<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>E. Catch Is Grossly Underreported</p> <p>As mentioned above, there is no requirement for recreational aquarium collectors to report catch. For commercial collectors, while reports are required, catch report compliance is substantially low. As such, the impact of the aquarium fishing industry is likely larger than is reported, which has been discussed in the scientific literature.³⁸ As a former DLNR employee succinctly wrote regarding aquarium catch reports: “The reliability of the data depends upon the sincerity of the permittees.”³⁹ There is no verification system, such as that provided by independent observers, to ensure the accuracy of self-reported data. One additional major impediment to accurate data stems from the lack of a license requirement for marine dealers and/or exporters. Currently there is a requirement for dealers (i.e. those who buy directly from aquarium collectors) to report their purchases. According to DLNR, the effect is that “dealer reporting is essentially on a voluntary basis and a few dealers are not reporting in whole or in part.”⁴⁰ DLNR cannot know whether a “few” or a dozen dealers are not reporting, without a requirement for these businesses to have licenses, thus, these businesses operate beneath the radar and serve as a conduit for moving unreported catch out of the state. Establishing a marine dealer/exporter license has long been a priority for those within DLNR concerned about Hawai‘i’s marine resources, because it would enable the department to verify catch reports, identify unlicensed collectors (and all commercial fishers), identify dealers and helped with generating economic data about the fisheries. Without this information, DLNR/DAR has no accurate data on health of fish populations. According to a former DAR Commercial Fisheries manager, Karl Brookins, the process of establishing the license was abandoned due to lack of funding.⁴¹</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, analysis by the DAR (2019a) has shown that actual underreporting of catch is small, with a 3.5% difference between the number of animals reported caught and sold in 2010 and a 0.4% difference in 2014 , which likely represent live releases and mortality. This impact has been added as a Cumulative Effect in Section 5.4.3.6 of the FEIS.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>F. Further Necessary Data Excluded is Needed for an EIS</p> <p>As discussed above, there is no reliable data on how many fish and other species are actually taken pursuant to aquarium permits in any given year. The DEIS repeatedly refers to a lack of data for numerous species. For example:</p> <ul style="list-style-type: none"> • “Most of the Flame Wrasse population occurs below the 60-foot 	<p>Your comment has been forwarded to the decision makers. The EIS used the best available science, including population estimates for those species which were available.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Environmental Laboratory, and The Humane Society of the United States			<p>depth surveyed by the WHAP and below the 98-foot depth surveyed by the CREP, and therefore the species is not observable by the methods of either survey. As such, data are not available to produce a reliable WHRFMA or island-wide population estimate.”⁴²</p> <ul style="list-style-type: none"> • For Psychedelic (Redtail) Wrasse, Tinker’s Butterflyfish, Longfin Anthias, Flame Wrasse, Fisher’s Angelfish, and Eystripe Surgeonfish (Palani), open area populations and catch as a percent of the open area populations are not available, because species “occur[] in habitats not adequately surveyed by transects.”⁴³ <p>This data is necessary in order for the EIS to properly assess impacts. Furthermore, the Agency must conduct stock assessments of species before it is able to determine a sustainable rate of take. Clearly the Agency has not done so, as DLNR personnel have stated that to do so would take over a decade for just 40 fish species, out of the more than 287 fish and invertebrate species the Agency identifies as targeted by the trade (found at Appendix 5).⁴⁴ Without such data, the Agency cannot meaningfully assess the environmental impacts of commercial aquarium collection. Such assessments must be completed prior to the issuance of the EIS, and in the face of any uncertainty, the EIS’s analyses must err on the side of caution to protect these vulnerable species.</p>	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>G. Examples of Proper Impact Analyses</p> <p>Other comparisons of reported catch to estimated populations reveal that upwards of 80% of Achilles tangs and 60% of yellow tangs in the WHRFMA open areas have been taken by commercial aquarium collectors in some years and concluded that “aquarium collecting is having a major impact on Achilles and yellow tang.”⁴⁵ Although these estimates are imperfect, because they do not factor under-reporting, they are still more accurate than presented in the DEIS because they are spatially relevant. Still, the extremely high levels of take are reflected in the difference between populations where they are taken (i.e. the open areas) and baseline areas where they have not been taken for decades (i.e. the MPAs). For yellow tangs, it has resulted in a 62% reduction in natural abundance in those areas, on average, compared to the MPA baseline since researchers began documenting the differences in 1999 in the three management areas comprising the WHRFMA.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, populations of Yellow Tang have increased significantly in FRAs, Open Areas, and MPAs between 1999/2000 and 2017/2018, even in the presence of commercial aquarium collection. The Achilles Tang population has decreased in all three areas (significantly so in FRAs and Open Areas), indicating that commercial aquarium collection is not driving the decline (DAR 2019a). The Preferred Alternative includes bag limits and size limits for both of these species, including a reduction in the bag limit for the Achilles Tang, as well as reducing the number of commercial aquarium permits to 10.</p> <p>As requested, the impacts of collection on WHAP Open Area population estimates have been added in Appendix B of the FEIS.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental	N/A	1/7/2020	<p>III. All Impacts Improperly/Inadequately Analyzed</p> <p>A. Failure to Adequately Analyze Long-Term Impacts</p> <p>The Applicant unlawfully limited its analyses to the time period of five years.⁴⁹ PIJAC’s provides no reasoning for this 5-year period, while noting that each permit lasts only one year, and therefore a new HEPA analysis would need to be completed on an annual basis.⁵⁰ However, while Commenters agree that it is critical for the Agency to continue</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>A five-year analysis period was chosen because, as stated in Section 5.0. of the EIS, the temporal scope of the impacts analysis is five years because the WHRFMA management plan is reviewed every five years by the DLNR in cooperation with the University of Hawai’i (DAR 2019a). Because the most recent DAR review was released in 2019,</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Laboratory, and The Humane Society of the United States			<p>to monitor the impacts that aquarium collection is having over time, the relatively short time period of the activity itself does not nullify HEPA’s clear requirement for considering the long-term effects of that activity.⁵¹ For example, a large excavation project could destroy habitat in an area of an island that takes decades to regrow—and even if the excavation itself was only for a year, HEPA would clearly require consideration of the impacts to the environment during the decades of regrowth. Similarly, the use of a pesticide could have known impacts on a species where serious or lethal effects are felt far beyond the time frame of the actual application of the pesticides—yet HEPA would clearly require consideration of those expected impacts. Thus, PIJAC’s logic simply does not hold up. Additionally, stating that the Agency can simply reevaluate the consequences of a year-long permit after that year is up entirely contradicts HEPA’s mandate to evaluate the potential consequences of an action before the Agency authorizes the action.</p> <p>Additionally, a 5-year timeframe that analyzes impacts is inadequate because the impact of fish removal will accumulate over time. For example, though collection pressure has been removed from the White List species in the FRAs, populations of once heavily targeted species in those areas, such as yellow tangs, have yet to return to natural levels of abundance, as reflected in the baseline MPAs, even after 20 years of protections. For very long-lived species such as the yellow tang and other surgeonfishes heavily targeted by aquarium collection, which have lifespans measuring decades, and which may not reproduce until they are at least 5 years old, a 5-year analysis period is far too short.</p>	<p>the next DAR review overlaps in time with the analysis period in the EIS. If the Preferred Alternative is implemented, presumably the DAR will review the effects during its next five year review and can make any necessary changes to permit issuance at that time. In addition, because Aquairum Permits have a 1-year duration, the DLNR can decide each year whether or not to issue permits based on new data. The cumulative impact of fish collection is addressed in Section 5.4.3.3 of the EIS.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>In addition, studies show that catch numbers from the commercial aquarium fishery in Hawai’i have significantly increased over the last few decades and are likely to increase even more, despite the limited request for 14 permits.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>To account for this, the EIS uses the maximum collection rates from the past 18 years, and applies an annual growth rate to that collection to account for increasing collection over time.</p>
For the Fishes, Center for Biological Diversity,	N/A	1/7/2020	<p>DLNR data shows a strong correlation between the number of permits issued and the level of catch (Fig. 2); however, historically commercial aquarium collectors have reported catching fish just three days per week.⁵² There is nothing preventing them from increasing that effort,</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The concept of “unlimited” collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful</p>

Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States			via increasing the number of hours and/or days they collect, in response to perceived scarcity from, for example, impacts to habitat from storms and climate change, or from additional collectors seeking permits through the HEPA process (i.e. the “get it while you can” mentality); or, in order to meet the high demand for aquarium reef fish and their increasing market value. ⁵³	<p>(and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, the collection of “every fish and every marine creature” is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	Furthermore, the Hawai’i Supreme Court has made clear that the proper inquiry under HEPA is “the outer limits of what the permits allow” ⁵⁵ The outer limits allowed by the permits are the take of every fish and every invertebrate from every reef in the state of Hawai’i that isn’t in a protected area. Permits issued under this DEIS would allow just that without a new law, rule, or permit condition, defining geographic and take limits. Further, as there are no limits on the number of commercial marine licenses (CML) issued for aquarium collecting, in the rest of the state and East Hawai’i, the issue of aquarium trade impacts to Hawai’i’s coral reefs remains unresolved.	<p>Your comment has been forwarded to the decision makers.</p> <p>The concept of “unlimited” collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. 				of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The DEIS analyzes the effects of issuing aquarium permits to 14 people in the WHRFMA, however permits are issued statewide, with no geographic limits, other than those pertaining to managed areas, which are regulated by other statutes. The DEIS fails to identify this unresolved issue, to discuss how it will be resolved prior to commencement of the action, or describe any overriding reasons for proceeding without resolution of the issue, though legally required to do so. ⁵⁶ Currently the use of fine mesh nets for aquarium purposes is prohibited everywhere, and with the issuance of any geographically limited permits, DLNR would likely be unable to enforce those geographic limits given their extremely limited resources.	Your comment has been forwarded to the decision makers. The following statement has been added to the Limited Permit Issuance Alternative and the WHRFMA-only Programmatic Issuance of Permits Alternative: <i>It is assumed that, upon issuance of an Aquarium Permit, a permit condition would be included in each permit limiting the geographic area covered by the permit to the WHRFMA.</i>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	Furthermore, the DEIS is for 14 fishers, however nothing prevents more fishers from seeking permits through additional HEPA reviews. In addition, pursuant to HRS § 189-2, DLNR is currently issuing an unlimited number of commercial marine licenses for aquarium collecting. The relationship between the number of participants in a fishery and impacts to fish populations is well-established in the literature. The importance of restricting access to fisheries has been acknowledged and used for thousands of years to conserve and help sustain fish populations. ⁵⁷	Your comment has been forwarded to the decision makers. While it is true that additional persons may seek permits, issuance of additional permits beyond the 10 analyzed in this EIS would a separate HEPA review and analysis by the DLNR before permits could be issued.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The DEIS failed to take into account how increasing demand and increasing market value will affect already depleted targeted reef fish species in the coming years, thus resulting in significant environmental impact. For example, the market value of tropical reef fish (e.g., Yellow Tang) has increased and thus collection/fishing pressure is also likely to increase in the near future. The commercial aquarium fishery in Hawai'i reports annual landings of over 579,000 organisms (fish and invertebrates combined). ⁵⁸ The number of aquarium fish caught on the island of Hawai'i since 1976 has substantially increased by 645%. ⁵⁹ Similarly, the adjusted value of the Hawai'i Island aquarium fishery increased by over 280% between 1976 and 2003. ⁶⁰ The DEIS fails to properly analyze this relationship, and fails to propose	Your comment has been forwarded to the decision makers. The EIS conservatively uses maximum collection rates to project future collection, and also applied a growth rate for socioeconomic and biological consequences based on historic trends. A five-year analysis period was chosen because, as stated in Section 5.0. of the EIS, the temporal scope of the impacts analysis is five years because the WHRFMA management plan is reviewed every five years by the DLNR in cooperation with the University of Hawai'i (DAR 2019a). Because the most recent DAR review was released in 2019, the next DAR review overlaps in time with the analysis period in the

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>mitigation to reduce population declines. The DEIS claims that the high fecundity and long lifespans of reef fishes combined with the limited targeting of adult brood-stock by the trade removes the certainty that the losses will accumulate over time is false. Studies show that populations of heavily targeted species, such as Yellow Tangs, are neither annually replenished, nor restored over time to their natural levels of abundance, even 20 years after collection pressure has been removed. On the contrary, they have been severely depleted over time, especially in the areas where they are collected. While the DEIS noted that for Yellow Tang and kole, which represent two of the top three collected species, population trends are stable or increasing, it failed to acknowledge that the increase in fish abundance is due to an anomalous recruitment pulse that coincided with warming waters in 2014.⁶¹ Typical recruitment pulses, such as those that occurred in 2002 and 2009, have resulted in short-lived increases in fish populations that were followed by prolonged or short and steep population declines. ⁶²</p> <p>More importantly, the 2017 and 2018 increases in populations of White List species in the Open Areas was due to the total prohibition of aquarium collecting in the WHRFMA as of January 5, 2018. In fact, the 2018 surge in yellow tang abundance was the largest ever recorded in the WHRFMA and occurred only in the Open Areas while populations in the FRAs declined in 2018, and were slightly, but insignificantly higher in the MPAs (i.e. they cannot be attributed to anything other than the removal of collection pressure).</p> <p>Thus, the DEIS not only fails to acknowledge the evidence of depletion caused by collection activities that is apparent when using the proper baseline, but also fails to acknowledge the beneficial impact that would occur in the WHRFMA under the No Action Alternative.</p> <p>The failure of the DEIS to conduct a proper analysis, as described above, is not only a legal flaw but also the main reason that the DEIS does not find a significant impact of the aquarium fishing industry on targeted species and their habitat. In addition, by limiting the timeframe of their analysis to five years, the DEIS fails to accurately consider the impacts of one-year collection permits cumulatively with other “past, present, and reasonably foreseeable actions” “over a period of time.” ⁶³</p>	<p>EIS. If the Preferred Alternative is implemented, presumably the DAR will review the effects during its next five year review and can make any necessary changes to permit issuance at that time. In addition, because Aquairum Permits have a 1-year duration, the DLNR can decide each year whether or not to issue permits based on new data. The cumulative impact of fish collection is addressed in Section 5.4.3.3 of the EIS.</p>
For the Fishes, Center for Biological Diversity,	N/A	1/7/2020	<p>B. Failure to Analyze Indirect and Cumulative Impacts Coral reefs are connected by currents which carry and disperse fish larvae to other areas, both near and far. Most fishes on Hawai'i's reefs are the result of other fishes upstream of that reef.⁶⁴ The currents</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS recognizes and acknowledges larval connectivity around the Island of Hawai'i, which is why it is felt that the island-wide population</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States			<p>and conditions that control larval connectivity and dispersal processes are complex. The larvae of some species are able to travel between islands, while others do so to a lesser extent. For example, in one study, some yellow tang larvae on Hawai'i Island travelled on ocean currents for 15 km before settling on a reef while others traveled 184 km.⁶⁵</p> <p>Recent research into two species of small bodied surgeonfishes, including kole which is heavily targeted by the aquarium trade, has determined that populations of these fishes are genetically distinct on each of the main Hawaiian Islands. This means that, for at least these two species, there is little genetic mixing between islands, and once species are depleted on any given island, there is no other source for population replenishment. Further, connectivity and dispersal studies on the island scale for certain species have identified important spawning source areas that are essential for maintaining populations on other reefs across the island.</p> <p>This larval connectivity between coral reefs serves to highlight areas where secondary or indirect impacts of the Applicant's actions will manifest. Regardless of whether larval connectivity exists mainly intra-island or extends inter-island, reduced populations of reef fishes in their source areas will seriously impact reef fish abundance in their downstream, sink reefs, and thus the entire island.⁶⁶ The DEIS fails to account for this critically important reproductive strategy used by Hawai'i's reef fishes. The precautionary approach requires the determination of source areas for the 40 White List species on Hawai'i Island and the establishment of protections for those populations to ensure local species survival, which was not provided in the DEIS.</p>	estimates based on CREP data are the best metric when measuring population impacts.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>Additionally, the DEIS fails to properly address the true nature of what the Applicant is requesting in its Preferred Alternative whereby: "DLNR would issue Aquarium Permits to 14 aquarium fishers in the WHRFMA...No Aquarium Permits would be issued for areas outside of the WHRFMA (in East Hawai'i aquarium collection using legal gear or methods other than fine-mesh nets could continue but use of fine mesh nets would not be allowed). Permittees would abide by all rules and regulations set forth in HRS 189-2,3 (Commercial Marine Permit), HRS-188-31 (Section 1.2.1), governing Aquarium Permit use, and would obtain a West Hawai'i Aquarium Permit as required under HAR 13-60.4 (Section 1.2.3.2). These rules and regulations include restrictions on equipment, restrictions on access to various areas, bag limits on various collected fish species, collection in the WHRFMA restricted to 40 White List Species only, and reporting requirements.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Size and bag limits exist for species other than the Achilles Tang, as outlined in Section 1.2.3.2 of the EIS.</p> <p>The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>In addition, under this alternative, the daily bag limit for commercial aquarium collection of Achilles Tang within the WHRFMA would be reduced from 10 per day to 5 per day.” 67</p> <p>In other words, the Applicant’s Preferred Alternative continues to be the collection of an unlimited number of fish, with one exception for the Achilles Tang—the limits of what regulation allows. Yet, the DEIS considers only very limited collection. HEPA requires that an EIS assess the potential cumulative impacts of what State regulations allow, not just what some permittees may claim they intend to do, or have historically done, with their permits. As the Hawai’i Supreme Court clearly stated, “the properly defined activity for the purposes of the HEPA analysis must encompass the outer limits of what the permits allow and not only the most restrictive hypothetical manner in which the permits may be used.”68 The DEIS failed to address this.</p>	<p>year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, the collection of “every fish and every marine creature” is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>Relatedly, the DEIS assumes that aquarium collection without the use of fine-mesh gear will continue “legally” in East Hawai’i; however, as indicated in a letter dated January 7, 2020, from Earthjustice to DLNR (attached as Appendix 8), such collection also requires HEPA review, which currently is not being conducted. If this purportedly “legal” collection were halted pending environmental review, then the 14 collectors would have even greater incentive to increase collection levels in West Hawai’i in the meantime. The DEIS fails to consider this effect.</p>	<p>Your comment has been forwarded to the decision makers. The 10 fishers have historically collected an average of only 294 fish from East Hawai’i, so closure of the East Hawai’i fishery, if it were to close, is not anticipated to greatly increase their collection in the WHRFMA.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>Likewise, although the DEIS purports to analyze impacts cumulatively with those of recreational collection permits, the DEIS still does not account for the fact that the Agency issues a permit for every application that is submitted, and therefore the take under recreational permits is potentially unlimited as well.69 And the DEIS admits that, as there is no required reporting for recreational permits, it is currently impossible to know how many of each species are taken under those permits, and therefore, the impact of collection under these permits on species collected under these permits cannot be quantified.70 This lack of data is not properly addressed in the EIS.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The cumulative impacts of recreational aquarium fish collection are analyzed in Section 5.4.3.1. Because, as noted by the Commenters, data are not available on the number of fish collected by recreational aquarium permit holders, the EIS evaluates a reasonable worst case scenario (i.e., all permit holders collect 50% of their allowable catch). These estimates are likely high based on results from Harding (2017), which found that 57% of recreational aquarium permit holders surveyed had not utilized their permit in the previous 12-month period. Of the 43% who had used their permits, their average yearly catch was 45 fish per permit (Harding 2017), which is below the maximum allowable number of 1,825 fish or the 50% used to estimate impacts above.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The analysis of cumulative impacts included the impact of the commercial aquarium fishery, regardless of the gear used to capture the marine life, combined with non-aquarium commercial and recreational fisheries and other activities that impact population abundance, but reached a conclusion that is erroneous. Commercial and recreational fishing combined with the aquarium fishery have a substantial impact on targeted species. The EIS fails to determine cumulative impact of all fishing on target species. In addition, the EIS fails to analyze indirect impacts from collection such as vessel traffic and accumulated reef damage due to vessel anchoring and collection practices.	Your comment has been forwarded to the decision makers. Section 5.4.3.7 of the FEIS concludes that cumulative impacts to the 12 White List Species with declining population trends would be significant, but that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline (DAR 2019a). Because these declines are occurring in FRAs and/or MPAs as well (i.e., areas not open to commercial aquarium collection) it is reasonable to assume that banning commercial aquarium collection would not halt the declines. In addition, for the 12 species that have shown a significant decline in population size in one or more management area since establishment of the WHRFMA in 1999, commercial aquarium collection under any of the five alternatives would collect less than 1% of the island-wide population estimates for 10 of the species (Table 5-14). For the remaining two species, Achilles Tang and the Pyramid Butterflyfish, commercial aquarium collection would collect less than 4% of the island-wide population (Table 5-14). Based on this, while commercial aquarium collection does contribute to the cumulative impact, it is a less than significant factor in the observed declines.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The DEIS fails to adequately evaluate the potential of cumulative impacts of climate change (warming, coral bleaching, and ocean acidification) on targeted fish species such as decline of coral coverage which have been demonstrated to influence reef fish species diversity and abundance. ⁷¹ The EIS recognizes that climate change poses serious threats to Hawai'i's coral reefs and the species targeted by the Applicant, yet ironically claims that climate change impacts coupled with the impacts of implementing the Preferred Alternative is expected to be less than significant. These statements completely dismiss the research and data that demonstrate what is stated, that climate change impacts, specifically ocean warming, acidification and coral bleaching events will continue, thus further analysis of impacts and exacerbation of impacts due to climate change is required. ⁷²	Your comment has been forwarded to the decision makers. The EIS does not claim that climate change impacts, when combined with other cumulative impacts and the Preferred Alternative, will be less than significant. The EIS does say the following: "When the full range of impacts to White List Species are considered (e.g., recreational aquarium collection, non-aquarium commercial fishing, recreational fishing, tourism, climate change), there is a significant cumulative impact to some White List Species. However, the Preferred Alternative is not a significant contributor to the cumulative effect upon the environment. " Collection under the Preferred Alternative is less than 2% of any population of White List Species .
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The	N/A	1/7/2020	It is clear from an analysis of cumulative impacts that many of HEPA's "significance criteria" apply. ⁷³ Had proper analyses been conducted, the Preferred Alternative most certainly would have shown significant effects on the environment due to at the least, the following: the loss or destruction of natural and cultural resources; curtailing the range of beneficial uses of the environment; substantial degradation of environmental quality; cumulative effects on the environment; and potentially substantially affecting rare, threatened or endangered species, or its habitat. ⁷⁴	Your comment has been forwarded to the decision makers.

