the reefs.	Your comment has been forwarded to the decision makers.
Dominic Romer	FL	1/7/2020	I'm writing asking you to please keep the ban on the West Hawaii ornamental fish trade active. I first moved to the Big Island in 2001. Before that I was living in Oahu. When I moved to the big Island I was amazed at the variety and numbers of fishes and coral compared to what I'd seen on Oahu. I got my scuba certification and began to dive almost every day after work. After a few years I moved to the mainland for a job opportunity. I just move back to the Big Island in July 2019. I began snorkeling my 2nd day off the plane. I was shocked at what I saw. There was so much dead coral. The fish life was nothing like it was, In fact I can name specific fish..Since I've been back I've seen 3 scrawled file fish...I used to see numerous scrawled file fish every dive. The amount of parrot fish is also down an immense amount. Tinkers butterfly fish used to be common in large swarms all over the reefs. Now due to fish collection the only place to see them is either in south point or on very deep reefs well beyond the recreational diving limits. So what I'm asking is to please to not allow ornamental fish collection in West Hawaii. The reefs are in trouble and need the herbivores to keep them clean and healthy, the tourists comes to see the reefs and the fishes. There is only one West Hawaii there will be a tipping point where the fish populations are too small to reproduce effectively and like the Tinkers butterfly fish they will disappear. The science that the fisherman are using does not take into account the coral bleaching events of 2015 and 2019 and future events. Please don't let the greed of a few individuals ruin the precious underwater environment of West Hawaii.	<p>Your comment has been forwarded to the decision makers.</p> <p>Collection of scrawled file fish and parrot fish is not curenly allowed in the WHRFMA as they are not on the White List of 40 species that can be collected and neither the Proposed Action nor any of the alternatives considered in the EIS include collection of these species. Tinkers Butterflyfish are on the White List, however, collection under any alternative is anticipated to be less than 5% of the island-wide population. They are also known to be more common in deeper waters where aquarium collection does not occur</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>The coral bleaching events are discussed in Section 5.4.3.5 of the EIS.</p>
Donna Marino	N/A	1/6/2020	Please limit fish collection for the aquarium trade; this practice has enormous negative implications for wild fish populations.	Your comments have been forwarded to the decision makers.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>Estimates predict that Hawaii is expected to lose 70% of its coral reefs in the next couple of decades and cannot afford to allow the aquarium industry to raid the reefs.</p>	<p>The Preferred Alternative would limit the number of Aquarium Permits to 10, and limit their use to the WHRFMA.</p>
<p>Dorothy Branch</p>	<p>N/A</p>	<p>1/5/2020</p>	<p>Extinction is forever—it’s that simple. It’s my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It’s a devastating commercial enterprise that trashes near-shore habitat and species. Don’t export Hawaii reef wildlife to feed the mainland aquarium trade. Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It’s truly heart-breaking. Many factors conspire in this tragedy. Maybe we can’t combat global warming locally. But we bloody well can put a stop to aquarium collecting. The so-called “Environmental Review” consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii’s DLNR (to that department’s shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood. But where is the traders’ credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii’s taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists, PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal. I implore you to do the right thing</p>	<p>Your comment has been forwarded to the decision makers. The EIS was prepared using the best available science. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline. PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC’s Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/</p>
<p>Doug Perrine</p>	<p>HI</p>	<p>12/2/2019</p>	<p>Of the listed alternatives, the No Action alternative is preferable to any of the others as written. However, I would support the Limited Permit Issuance alternative with the following modifications: 1) Collecting is limited to the White List species statewide, not just in the WHRFMA only; 2) The following species are removed from the White List: flame wrasse, Cirrhilabrus jordani; psychedelic wrasse, Anampses</p>	<p>Commenter sent a revised comment later, and asked that this one be discarded. See response to other comment.</p>