Humane Society of the United States			<p>Flawed analyses prevented the DEIS from accurately assessing and addressing these effects, in part, because the DEIS uses as a baseline, current conditions, which have been impacted by decades of the aquarium collecting activity.⁷⁵ Therefore, the scope fails to factor the impacts of collection pressure over time. Proper examination of the magnitude of the effect of aquarium collecting on natural populations and the coral reef ecosystem over time requires a proper baseline such as occur in MPAs, which reflect natural populations, before they were depleted by this activity, and have been used as such in numerous studies.⁷⁶</p>	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>IV. Failure to Adequately Analyze and Address Significance Criteria and Other Areas of Concern Proposed by DLNR in NOD</p> <p>DLNR, in the Final Environmental Assessment, Notice of Determination, described five HEPA significance criteria and eleven additional areas requiring further analysis by the Applicant. Here too, the DEIS is totally inadequate, falls far short of providing proper analyses, and fails to reach conclusions that are supported by the evidence.⁷⁷</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The HEPA significance criteria, and the Applicant's conclusions, are provided in Section 5.6 of the EIS.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>A. HEPA Significance Criteria #1: To the question of “whether the annual take of cumulative numbers of fish as a percentage of estimated population results in irrevocable loss or destruction of populations of fish,” the DEIS wrongly concludes “the Preferred Alternative (i.e., Limited Permit Issuance Alternative) does not involve an irrevocable commitment or loss or destruction of any natural or cultural resource.”</p> <p>Fish Populations: Any and all substantial reductions in natural abundance of White List species in West Hawai’i indicate lost natural and cultural resources. While it may be true that a potential revocable loss may be indicated by increasing populations of some White List species when aquarium collecting is halted, such as occurred for yellow tangs in the FRAs after their establishment in 2000 and in the open areas after collection was prohibited in 2018, there is no evidence that natural abundance will ever return. The reduced populations of yellow tangs in the FRAs, compared to baseline, natural populations found in the MPAs, even after 20 years of no aquarium collecting, is further evidence of an irrevocable loss that has occurred. Furthermore, severe coral bleaching caused by climate change has already reduced coral cover in West Hawai’i and is only expected to worsen, with annual bleaching that could begin as early as 2030 and</p>	<p>Your comment has been forwarded to the decision makers.</p>

			contribute to the cumulative effect upon the environment, with the exception of the No Action alternative, which would have a beneficial effect.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>E. Additional Areas Requiring Further Analysis as Described in the DLNR NOD:</p> <p>1) "It is also necessary to analyze the potential impacts under the no action alternative resulting from non-issuance of aquarium permits, including the increased take of larger, reproductively mature aquarium fish in East Hawai'i using legal mesh nets." Since aquarium collecting was prohibited in the WHRFMA, aquarium take in East Hawai'i has grown to be 5X the historic average catch for that entire coastline.⁸⁵ Most of that catch has been reported from zones 107 and 108, which share a boundary with Punalu'u, a known source area for juvenile yellow tangs in West Hawai'i (see DLNR map of aquarium fish zones at Appendix 6).⁸⁶ As previously stated, understanding and factoring larval dispersal and connectivity patterns is critically important for determining impact. It is through the identification of larval source and sink areas that appropriate direct, indirect and cumulative impacts, whether past, present or future, can be assessed and proper levels of take determined in order to prevent harm to populations of targeted species.</p> <p>Both DLNR and the DEIS assert that under the no action alternative, aquarium take outside the WHRFMA is performed by using purportedly legal nets with larger than 2 inch mesh, and therefore, small fish will not be captured at the same rates as they would be with small (less than 2 inch) mesh, because "the smaller fish would escape the larger mesh."⁸⁷ The DEIS concludes that the impact of this scenario cannot be quantified at this time.</p> <p>We understand that because catch reports do not require information on fish sizes other than for yellow tangs, it impossible to determine size-related volumes of catch in the states commercial data. However, information gleaned from the retail market provides ample evidence that fish under 2" (i.e. small enough to escape purportedly legal mesh nets) continue to be captured in very high numbers despite the prohibition on small mesh nets (see Appendix 7 for examples). Further, and as noted in Appendix A, there was no response to our questions as to the specific methods or net sizes used for ongoing collection outside of the WHRFMA.</p> <p>Therefore, the DEIS wrongly concludes that in East Hawai'i, the "no action alternative would have a less than significant direct impact on reef fish populations and the reefs in which they occur." As with the WHRFMA, a proper and thorough analysis of the impacts has not been conducted for East Hawai'i.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS does not state that smaller fish will not be captured, only that the size class of fish collected may increase.</p> <p>Per the DAR, in lieu of fine mesh nets, other gear types that were previously allowed are still legal to use outside the WHRFMA. See the following for more details: https://dlnr.hawaii.gov/dar/files/2017/11/aquarium_permit_faq_rev4.pdf</p>

For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>2) "The FEA identifies the scope of the analysis as one year and states that an EA with updated data and analysis would need to be completed on an annual basis. This improperly segments the analysis which must include the long-term and cumulative impacts over time of aquarium collection."</p> <p>The DEIS expands the scope of the analysis to 5 years. However, this time frame is too short to adequately analyze long-term and cumulative impacts over time. For example, though collection pressure has been removed from the White List species in the FRAs, populations of once heavily targeted species in those areas, such as yellow tangs, have yet to return to natural levels of abundance, as reflected in the baseline MPAs, even after 20 years of protections. For very long-lived species such as the yellow tang and other surgeonfishes heavily targeted by aquarium collection, which have lifespans measuring decades, and which may not reproduce until they are at least 5 years old, a 5-year analysis period is far too short.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>A five-year analysis period was chosen because, as stated in Section 5.0. of the EIS, the temporal scope of the impacts analysis is five years because the WHRFMA management plan is reviewed every five years by the DLNR in cooperation with the University of Hawai'i (DAR 2019a). Because the most recent DAR review was released in 2019, the next DAR review overlaps in time with the analysis period in the EIS. If the Preferred Alternative is implemented, presumably the DAR will review the effects during its next five year review and can make any necessary changes to permit issuance at that time. In addition, because Aquarium Permits have a 1-year duration, the DLNR can decide each year whether or not to issue permits based on new data. The cumulative impact of fish collection is addressed in Section 5.4.3.3 of the EIS.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>3) "There is no statistical analysis of population growth compared to the life span of each fish and the number of years to and size of first reproduction against which this annual proposed take can be measured for purposes of estimating sustainable take."</p> <p>The DEIS fails to address this issue entirely, providing zero of the statistical analyses that were requested and zero reasons for not doing so. Notably those statistical analyses form the foundation of determining estimations for sustainable in the Ochavillo and Hodgson (2006) work, which is referenced throughout the DEIS concerning what constitutes "sustainable reef fish harvest". Instead, the DEIS relies solely upon analysis of catch as % of population, which as described here, is far too flawed to be used to legitimately justify the levels of take proposed in the DEIS.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, specific research into sustainable levels of collection has not been conducted for the 40 White List Species. Therefore, the best available science (i.e., Ochavillo and Hodgson 2006) was used, in conjunction with the DAR (2019a) data on past population trends in the presence of commercial aquarium collection.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>4) "With regard to proposed levels of sustainable catch, using "5% to 25% annual take of estimated populations as proposed in several research papers, we note that 5% to 25% is a wide range, and the precautionary principle calls for applying the lowest estimated percentage of sustainable take in the absence of scientific certainty." Here again, using the fatally flawed analysis described earlier, the DEIS summarizes that "under the Preferred Alternative, collection of any of the 40 White List species is anticipated to be below 5% of the island-wide populations." It is to be expected that inaccurate and under-reported catch levels applied to areas far beyond the directly impacted environment will result in a greatly reduced level of impact. The 5% to 25% annual take of estimated populations, as proposed by Ochavillo and Hodgson (2006) pertains to small finite areas, called "collection areas" where the collection activity occurs. For example, two of the Philippine collection areas that form the basis for Ochavillo</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, the Ochavillo and Hodgson (2006) paper is the best available science. Collection under the Preferred Alternative in the FEIS is below 2% for any of the 38 White List Species with a population estimate. The two species which do not have a population estimate, the Flame Wrasse and the Longfin Anthias, have been collected on average less than 175 individuals per year, even when the number of Aquarium Permits was unlimited.</p> <p>Furthermore, the DAR (2019a) has noted that 24 of the 40 White List Species have remained stable or significantly increased between 1999 and 2017, when commercial aquarium collection was at a higher rate than what would occur under the Preferred Alternative. For the 12 White List Species which had significant declines, as noted in Section</p>

			<p>and Hodgson’s work, Batasan Island and Clarin, are part of Bohol, an island with a coastline that’s 390 km long and comparable to, though smaller than, Hawai’i Island’s 428 km long coastline.⁸⁸</p> <p>One area is Batasan Island, a minor island of less than 120,000 m² that lies about 6.4 km off the Bohol coast, and is part of the municipality of Tubigon, itself just 81.87 km². The other collection area is the neighboring municipality of Clarin, which has a total municipal land area of 62.79 sq. km and a coastline of approximately 6 linear km. The Ochavillo and Hodgson total allowable catch (TAC) as % of population is based on estimated natural mortality rates for certain reef fishes in those specific areas. Furthermore, their TAC relates to fish populations in those specific small areas, not the entire island of Bohol. The DEIS erroneously takes their 5% to 25% range, applies it to species that are not included in their work, to an area that extends far beyond the proposed collection area (i.e. the WHRFMA) to encompass the entire island of Hawai’i, an area which is orders of magnitude larger than those used by Ochavillo and Hodgson.</p>	<p>5.4.3, these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline (DAR 2019a). Because these declines are occurring in FRAs and/or MPAs as well (i.e., areas not open to commercial aquarium collection) it is reasonable to assume that banning commercial aquarium collection would not halt the declines.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>5) “We also note that there are no bag limits for most species, and that the fishery as currently regulated does not limit the number of permits, so that the annual take as a percentage of estimated population could rise significantly. Alternatives of overall annual take limits, a limited entry aquarium fishery program, and restrictions including full moratoria on the take of herbivores, species of special concern, and species evidencing severe population declines have not been proposed or analyzed.”</p> <p>The DEIS does not address this issue. The Preferred Alternative includes limited issuance of permits in this instance, but nothing prevents others from pursuing additional permits for themselves. Other than a reduced bag limit for Achilles tang, nothing more is proposed or analyzed.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>It is beyond the scope of this action to impose or recommend restrictions on additional permits that may be requested in the future. Should such permits be requested, it would be a separate action requiring its own HEPA review and DLNR decision. The FEIS has been limited to 10 permits, and as stated in the FEIS, the species with the highest collection under the Preferred Alternative as a percentage of the population, the Yellow Tang, is at a maximum of 1.93% (see Section 5.5.1). Collection would need to increase by 2.6X to reach the lower end of the 5% to 25% sustainable threshold in Ochavillo and Hodgson (2006). Collection of other species would need to increase by even more than that.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>6) “The FEA asserts that certain types of fish such as Psychedelic Wrasse, Tinker’s Butterflyfish, and Fisher’s Angelfish inhabit waters deeper than the CREP monitoring studied, resulting in populations being underestimated and thus the annual take as a percentage of estimated population being overestimated.”</p> <p>The inclusion of these species on the state’s species of concern list indicates a heightened need for an accurate and thorough assessment of their populations.⁸⁹ As noted earlier, the annual take as a percentage of estimated population should factor under and non-reporting and should apply to the areas where direct impacts occur. Reporting sub-zones would represent the largest area that might be considered appropriate, however more specific areas would be the most appropriate (e.g. bays, reefs, and depth ranges). Allowing limitless take under the Preferred Alternative is contrary to DLNRs</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Even with the underestimated population estimates, collection of these three species is less than 5% under any of the alternatives under consideration. Given that the population estimates are likely underestimated, the actual impact is likely even less.</p>

			<p>conservation actions identified for these species which includes protecting current populations and establishing further populations to reduce the risk of extinction.⁹⁰</p>	
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>7) "In addition, we note the proposed alternatives for reduction in bag limits for Achilles Tang, but do not see a scientific basis for concluding that the proposed reduction would be sufficient to sustain the population." The DEIS fails to address this issue entirely. Reducing the Achilles tang daily bag limit from 10 to 5 would do nothing to prevent further depletion, and extirpation of these important species. In 2014 a bag limit of 10 Achilles Tang per day was imposed on the aquarium trade in an attempt to address declining populations in West Hawai'i. Since 2014, the Achilles tang market price has increased, while populations have decreased. The outer possibilities of what the permits would allow must be considered. A cursory analysis of the Preferred Alternative and the data presented in the DEIS shows that 14 permittees taking 5 Achilles tang per day equates to 25,550 fish. This amount exceeds to total population estimate in the WHAP surveys in the 30'-60' range and is 11% of the island-wide population under the CREP estimates. Combined with the limitless take allowed by aquarium collectors in East Hawai'i, and the pressure from food fishers, the cumulative impact on this important species is extreme.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The following explanation has been added to the FEIS: A 50% reduction is assumed, as collection decreased markedly from an average of 7,732 and a maximum of 13,615 per year prior to imposing the bag limit of 10. Since the bag limit of 10 was imposed, collection has stayed fairly constant, ranging from 5,473 to 5,757 per year (difference of 284 fish), suggesting that fishers may be collecting near the maximum allowed under the bag limit since there has been no growth in collection. Therefore, if fishers are currently collecting at or near the maximum allowed under the bag limit, it is reasonable to assume that reducing that bag limit by 50% would result in a 50% reduction in collection.</p> <p>The concept of "unlimited" collection is speculative and not reasonably foreseeable (including all 10 fishers collecting the bag limit 365 days a year, which is not reasonable to assume if for no other reason than weather). Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA, including a bag limit of 5 Achilles Tang per day. Within the WHRFMA, the collection of Achilles Tang is not feasible for the following reasons: (1) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (2) The level of effort to collect all individuals of the Achilles Tang from the Open Areas is not reasonable, as collection would need to increase by 240% over the historic maximum collection under the 10/day bag limit that has occurred when the fishery was open to all collectors (19-21 reporting from 2014-2017) in order to take 100% of the Open Area population. However, under the Preferred Alternative, effort would actually need to be an estimated 960% higher than previous years (due to the 50% decreased bag limit and the 50% decrease in number of permitted fishers).</p>

For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>8) "Cultural impacts of aquarium fishing need significantly more analysis than provided in the FEA. The OEQC guidelines should be followed for assessing cultural impacts, including consulting with traditional cultural practitioners and other knowledgeable informants and sources about cultural resources, cultural practices, and the proposed action's potential impacts. Traditional Hawaiian practices and subsistence uses, local place-based and life-cycle knowledge, and traditional Hawaiian cultural significance of each type of aquarium fish taken should be reviewed. The indirect impact of modern technologies for highly efficient catch methods on traditional harvest capabilities should be included in the analysis."</p> <p>As extensively noted herein, the DEIS' Cultural Impact Assessment (CIA) is extremely flawed and inadequate, with its inherent purpose-- to identify cultural impacts and propose mitigations measures to limit such impacts, not being met.</p>	Your comment has been forwarded to the decision makers.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>9) "Enforcement and compliance needs and challenges are key factors in the effectiveness of fisheries management, and should be analyzed as part of the environmental impact statement."</p> <p>The DEIS fails to address this issue, citing only an unreliable claim regarding so-called "catch report validation" that did not indicate substantial underreporting of catch by aquarium collectors. DLNR is well aware of the major gaps and flaws in their reporting system that facilitates any amount of under and non-reporting. Additionally, an important avenue for validation, tallies of the species and their numbers leaving the state via air cargo, which are required by federal law, are not being provided, exposing both aquarium trade members and air cargo carriers to violations of the federal Lacey Act.⁹¹ Furthermore, the DEIS fails to analyze other significant gaps in enforcement and compliance, as we, too, spelled out in our comments to the Applicant/Stantec, responding with a single sentence, "enforcement is within the purview of the State of Hawai'i."⁹²</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Enforcement is within the purview of the state of Hawai'i.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>10) "We appreciate that as an applicant action, the applicant can propose but not ensure regulations aimed at protecting and restoring populations of aquarium fish. We are interested in proposals for self-regulation by aquarium permit holders which could be incorporated into permit conditions even in the absence of or prior to establishing other regulations to accomplish the same purposes."</p> <p>The DEIS fails to address this issue, providing no proposals for self-regulation that could be incorporated into permit conditions.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Reporting of catch is already a permit condition. An additional permit condition limiting the collection to the WHRFMA has been added to the Preferred Alternative in the FEIS. The Preferred Alternative limits the number of permits to 10.</p>

For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	11) "Overall, we appreciate that certain alternatives have been proposed, but believe they are more appropriately proposed as mitigation measures in an environmental impact statement to mitigate potential environmental impacts, rather than as alternatives in an environmental assessment, which, if implemented, might result in a finding of no significant impact. The Department of Land and Natural Resources is obligated to ensure full analysis under HRS Chapter 343 of potential environmental impacts of its actions in issuing aquarium permits. We believe this is most appropriate in an environmental impact statement." The DEIS fails to address this issue and proposes no mitigation measures because their flawed analysis concludes there are no significant impacts to mitigate.	Your comment has been forwarded to the decision makers.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	IV. Further Impacts Inadequately Analyzed Environmental impacts from aquarium trade activities have been documented for over forty years. Under the Preferred Alternatives, every fish and marine creature, other than corals and those associated with live rock, could be removed from one, or all, of the State of Hawai'i's reefs—with catastrophic effects. This is not speculation: there is currently no law, regulation or enforcement capability that would prevent this from occurring. The potential for unlimited collection is a fact that encompasses the outer limits of what the aquarium permits allow, as was explained earlier.	Your comment has been forwarded to the decision makers. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period. The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, the collection of "every fish and every marine creature" is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.
For the Fishes, Center for Biological	N/A	1/7/2020	Collecting individual species in high numbers poses a significant threat to coral reef health. As explained herein, herbivorous species, such as Yellow Tangs and Goldring Surgeonfishes, are the most heavily	Your comment has been forwarded to the decision makers. The term "irrevocable" is defined by Webster's dictionary to mean

Commenter	State/ Location	Date Received	Comment	Response
<p>Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>			<p>targeted.⁹³ Herbivorous fish are essential to avoid algal overgrowth of corals and concomitant degradation of the reef. Other important functional groups include: planktivores (e.g. Hawaiian Dascyllus), corallivores (e.g. Fourspot Butterflyfish, Multiband Butterflyfish), fish predators (e.g. Hawkfishes, Hawaiian Lionfish) and cleaner fishes (e.g. Hawaiian Cleaner Wrasse).</p> <p>The reduction of natural populations of species taken by the aquarium trade in any area (e.g. specific site, zone, coastline, island or statewide), and by any amount, whether one or one hundred percent, indicates an irrevocable commitment and loss of a natural and cultural resource.⁹⁴ This very loss curtails the range of beneficial uses that would otherwise be provided by the natural abundance of these populations.⁹⁵</p> <p>We disagree with the DEIS response to our comment above that “this is not an irrevocable action, as commercial aquarium permits may be suspended pursuant to HAR 13-74-3(1) if the department determines that it is necessary for the protection and conservation of aquatic life. In addition, fish will continue to reproduce.” As previously stated, any and all substantial reductions in natural abundance of White List species in West Hawai’i indicate lost natural and cultural resources. While it may be true that a potential revocable loss may be indicated by increasing populations of some White List species when aquarium collecting is halted, such as occurred for yellow tangs in the FRAs after their establishment in 2000 and in the open areas after collection was prohibited in 2018, there is no evidence that natural abundance will ever return. The reduced populations of yellow tangs in the FRAs, compared to baseline, natural populations found in the MPAs, even after 20 years of no aquarium collecting, is further evidence of an irrevocable loss that has occurred.</p>	<p>“not able to be changed, reversed or recovered; final.” The preferred alternative does not meet this definition because available scientific data indicate that the populations targeted by the fishery are naturally self-sustaining, and population levels for many of the species are stable or increasing. For species that are decreasing, they are decreasing in areas both open and closed to aquarium collection, indicating that aquarium collection is not driving the decline, and that banning aquarium collection would not reverse this decline. Consequently, the impacts of the fishery are will not cause an irreversible impact on either the populations or the ecosystems they inhabit.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>As has been long recognized, The impact of commercial aquarium fish collecting is a complicated issue. The fish community members are highly dependent on one another. There is a constant interaction between predators and competitors, as well as other members of the food web. There is a lot of variability in the system, even when it is not disturbed by man. Reefs seem to undergo natural cycles. At times they may be very abundant. There is also natural variation in the fish community at different locations.⁹⁶</p> <p>The DEIS fails to assess the high aesthetic value of this beautiful marine life as well as impacts to the complex relationships inherent in coral reef ecosystems and impacts to overall coral reef health. “Animal communities” are included in the rule definition for “environment,” however the EIS excludes any mention of the impact to fish and invertebrate communities, or the impact to the animals themselves.</p>	<p>Your comment has been forwarded to the decision makers.</p>

			<p>The Hawai'i State Wildlife Action Plan (SWAP) states that "Excessive extractive use constitutes a threat to wildlife. Certain reef fishes are harvested for sale in the aquarium trade . . . These activities are not sustainable on a large scale and impact native wildlife."⁹⁷</p>	
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>A. General Impacts on Targeted Species</p> <p>The list of species of greatest conservation need includes at least 18 native fish species that are threatened by the aquarium trade and in need of conservation actions to reduce the risk of extinction (depicted in Fig. 3).</p> <p>Butterflyfishes are among the most beautiful of coral reef fishes (see Fig. 4). Their bright yellow, white and black markings are especially striking against pale corals and deep blue waters. When encountered by snorkelers/divers the beauty of these species is often breathtaking. They are heavily targeted by the aquarium trade in Hawai'i. In 1976 five of the top ten most collected species were butterflyfish (see Fig. 5).⁹⁹</p> <p>Reported aquarium harvest of those same five species has since plummeted (see Fig. 6). The same is true for other heavily targeted butterflyfish species that have been among the top twenty aquarium fishes collected by the trade since 1976.¹⁰²</p> <p>This sharp decline in reported catch is not an indicator that these species are no longer in demand. Continuing demand is confirmed by several examples:</p> <ul style="list-style-type: none"> • These species' inclusion in the West Hawai'i White List. • Their exclusion from the O'ahu rules. <ul style="list-style-type: none"> o The O'ahu aquarium rule prohibits take of three butterflyfishes, citing their "coral diets" as the need for the restriction.¹⁰⁴ Since 1999 total reported take of those three species was 50 fish.¹⁰⁵ o Zero restrictions were provided for three additional coral eating butterflyfishes, with total reported take of over 51,000 individuals since 1999.¹⁰⁶ • The Fourspot Butterflyfish catch increase that followed the 2014/2015 warming event and unprecedented fish bloom.¹⁰⁷ Subsequently, catch of the Fourspot Butterflyfish declined to an all-time low.¹⁰⁸ <p>The EIS fails to use a temporal baseline that captures the impacts of the heavy collection pressure on these species over time, before their natural populations were depleted by this activity.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Of the four species identified in Figure 4 of the comment (the Longnose Butterflyfish and the Forcepsfish are now classified as the same species), three may be collected in the WHRFMA. Collection of the Fourspot Butterflyfish is less than 0.4% of the population. collection of the Multiband Butterflyfish is less than 0.25% of the population, and collection of the Forcepsfish is less than 1.15% of the population. The Forcepsfish has not exhibited significant declines between 1999/2000 and 2017/2018, and the other two species have exhibited declines in both Open Areas and protected areas, indicating that aquarium collection is not driving the decline (DAR 2019a).</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>B. Damage to Reef Habitat</p> <p>In nearly every encounter with commercial aquarium collectors on West Hawai'i reefs, snorkelers and divers have witnessed and documented destructive practices that harm corals, with the most damage coming from vessel anchors and chains. Sticks, buckets, nets, underwater propulsion devices (scooters) are laid in the corals and the</p>	<p>Your comment has been forwarded to the decision makers.</p>

Environmental Laboratory, and The Humane Society of the United States			fins, knees and legs of collectors often come in contact with the reef—in fact, they are typically described as “crawling across” or “standing” on the corals. The results of these actions include abrasion and coral breakage. Both FEAs refer to a study that determined there was no evidence to indicate the presence of destructive fishing practices (e.g. breaking apart corals to capture hiding fishes). ¹⁰⁹ However, the abundance of photographic evidence documenting coral breakage from vessel anchoring and fish capture activities, these impacts cannot be dismissed and must be evaluated in the EISs. Photographs of these practices and their effects can be found at Appendix 3. Abundant coral reefs—put at risk by the Preferred Alternative—have a range of beneficial uses. The DEIS fails to adequately assess the curtailment of “the range of beneficial uses of the environment.” ¹¹⁰	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	C. Examples of Impacts in Various Hawai’i Island Regions Baseline fish population data from the 1970’s at Honaunau in West Hawai’i were compared to data gathered in surveys conducted 1998 – 2001. The results indicated that nearly all small bodied surgeonfish, butterflyfish and angelfish (i.e. species targeted by the aquarium trade) declined in abundance. Commercial aquarium collecting was implicated in the decline (see Fig. 9). ¹¹¹ Similar results were found at Ke’ei where the site had been intermittently surveyed since 1979. ¹¹² “Of the 20 most collected aquarium species, 18 declined in abundance with the species facing the heaviest fishing pressure typically showing the greatest declines.” ¹¹⁴ In addition to documenting the impact of aquarium collecting in these areas, these studies also document baselines for abundance levels of aquarium targeted and other impacted species. Examinations of reported catch, as documented by DLNR, serve to further highlight the impacts of the trade. ¹¹⁵ The documentation shows that the initial surveys were conducted during a time when the aquarium trade reported taking fewer than 50,000 fish annually from West Hawai’i reefs. In subsequent years, from 1987 to the final surveys in 2001, reported aquarium fish catch in West Hawai’i ranged between 150,000 and 300,000 individuals taken. Since then the annual West Hawai’i aquarium fish catch has ranged between 250,00 and >450,000 fish. Additionally, with the closure of approximately 32% of the reefs in West Hawai’i with the implementation of the FRAs in 2000, this increased fishing pressure was focused in smaller areas with likely intensified results.	Your comment has been forwarded to the decision makers. While this paper does note a decline in fish abundance between 1975-1978 and 1998-2001, it should be noted that this study utilized data collected prior to establishment of the WHRFMA, establishment of bag limits, the creation of the White List, and closure of >30% of the West Hawai’i coastline to commercial aquarium fishing. More recent data from the DAR (2019a) has shown that 9 of the top 10 collected species have increased significantly since establishment of the FRAs in 1999, even in the presence of continued commercial aquarium collection. This includes increases in Open Areas where collection is now focused.
For the Fishes, Center for Biological Diversity, Moana Ohana,	N/A	1/7/2020	Another long-term study looked at reefs in South Kohala and determined that reef fish abundance was in “drastic decline” and reefs were in “dire straits”. ¹¹⁶ Populations of all of the top five most abundant fish families had declined since the original surveys conducted in 1979-1981 (see Fig. 10). Thirty-one of the thirty-five	Your comment has been forwarded to the decision makers. More recent data from the DAR (2019a) has found that two of three long-term monitoring areas in South Kohala and South Kona have Yellow Tang populations that have increased to levels found over

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Haereticus Environmental Laboratory, and The Humane Society of the United States			<p>most abundant fish species had declined, including 19 species targeted by the aquarium trade. Most of the aquarium targeted species had declined by more than 50% and many were down by more than 80%.¹¹⁷ The extent to which the massive increase in reported take has contributed to this decline was not studied in the DEIS.</p> <p>As the Applicant noted in the FEAs' responses to this comment, the "Dire Straits" report concluded that "the widespread declines in families of fish not typically targeted either for food use or for the aquarium fishery suggest that other, more widespread factors are additionally contributing to the overall long-term declines in fish abundance."¹¹⁸[emphasis added] Rather than rebutting the argument that further analysis is needed, this statement only served to highlight why the DEIS needed to also evaluate the potential of cumulative impacts of other factors (e.g. pollution, and sedimentation) on targeted fish species, such as decline of coral coverage, which have been demonstrated to influence reef fish species diversity and abundance.¹¹⁹ Here, too, the flawed analyses failed to accurately identify impacts.</p> <p>The areas south of these reefs are subject to some of the most intense aquarium collecting pressure in the state. Aquarium take between Keahole Point and these reefs in South Kohala, in one year alone, exceeds the aquarium take from the entire Great Barrier Reef in Australia, which has a reef area that is 300 times larger than Hawai'i's. For example, in 2014 aquarium collectors reported taking 191,083 fish from this Hawai'i zone. ¹²¹ By comparison, 2014 reported aquarium take from the Great Barrier Reef was 112,000.¹²²</p>	<p>three decades ago, prior to the expansion of commercial aquarium collecting in West Hawai'i. Kole populations in South Kohala have declines, however, the DAR (2019a) concludes that "given the length of protection at these sites and the overall decline in habitat quality and fish populations in South Kohala it seems unlikely that the declines are due primarily to aquarium collecting." In addition, "Aquarium targeted species are not the only ones which have declined but rather major declines were apparent in all trophic levels and most fish families. As noted above, both areas have been off-limits to aquarium collecting for quite some time and thus it is not reasonable to attribute the extensive changes in habitat and fish populations at these sites to aquarium collecting."</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>Abundant populations of herbivorous fishes are critically important to coral reefs. They keep algae from overgrowing corals or preventing new corals from starting. Important families of herbivorous fishes in Hawai'i include surgeonfishes, damselfishes and parrotfishes. The vast majority of fishes taken by the aquarium trade are surgeonfishes. Yellow Tangs are the dominant herbivore in West Hawai'i.¹²³ They are also the most heavily collected species. The Dire Straits study documented a 90% decline in herbivorous surgeonfish and damselfish populations, while parrotfish populations had actually increased over time.¹²⁴</p> <p>This aforementioned 90% decline in herbivores contributed to a 35% reduction in coral cover, a 64% reduction in coral building coralline algae, a 38% increase in algae at one site and a staggering 322% increase in algae at another. DLNR claims that parrotfishes are more important herbivores than surgeonfishes when it comes to keeping algae in check on coral reefs. ¹²⁵ On these South Kohala reefs, the increased parrotfish populations were not enough to offset the loss of surgeonfishes and damselfishes, and the algae still outcompeted the</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS notes the importance of herbivores throughout the document. As stated in the EIS, DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.</p>

			corals. The notion that surgeonfishes taken by the aquarium trade are not an important component to coral reef health is challenged by this study.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The DEIS attempts to downplay the importance of surgeonfishes and other herbivorous fishes taken by the trade by citing a 2003 study by Tissot and Hallacher (described more in the next section) that found no evidence of increased macroalgal growth in areas of collection versus areas without collection, despite reduced fish abundance in the collected areas. ¹²⁶ However, the authors concluded that the study may not be a good test of that hypothesis for several reasons, including that most surgeonfishes taken by aquarium collectors consume filamentous algae, not macroalgae, and that further investigation is warranted. ¹²⁷	Your comment has been forwarded to the decision makers. As stated in the EIS, DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	Further, a more recent assessment of ecosystem trends in West Hawai'i includes, among other data, the differences in herbivore biomass and coral cover between reefs on the northern portion of the West Hawai'i coast (which encompasses the South Kohala area described above and extends from Keahole Point, northward) and reefs on the southern portion (from Keahole Point, southward). ¹²⁸ The data shows that herbivore biomass in the north is significantly lower than that found on the south. ¹²⁹ Additionally, while the northern reefs are now dominated by algae, and coral cover has declined by ~30%, the same not true for the southern reefs. ¹³⁰ Notably, though the northern area is ~33% smaller than the area to the south, catch reports do not indicate a corresponding reduction in take. In fact, in 2014 take was higher in the north than in the south. ¹³¹ The extent to which heavy collection pressure in the north has contributed to this shift was not addressed in the DEIS.	Your comment has been forwarded to the decision makers. As stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The DEIS also attempts to downplay the importance of herbivores taken by the trade by claiming that they target the smaller fish which are "the least effective sizes for cropping algae." ¹³² However, research shows that these fish play key roles: <ul style="list-style-type: none"> • "The degree of change that a herbivore or group of herbivores can impose on a system is determined by several factors, including the intensity of the bit size, the number of bites and the number and type of each grazer in the system."¹³³ • Research on Maui shows that more herbivorous fishes on the reef, even those that are smaller bodied, equates to "more mouths on the algae."¹³⁴ • In addition, a comparison of adult Yellow Tang densities in the West Hawai'i long-term protected areas (i.e. MPAs) vs. the Open Areas, shows that collection pressure on small, juvenile, Yellow Tangs has 	Your comment has been forwarded to the decision makers. As stated the EIS, DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.

			reduced the natural abundance of sub-adult and adult yellow tangs, which are 2 – 4 times larger than juveniles, by an average of 60%. ¹³⁵ The fact remains that algae now dominates many West Hawai'i reefs, but the DEIS failed to accurately evaluate Applicant impacts that occur as a result of reduced herbivory.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	D. Examples of Impacts to Species Two peer reviewed studies documented the magnitude of the effect of aquarium collecting on natural populations of heavily targeted species by the aquarium trade. One, published in 2003 by Tissot and Hallacher, was conducted the two years prior to the establishment of the West Hawai'i Fish Replenishment Areas (i.e. aquarium no-take zones). ¹³⁶ The next study, by Tissot, et al., was conducted in 2000-2002, three years after those area closures. ¹³⁷ The results of each study showed that aquarium collectors have a significant effect on the abundance of targeted aquarium fishes (see Fig. 11). The U.S. Coral Reef Task Force described these results as follows: "Severe overfishing for aquarium trade occurs even in the United States: Aquarium fishes outside of reserves [in West Hawai'i] experience significant declines – from 14% to 97%." ¹³⁹	Your comment has been forwarded to the decision makers. The DAR (2019a) has noted that 24 of the 40 White List Species have remained stable or significantly increased between 1999 and 2017, when commercial aquarium collection was occurring at the rates anticipated under the Pre-Aquarium Collection Ban Alternative. For the 12 White List Species which had significant declines, as noted in Section 5.4.3, these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline (DAR 2019a). Because these declines are occurring in FRAs and/or MPAs as well (i.e., areas not open to commercial aquarium collection) it is reasonable to assume that banning commercial aquarium collection would not halt the declines.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	In a 2010 grant report to NOAA, DLNR documented that "a number of aquarium-targeted species have not responded to the increase in protected areas and have actually decreased in West Hawai'i since 1999" (see Fig. 12). ¹⁴⁰ Per DLNR aquarium catch reports, these species are also among the top 20 most harvested fishes. Nonetheless, all but two species, the Moorish Idol and the Hawaiian Cleaner Wrasse, were included in the West Hawai'i 40 Species White List adopted in 2014. DLNR therefore calls for the continued harvesting of these species, despite knowing that their populations are in decline.	Your comment has been forwarded to the decision makers. As noted in the EIS, more recent data from the DAR (2019a) has noted that 24 of the 40 White List Species have remained stable or significantly increased between 1999 and 2017, when commercial aquarium collection was at a higher rate than what would occur under the Preferred Alternative. For the 12 White List Species which had significant declines, as noted in Section 5.4.3, these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline (DAR 2019a). Because these declines are occurring in FRAs and/or MPAs as well (i.e., areas not open to commercial aquarium collection) it is reasonable to assume that banning commercial aquarium collection would not halt the declines. The pressures from commercial aquarium collection under the Preferred Alternative are anticipated to be lower than rates seen prior to the October 2017 ban on commercial aquarium collection
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental	N/A	1/7/2020	Three species identified in the SWAP, the Bandit Angelfish, Bluestripe Butterflyfish, and Hawaiian Turkeyfish Figure 4 (in gold outline) were included in a DLNR presentation on West Hawai'i Species of Special Concern (Fig. 3) where two were described as routinely seen in the 1970's and now very rare, and one was described as down by 99% in two different areas. ¹⁴² In West Hawai'i the decline of butterflyfishes has been well-	Your comment has been forwarded to the decision makers. None of these species are on the White List, and therefore cannot be collected with the WHRFMA.

Commenter	State/ Location	Date Received	Comment	Response
Laboratory, and The Humane Society of the United States			documented in both population surveys and aquarium catch data. A 2008 presentation on West Hawai'i aquarium species of special concern reported declines in butterflyfish abundance and diversity. ¹⁴³ Two species were particularly hard hit: the Bluestripe Butterflyfish and the Teardrop Butterflyfish, experienced population declines ranging from 89% - 100% in two West Hawai'i areas (see Fig. 13).	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>The Bluestripe Butterflyfish is a highly unique, endemic Hawaiian species that, having no sister species elsewhere in the Indo-Pacific, is also known as a relic (see Fig. 14).¹⁴⁴ Until 1980, this species was among the top twenty fishes collected in West Hawai'i, with an annual average harvest of 347.¹⁴⁵ By 2012, the last year this species appeared on West Hawai'i catch reports, reported harvest had dropped to a total of nine.¹⁴⁶ This species was excluded from the West Hawai'i forty species White List which went into effect in 2014.¹⁴⁷</p> <p>The 2015 Hawai'i SWAP lists the Bluestripe Butterflyfish among the species of greatest conservation need. Threatened by the aquarium trade, conservation actions include to "protect current populations, but also to establish further populations to reduce the risk of extinction."¹⁴⁸</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The Bluestripe Butterflyfish is not on the White List, and therefore cannot be collected within the WHRFMA.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>According to DLNR reef surveys and catch data, the Teardrop Butterflyfish has also experienced drastic declines on West Hawai'i reefs (see Fig. 13). This beautiful species is named for the striking upside-down black teardrop located mid-body (see Fig. 4). Until 1980, the Teardrop Butterflyfish was among the top ten fishes collected in West Hawai'i with an average annual harvest of 1,454 individuals (see Fig. 15).¹⁴⁹ During the following five years, the harvest rate dropped, but it was still among the top twenty species collected (see Fig. 15).¹⁵⁰ Though collection continued until at least 2013, by the late 1990's DLNR considered Teardrop Butterflyfish as no longer targeted by the aquarium trade and excluded them a list of aquarium targeted species provided to researchers, Brian Tissot and Leon Hallacher, who were embarking on a project to document the magnitude of the effect of aquarium collecting on natural populations.¹⁵¹ They were, however, included in the surveys to test assumptions since they were similar to targeted species.¹⁵² The researchers encountered just one individual Teardrop Butterflyfish during the entire study and so they were excluded from further analysis.¹⁵³</p> <p>In 2011 a group of divers encountered an aquarium collector at a popular North Kohala dive site. They watched in horror as the collector scooped up the first Teardrop Butterflyfish they had seen in that area in years along with a number of Yellow Tangs and other</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The Teardrop Butterflyfish is not on the White List, and therefore cannot be collected within the WHRFMA.</p>

Commenter	State/ Location	Date Received	Comment	Response
			fishes (Fig. 16).154 In 2013, the last year Teardrop Butterflyfish appeared on aquarium catch reports, reported take had dropped to a total of ninety, reflecting a 99% drop in annual catch since 1980.155 This species was excluded from the West Hawai'i forty species White List which went into effect in 2014.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The exclusion of any formerly collected species from the White List, such as the Bandit Angelfish, Bluestripe Butterflyfish, Hawaiian Turkeyfish, Teardrop Butterflyfish, or Thornback Cowfish, is not an exemption for a thorough analysis of their current status within the West Hawai'i Regional Fishery Management Area (WHRFMA) and elsewhere on Hawai'i Island, compared to the baseline (i.e. historic natural abundance)..	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS evaluates the effects of the proposed action. Since collection of species not on the White List would not be allowed under the proposed action, the EIS does not evaluate impacts of future collection on these species as it is assumed to not occur. The action being evaluated in the EIS is the issuance of 10 Aquarium Permits with the current restrictions, and not past issuance of permits prior to establishment of the White List.</p> <p>An analysis of the cumulative impact of poaching and underreporting has been added to the FEIS.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>The aquarium fishery in West Hawai'i takes 1.8X more reef fish than recreational and other commercial fishing combined. Most of these fish are Yellow Tangs.156</p> <p>"Overall Yellow Tang abundance in 30'-60' hardbottom habitat in West Hawai'i increased by 355,758 individuals from 1999/2000 to 2010-2012 even though Yellow Tang abundance in the Open areas decreased by 21%. This decrease is attributable largely to an increase in the number of aquarium collectors and collected animals relative to the period when the FRAs were established."157</p> <p>Over sixty percent of West Hawai'i reefs are open to the aquarium trade. On the reefs in those areas, the impact of the aquarium trade on natural populations of Yellow Tangs has been a significant reduction in the abundance.158 For example, natural populations were reduced by over 75% in 2007-2009 and in recent years, by 60% (see Fig. 17). The increase in FRA Yellow Tang abundance that began in 2002, three years after establishment of these protected areas, is a clear example of the impact of the trade on natural populations: when collection pressure is removed, given enough time, populations may be able to rebound. As noted earlier, the overall increase in Yellow Tang abundance that has occurred since 2014 is due to an anomalous recruitment pulse that coincided with warming waters in 2014.159 Typical recruitment pulses, such as those that occurred in 2002 and 2009, have resulted in short-lived increases in fish populations that were followed by prolonged or short and steep population declines (see Fig. 17).</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The commenter is citing a report from the DLNR from 2014, compared to more recent 2019 data used in the EIS. As stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. Additionally, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui.</p>

Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States			<p>other fisheries, aesthetic and other social values are also heavily impacted.¹⁶¹ Species experiencing the heaviest collection pressure, with a corresponding reduction in natural abundance, are Hawai'i's most beautiful, charismatic and iconic fishes. The diminished aesthetic value from the cumulative and substantial reductions in species such as Yellow Tangs, butterflyfishes and Moorish Idols, which are dominated by vibrant yellows and oranges and striking white and black patterns, cannot be overestimated (see Fig. 7). These colors are more than aesthetically pleasing, as our eyes are physiologically attuned to them. The frequencies and wavelengths of yellows, oranges and reds allow them to strike our eyes much faster than the other colors.¹⁶²</p> <p>By removing the species with prominent yellow, orange, red or white coloration and markings, the palette and very essence of what makes a coral reef beautiful to the human eye is diminished and degraded. It is impossible to decrease populations of a coral reef's beautiful wildlife without greatly decreasing the natural beauty of the place. Divers who have frequented these coral reefs, such as some of the Commenters, have noticed decreased abundance of colorful fish in recent years. The DEIS fails to address these cumulative losses and propose proper mitigation measures.</p>	As stated in the EIS, the DAR (2019a) has noted that 24 of the 40 White List Species have remained stable or significantly increased between 1999 and 2017, when commercial aquarium collection was occurring at the rates anticipated under the Pre-Aquarium Collection Ban Alternative. For the 12 White List Species which had significant declines, as noted in Section 5.4.3, these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline (DAR 2019a). Because these declines are occurring in FRAs and/or MPAs as well (i.e., areas not open to commercial aquarium collection) it is reasonable to assume that banning commercial aquarium collection would not halt the declines.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>F. Failure to Assess Impacts to Property/Amenity Value</p> <p>The DEIS fails to acknowledge and address the effects of the trade on the amenity/property values and propose proper mitigation measures. Houses that are within a block or 100 meters of beautiful, clean and healthy coastlines, beaches and coral reefs are more valuable and sell for significantly higher prices than comparable properties elsewhere. The same is true for condos and hotels/hotel rooms which generally command higher room and occupancy rates. Healthy coral reefs are also more likely to prevent beach erosion and, therefore, add value as a form of coastal protection. One and a half percent of the sale price of these properties is attributable to the marine ecosystem. Hawai'i's reef-related property value in 2001 was calculated at \$40 million.¹⁶³</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS evaluates impacts to land values in Section 5.2.2. As stated in the EIS, despite the housing crisis and recent recession, the average sale price of homes steadily increased in Hawai'i from 2011 to 2014 after a few years of year-to-year fluctuation. The average sale price of homes in 2014 was \$594,440, which was 26.4% higher than the average sale price in 2011. A rapid price increase was observed particularly in 2013 and 2014. The average sale price in 2013 and 2014 was about 10% higher than the price in the prior year. In 2015, the total number of home sales increased by 9.3%, but the average sale price was 0.3% lower than the previous year (HDBEDT 2016). This occurred while commercial aquarium collection was also occurring.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>G. Failure to Assess Impacts to Recreational Value</p> <p>The DEIS fails to acknowledge and address the effects of the trade on the recreational value of this marine life and their coral reef homes and propose proper mitigation measures. The annual estimated expenditures related to marine life viewing (i.e. snorkeling and scuba) in Hawai'i is \$551 million. Reef-adjacent marine tourism expenditures (including hotel rooms) within 30 km of the coastline are an annual \$680 million.¹⁶⁴ These amounts exclude the lost value from declining fish abundance which is captured in willingness to pay surveys and summarized below:</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the commenter cites "anecdotal reports" about revenue loss, as stated in Section 5.2.2.2 of the EIS, there is no available data to suggest that commercial aquarium collection has impacted the tourism industry. In fact, Hawai'i's tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). When adjusted for inflation, total</p>

Society of the United States			<ul style="list-style-type: none"> • Healthier reefs lead to substantial economic gains. • Recreational users are willing to pay higher rates for a healthier marine environment. 165 • Snorkel/dive businesses benefit when there are more fish for their clients to see.166 One recent study showed divers were willing to pay \$93 to \$110 more to dive with abundant fish life. 167 • Without new regulations the potential for increasing losses is real. • Inability to stem declining reef fish numbers could cause significant losses to dive tourism industry (i.e. reductions in willingness to pay).168 • These consumer surplus losses could range from \$1.2 million to \$12.2 million annually.169 • Areas with degraded reefs and low fish populations could also see significant losses from a decrease in their share of the global dive market.170 • Anecdotal reports from long-time residents and visitors point to revenue loss already occurring from reduced abundance of beautiful fishes on Hawai'i reefs. 	<p>visitor spending was up 3.5% from 2016 (Figure 3). A total of 9,404,346 visitors came by air or by cruise ship to the state, up 5.3% from the previous record of 8,934,277 visitors in 2016. Total visitor days rose 4.8% compared to 2016. The average spending per day by these visitors (\$198 per person) was also higher than 2016 (\$197 per person; HTA 2018).</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>H. Failure to Assess Impacts to Passive Use Value</p> <p>The DEIS fails to acknowledge and address the effects of the trade on the substantial non-use values of this marine life and their coral reef homes and propose proper mitigation measures. Intrinsic and social values associated with coral reefs are diminished by reduced fish populations. Concern for the marine environment has increased in recent years and people now place tremendous value on coral reef ecosystems. Many people value beautiful and healthy coral reef ecosystems as part of their legacy and responsibility to ensure future generations are able to experience them. A 2011 report for the National Oceanic and Atmospheric Administration (NOAA) estimated the passive use annual value of Hawai'i's coral reef ecosystems through a willingness to pay survey of U.S. households. The survey included a visual representation of an overfished and an abundant coral reef (see Fig. 8).</p> <p>The project determined that increased protections and restoration of degraded coral reefs in Hawai'i is worth about \$288 to the average U.S. household which aggregated over all U.S. households amounts to a \$34 billion annual passive use value for Hawai'i's coral reefs.172 This and other socio-economic values described here provide meaningful insights into the public's concerns and should be addressed in a comprehensive DEIS.</p>	<p>Your comment has been forwarded to the decision makers.</p>
For the Fishes, Center for Biological Diversity,	N/A	1/7/2020	<p>I. Failure to Assess Impacts to Aquatic Life Post Capture</p> <p>A major factor that drives the rates of collection is premature mortality rates in captivity. According to a long-time industry insider, most Yellow Tangs die with the first month in a hobbyist tank and</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>A discussion on post-collection mortality has been added to Section 5.4.2 of the EIS. Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States			<p>fewer than 1% of those captured survive one year in captivity.¹⁷³ A 2012 study determined that mistreatment in capture, handling, transport, and holding plays a larger factor in these premature deaths than hobbyist inexperience.¹⁷⁴ Hawai'i's Yellow Tang ranks among the top ten fish sold in the marine aquarium trade.¹⁷⁵ As such, it was prominently featured in the study, in both the consumer survey, as one of the nine fish species featured, and in the supply chain analysis, as one of the eighty-five species analyzed which included eleven other species that are captured both in Hawai'i and elsewhere in the Indo-Pacific.¹⁷⁶ The researchers also determined that each step in the supply chain significantly profits from customer purchases to replace fish that die prematurely, and that profits from replacement fish sales are so high, stores have no incentive to take action to reduce deaths.¹⁷⁷</p> <p>Every fish that dies early puts extra pressure on natural resources because of the take of replacements. There is a general consensus in many countries that it is not ethical to trade in live animals, unless their health and welfare are ensured. These unnecessary and early deaths have given the trade a poor image. A \$20 million, multi-stakeholder reform effort failed, in part, because of trade reluctance to address, and take steps to reduce, mortality rates.</p>	<p>2012) is focused on marine ornamentals from the "Coral Triangle" (Philippines, east Malaysia, Indonesia, Timor-Leste, Papua New Guinea, and the Solomon Islands), where they commonly use harmful chemicals such as cyanide and dynamite to catch fish, which then leads to extremely high mortality rates in the supply chain. These practices are not used in Hawaii.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>Fifty percent of species among Hawai'i's historical top 20 fish list are either not guaranteed to arrive alive or stay alive longer than 7 – 14 days when purchased from online or "brick and mortar" retailers. Examples are found in Appendix 4.</p> <p>The DEIS erroneously excludes an analysis of impacts to fish and other aquatic life once they are taken, stating "because population effects have already occurred once an individual fish has been removed from the ocean, it is beyond the scope of this analysis to evaluate effects on individual fish once they are removed from the population." One of the core requirements of the aquarium collection statute, HRS § 188-31 is that aquatic life taken under the permit is maintained alive and in reasonable health. Aquarium catch reports capture presumed mortalities between capture and sale to marine dealers and indicate that an average of 3% of captured fishes die at this stage of the chain of custody. Self-reporting by a handful of wholesalers report that up to 2% more die while in their custody and an additional 1% - 2% die in air cargo transport. Wholesalers receiving fish from Hawaii report a similar "dead on arrival" rate, and note that the industry standard is to allow up to 5% to arrive dead with no charge-back to the shipper for losses.</p> <p>Per Appendix A, the Applicants failed to respond to any questions regarding mortality rates. In order to fulfill its statutory duties to exercise discretion in granting permits, DLNR needs the average and</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>A discussion on post-collection mortality has been added to Section 5.4.2 of the EIS.</p>

Commenter	State/ Location	Date Received	Comment	Response
			day, than if using traditional subsistence fishing methods. Further, there is no discussion about additional species take-prohibitions, bag limits (less reducing the daily bag limit of Achilles Tang from 10 to 5), “pono” fishing practices, the foundation of which is taking only what is needed, or a discussion on “resting” (closing) certain areas from commercial extraction.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	OHA also states it “anticipates that the DEIS will include a broader scope of analysis and include a consideration of all consequences on the environment, including both direct and indirect effects, in accordance with Hawai’i Administrative Rules § 13-200-17(i)...” yet the scope of the discussion of impacts is limited to 14 collectors who made up nearly 80 percent of the total catch even in years when not all 14 collectors were reporting take. The CIA also fails to include any legally required proposed mitigation measures, to address cumulative (past, present and reasonably foreseeable future) impacts to cultural resources.182	Your comment has been forwarded to the decision makers. Direct, indirect, and cumulative impacts are discussed in Section 5.0 of the EIS, both for the Preferred Alternative (issuance of 10 Aquarium Permits) as well as for the other alternatives under consideration.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	In yet another gross contradiction, the CIA states that: “According to those guidelines: In scoping the cultural portion of an environmental assessment, the geographical extent of the inquiry should, in most instances, be greater than the area over which the proposed action will take place. This is to ensure that cultural practices which may not occur within the boundaries of the project area, but which may nonetheless be affected, are included in the assessment. (State of Hawai’i, Office of Environmental Quality Control 2012:11) For this reason, for assessing the potential cultural impacts of the issuance of fourteen commercial aquarium permits within the WHRFMA, the entire fishery management area along the western coast of Hawai’i Island is considered, not just those areas within which commercial aquarium fishing will be permitted. To Hawai’i’s host culture, the ocean is viewed as an integrated whole, flowing unrestrained by politically imposed boundaries...” but fails to consider the impacts to the entire island of Hawaii, including the East side of the island which is seeing increased take rates from those seen in the past, with no disclosure or discussion of current gear-take methods, or the impacts of reducing species in one area impacting their health and abundance in other areas.183	Your comment has been forwarded to the decision makers.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus	N/A	1/7/2020	The CIA concludes with the following inadequate and/or unmeasurable recommendations, that in no way could be considered substantive mitigation measures, especially based on the numerous oral interviews and testimonies proposing a full closure of the trade or significant remedies to past and continuing conflict: “It is clear that the nearshore waters of West Hawai’i Island, along	Your comment has been forwarded to the decision makers.