			<p>chrysocephalus; longfin anthias, Pseudanthias hawaiiensis; Tinker’s butterflyfish, Chaetodon tinkeri; These endemic (nearendemic in the case of C. tinkeri) species do not have sufficient population data to determine a safe level of take, while anecdotal evidence indicates that collection has severely reduced populations in waters shallow enough for recreational scuba diving.; 3) Collection of harlequin shrimp, Hymenocera picta, is prohibited statewide. The genetically distinct Hawaiian population segment of this species is an obligate commensal of the coral Pocillopora eydouxi, which suffered >90% mortality in the bleaching event of 2015 2015, followed by extremely high mortality of newly recruited colonies in the 2019 bleaching event. The loss of critical habitat severely threatens the survival of harlequin shrimp in Hawaiian waters.</p> <p>Thank you for considering my comments.</p>	
Doug Perrine	HI	12/3/2019	<p>Please discard my previous comments (sent yesterday), which contained a factual error.</p> <p>Revised Comments on PIJAC DEIS for Hawaii Aquarium Fishery. Of the listed alternatives, the No Action alternative is preferable to any of the others as written. However, I would support the Limited Permit Issuance alternative with the following modifications: 1) Collecting is limited to the White List species statewide, not just in the WHRFMA only; 2) The following species are removed from the White List: flame wrasse, Cirrhilabrus jordani; psychedelic wrasse, Anampses chrysocephalus; longfin anthias, Pseudanthias hawaiiensis; Tinker’s butterflyfish, Chaetodon tinkeri; These endemic (nearendemic in the case of C. tinkeri) species do not have sufficient population data to determine a safe level of take, while anecdotal evidence indicates that collection has severely reduced populations in waters shallow enough for recreational scuba diving.; 3) Collection of harlequin shrimp, Hymenocera picta, is banned statewide. The preferred habitat of the genetically distinct Hawaiian population segment of this species is the coral Pocillopora eydouxi, which suffered >90% mortality in the bleaching event of 2015 2015, followed by extremely high mortality of newly recruited colonies in the 2019 bleaching event. The loss of critical habitat severely threatens the survival of harlequin shrimp in Hawaiian waters.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Collection with the use of fine mesh nets (i.e., with an Aquarium Permit) will be limited to the WHRFMA, and thus the 40 White List Species. No invertebrates, including the harlequin shrimp, will be allowed to be collected in the WHRFMA.</p> <p>Psychedelic wrasse and Tinker's butterflyfish populations have been estimated by CREP, and collection under the Preferred Alternative would be up to 1.06% of the Psychedelic Wrasse island-wide population, and up to 0.87% of the Tinker's Butterflyfish island-wide population, both below the lower limit of the 5% to 25% threshold (Ochavillo and Hodgson 2006). Collection of Longfin Anthias is anticipated to be only 3-5 individuals per year, and collection of Flame Wrasse 24-73 individuals per year. As noted in Section 4.4.1.38 of the EIS, prime Flame Wrasse habitat is within an FRA, where aquarium collection is not allowed.</p>
Dr. Will Tuttle	N/A	1/6/2020	<p>The Pet Industry Joint Advisory Council has submitted an environmental impact statement surmising that " the unlimited collection of Hawaii’s reef animals has a minimal impact on the state’s coral reef ecosystem” - This is self-serving and patently false! Please do all you can to protect the fishes on Hawaii’s reefs from capture for the pet industry!</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The commenter incorrectly states that the EIS surmises "that the unlimited collection of Hawaii’s reef animals has a minimal impact on the state’s coral reef ecosystem". The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
				<p>period. The concept of “unlimited” collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p>
Ed Dowling	N/A	1/3/2020	I am against taking live fish for the Aquarium trade.	Your comment has been forwarded to the decision makers.
Elizabeth Hoffman	N/A	1/7/2020	Please do not allow native Hawaiian fish to be caught for the aquarium trade. It is wrong for so many reasons. Bad for the coral reefs, and a nightmare for the fish.	Your comment has been forwarded to the decision makers.
Elizabeth McDermott	HI	11/25/2019	Oops, Meant to say West Hawaii not West Oahu. I am opposed to 14 commercial aquarium fishing permits being issued for West Hawaii in my first sentence.	Your comment has been forwarded to the decision makers. A note was made in your previous comment correcting the location.
Elizabeth Parker	N/A	1/6/2020	NO to reef damage, please do what is right	<p>Your comment has been forwarded to the decision makers.</p> <p>It is acknowledged that reefs face many threats and reef conservation is important; however, as stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time. In addition, Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.</p>
Ellen Robbins	N/A	12/9/2019	Hawaiian Supreme Court made their decision clear two years ago, regarding precious marine life, but it has been circumvented.	Your comment has been forwarded to the decision makers.

Commenter	State/ Location	Date Received	Comment	Response
			<p>Those of us here on the mainland, tourists, divers, lovers of Nature and Beauty ask that the Hawaiian Paradise be protected. The aquarium trade is sadly voracious and greed driven.</p> <p>I ask that the long term lure of dollars from tourists, such as myself, take priority over destructive short term dollar gains to be made by plundering precious Hawaiian reefs for the aquarium trade.</p>	<p>The Supreme Court decision was that issuance of Aquarium Permits required HEPA review, not a permanent ban on commercial aquarium collection.</p>
Eric Moreno	N/A	1/8/2020	<p>Once again, I want to express that my position hasn't changed regarding Commercial Aquarium Reef Fishing. I still believe that Aquarium Reef Fishing along Hawaii coastal reefs should be prohibited, and I provide two reasons.</p> <p>First, the largest economic industry is tourism. It is estimated the tourism industry led to over \$16 Billion in visitor spending ("Annual visitor report" (PDF). files.hawaii.gov. 2017.) Tourist come to our islands to see all the beauty of the land and her oceans. Risking this industry for the sake of an industry est. to be under a \$1Million, lacks common sense and proper stewardship.</p> <p>Second, ornamental reef fish contribute to the overall health of our reefs and waters. Further, collection methods have inadvertently damaged the reefs. As we deal with water quality and safety issues for our residents and visitors, it would seem neglectful to allow potential damage to our reef balance.</p> <p>While I know the EIS discusses sustainability, I caution trusting in the data that benefits the parties with a vested interest.</p> <p>An additional point I will make regards the aquarium fish industry. As I'm sure you are aware. They had a similar fight in Florida regarding taking of fish off the coastal Florida waters. They claimed that it would have a devastating impact to the aquarium industry and that the fish in question COULD NOT BE farmed economically. But, the truth was they never needed to try because they were getting the fish for free off the coast. When Florida denied their request and shut down the removal of this species, they figured out a way to farm them and, over time, it was actually cheaper and safer to do so. So, they have a track record of fighting to take from the wild and environment risking an eco system, when a potential safer and more lucrative solution is in front of them. It is common knowledge that the closer the fish are raised to the potential customer / market, the more likely of survivability of the fish. So, if you can farm the fish on the mainland, where the market is, you will save the long shipping and potential harm to the fish.</p> <p>I'm sure I don't need to tell you any of this. As someone in your position, I'm sure has seen the decline in ornamental fish and water quality over the years on our reefs and in our waters. You know, first hand the reality and while we can discuss legal fishing, there is</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>It is acknowledged that reefs face many threats and reef conservation is important; however, as stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time. In addition, Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.</p> <p>The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.</p>

and The Humane Society of the United States			exposure to hurricanes, or flooding, and further impacts discussed below.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	DLNR has the authority to issue permits for the taking of fish and other aquatic life for aquarium purposes. ⁴ While these permits are limited in duration to one year, neither the aquarium collection statute nor DLNR places any limits on the number of animals that can be captured per commercial permit, nor on the number of permits the Agency issues. ⁵ In fact, prior to court mandated compliance with HEPA, DLNR automatically granted every commercial aquarium permit application, and allows the collection of unlimited numbers of animals under those permits. ⁶ DLNR also automatically granted every recreational permit application, which effectively allowed for unlimited recreational collection of nearly 2,000 fish per year per collector. ⁷ In addition, DLNR also automatically grants commercial marine licenses for aquarium collecting issued pursuant to HRS § 189-2, but does so without HEPA review as required by law. Furthermore, while commercial collectors are required to report their collections (but in practice, do so inaccurately), there is no similar requirement for recreational permits. ⁸ Therefore, there are no definitive data on how many of each type of fish or other aquatic animal is taken from the State's delicate coral reef ecosystem each year, nor on what level of take would be sustainable.	Your comment has been forwarded to the decision makers.