Commenter	State/ Location	Date Received	Comment	Response
Environmental Laboratory, and The Humane Society of the United States			with all of its contributing tangible and intangible elements and associations, could be considered a traditional cultural property significant under Criteria a, b, and e. Having a comprehension of the traditional cultural significance of nearshore waters of West Hawai'i Island by all of its user constituencies, is a first step in ensuring that the activities of any one user group does not in any significant way conflict with the activities of another user group. As part of any future permitting processes associated with the WHRFMA, it is recommended that DLNR-DAR provide to potential permit issues a document that provides a synopsis of the traditional cultural significance of the fishery” (emphasis added).184	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	It is woefully inadequate to attempt to simplify this complex issue by only providing collectors with “a” document. There is no way to ensure that collectors even read the document let alone take any actions not to impact cultural resources, beliefs and practices. The CIA then states: “... the authors recommend that PIJAC, and any commercial aquarium fishers who intend to conduct their operations within the WHRFMA, consider developing or partnering with governmental and/or local organizations to help improve the management and sustainability of the nearshore fishery as a means to not only sustain, but actually improve reef-fish populations in the take areas...” (emphasis added).185	Your comment has been forwarded to the decision makers.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The CIA notes that aquarium collectors should “consider developing or partnering with governmental and/or local organizations to help improve management and sustainability of the nearshore fishery...” yet fails to provide even the most basic information, timeline or explanation as to how any partnership would proceed. The CIA further states the hope of improving reef-fish populations in the take areas, yet goes on to support the status quo, “it is recommended that the existing bag limits and no-take areas within the WHRFMA remain in-place...”.186 The CIA adds “Furthermore, it is recommended that the applicant (PIJAC) continue to work with the approving agency (DLNR), and the various other user groups within the WHRFMA, to help improve the transparency of the accounting methods for fish takes, and the enforcement of the existing rules and regulations that govern those takes. With respect to limiting the potential for cultural impacts, DLNR-DAR plays a significant role in managing and enforcing the rules and regulations that are intended to support the sustainability, viability, and fecundity of the WHRFMA . . .” yet provides no information or guidance on actually improving the transparency of catch/accounting records and enforcement. This approach removes any all responsibility and accountability from the collectors and offers	Your comment has been forwarded to the decision makers.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>no solutions to the issues of enforcement, compliance and oversight.¹⁸⁷ The CIA continues, “As voiced by many of the consulted parties, the lack of support and funding have hampered DNLR DAR’s ability to fulfill its fiduciary responsibility, namely to enhance, protect, conserve, and manage Hawai’i’s unique and limited resources, which are supposed to be held in public trust for the current and future generations of the people of Hawai’i nei, and visitors alike. While achieving this goal is not an easy task, and it certainly cannot be achieved by any single means, DLNR-DAR should be proactive in seeking additional funding sources, and work with the various user groups who are most familiar with the WHRFMA, including the commercial aquarium fishers, to improve its enforcement capacity” (emphasis added). ¹⁸⁸ Again, this empty statement provides no information on mitigation measures, including proposed regulations, or funding sources, that could encourage better compliance or enforcement.</p>	
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>Finally, the CIA notes “As expressed by multiple community members, the lack of enforcement by DLNR-DAR has resulted in community members feeling the need to police their respective areas themselves, which ultimately diverts time and energy from their desire to educate the next generation of Hawai’i and to perpetuate their own cultural practices. As part of improving enforcement, as expressed by some of the consulted parties, the DLNR-DAR should consider incorporating more traditional Hawaiian fishery resource management practices (as detailed above) into the management of the WHRFMA, and representatives from the aquarium fishing industry should continue to work with the other user constituencies (i.e., Native Hawaiian organizations) that maintain an interest in the WHRFMA” yet fails to include any discussion on what, if any, traditional Hawaiian fishery resource management practices should be considered, when they might be considered or how.¹⁸⁹ In summary, the CIA remains extremely flawed and inadequate, with its inherent purpose-- to identify cultural impacts and propose mitigations measures to limit such impacts, not being met.</p>	<p>Your comment has been forwarded to the decision makers.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>VI. Additional Deficiencies A. Lack of Meaningful Alternatives Analyses The DEIS does not propose or consider adequate alternatives. The Limited Permit Issuance Preferred Alternative is not reasonable, as is required by HEPA.¹⁹⁰ The Preferred Alternative ignores the vast majority of comments submitted on the DEA, FEA and by the consulted parties. Instead, it focuses on just one species, the Achilles Tangs and ignores the many comments naming locations where the impacts of collecting pressure are of concern. The conclusion that no</p>	<p>Your comment has been forwarded to the decision makers.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Humane Society of the United States			<p>significant adverse effects would occur as a result of the Preferred Alternative is erroneous and unsupportable, The Agency’s letter of determination stated that “because the applicant can propose but not ensure regulations aimed at protecting and restoring populations of aquarium fish, [the Agency] is interested in proposals for self-regulation by aquarium permit holders which could be incorporated into permit conditions even in the absence of or prior to establishing other regulations to accomplish the same purposes.”¹⁹¹ We dispute the value of any self-regulation measure. Meaningful change must be binding on the industry, and a meaningful alternatives analysis requires the Applicant to propose binding measures. Here, the Applicant proposed neither self-regulation nor binding measures.</p> <p>A reasonable alternative would require the Agency to first determine:</p> <ol style="list-style-type: none"> 1) the life history, spawning grounds and offspring/recruitment patterns for each species to be collected for aquarium purposes (see DLNR list of aquarium species at Appendix 5);¹⁹² 2) natural abundance (i.e. unfished) levels and complete stock assessments, for each collection zone, for those same species (see DLNR map of aquarium fish zones at Appendix 6);¹⁹³ 3) a definition for “sustainable” as it relates to the natural abundance of coral reef species taken in Hawai’i for aquarium purposes; and 4) annual total allowable catch, by species, designed to restore and then sustain natural abundance levels, with negligible impacts as defined in the Queensland Ecological Risk Assessment of the Marine Aquarium Fish Fishery, for each species to be taken for aquarium purposes, in each zone.¹⁹⁴ <p>After making these necessary threshold determinations, the Agency should issue limited numbers of Aquarium Permits, by zone and by species with corresponding total allowable catch limits, per the above parameters. Additionally, the Agency should require Aquarium Collection Permits, for all take for aquarium purposes, regardless of the method of collection.</p>	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane	N/A	1/7/2020	<p>B. Lack of Mitigation Measures</p> <p>HEPA also requires an EIS to consider mitigation measures.¹⁹⁵ With minor exceptions, such a discussion is plainly absent from the DEIS. Decades of Applicant actions have directly impacted more than 200 species and indirectly impacted an unknown number of additional vertebrate and invertebrate species found in Hawai’i’s coral reefs, one of the most complex ecosystems on Earth, where the fate of each species is determined by the existence, abundance and diverse actions of a multitude of other species that inhabit or otherwise rely upon these unique places. Yet, the DEIS claims there are no significant impacts whatsoever, and therefore, proposes no mitigation measures</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, the HEPA Guide (OEQC 2014) indicates that an EIS needs to consider all mitigation measures to avoid, minimize, rectify, or reduce adverse impacts. Therefore, mitigation is only considered for alternatives with a significant adverse impact. No significant adverse impacts from the issuance of 10 Aquarium Permits are anticipated, and therefore, no mitigation is proposed.</p>

Commenter	State/ Location	Date Received	Comment	Response
Society of the United States			outside of the bag limit for Achilles tang found in the Preferred Alternative. ¹⁹⁶ The DEIS also fails to propose mitigation measures to address biological and related impacts to the various socio-economic values described herein, and also fails to propose mitigation for impacts to cultural resources, and for the ethical concerns and harm done to the animals, themselves, also described herein.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	VII. Conclusion For the reasons explained above, the DEIS is patently insufficient in its analysis of the impacts of commercial aquarium collection permits. A serious overhaul of aquarium fish permitting in Hawai'i is needed. Because currently there are not restrictions on the number of collection permits or the amount of take per species under a fine mesh net (i.e. aquarium) permit or commercial marine license, the impact that collection may have on target species must be evaluated before issuing permits. As such, each aquarium collection permit or commercial marine license issued for aquarium collecting must show the total allowable catch, per species and ideally per zone that permit holders must follow to prevent unsustainable fishing. Catch limits per species and per zone should be calculated in conjunction with input from all stakeholders and based on the stock assessment for each target species in the specific areas where they will be allowed to be taken under a permit.	Your comment has been forwarded to the decision makers. The Preferred Alternative includes a limited issuance of permits (i.e., 10 permits), bag limits on several species (including pre-existing bag limits, as well as a reduction in the Achilles Tang bag limit)), and continuation of the restrictions of which species can be collected from the WHRFMA (i.e., White List Species). Collection will also only be allowed within Open Areas.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	The legislature has decreed it the "policy of the State" that DNLR and other agencies must "[c]onserve natural resources . . . by preserving or augmenting natural resources, and by safeguarding the State's unique natural environmental characteristics . . ." ¹⁹⁷ The Agency must also "[e]ncourage management practices which conserve . . . all natural resources," and encourage all individuals "to fulfill the responsibility as trustees of the environment for the present and succeeding generations." ¹⁹⁸ In enacting HEPA, the State legislature found "that the quality of humanity's environment is critical to humanity's well-being, [and] that humanity's activities have broad and profound effects upon the interrelations of all components of the environment . . ." ¹⁹⁹ The Agency simply cannot meet these mandates by continuing to allow unlimited aquarium collection, in light of the serious environmental consequences of those permits.	Your comment has been forwarded to the decision makers.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental	N/A	1/7/2020	Appendix 1 Outstanding Questions from Consultation APPENDIX A Outstanding Questions The below questions were prompted after we were made aware of the limited geographic scope of the forthcoming DEIS, to include only West Hawaii, as well as the DEIS's intent to provide exclusive	Your comment has been forwarded to the decision makers.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Laboratory, and The Humane Society of the United States			<p>aquarium collection privileges to 14 individuals, which was contrary to the earlier Draft Environmental Assessments (DEAs). Stantec’s failure to provide this crucial information to all Consulted Parties limited some of the Consulted Parties’ ability to meaningfully comment, and undermined HEPA’s notice requirements.</p> <p>Despite our objections to this flawed process, we submitted the below comments and questions to Stantec in an effort to inform and improve the DEIS and ensure that they were thoroughly evaluating the environmental impacts of this proposed action pursuant to HEPA. Stantec’s response to our concerns with compliance with the HEPA process simply stated “Comment noted. The commenters were included in the consultation process for the DEIS.”</p> <p>Therefore, below are our outstanding questions and in red, those questions that were inadequate in their response, or were not answered, and thus await DLNR’s response. Stantec’s responses are italicized:</p>	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>1. What are the environmental benefits of removing tens to hundreds of thousands of animals annually for the West Hawaii aquarium trade? Response: Comment noted. No environmental benefits were provided by Stantec.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Environmental consequences, including benefits, are included in Section 5.0 of the EIS.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>2. Why is the proposed DEIS limited to West Hawaii? Collection continues in East Hawaii and at even greater rates since the Supreme Court of Hawaii’s September 2017 opinion. Why would other areas of collection be excluded? Do the 14 collectors propose to collect only in West Hawaii, or is this due to the need for an additional West Hawaii permit to take in this area? <i>Response: Comment noted. The DEIS evaluates the impact of commercial aquarium collection on the entire island of Hawai’i. However, the Applicant is not requesting any permits to be issued for East Hawai’i...</i> Aquarium Collection permits issued under HRS 188-31 are issued statewide and necessary in order to have a West Hawaii aquarium fishing permit thus, it is not accurate/incorrect to state that the applicants are not requesting any permit to be issued for East Hawaii. Further, Stantec fails to state if the applicants have or will be fishing in East Hawaii or other areas, as we explicitly asked.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The FEIS has been revised to clarify that a permit condition would be added to the permits issued, limited their use to the WHRFMA.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>Under the Preferred Alternative, 14 individuals would be provided exclusive access to take aquarium fish in the WHRFMA and use fine mesh nets, privileges that no other person would otherwise have. Given these 14 applicants are requesting special permission to access and remove constitutionally protected public trust resources, the below information is needed to explain how and why these 14 applicants should be granted this exclusive access, that would otherwise be denied to others.</p> <p>Inadequate response. Awaiting response from DLNR.</p>	
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>3. Please identify the 14 applicants by name and business name (DBA). <i>Response: Comment noted. The applicant information is provided in the DEIS.</i></p> <p>Stantec claims the information on the 14 applicants is provided in the DEIS however, they only list PIJAC as the applicant. We repeatedly requested this information from Stantec and they never responded. We await this critical information. PIJAC is not an individual/collector nor are they a/the person who would potentially apply for, possess the necessary permits and engage in the activity (aquarium collecting) that is subject to HEPA. Again, given these 14 individuals/collectors are requesting exclusive access to natural resources, otherwise denied to all others, we need the name and business name of the collectors. This information is not privileged and is routinely disclosed any time an individual is requesting permission to potentially alter or degrade the environment, or access a resource held in the public trust. Further, as defined under HEPA, an Applicant is “Any person who, pursuant to statute, ordinance, or rule, officially requests approval for a proposed action. Under HEPA, an applicant cannot be an agency, nor can an agency be an applicant. This mutual exclusivity establishes an important boundary in HEPA and serves to divide the universe of actions in one of two different areas: applicant actions (see Section 343-5(c), HRS) or agency.</p> <p>Inadequate/no response. Awaiting response from DLNR.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>PIJAC is the applicant and Stantec's response indicated this. The comment erroneously indicates Stantec claimed information on the 14 applicants is in the DEIS. There are not 14 applicants.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>4. How many reef animals have been taken by the 14 applicants in the past decade (list per year, per species and method of collection) and in what area, and how many are the applicants proposing to take each year for the next decade (list per species and method)?</p> <p><i>Response: Comment noted. The average and maximum collection by species of the 14 fishers has been added to Table 5-11. It should be noted that these fishers waived their right to confidentiality, and as such, this includes all their collected numbers from 2000 through 2017 (no data are excluded due to Hawai'i confidentiality laws). The collection numbers are limited to the WHRFMA for the analysis. It is assumed for the environmental consequences that the collection rates seen over the past 18 years will remain relatively the same over the 5-</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The commenter is correct that not all fishers that may be issued permits under the Preferred Alternative (or any other alternative) have collected every year in the past. However, for this reason, the EIS used the maximum collection rates over the past 20 years for the Preferred Alternative, and then adjusted for annual growth, to project future collection over the 5-year analysis period. This was done to account for years in which certain fishers may not have collected, and then to account for growth in collection that may occur.</p> <p>Furthermore, it should be noted, as outlined in Section 5.2.1 of the</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p><i>year analysis period, though the maximum collection is also included in the analysis. Collection would occur via fine mesh nets or other legal methods.</i></p> <p>This is not correct nor accurate. As discussed in more detail in our comments, all 14 fishers either did not fish or did not disclose their catch in the data provided. In some years as few as 3 collectors reported taking in the WHRFMA. This grossly underestimates the impacts of 14 collectors in the WHRFMA. Moreover, the DEIS assumes that aquarium collection without the use of fine-mesh gear will continue “legally” in East Hawai’i; however, as indicated in a letter dated January 7, 2020, from Earthjustice to DLNR (attached as Appendix 8), such collection also requires HEPA review, which currently is not being conducted. If this purportedly “legal” collection were halted pending environmental review, then the 14 collectors would have even greater incentive to increase collection levels in West Hawai’i in the meantime. The DEIS fails to consider this effect.</p>	<p>EIS, although all members of the dive team must have a permit, only the principal diver is required to report the catch and effort for a dive team in order to avoid duplicate fish catch reporting. Therefore, while not all 10 fishers may have reported catch in a given year, some may have still been actively collecting as part of a team, and their catch was thus accounted for by the principal diver.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>5. Have any of the applicants been charged with any offense related to the aquarium trade or occurring during the course of aquarium trade activities, or county or state natural resource related offenses? If so, include date, offense and outcome of each offense.</p> <p><i>Response: Comment noted. We do not possess this information. Enforcement and information occurring during the course of aquarium trade activities, or county or state natural resource concerning it is within the purview of the State of Hawaii.</i></p> <p>Stantec could have asked the 14 applicants for this information. Given they chose not to provide this information we are requesting this information from DLNR. Again, given the 14 collectors are requesting exclusive privileges and access that no other person would have, it is in the interest of the public and the state, if these 14 collectors have been charged with any criminal or natural resource violation (i.e. at least 1 collector was criminally charged with attacking a diver in the WHRFMA in the past).</p> <p>Inadequate response. Awaiting response from DLNR.</p>	<p>Your comment has been forwarded to the decision makers.</p>
<p>For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>6. What steps will be taken by the 14 applicants to reduce the impacts of climate change, specifically, coral bleaching and ocean temperature rise, which is predicted to occur more frequently and more severely over the next decade, given they will be removing thousands of herbivorous species?</p> <p>The environmental review must fully disclose the changing baseline from climate change and the effects of the proposed activities on the reef in light of climate change. The Fourth National Climate Assessment, released in late 2018, projects that by 2040 Hawaii’s coral reefs will bleach annually which will result in the loss of 71% of the state’s current coral reef cover by mid-century, and 99% by 2100.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The cumulative impacts of climate change are addressed in Section 5.4.3.5 of the EIS. As stated in this section, based on studies in the Great Barrier Reef, fishing pressure had minimal effect on bleaching (Hughes et al. 2017). On the island of Hawai’i, the total cover of hard coral decreased between 2003 and 2017 in MPAs, FRAs and in Open Areas, with the smallest decline seen in Open Areas, though all areas saw significant declines ranging from 48.7% in Open Areas to 57.8% in FRAs (DAR 2019a, Gove et al. 2019). Given that Open Areas did not see a more severe decline than areas closed to commercial aquarium</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
Society of the United States			<p>Unprecedented coral bleaching across Hawaii and especially in West Hawaii has already occurred: back-to-back years of increased sea temperatures in 2014 and 2015 caused 50% of bleached corals to die in West Hawaii.</p> <p>Further, on August 23, 2019, the Hawaii Dept. of Land and Natural Resources (DLNR) warned of possible severe and widespread coral bleaching across the state within the next two months as the result of sea temperatures that are currently 3 degrees above normal. Because temperatures are expected to rise even further, this bleaching event will likely be even worse than the one that damaged so many of Hawaii's reefs 4 – 5 years ago. Reefs in West Hawaii are already showing signs of stress such as bleaching and both DLNR and the National Oceanic and Atmospheric Administration (NOAA) have asked the public to take actions to minimize any additional stress to Hawaii's reefs. Notably, among the actions to be avoided are many that are widespread and/or inherent to the aquarium trade, referenced below.</p> <p><i>Response: Comment noted. There is no evidence that suggests that commercial aquarium collection is a major contributor to climate change, including coral bleaching or ocean temperature rise...</i></p> <p>Our question did not suggest that aquarium collection causes climate change but that collection exacerbates the impacts of climate change, which include coral bleaching and ocean temperature rise and the removal of herbivores, which is discussed further in our comments.</p>	<p>collection, it is not anticipated that commercial aquarium collection has a less than significant impact on coral declines.</p> <p>In addition, DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>7. How will the 14 applicants 1) specifically comply with the following recommended actions, and, given the extremely limited enforcement resources and capabilities of DLNR, 2) how do they propose to show compliance with these recommended actions?</p> <ul style="list-style-type: none"> • Reduce or stop taking herbivorous fishes such as surgeonfish which are needed to keep algae growth under control so as not to smother and kill corals stressed from bleaching • Avoid touching, standing in corals • Keep vessel anchors and chains off corals <p>Inadequate response. Stantec failed to provide any information on how the 14 collectors would comply or show compliance with DLNR's recommended actions.</p> <p>Inadequate response. Awaiting response from DLNR.</p>	Your comment has been forwarded to the decision makers.
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory,	N/A	1/7/2020	<p>8. How do the 14 applicants propose to prevent population reductions of reef species when, outside of the current court order, there are no limits on:</p> <ul style="list-style-type: none"> • the issuance of West Hawaii aquarium collection permits • the issuance of State aquarium collection permits • the issuance of Commercial Marine Licenses • caps on the issuance of the above permits or a limited entry program • the use of certain types of gear that may be detrimental to the 	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS evaluates the effects of proposed action, which is the proposed issuance of 10 Aquarium Permits. Any additional Aquarium Permits issued in the WHRFMA, East Hawai'i, or elsewhere in the state, would need to complete their own HEPA review. The EIS also analyzes the environmental affects resulting from the issuance of other permits required to make use of Aquarium Permits, including</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
and The Humane Society of the United States			<p>environment</p> <ul style="list-style-type: none"> • overall take (Total Allowable Catch) • area/geographical limitations outside of “no take” areas • collection of species outside of the “white list” • number of “white list” species that may be taken <p>Aside from reducing the bag limit of Achilles Tang, Stantec failed to respond to any of the above questions. Further, they premise their Preferred Alternative on rules, regulations or legislative changes that the Applicants are not in a legal or policy position to change. Only DLNR, with public input, could make the changes necessary to amend or create a new permitting process to limit statewide issued aquarium collection permits (issued under HRS 188-31) to a specific geographic area and change the West Hawaii aquarium permit process to limit issuance to only 14 individuals. No other case is known where a proposed alternative subject to HEPA is contingent upon a state action(s) that has yet to be undertaken. A proposed action or alternative must be described in its entirety and cannot be broken up into component parts, as suggested in the preferred alternative that has yet to be initiated if at all. Per HEPA this could be considered a phased project (involving a later phase that cannot be fully described) or “segmenting”, which is generally forbidden under HEPA. This proposal further exemplifies the flawed process as the Applicants are proposing policy and legal changes that have yet to be implemented and are subject to the public input process and other approvals (BLNR, DLNR, state legislature). On pages 17-18 of the DEIS Stantec states “The Applicant has no legislative or regulatory authority and cannot create, eliminate, or alter conservation areas (e.g., MPAs, FRAs, MLCDS); create, eliminate, or alter current regulations (e.g., bag and size limits, season length, permit term); or change reporting requirements. Despite this, during the public comment period on the Draft EA Draft Environmental Impact Statement Alternatives 18 that was published on April 8, 2018, in response to DLNR concerns and in coordination with the DLNR, the Applicant developed an alternative that required regulation creation by DLNR (i.e., implementation of bag limits).”</p> <p>Please clarify if DLNR-DAR coordinated with and made any commitments to the Applicants about undertaking such regulatory/statutory changes, without notifying the public about such proposed actions, that must be disclosed immediately. Inadequate/no response. Awaiting response from DLNR.</p>	<p>commercial marine licenses and WHRFMA permits. Where appropriate, based on the best available scientific information, limits on collection activities for certain species are proposed for DLNR’s consideration when issuing such permits. The EIS also discloses and analyzes the reasonably foreseeable impacts of fishing activities on the environment as required by HEPA for consideration by DLNR in its issuance of fishing permits. DLNR will issue any permits in compliance with all applicable laws and regulations, including such limits as necessary to comply with law.</p>
For the Fishes, Center for Biological Diversity,	N/A	1/7/2020	9. The Hawaii Department of Land and Natural Resources (DLNR), specifically the Division of Aquatic Resources (DAR) and their enforcement arm, the Division of Conservation and Resource Enforcement (DOCARE) has severely restricted resources, such as	Your comment has been forwarded to the decision makers.