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The DEIS is entirely inadequate under the Hawai'i Environmental Policy Act (HEPA, Haw. Rev. Chapter 343) and its implementing regulations. The DEIS fails to address these and other notable flaws that we outlined in our prior comments on the Environmental Assessments: The DEIS fails to analyze the impacts of collection over time (i.e. the expanded 5-year scope of the analysis, beyond one year, is still inadequate);	Your comment has been forwarded to the decision makers. The EIS does analyze impacts of collection over time. A five-year analysis period was chosen because, as stated in Section 5.0. of the EIS, the temporal scope of the impacts analysis is five years because the WHRFMA management plan is reviewed every five years by the DLNR in cooperation with the University of Hawai'i (DAR 2019a). Because the most recent DAR review was released in 2019, the next DAR review overlaps in time with the analysis period in the EIS. If the Preferred Alternative is implemented, presumably the DAR will review the effects during its next five year review and can make any necessary changes to permit issuance at that time. In addition, because Aquarium Permits have a 1-year duration, the DLNR can decide each year whether or not to issue permits based on new data.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus	N/A	1/7/2020	<ul style="list-style-type: none"> • The DEIS fails to accurately analyze the environmental consequences (i.e. direct, indirect, and cumulative impacts) of unlimited collection of aquatic life to biological, cultural, and socioeconomic resources in the WHRFMA; • The DEIS fails to accurately analyze the environmental consequences 	Your comment has been forwarded to the decision makers. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred

Environmental Laboratory, and The Humane Society of the United States			(i.e. direct, indirect, and cumulative impacts) of unlimited collection of aquatic life to biological, cultural, and socioeconomic resources in East Hawai'i and other parts of the State that may be connected via larval dispersal patterns;	<p>Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, the collection of "every fish and every marine creature" is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p> <p>Impacts to species are evaluated using the island-wide populations to account for larval dispersal, but limited to the island of Hawai'i due to the barriers for dispersal between islands (see Section 4.4 of the EIS).</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<ul style="list-style-type: none"> The DEIS fails to accurately analyze the cumulative impacts of commercial collection along with recreational collection; 	<p>The cumulative impacts of recreational aquarium fish collection are analyzed in Section 5.4.3.1. Because, as noted by the Commenters, data are not available on the number of fish collected by recreational aquarium permit holders, the EIS evaluates a reasonable worst case scenario (i.e., all permit holders collect 50% of their allowable catch). These estimates are likely high based on results from Harding (2017), which found that 57% of recreational aquarium permit holders surveyed had not utilized their permit in the previous 12-month period. Of the 43% who had used their permits, their average yearly catch was 45 fish per permit (Harding 2017), which is below the maximum allowable number of 1,825 fish or the 50% used to estimate impacts above.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus	N/A	1/7/2020	<ul style="list-style-type: none"> The DEIS fails to accurately analyze impacts on cultural resources; 	<p>Your comment has been forwarded to the decision makers. Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States				
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The DEIS fails to adequately incorporate input of Native Hawaiian groups, experts, affected citizens and consulted parties.	Your comment has been forwarded to the decision makers. Responses to these issues are addressed below.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The Applicant's Preferred Alternative does not ensure that commercial aquarium fish collection is lawful, responsible, and sustainable for any of the White List fish species from nearshore habitats in the WHRFMA nor for any species taken elsewhere in the state where collection is allowed under the current geographic scope of the aquarium permits. The DEIS's continued conclusion that the aquarium fishery in the WHRFMA has "no significant impact" on targeted reef fish species, coral reefs, and the human communities that rely on them is unsupported. The DEIS fails to accurately evaluate the true primary, secondary, cumulative, short-term and long-term effects of the Preferred Alternative and fails to propose any proper mitigation.	Your comment has been forwarded to the decision makers. The geographic scope of Aquarium Permits under the Preferred Alternative is limited to the WHRFMA, and use of an Aquarium Permit outside of this area would not be allowed under the Preferred Alternative. Issuance of Aquarium Permits outside of the WHRFMA would require a separate HEPA analysis.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane	N/A	1/7/2020	As previously mentioned, fundamental errors in the DEIS's impact analysis resulted in patently false findings of no significant impacts and improper evaluations of HEPA significance criteria. Those errors include, but are not limited to, the use of an improper baseline, the minimization of potential collection rates under the proposed alternatives, and an expanded area to which the impacts would apply. A properly conducted DEIS would focus on impacts to the area(s) where the subject activity is to take place. This DEIS is fundamentally flawed in that it fails to do so. In addition, the DEIS ignores the true evidence of impacts, including the most important one: the magnitude	Your comment has been forwarded to the decision makers. Responses to these issues are addressed below.

Commenter	State/ Location	Date Received	Comment	Response
Society of the United States			of depletion to targeted species in the areas from which they are taken as determined by a comparison to the baseline.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>A. The use of an improper baseline.</p> <p>A critical component in any DEIS is the establishment of proper baseline against which to compare the impacts of the proposed action. Any analysis stemming from an improper baseline cannot be considered accurate or relevant. A proper baseline reflects pre-project environmental conditions, and is spatially relevant. In this case, a proper baseline is found in the conservation districts and managed areas, collectively referred to as Marine Protected Areas (MPAs), within the WHRFMA where aquarium collecting has been prohibited for nearly 30 years.</p> <p>Rather than using a proper baseline, free from the impacts of aquarium collecting, the DEIS incorrectly incorporates the effects of prior aquarium collecting into the baseline, and states in sections on the scope and affected environment, “the evaluation includes past use and potential impacts by the commercial aquarium fishery because it has been a part of the baseline condition of these resources since the late 1940s,” and “permitted commercial aquarium fishing has been a part of the socioeconomic, cultural, physical, and biological resources for decades and is considered a part of the baseline condition of the affected environment.”⁹</p> <p>The important role MPAs serve as a baseline for fish populations in the WHRFMA is underscored by their use as such in reports and papers that seek to document the effects of aquarium collecting on targeted fish populations. For example:</p> <ul style="list-style-type: none"> • Six MPAs were among the 25 study sites established by West Hawai’i Aquarium Project (WHAP) to measure the effects of aquarium collecting in the WHRFMA as part of the WHAP design, because at the time (1999), they had been closed to aquarium collecting for at least 9 years (now 28 years as of 2018) and were presumed to have close to “natural” levels of aquarium fish abundances and, thus, “serve as a reference or ‘control’ to compare with the [Fish Replenishment Areas] FRAs and open areas.”¹⁰ <p>They further noted, “changes in FRAs and open areas can best be estimated by comparing them to other areas which have been protected for relatively long periods of time. These areas (MPAs) serve as control areas against which the FRAs are measured both before and after the closure of the FRAs. This rationale is derived from a well-known statistical procedure known as the BACI (Before-After-Control-</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS includes a comparison of fish densities between MPAs and Open Areas in Table 5-4 and Table 5-8. The proposed action in the EIS is the issuance of 10 aquarium permits in the WHRFMA. Therefore, the proper baseline that reflects pre-project environmental conditions (i.e., conditions prior to issuance of the 10 permits) and is spatially relevant is harvest data and population data for the past 20 years since the creation of the FRAs and MPAs and bag limits along with the most recent population estimates available for these fish (2016 CREP population estimates and 2017/2018 WHAP population estimates).</p>

			<p>Impact) procedure (Tissot et al, 2004) which is an especially appropriate and statistically powerful method . . ." (emphasis added).¹¹</p> <ul style="list-style-type: none"> • Two MPAs were used in 1997-1998 to document the magnitude of the effect of aquarium collecting on natural populations: <ul style="list-style-type: none"> o "The magnitude of the effect was estimated by comparing fish abundance at collection sites where aquarium fish collecting was known to occur and control sites where collecting was prohibited. Because the study was initiated after collection had begun, we assumed there were no differences between control and collection sites in the abundance of aquarium fishes prior to the onset of aquarium harvesting (i.e. their natural abundances were similar." (emphasis added).¹² 	
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>B. Flawed Impact Analysis In determining the level of impact to targeted (i.e. White List) species that would occur under the preferred alternative, the DEIS compares reported catch from "the 14 fishers" (presumably the 14 unidentified collectors who are seeking aquarium permits) to the estimated island-wide populations of those species. When used properly, the basic analysis – catch as % of population – is useful in describing impacts and has been employed since at least 2010 as one method for doing so in the WHRFMA.¹³ The analysis would be properly conducted by comparing the estimated population of a given species in the area of interest to the average reported catch of that species during the same time frame. Unfortunately, the analysis is easily manipulated, and in the DEIS, the impacts are minimized as described below:</p> <p>1. Affected Environment/Directly Affected area The use of island-wide fish populations in determining impacts of the proposed action to targeted (i.e. White List) species, which would occur in the WHRFMA, minimizes the appearance of impacts by expanding the population. Proper analyses use the WHAP data to assess aquarium collecting impacts via catch as % of population, because, as noted in the DEIS, the WHAP was designed to "gauge the effects of the aquarium fishing industry" in the WHRFMA.