			of the EA and was not addressed by the applicants. Inadequate response. Awaiting response from DLNR.	
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>11. The earlier DEAs for the aquarium trade failed to include data and records which are not readily accessible to the public and other interested parties. Please provide the necessary data and response to the following to address our outstanding concerns with enforceability of the above-referenced laws specifically as it relates to animal health, welfare and mortality rates:</p> <p>a) Thousands of fish have been taken since the Supreme Court opinion and subsequent District Court orders were issued in September and October of 2017 which prohibited the use of fine mesh nets (nets with a mesh less than 2 inch). Ninety plus percent of catch prior to the court ruling involved the use of fine mesh nets. Please explain in detail the gear and method(s) of collection currently (October 2017 to present) used by each of the 14 applicants and for what species. If the 14 collectors did NOT collect during this period please provide that information as well.</p> <p><i>Response: Comment noted. Within the WHRFMA, collection of aquarium fish is not occurring under any method. In East Hawai'i, collection can occur without fine mesh nets...</i></p> <p>Stantec again fails to answer the questions, including providing info as to if and who is collecting in East Hawaii, and what methods of catch are currently being used by the applicants if collecting in East Hawaii, given the use of fine mesh nets are prohibited and 90+ percent of collection prior to the court ruling was performed with fine mesh nets. Inadequate/no response. Awaiting response from DLNR.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Data on collection numbers is available via the DAR.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>b) Per HDOA intrastate shipment records, thousands of fish have been shipped since the above-referenced court order took effect. For the 14 applicants please provide:</p> <ul style="list-style-type: none"> • how many fish/animals were shipped by each applicant per month since October 2017 to the present and; • specifically where these fish/animals were shipped to (e.g., intrastate to Honolulu, interstate or international) and; • the mortality rates for each shipment (a) upon arrival and (b) at 14 days post-shipment; • what percentage of animals remain in Hawaii (for resale) versus those who are shipped 1) to the US mainland and 2) international; <p>Inadequate/no response. Awaiting response from DLNR.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>2018 collection rates are provided in Table 5-2 for the 10 fishers, as well as for all other fishers. The Applicant does not have the data to split this out by month, or information on where fish were shipped.</p>
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus	N/A	1/7/2020	<p>c) For each of the 14 applicants please note whether the collector is also a dealer. If the collector is not a dealer, provide who the collector sells their catch to;</p> <p>Inadequate/no response. Awaiting response from DLNR.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The Applicant does not have this data.</p>

Environmental Laboratory, and The Humane Society of the United States				
For the Fishes, Center for Biological Diversity, Moana Ohana, Haereticus Environmental Laboratory, and The Humane Society of the United States	N/A	1/7/2020	<p>d) For each of the 14 applicants, please note which collectors engage in the following practices in contradiction to HRS 711-1109:</p> <ul style="list-style-type: none"> • withholding of food (starvation) and for what period of time; • fizzing or puncturing of the swim bladder; • cutting of spines or dorsal fins; • body compression (squeezing animal to force out ejection of fecal matter). <p>Inadequate/no response. Awaiting response from DLNR.</p>	Your comment has been forwarded to the decision makers.
Gail Grabowsky	HI	1/8/2020	<p>I have followed the aquarium fish issue for over 15 years now, conducted fish counts with my students, taught many classes on climate change, and done research on the effects of the removal of aquarium fish as revealed by the scientific literature. I am currently the interim dean of the school of natural sciences and math at Chaminade University. I would like to make testimony on the environmental impact statement re the aquarium fish industry.</p> <p>As I am sure you are aware, coral reefs all over the world are being lost and degraded by increasing water temperatures and polluted runoff that causes algae to grow. Most of the fish that are removed from the ocean for the aquarium trade are algae eaters, so they help defend the reef. We are now at a point with climate change so severe that most of the worlds reefs, including Hawaii's, have bleached multiple times recently and we are at risk of losing the keystone species that defines them - the coral.</p> <p>Because of this we need to leave all of the variables that help protect and defend the reef intact and the aquarium fish are one of those. I know it is sad that some will lose their jobs but there are many jobs right now and there is much room for new careers in aquaculture. I find that the EIS is just another statement allowing further use of a resource that the reef cannot afford to lose.</p> <p>Please opt for the cessation of the collection of these important fish that have nothing to do with food and are only about money. They may make some money in the short term but they will cost us all in the long term when we lose our Reefs and all of the food fish and eco</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>It is acknowledged that herbivore conservation is important; however, please note that as stated in the EIS the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). These trends occurred even with the pressure of commercial aquarium collection, which was occurring over the same time period.</p>

			tourism and aesthetic value that they create. Thank you for your time and consideration.	
Gary Harrold	HI	12/11/2019	As an proactive, lifetime member of The Sierra Club, I am advocating for Hawaii's Coral Reef health. Years upon years of cyanide poisoning our inshore waters, decades of juvenile reef fish extraction, globally broken swim fin damaged coral colonies due to careless divers/snorkelers, overfishing due to rising human population and demand and, now, ocean warming and acidification has most definitely had major negative impacts of reef vibrancy and species numbers and diversity. All marine creatures are victims of human impact. Lifetimes are cut short by disease and death due to aquatic plastic contamination. { As a certified diver, I have seen drastic deleterious changes in Hawaii, Fiji, Indonesia, Cook Islands, Mexico, Jamaica and California. } Any collection that may be allowed should be licensed educational aquariums such as the Monterey Bay Aquarium and the Waikiki Aquarium. And captive breed programs should be encouraged. That will take pressure off taking directly from our ocean environment. Extremely strict EIS should be drafted. I appreciate you three, David, Terry and Brian taking my testimony to heart.	Your comment has been forwarded to the decision makers. The use of cyanide or other harmful methods is not currently allowed in Hawai'i nor would it be allowed under any of the alternatives under consideration in the EIS. The Aquarium Permit is only for the use of fine mesh nets. Damage of coral will continue to remain unlawful as described in Section 1.2.3.2 of the EIS.
Gary Johnson	N/A	1/8/2020	I am a bit surprised ..actually shocked that our baby fish are being allowed to be sold to die in aquariums. Please make this stop immeniately or as quickly as possible I think you can really help out here David.	Your comment has been forwarded to the decision makers.
Gloria Snyder	HI	1/5/2020	Extinction is forever—it's that simple. It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade. Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting. The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood. But where is the traders' credibility? The Pet Industry Joint Advisory	Your comment has been forwarded to the decision makers. The EIS was prepared using the best available science. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline. PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC's Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/

			<p>Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists, PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.</p> <p>I implore you to do the right thing.</p>	
Grant Rakowski	MI	12/17/2019	<p>I feel that Aquarium hobby both professionally and at the hobby level is important way to learn about our earth.</p> <p>Through the use of conservation I think that Hawaiian fish can be enjoyed my many around the world without effecting the natural state of things on a reef. Often times aquariums are the only way for some to truly understand how beautiful the ocean world can be because of the cost it takes to visit Hawaii.</p>	Your comment has been forwarded to the decision makers.
Gregg Blue	HI	1/6/2020	Please leave the fish alone...no more shipping or capturing.	Your comment has been forwarded to the decision makers.
Haley Van Noord	N/A	1/3/2020	<p>The Environmental Review by the Pet Industry Joint Advisory Council is not relevant, not accurate, not pono and not legal. The aquarium trade is not fishing, it's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.</p> <p>Wildlife is best left in the wild.</p>	Your comment has been forwarded to the decision makers.
Heather Howard	HI	1/6/2020	<p>My name is Heather Howard. I am the Co-Founder of the Coral Reef Education Institute located on the Big Island. I am in extreme opposition to issuing any permits for fish collection for the aquarium trade in the state of Hawaii and especially the Big Island. Our coral reefs are in extreme decline and allowing fish collectors to remove our herbaceous fish from our reefs is negligent. Coral reefs are stressed more than they have been from the ever more frequent bleaching events. The state's new initiative 30% by 2030 should never allow our reef fish to be removed for resale and should focus on MPA's to protect our reef fish so they may become geriatric and produce more spawns for rehabilitation.</p> <p>Please do not allow the fish collection to restart in Hawaii.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>It is acknowledged that reefs face many threats and reef conservation is important; however, as stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed</p>

				<p>to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time. In addition, Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.</p> <p>It is acknowledged that herbivore conservation is important; however, please note that as stated in the EIS the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). These trends occurred even with the pressure of commercial aquarium collection, which was occurring over the same time period.</p>
Heather Rosmarin	CA	12/28/2019	<p>As a frequent visitor to Hawaii, I strongly oppose the collection of wildlife from reefs to supply the aquarium trade. It is unsustainable and unethical, especially when there are alternatives such as farmed fish for the trade. We cannot continue to exploit and destroy our reefs. I want to bring my children and grandchildren to Hawaii to see the reefs. Please protect them.</p>	Your comment has been forwarded to the decision makers.
Ilene Harrington	HI	1/7/2020	<p>My name is Ilene Harrington and I am absolutely confused why you would consider issuing 14 permits to allow our beautiful and unique tropical fish to be collected. Sometimes it not about the money but about what's right for our oceans and earth.</p> <p>I own and operate two million dollar businesses and two non-profits in Kona and Waimea. I have lived on the Big Island for 14+ years and I snorkel up and down the North and West Hawaii coastline. I have sadly seen the massive decline in marine life. Between the Black Water run off along the West Coast of Hawaii Island, chemical spraying along the coastlines to keep golf courses green and weed free and the recent coral bleaching, our reefs are in disrepair.</p> <p>I am writing to respectfully inform you, I STRONGLY oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish. I understand that some would argue that this would provide some jobs, but what about those of us that already work in the industry, and our past, present and future visitors. Its seems very short sighted to not consider how you are impacting our</p>	Your comment has been forwarded to the decision makers.

Commenter	State/ Location	Date Received	Comment	Response
			natural underwater wonderland. Permitting 14 more companies to collect Hawaii's Tropical Fish for entertainment and take them from Hawaii's Reefs is counter-productive. Shouldn't we tell our visitors to enjoy Hawaii here, don't take the lava rocks, the shells, the multi-colored sands from our beaches, why would you condone this? Our oceans are dependent on people like yourself to do what is Pono. Please choose to do the right thing, our community will be watching. Thank you for taking the time to read my comments.	
Jack Lavin	Hi	12/27/2019	Stealing the reef fish from Hawaii is a crime and must Stop. We have enough pressure on our ocean reefs Home salt water aquariums are another selfish way to destroy Hawaii's ocean beauty This must Stop. Jack Lavin Maui Hawaii Voter	Your comment has been forwarded to the decision makers.
Jack Zimmerman	N/A	12/16/2019	I share your feelings and will make a the phone call... [David Hunt's email attached]	See response to David Hunt's comment.
Jacqueline Wessel	N/A	1/6/2020	I am writing to you to say that here at Earth Warrior Project we are devastated to learn about the 14 new permits for fish collection in Hawaii. This is unacceptable since the coral reef is already being destroyed due to the current environmental issues which is plaguing our oceans. Action like this is like taking 10 steps in the opposite direction , we must move forward and help life on this planet flourish. I hope you consider the long term effects of what this will do to not only Hawai'i but the world.	Your comment has been forwarded to the decision makers.
James Ward	HI	1/6/2020	I'm writing to voice my concerns regarding the possible reversal of the tropical fish collection ban that's been in place for a few years. As a scuba dive in the south Kona , captain cook area over the last 11 years I've seen first hand how some species were decimated, particularly in the Milolii area where some of the collectors operate. Since the ban went into effect I've noticed some of the species start to appear in juvenile form. As the tropical fish population starts to recover, it seems an odd time to lift the ban. The argument that 14 licenses won't hurt isn't valid, as many divers can operate under one license. Also determining which collectors are legitimate and which are not will be impractical given DNLRs limited resources. While I personally think a permanent ban is the right thing, certainly leaving the ban in place for the next few years only makes sense as the reef fish are only starting to recover. The reef fish are also vital to the health of the coral reefs which have been struggling due to bleaching. Further stressing the coral at this time doesn't make sense. As someone who worked in the tourism industry until this year, I received many comments from visitors that they don't see as many fish (yellow tang, clown fish, butterfly fish etc) as they used to. Knowing how important tourism is	Your comment has been forwarded to the decision makers. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline. The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA

			to this island, it seems foolish to deplete what keeps visitors coming back for snorkel adventures. Even if you remove the moral element to this situation, it seems like taking from the many to benefit the few financially. Again, having seen the collection operations of the past first hand, I'm quite sure bringing them back will be very harmful to our ecosystem and our livelihoods. I appreciate you time	2018). This occurred in the presence of commercial aquarium collection.
Janet Mercer	HI	1/6/2020	I have been swimming almost daily in the water off south Maui for over 30 years. During that time I have seen a huge decline in the tropical fish population and the degradation of the coral reef. Now I know that the aquarium trade is not solely responsible for the decline in tropical fish but it has been a contributing factor. How can it not be? With the aquarium trade removing tropical fish from the ocean, they are also removing all the future fish those collected fish would have created. The math just doesn't add up to 'no impact' which the aquarium trade would like us to believe. As a long term resident of Maui County and an avid ocean swimmer, I urge you to reject any Environmental Review which supports aquarium collection. Please protect Maui's fish and thus our ocean.	Your comment has been forwarded to the decision makers. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.
Jason Murray	HI	12/5/2019	I am an avid snorkeler, underwater photographer and I snorkels every chance I get. Over the last 6 years I have watched many coral populations along the Kona coast die due to climate change and a warming ocean. These corals that are stressed need every fish they can to help keep them clean of the onslaught of ever growing algae. It does not make any sense to sell these fish for novelty pets so a few people can make a buck. These islands make money from tourist dollars, people come here to see these essential, beautiful, native fish. Last night I read the passage below on an underwater photography guide for travelers to Kona and it made me very sad. "Hawaiian Fish Life Some people report that the aquarium trade has taken its toll on the fish life here, and the reef fish around Kona do tend to be on the smaller side. However, there are still plenty of fish to see, especially on the less-dived sites south of Kona." The word is out. Fish collection takes it's toll. Please leave the aquarium collection ban in place and move to stop the collection of reef fish in all of Hawaii. This does not line up with the pono practices of caring for the 'aina in Hawaii. You would never sell a I'iwi or Nene to a pet store, these fish are our native wildlife as well, and they deserve protection.	Your comment has been forwarded to the decision makers. It is acknowledged that herbivore conservation is important; however, please note that as stated in the EIS the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). These trends occurred even with the pressure of commercial aquarium collection, which was occurring over the same time period. The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.
Jeanne Schaaf	HI	1/5/2020	Aloha Mr. Sakoda, The aquarium trade is being protected by DLNR at the expense of the reef species and habitat around our islands. Please discontinue this practice immediately. We are watching closely and will not relent on this issue ! Mahalo nui loa	Your comment has been forwarded to the decision makers.

Jeannine Moore	N/A	1/7/2020	Please do NOT allow the 'Pet Industry' to start capturing fish in our Hawaiian waters again. Too much damage has already been done - wildlife need our help, as does the Eco-system that now hangs in the balance.	Your comment has been forwarded to the decision makers.
Jennifer Hagens	N/A	1/6/2020	paradise on earth, your native fishes need and deserve effective legal protection and should be left in the wild. "Hawaii is expected to lose 70% of our coral reefs in the next couple of decades, so we don't have time for aquarium industry-sponsored justifications for raiding the reefs" - Maxx Phillips, Hawaii director with the Center for Biological Diversity. More info is at: https://www.thegardenisland.com/2019/12/02/hawaii-news/comment-nowon-aquarium-fishing-impacts/ https://www.hawaiinewsnow.com/2019/11/27/input-sought-proposal-resume-commercial-aquarium-fishing-off-west-hawaii/ The Dark Hobby is a film about this cruel industry: https://thedarkhobby.com/index.html	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	I tried to give you a call today and would love to chat.	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	Respectfully, please accept my comments on this proposed Draft Environmental Impact Statement (DEIS), which totally fails to meet the legal requirements specified by HRS Chapter 343. It's difficult to comment on this document because almost nothing was done properly and the underlying assumptions and status quo are simply wrong. For one, the consultation process was incomplete and is invalid, because many people, organizations and agencies were not consulted or notified of the proposed action. There is information that was not considered as a result. For example, regularly beach goers, park users and many Native Hawaiians who access the beaches and nearshore waters in West Hawai'i were not given notice or consulted. I wonder who is advising PIJAC and if anyone on the Hawai'i State Environmental Council was notified of this issue. I personally was not made aware, given notice or consulted even though I have been publicly outspoken and actively involved in the aquarium collection policy and regulatory compliance issues for more than 5 years and, as the former Director of the Office of Environmental Quality Control (OEQC) agency, authored the October, 2015 letter advising the Governor and DLNR that it was critical to put an immediate moratorium on commercial collection of reef wildlife until the HEPA process could be completed. In addition, the proposed DEIS treats the action as being relevant to people and interests on the island of Hawai'i in West Hawai'i only, yet there are statewide implications.	Your comment has been forwarded to the decision makers. See Section 1.1.2 of the EIS for a summary of the previous HEPA documents submitted related to this action, including a public review period after the DEA was published in The Environmental Notice in April 2018. All parties which requested to be consulted parties were contacted in August 2019 during preparation of the EIS, as described in Section 6.1. The commenter did not request to be a consulted party after the publication of the EISPN on August 8, 2018.

Jessica Wooley	N/A	1/7/2020	Two, there is no clear applicant - just a commercial trade association that profits off of trafficking Hawai'i reef wildlife, asserting that it represents 14 unnamed permittees; nothing and nobody, not even a corporation connected to Hawai'i, is identified as having a role or responsibility.	Your comment has been forwarded to the decision makers. PIJAC is the applicant who is officially requesting approval of the proposed action, which is issuance of 10 Aquarium Permits. Permits would still be issued by the DAR, PIJAC is simply requesting approval for the issuance of 10 Aquarium Permits.
Jessica Wooley	N/A	1/7/2020	The "applicant" tries to assert all alternatives are similar and there is no significant difference between any alternative, including the illegal activities occurring under the status quo, and so no mitigation is necessary. 1 2 1 The proposed DEIS explains as follows: "Given the long history of commercial aquarium collection in Hawai'i, it is reasonably foreseeable that commercial aquarium collection will continue. Based on available data regarding species abundance and yearly commercial aquarium catch over the past 18 years, it is expected that in the reasonably foreseeable future, commercial aquarium collection will proceed generally at the same rate and have the same level of impact as in the past 18 years. To the extent new data regarding the impacts of commercial aquarium collection on biological resources becomes available in the future, DLNR may consider those data and, to the extent necessary, supplement this impacts analysis. 2 This is so indicative of the larger problem here, the applicant has no concept of "give back", "take care" or "respect" (e.g., malama `aina).	Your comment has been forwarded to the decision makers. The differences between the alternatives are summarized in Table 5-13 of the EIS. The commenter does not indicate what illegal activities she is referring to; however, legal commercial aquarium collection has continued outside of the WHRFMA using gear/methods other than fine mesh nets, which do not require an Aquarium Permit. No collection has been allowed in the WHRFMA since the supreme court ruling. The Applicant has no control over the continued collection of aquarium fish using other methods in East Hawai'i. Regarding mitigation, as stated in Section 5.0 of the EIS, the HEPA Guide (OEQC 2014) indicates that an EIS needs to consider all mitigation measures to avoid, minimize, rectify, or reduce adverse impacts. Therefore, mitigation is only considered for alternatives with a significant adverse impact.
Jessica Wooley	N/A	1/7/2020	There is no valid regulatory system for a West Hawaii, 14 permittee option. The old, illegal regulatory system (that was in place prior to the Hawaii Supreme Court ruling in Umberger) is a statewide and unlimited permit system that does not fit the proposed action (to allow exclusive use by 14 West Hawaii unnamed "permittees" to collect nearly unlimited reef wildlife for the aquarium industry in West Hawai'i using small mesh nets). There is so much missing. What is the system? What are the rules? What are the limits? How is anything enforced? Who profits? Who pays?	Your comment has been forwarded to the decision makers. The October 2017 supreme court ruling was that a HEPA review needed to be completed before Aquarium Permits could be issued. This EIS is fulfilling that requirement for 10 Aquarium Permits. Any additional permits requested would need to undergo their own HEPA review. All existing rules and regulations, outlined in Section 1.2.3 of the EIS, would be enforced under any of the alternatives involving issuance of Aquarium Permits. A section on enforcement and compliance has been added to Section 1.2.3 of the FEIS.
Jessica Wooley	N/A	1/7/2020	Perhaps most offensive, the proposed DEIS asserts that the no alternative and baseline is essentially the continued unlimited	Your comment has been forwarded to the decision makers.

			<p>collection of reef wildlife. There is no alternative evaluated that does not include unlimited collection of reef wildlife.³ The alternatives are a wish list of the options PIJAC would like, not the options that are legal or available, and no option examines “no action alternative” as in, no commercial collection of reef wildlife by aquarium profiteers.</p> <p>³ For example, the applicant states “During the evaluation process, it was determined that some resources typically evaluated in an EIS would not be impacted by any of the alternatives under consideration. The evaluation includes past use and potential impacts by the commercial aquarium fishery because it has been a part of the baseline condition of these resources since the late 1940s. Because a significant increase in commercial aquarium fishing is not anticipated during the 5-year assessment period evaluated in this DEIS, and in fact a decrease when compared to historic conditions is anticipated due to the issuance of only 14 Aquarium Permits, this DEIS does not anticipate a significant change in the current baseline condition of these resources.”</p>	<p>As stated in the EIS, under the No Action Alternative, the court order would remain in place, and no Aquarium Permits would be issued for the entire island of Hawai’i and the taking of aquarium fish or other aquatic life in the WHRFMA for commercial aquarium purposes would be prohibited.</p> <p>Legal commercial aquarium collection has and would continue outside of the WHRFMA using gear/methods other than fine mesh nets, which do not require an Aquarium Permit. No collection has been allowed in the WHRFMA since the supreme court ruling, and none would be allowed under the No Action Alternative. The Applicant has no control over the continued collection of aquarium fish using other methods in East Hawai’i.</p> <p>Section 3.6 has been added to the FEIS to outline the alternatives considered but dismissed.</p>
Jessica Wooley	N/A	1/7/2020	<p>The document is totally incomplete in myriad ways. It’s as if someone got about 1/50th of the way through a final exam then hurriedly turned it in. Essentially, the document does not evaluate environmental impacts but simply claims there are none and proposes no mitigation.</p> <p>When it comes to data, the document includes references and charts with some remnants of some data collected but it’s not clearly sourced, accurate or peer reviewed and is admittedly incomplete in many circumstances. It’s as if the authors’ shrugged their shoulders, looked around real quick, found most data was missing or scarce, and conclude it’s not important to know much, including numbers and habitat availability as climate change impacts increase for each species, cumulative impacts, effects on subsistence fishers, economic costs and benefits or interactions and impacts on commercial food fishing (just some examples). Also, the limited scope in time (5 years) is too short, the document does not analyze the alternatives, impacts on corals or climate change implications, for example.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The environmental consequences for all alternatives are disclosed in Section 5.0 of the EIS and summarized in Section 5.5. The EIS used the best available science and best publicly available data (historic collection data and population trend data from the DAR and population estimates from CREP), and all data and references are cited in text and included in the literature cited.</p>
Jessica Wooley	N/A	1/7/2020	<p>The document ends with the Cultural Impact Statement, which was clearly tacked on in the end of the proposed DEIS when it should have been relevant from the beginning. The DEIS itself needs to incorporate what was described in the CIA from the start. It is impossible to conclude the proposed action would have no significant impacts. The cultural and environmental (and economic) impacts are inextricably intertwined and they were not analyzed in this document.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The CIA is referenced throughout the EIS, however, additional summaries of the CIA have been added to Section 5.3.1 of the FEIS. As concluded in the CIA, cultural impacts would occur if issuance of Aquarium Permits under an alternative would cause a significant decline in the population of a White List Species considered to be a cultural resource, either directly through the collection of fish or indirectly through habitat impacts.</p>

Jessica Wooley	N/A	1/7/2020	The application for 14 unnamed permittees to be able to obtain a permit to use a small mesh net to collect reef wildlife, presumably for the trade organization PIJAC, if granted, would result in a total incoherent management philosophy that permits the use of small mesh nets in West Hawaii and prohibits them every else, and prohibits the use of small mesh nets everywhere but West Hawaii. This bizarre outcome is the result of the wacky illegal activities still occurring outside West Hawaii that the State Executive branch has sanctioned.	Your comment has been forwarded to the decision makers. The Preferred Alternative in the FEIS would be issuance of 10 Aquarium Permits for the WHRFMA. If other fishers request Aquarium Permits for other areas of Hawai'i, including other islands, they would need to perform their own HEPA review. The Applicant does not have the authority to ban issuance of Aquarium Permits for any area.
Jessica Wooley	N/A	1/7/2020	In summary, this DEIS is a total sham and throughout reveals what appears to be an illegal deal between the Executive Branch and the applicant, PIJAC, the trade association for the reef wildlife trade (now trafficking) industry. As the recent Hawai'i Supreme Court in the 2016 Umberger v. DLNR decision, the Hawaii Environmental Policy Act (HEPA), the OEQC and EC letter make clear (in addition to numerous statutes and the Hawai'i State Constitution Sections 11.1, 11.2, 11. 6, 12.4 and 12.7), the state government cannot allow unlimited collection of reef wildlife until and unless the environmental review process under HRS Chapter 343 is complete, if at all.	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	It's almost impossible to further comment on this document because every aspect of it is devoid of relevant facts and information The focus is generally on the benefits of aquariums and zoos, for example, not on the environmental impacts due to removal of reef wildlife from nearshore waters. I can't help but want to elaborate and provide some examples.	Your comment has been forwarded to the decision makers. The focus of the EIS is the disclosure of the impacts of the Proposed Action on socioeconomics, cultural resources, and biological resources (see Section 5 of the EIS, which includes over 50 pages of relevant information). Of the over 170 pages in the main body of the EIS, Section 4.2.1.2 on public and private aquariums is one paragraph encompassing less than ½ a page.
Jessica Wooley	N/A	1/7/2020	Despite the very clear rule of law that there should be no commercial aquarium collection of reef wildlife absent compliance with HEPA, an illegal scheme to get around the review and disclosure laws was devised once again. So at this moment unlimited numbers of collectors continue to be able to capture unlimited numbers of reef wildlife from our islands' nearshore waters (except in West Hawai'i due to specific permit rules, Maui due to County prohibitions based on cruelty to animals and a few small protected areas). ⁴ One irony is commercial collectors are collecting plenty of animals and being told they can use any kind of technology except a small mesh net. So under the current administration, during these most important times to be paying attention to coral reefs, wildlife and climate change challenges, the most harmful collection techniques for capturing our underwater wildlife are proliferating, hurting reef wildlife and habitat. ⁴ Under the new illegal scheme and status quo, any person can apply and receive a commercial license to sell (export) reef wildlife, with no limits. There are no regulations, limits or boundaries save a few tiny	Your comment has been forwarded to the decision makers.