¹⁴ In those analyses, the impacted populations have appropriately been defined as those within the WHRFMA open areas, and more narrowly, within the 30'-60' depth range, because those are the areas and depths from which the fish are taken (i.e. the directly affected area).¹⁵</p> <p>The DEIS includes an example of a WHAP catch as % of population analysis, but discards it for the impact analysis in favor of island-wide</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>WHAP population estimates for each of the 40 White List species (where available) are provided in the EIS in Section 4.4.1. The trends in populations, and specifically within the open areas in the presence of historic commercial aquarium collection, are provided in Table 5-4 and Table 5-8.</p> <p>Data used in the EIS are publicly available and can be found online here: http://files.hawaii.gov/dlnr/reports-to-the-legislature/2020/AR20-WHRFMA-Rpt-FY19.pdf</p> <p>As requested, the impacts of collection on WHAP Open Area population estimates have been added in Appendix B of the FEIS.</p>

Commenter	State/ Location	Date Received	Comment	Response
			<p>population estimates.¹⁶ The DEIS expands the affected environment in the impact analysis to include the fish populations in the nearshore reefs of the entire island of Hawai'i which is inappropriate, irrelevant, and wrong. The proposed action is for 14 aquarium permits to be issued in the WHRFMA, as stated throughout the document and as identified in the TMK (tax map key) sections in the Applicant submittal and publication forms. The action would not occur throughout the WHRFMA, but, specifically, on reefs and other areas only within the open areas of the WHRFMA. These open areas are where the direct (and greatest) impacts occur. Other indirect impacts likely occur to the closed areas of the WHRFMA, and possibly to East Hawai'i (i.e. Hawai'i Island as a whole), but they would be eclipsed by the impacts in the actual areas where the activity would take place.</p>	
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>similar data on</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The commenter is correct that not all fishers that may be issued permits under the Preferred Alternative (or any other alternative) have collected every year in the past. However, for this reason, the EIS used the maximum collection rates over the past 20 years for the Preferred Alternative, and then adjusted for annual growth, to project future collection over the 5-year analysis period. This was done to account for years in which certain fishers may not have collected, and then to account for growth in collection that may occur.</p> <p>Furthermore, it should be noted, as outlined in Section 5.2.1 of the EIS, although all members of the dive team must have a permit, only the principal diver is required to report the catch and effort for a dive team in order to avoid duplicate fish catch reporting. Therefore, while not all 10 fishers may have reported catch in a given year, some may have still been actively collecting as part of a team, and their catch was thus accounted for by the principal diver.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>C. Flawed Threshold for "Sustainable" Collection</p> <p>The applicant bases the DEIS on the premise that fish collection is considered sustainable if it removes less than 5% to 25% of the entire island-wide population (annually), but the reasoning behind this threshold is entirely flawed. The DEIS states that "While specific research into sustainable levels of collection has not been conducted for the 40 White List Species, Ochavillo and Hodgson (2006) suggest collection between 5% and 25% is sustainable for various reef species in the Philippines that are similar to those on the White List (e.g., tang, wrasse, butterflyfish, angelfish, triggerfish).¹⁹ However, the DEIS should not use these thresholds because:</p> <ul style="list-style-type: none"> • These thresholds for sustainable ornamental fish collection are 	<p>Your comment has been forwarded to the decision makers.</p> <p>The sustainable thresholds provided by Ochavillo and Hodgson (2006) represent the best available science regarding sustainable harvest of species with simialar life histories to those harvested in Hawai'i, as specific thresholds for the 40 White List Species (or for Hawai'i) are not available. Nevertheless, as concluded in the EIS, collection under the Preferred Alternative is below the lower limit of 5% for all 38 of the White List Species for which population estimates are available.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>species-specific based on estimated natural mortality rates (M) and fishing mortality at maximum sustainable yield (FMSY) or year-per-recruit analysis. Natural mortality rates for reef fishes are based on growth rates and length and thus are also area-specific. Mortality is based on catch data. Yield-per-recruit analysis should be derived from several annual surveys. Thus, these parameters should be specifically calculated for Hawaiian reef fish targeted by the aquarium industry as highlighted in Ochavillo and Hodgson (2006).</p> <ul style="list-style-type: none"> • These thresholds were developed to calculate total allowable catch (TAC) in comparatively small “collection areas” that are orders of magnitude smaller than Hawai’i Island. Specific collection areas used by Ochavillo and Hodgson (2006) to develop the methodology are adjacent to Bohol island in the Philippines, which is close in size, though smaller, than Hawai’i Island. One collection area, Clarin, is part of a coastal town of the same name that has a coastline of approximately 6 linear km. Another, Batasan Island, lies approximately 6.4 km off the coast of Clarin. Applying the 5%-25% threshold to the entire island of Hawai’i far exceeds the parameters it was developed for. • The 5%-25% threshold indicates “a good rule-of-thumb of collection limit” for coral reef fishes in the Philippines.²⁰ This does not mean it is a good rule of thumb for collecting reef fishes in Hawai’i. • Most ornamental fish species in Ochavillo and Hodgson (2006) are species different from those on the White list. Only a few species share the same genus or species (butterflyfish, a couple of wrasses, one angelfish, a couple of damselfish, one tang and one triggerfish). Thus, it is questionable whether this fairly wide threshold (5%-25%) is representative and applicable to Hawaiian species. • Finally, this report is not peer-reviewed research, it is a field manual: Marine Aquarium Trade for Coral Reef Monitoring Protocol with a Data Analysis and Interpretation Manual. This field manual was designed in part to: “provide a scientific basis for recommending sustainable levels of collection.”²¹ 	
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>The DEIS continues to assert that current fish abundance for target species is the baseline, and thus 1% to 5% of individuals removed from the population would be considered sustainable. But this is wrong. The DEIS fails to acknowledge that current population abundance of most of these fish species is already depleted due to in part to heavy exploitation by the aquarium trade since at least the 1980’s and habitat degradation. The total allowable catch for each species must be calculated based on information on natural mortality rates and the available and limited information on catch records, specific to the geographic areas and locations where they are taken in the WHRFMA.²² Additionally, an analysis of larval dispersal and</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The DEIS does not calculate total allowable catch, but discloses the percent of the population that would be collected via commercial aquarium collection as the metric for determining significance. Current population estimates are used to evaluate impacts, as those are the populations that would be impacted. The DEIS also addresses cumulative impacts, including other fisheries (i.e., non-commercial aquarium collection).</p>

Society of the United States			connectivity patterns for White List species on Hawai'i Island is key to preventing local extirpation of heavily targeted and/or rare species.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>D. Unrepresentative Data Used</p> <p>The Coral Reef Ecosystem Program (CREP) data used in the DEIS for the entire Island of Hawai'i (based on 2010-2016 surveys) are not representative of regional population abundance such as in East Hawai'i and the WHRFMA, and should not be used to estimate regional proportions of fish catch.</p> <p>Population abundance estimates for fish species for the entire island of Hawai'i²³ are not representative of regional fish abundances such as East Hawai'i and WHRFMA. The CREP data collect fish data from 257 stationary point count locations around Hawai'i between depths of 0-98 feet. In contrast, the West Hawai'i Aquarium Project (WHAP) collected data from 25 transect survey sites from WHRFMA area between depths of 30-60 feet.</p> <p>It is well established that population abundances of reef fish species in Hawai'i, especially relatively small-size species that are targeted by the aquarium industry, are highly variable in space depending on reef complexity, depth and wave exposure, and in time (within and among years) depending on the season, mortality, recruitment to the population, and environmental factors.²⁴ The relative proportion of fish species taken annually by the aquarium industry should be based on regional total abundances and regional catch records (e.g., aligned with the aquarium fish trip report zones). Allowable levels of take should be determined in conjunction with the wishes of Hawai'i residents and visitors who strongly desire that fish populations are restored to their naturally occurring (i.e. unfished) levels of abundance on the majority of Hawai'i reefs.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the FEIS maintains that the CREP population offer the best estimate to analyze impacts, the impact of collection on the WHAP Open Area populations, where collection would be occurring, has been added as Appendix B of the FEIS for reference.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>The allowable number of individuals that could be collected from aquarium fish populations must be substantially less than those proposed in the DEIS Preferred Alternative, because most of these species are already depleted. Fishing effort has substantially increased for aquarium fish species on the Island of Hawai'i.