			<p>geographically excluded areas (e.g., Hanauma Bay) and the requirement that you report what you catch. There is no enforcement or it is miniscule. Any person with a license can use any technology they want except a small mesh net to capture the native and wild reef animals, bring them to the surface and, if they survive, export them to make some money.</p>	
Jessica Wooley	N/A	1/7/2020	<p>Who knows what is happening? No one, is the answer, because anything goes.⁵ It appears to be a policy and goal to take what can be taken to maximize profits regardless of the law, people, animals, bigger economy and long-term consequences; hurry up, before numbers drop, someone realizes the wild populations are in jeopardy, climate changes make collection impossible for whatever reasons (e.g., the reefs are dead) or some group figures out how to more cheaply raise captive bred animals for aquariums.</p> <p>⁵ Please note that now, like previous years, the DLNR has been non transparent and developed an ad-hoc system for the aquarium industry to be able to collect as much as collectors can get, of any and all species (except live corals and rock). This can make it difficult to explain how it's possible that the State Executive allows unlimited, unmonitored and unstudied commercial collection of all reef wildlife species (save corals and rock). It makes the description of what's happening a little vague and unbelievable.</p>	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	<p>Although the commercial aquarium collectors were permitted to exploit the reef wildlife resources all these decades in violation of the law as HEPA (authorized in 1970) was never even initiated, the trade industry and apparently the Executive Branch continue to operate like the illegal activity is legal. In addition, the applicants are trying to say the the nearly 50 years of illegal activity that occurred and the status quo of unlimited collection is now the baseline for all studies moving forward. The applicants are trying to normalize the illegal activity of unlimited collection by claiming it is the status quo. ⁶</p> <p>⁶ Let's say there have been a minimum of 50 million Hawaii animals removed from our reefs over about 50 years without ever having the impacts on the economy, the environment, the culture or the animal abundance itself studied or potential impacts discussed or disclosed with the public. And this year, about a million more animals will be found, removed from their reef homes, brought to the surface and sold, if they survive the journey. At the same time, kupuna describe how 50 years ago, the reefs provided dinner to families throughout the islands. Not so long ago, there was reef wildlife abundance like you still see in the Northwest Hawaiian Islands. Now, not only is there no dinner to find, the commercial fishermen themselves are barely</p>	Your comment has been forwarded to the decision makers.

			able to find fish for the market. There is just not much left. Now the aquarium collection trade industry group PIJAC wants all of us to believe that there is no significant socioeconomic, environmental or cultural impact when the collectors are allowed to take unlimited reef wildlife— never has been a significant impact and never will be? 50 million animals don't matter? How many would it take to matter?	
Jessica Wooley	N/A	1/7/2020	<p>This proposed DEIS is a sham,⁷ like the regulation of the industry itself for the last 50 years. It reveals the applicant's total misunderstanding of reef wildlife issues as well as the State Executive branch's willingness to collude with corporate commercial interests to evade environmental review requirements. Does DLNR continue to claim that there is no problem with unlimited commercial collection of reef wildlife because the commercial collectors are not complaining?</p> <p>⁷ In this bizarro world, the rule of law appears meaningless — just words thrown around, as the Executive Branch will do whatever it takes to accommodate commercial corporate profiteers; in this instance, reef wildlife traffickers. Despite the ruling by the Hawaii Supreme Court, the Hawaii Constitution, agency and board urgings and official letters, legislative action and grave public concern for decades, the Executive Branch has totally ignored the rule law, the public trust and well being of our island people.</p>	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	How does this document comply with HRS Sections 1 - 853, HRS Chapter 342, 343, 344, 345 in particular? What are the agencies tasked with prioritizing natural resources, the public trust or protecting the environment? Who are the Governor's Cabinet members, who advise him on environmental issues? Is there no agency funded and tasked with advising the Executive Branch or advocating primarily for the protection of environmental resources?	<p>Your comment has been forwarded to the decision makers.</p> <p>The FEIS, DEIS, FEA, and DEA explain in detail how they comply with HEPA and other applicable laws. The HEPA EA and EIS has been prepared by PIJAC for use by the Hawaii Department of Land and Natural Resources in its deliberations whether to issue Aquarium Fishing Permits and other required permits subject to HEPA. Questions regarding the Governor's Cabinet should be directed the Governor's office and DLNR. DLNR is responsible for advocating for resources under its jurisdiction consistent with applicable laws.</p>
Jessica Wooley	N/A	1/7/2020	Even if all the illegal issues were ignored and the government were to accept this Draft EIS on its face, as being accurate, what are the consequences for violations? What happens when we discover various species populations have been depleted, perhaps beyond recovery? We could be there already. Are there any penalties for violations? Is there any plan for enforcement?	<p>Your comment has been forwarded to the decision makers.</p> <p>A section on enforcement and compliance has been added to Section 1.2.3 of the FEIS.</p> <p>Regarding population monitoring, as described in Section 1.2.3 of the EIS, a review of the effectiveness of the WHRFMA plan shall be conducted every five years by the DLNR in cooperation with the University of Hawai'i (UH). The DLNR shall submit a report of its findings and recommendations based on the review to the legislature no later than 20 days before the convening of the regular session following the review.</p>

Commenter	State/ Location	Date Received	Comment	Response
Jessica Wooley	N/A	1/7/2020	For there to be a valid draft EIS to evaluate potential environmental impacts from commercial aquarium collection, there must be a state program in place that ensures cumulative impacts are evaluated before individual permits are granted or the applicant must provide that cumulative analysis. There has yet to be a programmatic evaluation of actions by the Executive Branch to grant permits and/or licenses so the applicant must do it themselves to meet the statutory requirements. Where is that?	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	There is no legal permit system for commercial aquarium collection of reef wildlife. The State has the authority to set up a permit program, similar to the program the Hawaii Supreme Court found illegal, after the program goes through the environmental review process. This is an important point to understand. Based on this proposed DEIS, it appears PIJAC wants to be a quasi-agency, pre-determining government actions statewide. It appears PIJAC is proposing to be the exclusive applicant throughout the state, e.g., this is an application for PIJAC to get sole use and control over all nearshore water permits. Please explain the concept envisioned here.	Your comment has been forwarded to the decision makers. The October 2017 supreme court ruling was that a HEPA review needed to be completed before Aquarium Permits could be issued. This EIS is fulfilling that requirement for 10 Aquarium Permits. PIJAC would not act as an agent of the DLNR. Permits would still be issued by the DAR, PIJAC is simply requesting approval for the issuance of 10 Aquarium Permits.
Jessica Wooley	N/A	1/7/2020	This is the use of conservation land adjacent to county and state parks. Have all park users been notified if the proposed actions by PJAC in the conservation district and associated activities in the shoreline area? Are any county shoreline access authorizations relevant and do they need to be applied for?	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	How is a pet association trade group planning to be responsible for the actions of the collectors? Are they employees? Why are their names not revealed? What is being hidden? Are there any other situations where an environmental review process has been complied with that are similar, e.g., with a trade association acting as the agent for collectors? Has there ever been an environmental review document with such anonymity? What PIJAC business interests and in-state business addresses exist and where locally can the applicant be found? Does the applicant have any experience, responsibilities, connections or obligations in the State of Hawaii? If so, please list and specify all.	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	Does the consultant preparing the draft EIS have any experience, responsibilities, connections or obligations in the State of Hawaii? If so, please list and specify all.	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	Is Section 1.2.3.1, a complete list of opportunities provided throughout the history of the commercial aquarium fishery for citizen participation, as alleged?	Your comment has been forwarded to the decision makers. Section 1.2.3.1 of the EIS is a summary of the West Hawai'i Fishery Council and does not claim to include a complete list of opportunities.
Jessica Wooley	N/A	1/7/2020	The action summary is "to ensure that commercial aquarium fish collection allows for the lawful, responsible, and sustainable	Your comment has been forwarded to the decision makers.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			commercial collection of various fish species from nearshore habitats” by getting 14 permits. However, there is no definition of what is lawful, responsible or sustainable for any species. And again, under what program do these definitions exist?	<p>Issuance of Aquarium Permits would be under HRS 188-31 and HAR 13-60.4. Existing bag limits and regulations are summarized in Section 1.2.3 of the EIS and would be implemented under any of the alternatives analyzed.</p> <p>Regarding sustainability, collection under the Preferred Alternative in the FEIS is below 2% for all of the 38 White List Species with a population estimate. The two species which do not have a population estimate, the Flame Wrasse and the Longfin Anthias, have been collected on average less than 175 individuals per year, even when the number of Aquarium Permits was unlimited. This level of collection is under the lower limit of 5% to 25% in Tissot and Hallacher (2006).</p>
Jessica Wooley	N/A	1/7/2020	Please explain when and how the State Executive has been working with PIJAC, to try to explain the regulatory system and/or figure out ways around it. The DEIS states “The DLNR has been working with stakeholders (e.g., public, various fishing and tourism industries, local governments) since the 1970’s, and continues to work with them to ensure the commercial aquarium fishery is environmentally sustainable and prevents degradation of fish populations and the habitats in which they occur. “ When has the DLNR worked with the public, environmental groups or Native Hawaiians? When has the DLNR worked with the various fishing, snorkeling, scuba diving and tourism industries? When has the DLNR worked with local governments? What are the actions that have been taken for all of the above?	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	Table 3-1 demonstrates how PIJAC and DLNR are trying to present a false sense of choices — alternatives — the choices PIJAC would like, and has dictated in the past. These are not the legally allowable choices.	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	What, if any, of the data and studies referred to in this proposed DEIS have been peer reviewed? Please provide details if there is any data or are any such studies. For the data that is not peer reviewed, are there alternative data or studies that have been evaluated? If not, why not?	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS used the best available science and best publicly available data (historic collection data and population trend data from the DAR and population estimates from CREP), and all data and references are cited in text and included in the literature cited.</p>
Jessica Wooley	N/A	1/7/2020	What ethical, transparency or accountability rules or limits exist to ensure the state government employees are not making money from the industry or being paid by the collectors and/or trade industry agents or given gifts or, at least if they are, there is public disclosure?	Your comment has been forwarded to the decision makers.
Jessica Wooley	N/A	1/7/2020	In a footnote, the proposed DEIS acknowledges there is very little information on 4 unique species that the proposed action would allow to be collected in unlimited numbers. Like so often in this document and Executive agency documents, the authors of this document rely on what commercial collectors reported they were able to catch	<p>Your comment has been forwarded to the decision makers.</p> <p>The footnote is actually referring to WHAP population estimates and trend data. CREP population estimates are available for two of those species. Tinker’s Butterflyfish have a CREP (2018) population estimate</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			to conclude that not much would be collected. In other words, because collectors could not find very many, we shouldn't worry about the impacts, despite the fact that this very information is an indication that the species is unusual, rare, perhaps it should be an endangered species but we don't know much. Please explain and, I hope, prove me wrong.	of 18,475, and collection under any of the alternatives would be less than 5% of the island-wide population (though it should be noted that the vast majority of the population occurs well below the 98-foot depth surveyed by the CREP and thus the population estimate is likely low). Eyestripe Surgeonfish has a CREP (2018) population estimate of 578,835, and collection under any of the alternatives would be less than 0.3% of the island-wide population.
Jessica Wooley	N/A	1/7/2020	It's difficult to make comments or ask questions of this document, so please go ahead and put a "why" before each statement, so that it is read as a question. For example, when I state "The document totally fails to meet the legal requirements specified by HRS Chapter 343." Please read it as "Why does this document totally fail to meet the legal requirements specified by HRS Chapter 343?" ⁸ 8 Here is a conclusion I agree with but it looks like a typo, FYI. "Given that Open Areas did not see a more severe decline than areas closed to commercial aquarium collection, it is not anticipated that commercial aquarium collection has a less than significant impact on coral declines."	Your comment has been forwarded to the decision makers. The text in the FEIS has been edited.
Jessica Wooley	N/A	1/7/2020	I'm hopeful PIJAC will see the light and stop selling Hawai'i reef wildlife and begin to invest in captive-bred options to create reef wildlife abundance and a world-class aquarium industry in Hawai'i that is respectful and gives back to Hawaiian culture and the environment.	Your comment has been forwarded to the decision makers.
Joan Lloyd	HI	12/27/2019	In October 2017, when the Hawaii Supreme Court issued injunctive relief and shut down all aquarium collecting pending environmental review, it was disturbing to see Kona aquarium collecting persist with support from Kona DAR and Hawaii DLNR. Hawaii's people have spoken, but no one's listening. And now, the "environmental review" supplied by DLNR with heavy support from PIJAC (Pet Joint Advisory Council) advocates for aquarium collectors' livelihood. This isn't an environmental review, it's a transparent lobby for Big Island and Oahu collectors who believe Hawaii's reefs are their private reserve, to trash and sell for personal gain. Aquarium collecting isn't fishing, it's a debilitating commercial enterprise ravaging Hawaii reefs. Don't sell out Hawaii reefs to the a handful of collectors and mainland interests. Stand firm and defend Hawaii reefs for Hawaii reef wildlife, Hawaii people, and Hawaii's economic future which has far more to gain by preserving this public trust.	Your comment has been forwarded to the decision makers. Legal commercial aquarium collection has continued outside of the WHRFMA using gear/methods other than fine mesh nets, which do not require an Aquarium Permit. No collection has been allowed in the WHRFMA since the supreme court ruling.
John and Diane Appler	HI	12/14/2019	We are concerned that the aquarium trade is being protected by DLNR at the expense of our reef species and habitat here around our islands. Please do all you can to discontinue this practice. We will be watching this issue closely.	Your comment has been forwarded to the decision makers.

John Naylor	HI	1/6/2020	<p>The aquarium trade is being protected by DLNR at the expense of the reef species and habitat around our islands. I've been observing our Maui reefs for over 37 yrs.</p> <p>It's shockingly different now than when I started! Please cease the aquarium trade and all netting immediately. I am watching closely and will not relent on this issue!</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The Preferred Alternative is issuance of 10 permits for the WHRFMA. No permits would be issued for Maui under any of the alternatives evaluated in the EIS.</p>
John Replogle	N/A	1/7/2020	<p>Mission Statement: Enhance, protect, conserve and manage Hawaii's unique and LIMITED natural resources held in PUBLIC TRUST for current and future generations of the people of Hawaii Nei and its visitors in partnership with others from public and private partnerships.</p> <p>This Mission Statement of the Division of Land and Natural Resources is in its essence from Hawai'i Constitution Article XI section 1. To promote the development and utilization of these resources in a manner consistent with their conservation and in furtherance of self-sufficiency of the State. Furthermore "All public natural resources are held in Trust by the State for the benefit of the people".</p> <p>All this being said, when one considers what is happening climatically on our planet; our coral reefs are bleaching, there is sea level rise in evidence around our State (Hauula), unheard of rainfall events and to round it out, over 200 record High temperatures were broken around the State is past 2019 year. "Australia today is ground zero for the climate catastrophe. It's glorious Great Barrier Reef is dying, its world-heritage rainforests are burning, its giant kelp forests have largely vanished, numerous towns have run out of water or about to, and now the vast continent is burning on a scale never before seen." (The New York Times) It is no longer disputed within the scientific community that our current situation concerning the climate is Homo sapiens (man) induced (caused).</p> <p>Our Hawaiian Reefs and its Species have evolved and developed over millennia in time. Do people think there were too many fish on the Hawaiian reefs before Kanaka first arrived? The first Kanaka had a good working knowledge of their nearshore reefs and species therein; through a system of Kapus and understanding of the species were able to maintain a very healthy reef and fishery. (in furtherance of self-sufficiency of the State) Our State has no fishing license requirement and no ocean/reef education program even though we are surrounded by reef and ocean. This however is on the people of Hawaii for accepting this situation. This then brings us to the handing out of 14 special permits for the collection of reef fish from west Hawaii waters. How does letting 14 special entities extract natural resources benefit the reefs first and the public trust? There are no Ecosystem Services Fees in place, Climate change is a real threat and our reefs may need all their components and species in tack to with</p>	<p>Your comment has been forwarded to the decision makers.</p>

			<p>stand the onslaught of climate change. Our State Dept. of Conservation and Resource Enforcement has but three people on duty at any one time on Hawaii Island and they struggle to deal with that. So let us saddle them with monitoring and enforcement in reef collecting of 14 different permits. So it will turn to self-regulation and enforcement by the Aquarium industry itself and that is tantamount to the proverbial Fox guarding the Hen House. Public Trust will be broken. There will be no benefit or reward to the people of Hawaii or to the Natural Resource. (Hawaii Constitution Article XI section 1.)</p> <p>We should not grant these permits. We do not have the capability of enforcing or monitoring. We should not grant these permits. We have no idea of what climate change will visit upon us way out here in the Pacific Ocean and what we may need to survive; We the people and our Natural Resources. [P]romote the development and utilization of these resources in a manner consistent with their CONSERVATION and in furtherance of SELF-SUFFICIENCY of the State. Hawaii Constitution Article XI, section 1; I in the strongest terms urge you to deny this Application for Commercial Aquarium Fishing Permit on Hawaii Island. I further encourage you to rescind all previously issued permits within the entire State at this time. Please look down the road to where we are heading and remember we are the most isolated place on the planet. We must look out for our collective best interests; the Public Trust is in your hands.</p>	
Jon Jokiel	N/A	12/2/2019	Of the listed alternatives, the No Action alternative is the most preferable . I think letting the reefs of Kona rest for another few years is a good idea to replenish the fish. It's been shown to work at Kahupulehu and other places in the state.	Your comment has been forwarded to the decision makers.
Jon. Kuahiwi Moniz	HI	11/27/2019	<p>I am a Native Hawaiian Cultural Practitioner. I also come from a line of fishermen on both sides of my family. I have noticed the fish population depleting. I have notice a surge in invasive fish such as the Toao and Roy. Take more efforts into eradicating those first. Put more efforts into restoring our reefs, rather than depleting our marine life.</p> <p>No more. Stop and Deny this request to resume commercial aquarium fishing not only in West Hawai`i, but in Hawai`i shores... from Lo`ihi to Papahanaumokuakea.</p>	Your comment has been forwarded to the decision makers.
Jonathan Boyne	N/A	1/6/2020	<p>Hawaii is considering the impact that fish collection for the aquarium trade has on wild fish populations.</p> <p>The Pet Industry Joint Advisory Council has submitted an environmental impact statement "surmis[ing that] the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem"!</p> <p>"It's common sense that this level of unrestricted take can't be sustainable," explains Earthjustice attorney Kylie Wager Cruz, who</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The commenter incorrectly states that the EIS surmises "that the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem". The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>further notes that the state shouldn't ignore "that except for bag limits for a limited number of species, nothing prohibits these collectors from taking every single fish from every single reef in the state." "Hawaii is expected to lose 70% of our coral reefs in the next couple of decades, so we don't have time for aquarium industry-sponsored justifications for raiding the reefs" - Maxx Phillips, Hawaii director with the Center for Biological Diversity. Hawaii's native fishes need and deserve effective legal protection, and should be left in the wild.</p>	<p>period. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p>
Judith Culler	N/A	1/6/2020	Please, do the right thing, ban aquarium collecting on Hawaiian reefs.	Your comment has been forwarded to the decision makers.
Judith Graham	N/A	1/1/2020	<p>Applicant Seems Ineligible The Applicant, Pet Industry Advisory Council, is named only once in the DEIS on an unnumbered page at the start. This page scarcely seem to be included in the document. Other EISs submitted in Hawaii, for example "The Village at Aina Lea,"(September 2010) which I checked, describe the Applicant in at least some detail. The cause in this instance may be that the Applicant is inappropriate for this Action. The statutory definitions in HRS 343, the state's environmental law, of Applicant and Action appear to be somewhat circular but in any case show the two to be inseparably linked. The Applicant undertakes the Action which in turn is a project or program undertaken by the Applicant. But in this case the two appear not to be so linked unless the Action is construed to be preparation of an EIS. But the effects described in the DEIS concern the collection of reef fish. This activity will not be undertaken by the Applicant, which appears to be a trade industry advocacy group. Thus, this EIS submittal does properly represent a portion of its membership--aquarium industry wholesalers, retailers, etc. Information about the PIJAC is readily available on its main web site and a handful of related sites such as that for its Aquatics Committee, where a FAQ about donations is partly answered in this manner:</p>	Your comment has been forwarded to the decision makers.