²⁵ Prime-targeted species have significantly declined due to overharvesting.²⁶ For example, population abundance of one of the most heavily exploited species, Yellow Tang (<i>Zebrasoma flavescens</i>), on the west coast of the island of Hawai'i (West Hawai'i) declined 45% due to exploitation in areas open to fishing/collection from 1999 to 2007.²⁷ Yellow Tang abundance is closely tied to annual levels of recruitment, and after good recruitment levels from 2008 – 2013, Yellow Tang abundance in the Open Areas improved, but was still 4.7% lower than the 1999 – 2000 Open Area baseline.²⁸ As noted earlier, an anomalous recruitment pulse in 2014 is likely behind the increase in abundance seen since</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS relies on the most up-to-date population estimates, as such the DAR (2019a) has noted that 24 of the 40 White List Species have remained stable or have significantly increased between 1999 and 2017, and, for the 12 White List Species which had significant declines, these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline (DAR 2019a).</p> <p>The commenter specifically references a decline in Yellow Tang and cites an earlier source. As stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range</p>

			<p>then.²⁹</p> <p>Even when including marine managed areas (MMAs) such as FRAs, where collection is prohibited and abundances are five times higher than in open areas, the population abundance of Yellow Tangs on West Hawai'i is substantially less than historical levels.³⁰ The established networks of MMAs have definitely worked to increase Yellow Tangs and some other fish species in the West Hawai'i FRAs,³¹ but not all species have responded positively, and some have actually decreased overall since the FRAs were established. The extent to which collection pressure—whether in the Open Areas or due to poaching—is driving the decline of heavily targeted aquarium species in the areas closed to the trade must be studied. While the DEIS attempts to minimize the impacts of collection pressure by proposing that factors other than aquarium collecting are also affecting their populations, it remains highly likely that the main cause is collection pressure. An example of the effect of collection pressure on populations in MMA's is found in the significant decline of Yellow Tangs in those areas from 2004-2009 which coincided with Yellow Tang reported catch during that period that was substantially higher (e.g. in 2004 and 2006 it was more than double that reported in 2002).</p>	<p>over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. Additionally, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>Given the relative long life-span of Yellow Tangs (>40 yrs.) and increasing fishing intensity, these MMAs are just becoming sources for the aquarium fishing industry. The recovery of this species to past levels is unlikely if fishing/collection intensity continues or increases in the future.</p> <p>The commercial aquarium fishery in the Island of Hawai'i has grown over the last three decades, particularly after the O'ahu aquarium fishery substantially declined in the early 1990s due to hurricanes and localized overfishing.³² It is thought that the expansion of the Island of Hawai'i aquarium fishery was due to new collectors and relocation of collectors from O'ahu.³³ Scientific evidence shows that collecting activities substantially affect targeted species in Hawai'i³⁴ and fishing intensity remains high even when stocks are depleted or recruitment is weak.³⁵</p> <p>Therefore, the current estimates of population abundance of fish species for the entire Island of Hawai'i (from 2010 to 2016)³⁶ should not be used as regional/local reference abundances (e.g., East Hawai'i, WHRFMA) to estimate minimum and maximum percentage of fish taken per year.³⁷ This is because these calculations underestimate the proportion of fish collected by region (East and West Hawai'i) and assumes fish populations of the entire Island of Hawai'i are distinct or discrete. A more accurate calculation of allowable catch would be based on regional population abundance, using the aquarium trip</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As shown in Table 5-4 of the EIS, the Yellow Tang population has significantly increased in FRAs, Open Areas and MPAs between 1999/2000 and 2017/2018, even in the presence of historic collection rates. The current population estimates are used, as those are the populations which would be impacted by the Proposed Action (issuance of 10 commercial aquarium permits).</p> <p>While the FEIS maintains that the CREP populations offer the best estimates to analyze impacts, as requested, the impact of collection on WHAP Open Area populations has been added as Appendix B of the FEIS.</p>

			<p>report zones, and by using the WHAP data estimates obtained from the depth ranges where the fishes are captured, rather than by regions.</p> <p>Finally, sustainable fishable abundance for target species must take into consideration the fact that most target species are depleted in comparison with historical levels. The EIS fails to analyze the impact of collection/fishing on current population abundance and fails to consider that these populations are far below the historical baselines as represented in the MPAs, or otherwise.</p>