			<p>"If you are a PIJAC member, consider the connection between ensuring access to live organisms and the success or failure of your enterprise." This appears closer to the purpose for PIJAC's involvement in the EIS preparation than the frequently cited purpose of ensuring the livelihood of 14 fish collectors.. Hawaii's Supreme Court had stopped commercial aquarium fishing in West Hawaii as of 2018. Yet the DEIS acknowledges that West Hawaii is among the state's richest sources of reef fish for collection. In any case, in this instance the Applicant does not undertake the Action. The Action may not properly be seeking the issuance of 14 permits from the DLNR. If the DNLR undertakes that action, it is an agency action and this instance is not an agency EIS process.</p>	
Judith Graham	N/A	1/1/2020	<p>Probable Consequences for Yellow Tang Yellow tang are a pleasing yellow in color and according to saltwaterfish.com, a retail dealer with web pages very similar to Amazon's, "is among the most popular of all marine species" for aquariums. Its prices per individual, depending on size from 1.5 to 4.5 inches, vary on this site from \$62.99 to \$162.99. These high prices will drive up collection rates. According to the DEIS, about a quarter million individuals were collected in 2013-14 and again in 2017-18, some recent years for which figures were cited (page 74). Further, the West Hawaii commercial aquarium fishery depends over 80% on yellow tang collection (page 74)..Actually, the take may have been higher, one reasons, because according to a table on page 24, the percentage of statewide collectors who submitted the DLNR-required monthly reports of their takes was about 30% in 2017, about 40% in 2016 and about 42% in 2015. (I have interpolated figures given.)</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS in Section 5.2.1, to avoid duplicate fish catch reporting, only a principal diver is required to report the catch and effort for the dive team (DAR, pers. comm., 2018). This process ensures that reported catch data are not duplicated in the State's system. However, this reporting mechanism can lead to confusion by outside observers, as the total number of permit holders is higher than the number of permit holders reporting data (Table 4-1), giving the appearance of under reporting.</p> <p>Collection of Yellow Tang under the Preferred Alternative is anticipated to be 0.84% to 1.93% of the island-wide population. In addition, see Section 1.2.3.2 for the existing size and bag limits on Yellow Tang, which would remain in effect under any of the alternatives under consideration.</p>
Judith Graham	N/A	1/1/2020	<p>The DEIS describes all sales in Hawaii after collection as valued at about \$5 million annually while noting in the same sentence that most sales are to the US mainland, Europe and Asia pages 24-25). It becomes clear that this market is very large, and for the popular yellow tang, quite overbearing. In 2017 the chair of PIJAC's board of directors described it thus: "Ninety-three percent of the world's Yellow Tangs found in aquariums come from Hawaii. This is at risk thanks to ... the Hawaii court decision." (reef2rainforest.com/2017/11/09/aquarium-industry-under-siege) The commercial aquarium take from other islands--Maui, Kauai,Oahu-- has not been described in the DEIS, so what proportion of total collection is yellow tang could not even be inferred .. The DEIS does say Hawaii Island represents well over half of State of Hawaii collection. Given the relatively high retail price for yellow tang, and the apparent size of the market relative to the West Hawaii grounds, it</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>All alternatives under consideration in the EIS are limited to the island of Hawai'i. The Proposed Action is limited to the WHRFMA.</p> <p>As stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish.</p> <p>In addition, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow</p>

			is unreasonable to suppose this species will survive the five-year period envisioned in the DEIS without serious depletion. Serious depletion can occur and can be attributable to commercial aquarium collection as stated in the Humane Society's comment herein pertaining to the loss of butterfly fish off Oahu.	<p>Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui.</p> <p>As stated in the FEIS, Toonen et al. (2011) conclude that the Hawaiian Archipelago is not a single, well-mixed marine community, but rather there are at least four significant multi-species barriers to dispersal along the length of the island chain, and that species that appear capable of extensive dispersal, such as Yellow Tang and Kole, show significant population differentiation within the Hawaiian Archipelago. In addition, there are significant consensus genetic breaks that restrict gene flow between islands, including a barrier between the island of Hawai'i and the rest of the Main Hawaiian Islands (MHI). Therefore, the geographic boundary for analysis of cumulative effects is the island of Hawai'i.</p>
Judith Graham	N/A	1/1/2020	In one instance, the DEIS has used an island-wide CREP count of the yellow tang base population, instead of a regional West Hawaii count, to infer no significant diminishment (page 100). But that is erroneous, and in this instance collection would be augmented by the factors mentioned above--beauty, price, size of market. It is hard to see how the DLNR, given its mandate, could accept a program or project that did not clearly address this jeopardy to yellow tang. The current DEIS unfortunately does not address it,	<p>Your comment has been forwarded to the decision makers.</p> <p>The impacts of collection on WHAP Open Area population estimates have been added in Appendix B of the FEIS for comparison purposes.</p>
Judith Graham	N/A	1/1/2020	A Question Would a conservation district use application be required?	Your comment has been forwarded to the decision makers.
Jules Usinger	HI	1/7/2020	Please vote against the rights for aquarium fishing in Hawaiian waters. I find it sad that the fish populations have dwindled since I first snorkeled here 30 years ago. Now "snorkel beach" (Kahalu'u) has hardly any fish. I remember swimming around schools of all types of fish. Please stop the fishing.	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>

Karen Bret Harte	N/A	1/7/2020	Aloha Mr. Sakoda, The aquarium trade is being protected by DLNR at the expense of the reef species and habitat around our islands. Please discontinue this practice immediately. We are watching closely and will not relent on this issue! Stop using wildlife for profit. How would you like to be placed in a glass home for all to see and never be able to get out? Want to see the fish, try watching videos or go to an aquarium!	Your comment has been forwarded to the decision makers.
Karima Katharyn Morgan	HI	1/3/2020	I am a resident of Maui and want to express my strong opposition to the way that the aquarium trade has been given so much access to the wildlife on our reefs, depleting them in ways that are absolutely unacceptable. The aquarium trade is a devastating commercial enterprise that trashes near-shore habitat and species. The vast majority of Hawaii people want the aquarium trade to end. And so do millions of visitors around the world, who hold Hawaii reefs in their hearts. Reef tourism supports many thousands more people, with revenue 400 (four hundred) times greater. The Environmental Review by the Pet Industry Joint Advisory Council is not relevant, not accurate, not pono and not legal. The aquarium trade is not fishing, it's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.	Your comment has been forwarded to the decision makers.
Karin Nelson	Canada	1/6/2020	Hello. I am writing to ask and insist that Hawaii help work towards a change in human attitudes about keeping animals captive for their entertainment. Please protect the fish living in the reef systems around your islands for the aquarium trade and please take a position against the use of (especially) wild fish for the aquarium trade. The bigger picture is of course that we have to end the industrial catch of all sea creatures in order to preserve the oceans. Please consider this in decisions going forward.	Your comment has been forwarded to the decision makers.
Kate Kenner	VT	1/6/2020	I am writing out of concern for wild fish populations there. I have received word that the Pet Industry Advisory council has submitted an environmental impact statement that states that the unlimited collection of Hawaii't reef animals will have little effect on the state's coral reef ecosystems. Of course they are going to say that because that means more fish thus more money for them. It is common sense that too much of something is never good. The ocean, like the rest of nature, has a balance and if too many fish are removed that balance will be upset and cause great harm to the coral reefs and there is an expected loss of those of 70% in the next couple of decades according the the Center of Biological Diversity. what is to stop the Pet Industry from practically depleting the amount of fish there? They do not care about the environment or fish but only about what they want. It is up	Your comment has been forwarded to the decision makers. The commenter incorrectly states that the EIS stats "that the unlimited collection of Hawaii't reef animals will have little effect on the state's coral reef ecosystems". The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10

			<p>to you to do what is right for Hawaii and the health of its ecosystems which includes not letting anyone have carte blanche for their own purposes. People who visit and want to see coral reefs and fish will be sorely disappointed when there are few to see.</p>	<p>permits, and limits the permits to the WHRFMA.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p>
Katherine Green	N/A	1/6/2020	<p>Native fish need protection! Please make the best informed decision to help them.</p>	<p>Your comment has been forwarded to the decision makers.</p>
Kathy Boyd	HI	1/6/2020	<p>My name is Kathy Boyd, I am the Lead Concierge for our on Island Expedia Local Expert Team. I have lived on the Big Island for 12+ years and have worked in the travel industry since day one. Those of us that call the island home have sadly seen the massive decline in marine life. Between the Black Water run off along the West Coast of Hawaii Island, chemical spraying along the coastlines to keep golf courses green and weed free and the recent coral bleaching, our reefs are in disrepair.</p> <p>I am writing to respectfully inform you, I STRONGLY oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish. I understand that some would argue that this would provide some jobs, but what about those of us that already work in the industry, and our past, present and future visitors. Its seems very short sighted to not consider how you are impacting all our current ocean operators (and supporting resort staff like myself) that take people out to see our natural underwater wonderland. Permitting 14 more companies to collect Hawaii's Tropical Fish for entertainment and take them from Hawaii's Reefs is counter-productive. We tell our visitors to enjoy Hawaii here, don't take the lava rocks, the shells, the multi-colored sands from our beaches, why would you condone this?</p> <p>Our oceans are dependent on people like yourself to do what is Pono.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.</p>

			Please choose to do the right thing, our community will be watching. Thank you for taking the time to read my comments.	
Kathyrn Lezenby	PA	1/7/2020	<p>As an animal and nature lover, I urge you to keep the fish who live in reefs off Hawaii's coast in their natural habitat where they belong. They are adapted to live in these reefs and are integral to them. Hawaii's reefs nurture life as well as protect its coasts from erosion. Over 500 species of plants and animals are found only in Hawaii coral reefs. These coral reefs depend on fish to eat algae that, left unchecked, can smother coral, rob it of nutrients or promote the growth of harmful algae that may kill it.</p> <p>Marine biologist Mike Gil has observed that fish only feel comfortable entering risky feeding grounds abundant with algae when they see other fish doing the same and, that, when fewer fish are present, fish are more risk averse and eat less which can allow algae to grow unchecked. Thus, removing fish from a reef ecosystem threatens the reef itself.</p> <p>And fish are living, feeling creatures, not commodities. Allowing them to be torn from their natural home to live in the confines of a tank at the mercy of humans is cruel as well as environmentally unsound.</p> <p>As someone who oversees Hawaii's natural heritage, please protect its fish and the reefs they protect from unnecessary exploitation. Thank you for considering my concerns.</p>	Your comment has been forwarded to the decision makers.
Kea Clebsch	HI	1/6/2020	<p>My name is Kea Clebsch and I am a sophomore at Kealahou High School and a frequent intern at Reef Teach; a program dedicated towards the education of our tourists and citizens about the importance of coral reef protection. Reef fish are an essential part of our marine ecosystems. We are already seeing the detrimental effects of overfishing, and our reefs are experiencing the consequences. Please keep in mind the severe environmental costs that will come as a byproduct of new fish collection permits. I — along with many in our community — am passionate about the wellbeing of our home and Hawaiian marine life. We hope that you keep this in mind when making your decision.</p>	Your comment has been forwarded to the decision makers.
Keith Christie	HI	11/29/2019	<p>My name is Keith Christie and I am a 35 year resident of Maui and have been an active underwater sports enthusiast for that entire time. I strong oppose the Aquarium Trade in Hawaii. It devastates the reefs by removing/extracting the very lives that are required to maintain a healthy and complete ecosystem for our reefs.</p> <p>The reefs are dying and we need all fish present and accounted for on our reefs, NOT IN AQUARIUMS AROUND THE WORLD FOR ENTERTAINMENT.</p> <p>These are wild animals and are part of the larger ecosystem that requires all inhabitants to maintain balance and health.</p> <p>The financial situation for the handful of these aquarium collectors is</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. 			<p>irrelevant to the health of our reefs. They can get other livelihoods and be retrained. The reefs cannot afford this very harmful practice. I have seen the affects first hand and and hear to tell you that it must stop at all costs.</p> <p>Please answer me this if you have the information: How is it that the trade has continued even in the face of a Hawaii Supreme Court ruling to halt all collecting? Who has allowed this?</p>	<p>not driving the decline.</p> <p>Legal commercial aquarium collection has continued outside of the WHRFMA using gear/methods other than fine mesh nets, which do not require an Aquarium Permit. No collection has been allowed in the WHRFMA since the supreme court ruling.</p>
Ken Stover	HI	1/7/2020	<p>The aquarium trade is being protected by DLNR at the expense of the reef species and habitat around our islands. Please discontinue this practice immediately. We are watching closely and will not relent on this issue!</p>	<p>Your comment has been forwarded to the decision makers.</p>
Kerry Beane	HI	1/5/2020	<p>I am very concerned about losing most of our reef fish to the pet trade. To quote Snorkel Bob, "It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.</p> <p>Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting.</p> <p>The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.</p> <p>But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,</p> <p>PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS was prepared using the best available science. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. 			<p>not legal. I implore you to do the right thing.” Please do not facilitate this trade in our marine heritage!!</p>	
<p>Kim (Last name not provided)</p>	<p>N/A</p>	<p>1/7/2020</p>	<p>I was born and raised in Kona, and have seen significantly less fish on our reefs in my lifetime. I have also seen the drastic, irreparable damage to our coral reefs that the reduction of herbivorous fish greatly exacerbates. No Hawaiian reef fish should be taken to supply the mainland pet trade. This is wildlife trafficking.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>It is acknowledged that reefs face many threats and reef conservation is important; however, as stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time. In addition, Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.</p> <p>It is acknowledged that herbivore conservation is important; however, please note that as stated in the EIS the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). These trends occurred even with the pressure of commercial aquarium collection, which was occurring over the same time period.</p>
<p>Kim Jorgensen</p>	<p>HI</p>	<p>12/18/2019</p>	<p>I am OPPOSED to the Draft EIS for commercial reef fish collections. Commercial aquarium fish collection permits are detrimental to our reefs and the survival of the populations of fish that care for them. Please do not accept this flawed EIS that suspiciously finds no significant impact caused by commercial fishing of reef fish. It is a wasteful and destructive industry, and anyone who truly cares about</p>	<p>Your comment has been forwarded to the decision makers.</p>

			our reefs will not exploit the fish for their own financial gain, or allow it to happen.	
Kristina Kahl	HI	1/6/2020	<p>It has come to my attention that the DNLN is set to issue 14 more permits for Fish Collections on the Big Island within areas Ka'u to Kohala West Shores.</p> <p>With the unprecedented climate changes occurring globally, allowing "reef raping" of Hawaii's natural sealife will undoubtedly create even more instability of our natural global world. For what? Money? The short term focus on monetary gain is what has produced the overwhelming climate and environmental problems we are seeing today and what will occur in the future.</p> <p>It is time to fully embrace Hawaii's Aina and reject profit and honor the land.</p> <p>My family has lived on the islands for over 50 years and I want the land and ocean to thrive, flourish, and be preserved for future generations.</p> <p>Do not issue any permits for Fish Collections.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS analyzed the impacts of issuing Aquarium Permits. The DLNR has not yet made a final decision on whether or not to issue the permits.</p>
Kristy Knudsen	HI	1/7/2020	<p>I have lived on the Big Island for 43 years. The ocean has always been a big part of my life. Working on boats over the years I was able to observe the "trop collectors" always with disdain. My belief is that there are too many people and visitors who live and vacation here to spend their time in our beautiful ocean. I have witnessed firsthand the decline of our reef fish.</p> <p>I ask you to please consider this before granting more permits for tropical fish collectors.</p>	Your comment has been forwarded to the decision makers.
Kurt Lieber	N/A	12/27/2019	<p>I have been diving the beautiful reefs of Hawai'i since 1979. I used to go there at least 3 times a year because it was a short jaunt from my home in California. I stopped going there altogether around 1996, because the once abundant reef fish were mostly gone. I started visiting again in 2014 because my organization was asked by Hawaiian's to help clean up the reefs of all the fishing gear that is smothering the reefs. While I still don't see the fish in the abundance I once did, protected areas like Hanauma Bay, remind me of what wonders Hawai'i could still hold if we just STOPPED letting the aquarium trade remove the fish. Please put a stop to it NOW!! The tourism industry will reap the rewards, which bring much need money into the local economy AND the government gets all the taxes that come with it.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.</p>
Laci Waters	N/A	1/7/2020	<p>I am writing to respectfully inform you, I oppose issuing permits to collect Hawaiian Reef Fish. Why would you even consider this? Protect your island don't help destroy it!</p>	Your comment has been forwarded to the decision makers.
Lacey Levitt, Ph.D.	N/A	1/6/2020	<p>As an American, I believe native fishes deserve effective legal protection and should be left in the wild. Please protect them and their habitat.</p>	Your comment has been forwarded to the decision makers.

Lali Prince Music	N/A	11/28/2019	<p>I am a HI voter & resident. I am shocked and dismayed by this recent submission for permits. This is in violation of UN Development Rights Article 41/128 adopted in 1986 & affirmed by the 1993 Vienna Declaration and Programme of Action. This needs to be brought before the Hawaii Supreme court to obey the law.</p> <p>Exploitation by greedy investors abound in Hawai'i. Our coral reefs and all animal life surrounding are dying or dead. No limu, kupipi, manini, kaunaoa, wana, gobi's, or hinalea to be found. Coral shelf at Kahalu'u beach is bleached out. Dive and see that this destruction is beyond tragic! This reef needs to be protected not pillaged. These sea life needs time to return to safe numbers. This area should not be allowed for permits.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>DLNR will determine the applicability of state, federal and international laws, and comply with such laws in administering its programs.</p>
Lanny Sinkin	HI	12/3/2019	<p>As an attorney whose primary area of practice has been environmental law, I sometimes feel like really bad ideas impacting the environment surface almost every day.</p> <p>As a broad context for any environmental discussion these days, we have to start with the tsunami of climate chaos that is already appearing now with fires, floods, "rain bombs," droughts, ecosystems collapsing,</p> <p>Of particular concern are the changes taking place in the ocean. The temperature of the ocean is rising, contributing to coral bleaching. That temperature increase is causing the ocean to expand in volume, contributing to ever more destructive hurricanes and storm surge. Ocean acidification is steadily increasing.</p> <p>The bottom line is that the ecosystems on Earth, and particularly the ocean, are under great stress. As one of the primary causes of that stress, humans have an obligation to those alive today and to future generations to take every possible step to reduce such stress.</p> <p>Which brings me to the terrible proposal to issue commercial aquarium fishing permits. Having been in the waters around Hawai'i Island for more than 25 years, I see far fewer fish today than in the past. While I know my observations are anecdotal, they are at least suggestive that something is going on.</p> <p>You will receive a number of comments that will detail the cruel and wasteful nature of the aquarium industry that is happy to strip mine our local fish population for private profit. That permit application highlights (again) the issue of why people come to our islands. There are those who come out of love and extend that love to protecting the 'Aina. Then there are those who come to exploit the 'Aina. The Hawaiian ways of sustainability have been supplanted by avaricious greed that apparently cares for nothing other than short term benefits not matter how destructive their actions are in terms of long term sustainability.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>

			I urge you to deny the permits based on the need to protect what is left of wildlife populations.	
Laura Roberts	HI	1/7/2020	I am an avid diver and also volunteer for coral restoration in Kona. The ornamental fish trade should NOT be allowed. Hawaii needs to keep its waters healthy, beautiful and bountiful. Without a healthy reef and fish to look at. The tourists will stop coming and that would be detrimental to the entire economy. The negative environmental impacts should be obvious. The waste is horrendous in the collection process. The dumpsters at Honokohau Harbor used to have giant trash bags full of dead yellow tangs that didn't survive collecting. That absolutely must STOP.	Your comment has been forwarded to the decision makers. The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.
Lee Ann Donner	MA	12/3/2019	I do not know where you stand on this issue, but I do know this: I come to Hawaii for one reason, and one reason only, to snorkel the reefs, to see the gorgeous reef fish of Hawaii alive and healthy in their natural habitat. The divers who vacation in Hawaii would say the same thing. You must know that reef ecosystems are delicate. Hawaii is the tourist destination that it is, not only because of the beautiful beaches, but also because of the reefs off those beaches. It is absurd to posit that the ecosystems of the reefs can serve as a cash cow for the aquarium trade and survive. There is no such thing as "sustainable" harvest from the reefs. You cannot "harvest" from the reefs and expect them to survive. No reefs = no tourists. Please stop any and all permits, now and in the future. The aquarium trade has no business in Hawaii. Please protect the reefs and the creatures that call them home.	Your comment has been forwarded to the decision makers. The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.
Leigh Bowles	HI	1/7/2020	Thank you for the opportunity to comment on this issue. Recently, on a visit to Two Step I had the wonderful opportunity to see how much the beloved yellow tangs have recovered since the ban on the aquarium trade went into effect. The last time I had been there, I saw hardly any at all. We should keep in place efforts to protect these creatures in their homes, and not allow them to be taken away to be used as a ornament in someone's living room in Kansas. Folks who live and visit Hawaii deserve to see these creatures in their homes in the ocean. We should be using each opportunity we have to protect Hawaii's resources from further degradation, especially considering climate change. Do we truly believe that Hawaii's sea life will be able to battle both aquarium trade collectors and warming temperatures, not to mention trash and people who don't always know the rules to respect the reefs? In short, our planet--including the oceans--is in crisis, as we are all aware. If we believe that allowing a trade to continue taking fish is going to help our fragile planet, we are sadly wrong. We have to keep our priorities logical. It's not logical to allow this trade to wreak further	Your comment has been forwarded to the decision makers. As stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. Additionally, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui. While the EIS acknowledges that reefs and reef fish face many threats,

			<p>havoc on Hawaii's wildlife. There are plenty of people who live and visit here to scuba dive and snorkel who contribute much more to Hawaii's economy than an aquarium owner ever will. What happens when there's nothing left to see scuba diving or snorkeling? Will we have to start planning vacations to go visit Hawaii's sea life in aquariums on the mainland, or to some other islands where they loved their natural resources instead of taking them for granted? Let's focus on supporting the trades that boost the economy while leaving nature intact.</p>	<p>the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. Liz Laliberte	HI	12/4/2019	<p>I strongly oppose the granting of 14 aquarium collecting permits for West Hawaii for many reasons.</p> <p>Currently Hawaii's coral reefs are under great strain. Agricultural runoff, boat traffic, heavy storms and climate change all damage the reefs and harm fish. If reefs are struggling to survive this means the fish which inhabit the reef are also under threat.</p> <p>Among the threats to reef fish is the mass bleaching of their habitat, coral and in particular staghorn coral. Some estimates of bleaching in 2016-2017 are as high as 70% of corals on West Side.</p> <p>Without a healthy coral reef habitat, many reef fish are already struggling to survive and don't need additional threats such as collecting.</p> <p>With the loss of reefs along Kapoho coastline it's even more critical to protect the intact reefs and wild fish that remain.</p> <p>The bottom line is that Hawaii has more to gain from conserving its ocean wildlife than it does from its short-term exploitation. I'm not advocating a reliance on tourist \$\$, but a large percentage of tourists want to dive/snorkel when they visit. Keeping our reefs healthy with plenty of reef fish is a draw for tourists and their revenue.</p> <p>At the end of the day we must consider the greater good for our communities which comes from a healthy ocean ecosystem which sustains us in so many ways. Protecting jobs of aquarium collectors who exploit our oceans is foolish and short-sighted. Ban aquarium collecting on Hawaii island!</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. Lu Haner	N/A	1/6/2020	Please leave native fishes in the wild!	Your comment has been forwarded to the decision makers.
Luther waiwaiole	N/A	1/7/2020	If said permits will be allowed then you will be REQUIRED to also consider opening all fma-fish management areas to commercial bottom fishermen-it is an unfair practice to allow these permits and not allow bottom fishermen to do the same In the case of a net versus a hook-there will be more collected by net-both legal and illegal-then any bottom fisherman can catch in a day by hook In closing: you have not regulated the tropical fish industry as stringent as you have the commercial fish side-and unless regular inspectors are at the pier upon the return of these collectors-there will be irreparable damage to the reef fish and coral-if you can control the sunblock industry then this should be controlled and regulated also	Your comment has been forwarded to the decision makers. All alternatives under consideration would include the existing regulations put in place for the WHRFMA, including MPAs, FRAs, and bag limits. Commercial aquarium collection would only be allowed within the Open Areas, and not within any managed areas (see Figure 1 of the EIS).
M.J.Wells	HI	1/7/2020	I hope it's not too late for my two cents about the Pet Aquarium trade. I'm very concerned about the disappearance of many species of beautiful local fish here in Maui and in these islands. Please do whatever is necessary to prevent any further losses, including stopping further losses that would result from supplying the pet trade outside Hawai'i. The reefs are dying and they too need the fish to keep them from disappearing faster. I heard this was the deadline for testimony including emails. Please add my voice to the others you've heard from. A moratorium or permanent ban seems like what's necessary to protect the wildlife here. Thanks for your consideration.	Your comment has been forwarded to the decision makers. The Preferred Alternative is issuance of 10 permits for the WHRFMA. No permits would be issued for Maui under any of the alternatives evaluated in the EIS.
Madolin Wells	HI	1/5/2020	I urge you to right action for saving Hawai'i's reefs! A 500-page lobbying piece does not deserve the title "Environmental Review" - a false and misleading designation. "Environmental impact review" is the term used for PUBLIC REVIEW AND HEARINGS on a proposed project, allowing typically at least 6-12 months for input from concerned citizens and relevant scientists in the public interest. (Which includes environmental interest.) The way this type of review was initially conceived was NOT to give equal time to the developer; it was to allow all necessary time for citizen input especially local, plus research developed in the public interest to consider potential hazards. The onus was on the developer/commercial interest to prove the project was safe, or to make changes that adequately addressed safety, quality-of-life, and environmental considerations. Failing that, the project would not be permitted to proceed. The "need" of any commercial interest to make profits is utterly bogus.	Your comment has been forwarded to the decision makers.
Madolin Wells	HI	1/6/2020	NOTHING justifies stealing critical parts of Maui's fragile ecology for commercial profits. This is stealing the birthright of the Hawaiian people. It is a crime against nature.	Your comment has been forwarded to the decision makers. The Preferred Alternative is issuance of 10 permits for the WHRFMA. No permits would be issued for Maui under any of the alternatives

			<p>It is extremely short-sighted financially as well. Without the fish and the reefs, Maui - or any other part of the state - would lose a significant part of the tourist trade.</p> <p>I urge you and the advisory council to block this massive theft by the interests represented by PIJAC and by their so-called "Environmental Review."</p>	<p>evaluated in the EIS.</p> <p>The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.</p>
Maggie Brown	HI	1/6/2020	<p>My name is Maggie Brown, I am owner of Body Glove Ocean Adventures. I have lived on the Big Island for 45+ years and have been operating commercial snorkeling and SCUBA diving tours since 1974. The massive decline in marine life, mostly fish has declined immensely since then. Between the Black Water run off along the West Coast of Hawaii Island and the recent coral bleaching, our reefs are in disrepair. I compare underwater pictures of our BI coral reefs/marine life from the 1970's- 80's and the devastating change would make a grown man cry.</p> <p>I am writing to respectfully inform you, I oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish.</p> <p>I invite you to view my page on TripAdvisor and see how many complaints we get, due to lack of fish and the condition of our coral reefs. We at Body Glove donate portion of our ticket sales to Legacy Reef Foundation and other non-profit organizations for the for the preservation, restoration and education of our coral reefs. Permitting those to collect Hawaii's Tropical Fish and take them from our Reefs is counter-productive.</p> <p>Thank you for taking the time to read my comments.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. 			<p>existing crisis & may lead to the depletion of essential reef species. Please ensure any decisions made regarding permits to collect fish are made with the sustainability of our coral reef ecosystems as TOP PRIORITY. Mahalo...</p>	<p>fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>It is acknowledged that reefs face many threats and reef conservation is important; however, as stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time. In addition, Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.</p>
Margie Park	HI	1/6/2020	<p>My name is Margie Park. I have been a resident of Hawaii Island for 30 years. I am writing to you voicing my strong opposition to the issuance of reef fish collection permits.</p> <p>I am a proud employee of Body Glove Cruises. We are an ocean adventure company that provides snorkeling, SCUBA, whale watching and historical dinner cruises. During my years living on the island and working in the ocean industry I have noticed fewer and fewer reef fish. Issuing permits for collections of our island's dwindling fish populations would negatively impact our fragile ecosystem. Not only have I personally noticed a decline in reef fish populations, we also have guests who complain about our dwindling populations. Working for a company that provides island guests a safe, ecologically friendly opportunity to enjoy our island's natural resources is a great honor. Body Glove Cruises donates a portion of its proceeds towards the preservation, restoration and education of our coral reefs. Please make your island's preservation contribution by not issuing fish collection permits. Making the "right" decisions now will make a huge difference in our future. Mahalo for your consideration.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. Marian Hussenbux, The Animal Interfaith Alliance	N/A	1/7/2020	<p>I write on behalf of The Animal Interfaith Alliance, an international alliance of faith groups founded in Britain concerned about the welfare of animals. Our member organisations and individual members include Buddhists, Christians, Hindus, Jains, Jews, Muslims and Sikhs. We are all united by our common concern for animals, based on our various faiths. Our member organisations are listed below.</p> <p>We send our compliments and refer to the report that Hawai'i is considering the impact that fish collection for the aquarium trade has on wild fish populations. We read that The Pet Industry Joint Advisory</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The commenter incorrectly states that the EIS surmises "that the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem". The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful</p>

			<p>Council has submitted an environmental impact statement "surmis[ing that] the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem".</p> <p>We cannot understand this complacent and dangerous assertion. On three occasions in 2017, when SB 1240 was on Governor Ige's desk for signing, we wrote to urge him to do so, fearing that unlimited fishing on the reef would decimate populations of native fishes and destroy the pristine marine environment of which you should be proud. We read that Earthjustice attorney Kylie Wager Cruz states:"it's common sense that this level of unrestricted take can't be sustainable," and further notes that the state shouldn't ignore "that except for bag limits for a limited number of species, nothing prohibits these collectors from taking every single fish from every single reef in the state."</p> <p>Maxx Phillips, Hawaii'i director with the Center for Biological Diversity, an excellent group some of our members support, says: "Hawaii is expected to lose 70% of our coral reefs in the next couple of decades, so we don't have time for aquarium industry-sponsored justifications for raiding the reefs" -.</p> <p>This is appalling and we hope that you agree. We are appealing to you to accept that your native fishes need and deserve effective legal protection, and should be left in the wild where they belong, not exploited for human amusement.</p>	<p>(and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p>
Marie Aguilar	HI	1/6/2020	<p>I am a long time resident of Hawai'i Island and know first hand on the conditions of the impact of fish collection on my island. First, the seriousness of the loss of our coral on the Hawai'i coasts are listed as severe and may not recover anytime soon. The State of Hawai'i has a responsibility to protect Hawai'i's natural resources. The tropical fish of Hawai'i are declining year after year. and I have seen the decline from 1988 through 2020. Yellow tang swam along the Kailua Pier and their visual presences created the name "Gold Coast" of the Big Island.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>As stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. Additionally, there were no significant differences in the abundance of</p>

				<p>adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui.</p>
Marie Aguilar	HI	1/6/2020	<p>The effects of environmental conditions have to be taken into consideration for the future of maintaining the population of our tropical fish populations. The recent Draft Environmental Impact Statement from Pet Industry Join Advisory Council is completely flawed. First, there is an impact of collection of tropical fish collecting on the population. The population of reef fish is declining due to over collecting reef fish from past years. The damage was severe to our coral from the warm waters this summer and need to recover, if its possible. Our coral reef live symbiotically with tropical fish to flourish and nurture.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>
Marie Aguilar	HI	1/6/2020	<p>The Supreme Court in 2017 held that collection without environment review violates the Act, and DLNR later ordered to cease issuing further aquarium collection permits until the environment effects of aquarium collection is fully and publicly vetted through the HEPA process. The heaviest impact to our fish collection is the lack of holding the permit holders with a limit to their taking aquarium fish.</p> <p>Today, the same permit holders want to be able to take aquarium fish with no limits. This most definitely will not support what the Supreme Court ruled. There is no management of the fish collection limits.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when</p>

				the fishery was open to all collectors in order to take 100% of the Open Area population.
Marie Aguilar	HI	1/6/2020	The most startling outcome of this Draft Environment Impact Statement written by Pet Industry Joint Advisory Council is this Council has a conflict of interest in presenting a proposal for the whole benefit for the retailing of our reef fish. They support aquarium fish pet stores throughout the mainland. Their impact statement is false, their statements do not prove the actual outcome of the fish population with fish collections with no limits. There is no study that would support their statements.	Your comment has been forwarded to the decision makers.
Marie Aguilar	HI	1/6/2020	In their DRAFT, there is no mention of who the 14 permit holders are and who they represent. Are these permit holders, actual residents of Hawai'i. Are we seriously trusting this Council with what they will do when the permit holders gain access to our reef fish every day of the year. Our fish population will dwindle to a server depletion, and could not recover.	Your comment has been forwarded to the decision makers.
Marie Aguilar	HI	1/6/2020	I oppose any fish collections on the Island of Hawai'i, especially as the Draft indicates from Ka'u to Kohala. Our island depends on economic sustainable tourism where tour operators bring visitors to snorkel, dive and swim and view our pristine waters. We can not have fourteen permit holders taking our natural resources for their economic benefit. Its true, third world countries protect the collection of their reef fish, and Hawai'i must continue the restriction on any fish collection for years to come. Thank you for reading my comments and recording the receipt of this letter.	Your comment has been forwarded to the decision makers. The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.
Marie Le Boeuf	HI	1/7/2020	I have been actively diving and snorkeling in Hawaii for over twenty years and I know that the aquarium trade most definitely has a VERY negative impact on the reefs. I produced a documentary in 2005 about Hawaii's near shore reefs and the animals that live there, and it is devastating to me to STILL see a steady decline in the health of ALL Hawaii's reefs. Our native fishes need and deserve effective legal protection, and should be left in the wild! Please help make the PONO choice! NO MORE FISH COLLECTING! If you'd like to view my film, you can find it here: https://www.youtube.com/watch?v=9NciCVLt3nY	Your comment has been forwarded to the decision makers. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.
Mark and Zinnia Cardamomum	N/A	1/6/2020	Greetings! We are a mother and father who cherish our region's fish. Please do not allow native Hawaiian fishes to be harvested for the aquarium pet trade. It's essential to protect our marine biodiversity, which is an irreplaceable treasure. Thank you for your time, and take good care.	Your comment has been forwarded to the decision makers.

Mark Joiner	HI	1/7/2020	<p>I am a resident of South Maui and a frequent visitor to the reefs in our area. I have noticed a depletion of our beautiful fish over the years, especially the yellow tangs. The difference between protected Molokini Crater and our near shore reef is stunning, as one is teeming with fish and the other is scant at best.</p> <p>Please take all steps necessary to stop this harmful practice, which I understand is being subsidized by my tax dollars through the DLNR. For the sake of the reefs and our tourism, this should have been addressed years ago.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The Preferred Alternative is issuance of 10 permits for the WHRFMA. No permits would be issued for Maui under any of the alternatives evaluated in the EIS.</p> <p>As stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. Additionally, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui.</p>
Mark Koppel	HI	12/3/2019	<p>I agree with all of the following. Mark Koppel Hawaii Island Mahalo</p> <p>Aloha, Granting 14 people aquarium fish collecting permits, with loose rules, realistically policed by no one, is a terrible idea. 14 more people making a (potentially full-time) career out of stripping our reefs of "aquarium fish " is detrimental to the health of the ocean, The west side of Hawaii Island and our own existence (loss of species on the planet has a domino effect that does in fact affect human beings). There are already many challenges that wildlife on the Westside have had to endure: resort/golf course runoff, Gated community on cliffs' landscape run off, Bloom which is said to be caused by Energy Lab that killed off Honokahau Harbor, and it is said that the Kawaihae harbor's bad design has stifled the circulation in the region and sickened fish. What is frustrating is, in the past, it seems that the state has sided with aquarium fish trade collectors and flown the doors wide-open for their collecting while regulating sustenance fishing of the same fish. Aquarium fish trade collectors have already stripped other islands of the beautiful reef fish and coming to Hawaii Island to do the same, must not be allowed. Hawaii's resources should not be for sale. The County of Hawai'i has</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. 			<p>declared an emergency with the state of the climate (changing). And because we are experiencing extreme rains, run off, reef bleaching events, etc., I Believe that we need to give the ocean a well-deserved break. I cannot imagine that an EIS could be done with any accuracy if it says that it is an OK thing to have harvesting of reef fish happen at this time.</p>	
Mark Tang	HI	12/6/2019	<p>I am writing to urge DLNR to select the "NO ACTION" alternative listed in the draft Environmental Impact Statement. Nothing in this report should convince an unbiased person that it is in the best interest of the people of this state to continue the wasteful and destructive Aquarium 'fishery' for the sake of just 14 recalcitrant collectors. Indeed, fishery it is not! It is a highly lucrative criminal enterprise that happens to specialize in our all too important reef maintaining organisms.</p> <p>Furthermore, it is highly ironic and the height of hypocrisy to ask, as DAR has recently, recreational and subsistence fishers to refrain from taking herbivorous reef fish while encouraging a select few collectors, the applicants of this report, to gain special license for the unlimited taking of many of the same species of fish!</p> <p>How sad is it that your agency tasked with conserving vital and imperiled resources such as still exist, would even entertain the perpetuation of this abominable business?</p> <p>Shall we bring back shark-finning while we are at it?</p> <p>Ua Mau Ke Ea O Ka Aina I Ka Pono!</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>It is acknowledged that herbivore conservation is important; however, please note that as stated in the EIS the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). These trends occurred even with the pressure of commercial aquarium collection, which was occurring over the same time period.</p> <p>The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Mary Finelli	MD	1/7/2020	<p>Fish Feel is a 501(c)3 organization that promotes respect and consideration for fishes and other animals. The following comments are submitted on behalf of our thousands of constituents, and in regard to the Pet Industry Joint Advisory Council (PIJAC)'s draft environmental impact statement.</p> <p>Hawaiian wildlife is invaluable, and among the state's greatest treasures. Hawaii's native fishes are cherished by many residents, and the ability to see them in their natural habitat is a great attraction to many others, too. Public perceptions of nonhuman animals are increasingly improving, and many people now recognize that these fellow beings deserve consideration as individuals with their own lives to live, which should be free from gratuitous human interference and cruel exploitation. Science has shown what many people have intuitively realized: that fishes are sentient beings who can suffer fear and pain: http://fishfeel.org/resources/facts/#accordion-1-3 Their well-being is deserving of our moral consideration.</p> <p>Taking animals from the wild to be kept in captivity for human</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>A discussion on post-collection mortality has been added to Section 5.4.2 of the EIS.</p>

			<p>amusement is increasingly recognized as an inhumane and unethical thing to do. Removing them diminishes wild populations and disrupts social structures. Even the largest zoos and aquariums cannot truly replicate natural conditions, let alone for home aquariums to do so. Few people will seek veterinary care for an ailing fish, and there are relatively few veterinarians who can capably treat fishes, especially exotic fishes. Many wild-caught fishes perish before even arriving at their final destination, and many if not most perish within their first year there.</p> <p>No one needs to collect or keep wild-caught fishes, instead it is a luxury pursuit. They should not be caught for private profit and pleasure but instead left in nature to be enjoyed by all and perform the invaluable ecological services they provide there. It is absurd for PIJAC to claim that continued removal of fishes as it has proposed will not affect species populations, and it is insulting to the intelligence of any reasonable person. They should not be removing any, for the sake of the fishes, the other animals who are genuinely dependent on them, and of the public. This is all the more important given the grim state of flux the oceans are in, and the hardships that coral reefs are experiencing – environmental changes which are only expected to worsen.</p> <p>Thank you for your consideration of these comments. Please act in the best interests of Hawaiian wildlife and the public by upholding the ban on commercial aquarium fishing.</p>	
Mary Marvin Porter	HI	1/7/2020	<p>Review of: DEIS</p> <p>As a resident and snorkeler on the island of Hawai'i for 25 years, I see a big decrease in the fish population. I have been snorkeling all around the island, Hilo, Kapoho, Kona, and Kohala, Before living here, I lived on Molokai for several years and there I had the wonderful experience of getting to eat small fresh fish, other than the few expensive varieties, available in grocery stores today. Fish is one of best food sources and should not be wasted as often happens in the aquarium fish capture, shipping off island, and then mismanagement in home aquariums resulting in early deaths.</p> <p>Given the severe planetary climate crisis, "There Were More Than 100 "Billion Dollar" Climate Disasters in the Past Decade," we need to do all possible to become more sustainable in food and fish. The island of Hawai'i also had major fish losses with the recent lava flows in the Puna area covering beautiful Kapoho coral reef and covering the only boat ramp for Puna fishermen. We need to do all possible to protect and replenish our fisheries.</p> <p>Although I am college graduate, getting through the draft EIS was a horrendous task and often seemed to make statements contradictory, confusing, and unclear.</p>	<p>Your comments have been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. 			<p>However the interviews with long time Hawaiian residents, was very interesting and they repeatedly spoke of how there used to be many more fish. I think that it should be our goal to do everything possible to increase fish populations.</p> <p>The EIS seems to claim studies show we have not lost in fish population in last 20 years so no problem with continuing aquarium collection, but my personal observation does not indicate that. And certainly much of the coral has died in last few years and how that will affect the future of the fishes is unknown, but probably badly. I used to see schools of fish, I rarely see that now. I do not find the draft EIS clear or acceptable. I oppose the continuation of aquarium collection other than for educational facilities that can care for the fish properly.</p>	
Matt Binder	HI	12/15/2019	I would like to submit this letter from my friend, David Hunt, as my testimony, as it expresses my own feelings as well.	See response to David Hunt's comment.
Matthew Gurewitsch	HI	1/4/2020	<p>Extinction is forever—it's that simple.</p> <p>It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.</p> <p>Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting.</p> <p>The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.</p> <p>But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,</p> <p>PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS was prepared using the best available science. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC's Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/</p>

			<p>harbor. These fish are part of an intricate reef system, all together making a reef that can help protect shoreline damage from storms, providing a healthy coral infrastructure and home for hundreds of marine life.</p> <p>Educate people that these fish should be in the wild not in tanks. Tanks are prison for these fish, they have no space, no natural life. The high percentage of these fish that die in transit is horrendous and then the chance that they will survive in someone's home is not high either. Let's just realize we are better than this and should not decorate our homes with tropical fish in tanks. As many countries have stopped trophy hunting, people have learned not to put Zebra skins on our floors, or lion heads on walls. Hawaii needs to stop the collecting and killing of tropical fish. This is how a population evolves, little by little we learn and teach one another not to kill or be cruel to other living beings, especially when they are critical in our survival too. Fish keep the reefs healthy and coral reefs rival the Amazon in producing oxygen for the world.</p> <p>We have seen a huge decline in the reefs here in Kona over the past decades and we all need to do our part to repair the damage and protect the reefs for our future generations. Please do not allow the fish collectors to make this trade their livelihood. It is time for them to find a new avenue for their living by not taking the lives of the fish and our reefs to oblivion.</p>	<p>Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>It is acknowledged that reefs face many threats and reef conservation is important; however, as stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time. In addition, Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.</p>
Michael Bell	HI	1/7/2020	<p>My name is Michael Bell. I have been a resident of Hawaii Island for nearly 30 years. I am writing to you voicing my strong opposition to the issuance of reef fish collection permits.</p> <p>I am a proud employee of Body Glove Cruises. We are an ocean adventure company that provides snorkeling, SCUBA, whale watching and historical dinner cruises. During my years living on the island and working in the ocean industry I have noticed fewer and fewer reef fish. Issuing permits for collections of our island's dwindling fish populations would negatively impact our fragile ecosystem. Not only have I personally noticed a decline in reef fish populations, we also have guests who complain about our dwindling populations.</p> <p>Working for a company that provides island guests a safe, ecologically friendly opportunity to enjoy our island's natural resources is a great honor. Body Glove Cruises donates a portion of its proceeds towards the preservation, restoration and education of our coral reefs.</p> <p>Please make your island's preservation contribution by not issuing fish collection permits.</p> <p>Making the "right" decisions now will make a huge difference in our future.</p> <p>Mahalo for your consideration.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.</p>

Michael Gilbert	HI	1/8/2020	Lived on Maui for thirty years and active diver and many years with Earthtrust I watched in Makena as off shore boats docked in our shallow reef and raped our reef fish It's disgusting short sighted and stupid. For want decimate reefs for a few commercial folks who give nothing back Are you kidding we met a few years back as I serve on the Board of our Hawaii State Art Museum. I know you understand so please stand up and be counted help do the right thing	Your comment has been forwarded to the decision makers. The Preferred Alternative is issuance of 10 permits for the WHRFMA. No permits would be issued for Maui under any of the alternatives evaluated in the EIS.
Micholene O'Haheer	N/A	1/6/2020	As a touring family wanting to visit Hawaii we strongly object our family will not visit if this proposal goes a head this is a cruel industry and must be stopped. Our intention is to visit this year. 2020. We will be keeping a close eye on this proposal Thank you tourists for South Africa.	Your comment has been forwarded to the decision makers.
Mike Essner	N/A	12/15/2019	David, the aquarium trade that you are supporting is removing all the fish from the reef the people come here to see! Please the remove your head from your a***** he mediately! Keep fish in the water we will keep people coming to Hawaii How much money are you receiving privately??? TAKE NO REEF FISH BAN SALT WATER AQUARIUMS	Your comment has been forwarded to the decision makers.
Mike Rudenko	HI	1/7/2020	I'm a scuba instructor, I work in the ocean every day. Commercial aquarium collection hurts Hawaii in so many ways. I'll list a few examples here: People come to Hawaii to enjoy the ocean and see beautiful tropical fish. Eco-tourism is ever growing, but with no bright and beautiful reef fish (such as Tangs and all other herbivores) the reef will be dead, which means less people will travel to Hawaii to enjoy it. Commercial aquarium fishing will bring irreversible damage to already harmed reef and its habitants. As we know from many studies reef is a very complex and precisely balanced system, with all links of the chain equally important in keeping that balance. All reef fish play major roles in keeping reef healthy and with recent coral bleaching events our reef needs to be left alone more than ever. Taking reef fish will only increase the damage which will lead to an end of the reef as we know it. The riches of Hawai'i are in the ocean, please don't let them to be taken away. Especially knowing that about 80% of collected reef fish dies during the process and never makes it to aquarium.	Your comment has been forwarded to the decision makers. The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection. A discussion on post-collection mortality has been added to Section 5.4.2 of the EIS.
Ms. Jojo Tanimoto	HI	1/6/2020	I am writing to oppose the draft EIS. 1. There is not enough DOCARE officers to check on infractions as is. 2. There is an unfair advantage to shoreline fishermen who fish for food sustenance. In South Kohala especially, there is a challenge to access favorite areas because of many gated communities and resort	Your comment has been forwarded to the decision makers.

			<p>scuba dive with fish. They want to see healthy coral reefs teeming with reef fish. When I tell guests at my house that Hawaii allows collections for the aquarium trade they are appalled. Utterly appalled.</p> <p>It is your job to protect our oceans. Our reefs. Our aina. Our reef fish. I ask that you not give in to the demands of a few people here and on the Mainland who want to exploit our natural resource.</p>	
Pat Harmon	N/A	1/6/2020	<p>Please protect the fish. The Pet Industry Joint Advisory Council is wrong in their statement re environmental impact of unlimited collection of Hawaii's reef animals. Common sense will tell you that unrestricted access and taking of fishes will lower the numbers. Nature is not infinite and these sentient being should be protect. You have a beautiful coral reef ecosystem. Please don't let them spoil it.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p> <p>All alternatives under consideration would include the existing regulations put in place for the WHRFMA, including MPAs, FRAs, and bag limits. The Preferred Alternative would limit the permit issuance to 10 permits, and would limit permits to the WHRFMA.</p>
Patti Breitman,	CA	1/6/2020	<p>Please keep wild fish in the wild. It is neither sustainable nor wise to collect them without limit for display in private when coral reefs and fish populations are in decline.</p>	<p>Your comment has been forwarded to the decision makers.</p>

			<p>Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.</p> <p>Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting.</p> <p>The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium collector livelihood.</p> <p>But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,</p> <p>PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.</p> <p>I implore you to do the right thing.</p>	<p>The EIS was prepared using the best available science. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC's Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/</p>
Paul Cox	HI	1/7/2020	<p>Thank you for the opportunity to comment on the Pet Industry Joint Advisory Council Draft Environmental Impact Statement (DEIS) for the issuance of commercial aquarium permits for the West Hawaii Regional Fishery Management Area.</p> <p>I am a West Hawaii, South Kona, Papa Bay resident and after review of the DEIS I would like to comment on the environmental, the cultural, and financial impact of the aquarium collecting industry with photo documentation as I have been a primary witness to aquarium collecting in West Hawaii and AQ collectors are personally known to me including individuals of the 14 permit applications to which this DEIS pertains, some represented in the following photos.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference. Breaking or damaging coral will remain illegal under state law (HAR 13-95-70 and HAR 13-95-71) under any of the alternatives under consideration.</p>

			<p>Moving to South Kona as a retiree with no prejudices or knowledge that aquarium collecting took place in the wild, while swimming recreationally near my home in Papa Bay I observed collecting of ornamental fish, I thought it odd and wrong that an apparent variance on coral damage was inherent with an aquarium collecting permit. After being advised by a Honokohau DOCARE officer via phone that coral damage certainly was an offense but that they would have to witness the coral damage and response time would prohibit that, I took up underwater photography.</p> <p>Logistics ruled DLNR's Conservation and Resources Enforcement out of the equation as Papa Bay is over an hour away from the Honokohau DOCARE office. Being aware that the breaking and damaging, with dive fins, leaded nets, and stick implements, of stony coral was occurring (HAR 13-95-70) I felt ethically obligated to assist, especially considering that I was one of very few non-collectors who have ever witnessed AQ collecting.</p> <p>Although not familiar with Hawaii's standards and training, as a retired California Peace Officer I Intended to contribute professionally and positively. My first actions were to swim to collectors that came into Papa bay, introduce myself and tell them I intended to photo document when I observed the reef being busted up. Four out of six sets of collectors never came back to Papa.</p> <p>Photos attached are small for the sake of a manageable email file. Full-size photos are available at this dropbox link: https://www.dropbox.com/sh/1ja1vagb7jI3suq/AAAafxptHkElgboCx6pmDpWHa?dl=0</p> <p>DEIS 2.0 Purpose and need</p> <p>2.1 "The purpose of the Applicant's action is to ensure that commercial aquarium fish collection allows for the lawful, responsible, and sustainable commercial collection of various fish species from nearshore habitats."</p> <p>2.2 "The need for the Applicant's action is to continue commercial aquarium fishers' livelihoods in compliance with all applicable laws, rules, and regulations pertaining to the industry.</p> <p>Photos #1 & 2, anchor damage, Papa Bay, February 25, 2014</p> <p>I filed anchor damage to coral report with DOCARE and it was referred to the Hawaii county prosecutors office. I was never interviewed. Months later I was told by an office assistant at the Hawaii County Prosecutors office that my case number was not in the system. The reporting DOCARE officer that took my report said that although it is clear that the AQ collectors are anchored in a healthy coral area it is not clear that any damage occurred therefore the case was dropped. In photo #1, the collector is aware that they have anchored into a rich coral area but made no effort to move and set the anchor into a sandy</p>

			<p>or rubble area. When this collector returned to Papa Bay a few weeks later, he was angry and stated that I should have understood that the wind came up after he was in the water causing the coral damage. In photo #2, I would like to point out that the majority of AQ collectors do not use buoyancy control device (BCD) vests, also note that knee pads are worn over the wetsuit. As with this photo, my observations of collectors confirm that contact with the reef is an inevitable part of the collecting process.</p>	
Paul Cox	HI	1/7/2020	<p>Photos #3 & 4, Poaching, incomplete vessel hull number and no AQ permit number on equipment, Papa Bay, March 18, 2014. I filed a poaching report with photos to DOCARE and this was also passed to the Hawaii County Prosecutors office. I was never interviewed and my subsequent phone inquiry produced the same result from the prosecutors' office, my case number was not in the system. The reporting DOCARE officer never returned my calls. Photo #3, This photo illustrates contact with the reef. In the DEIS executive summary, page ii, the statement "the aquarium industry has no significant impact on the reef ecosystem" and "the targeted collection of smaller, less fecund individuals, commercial aquarium collection likely has minimal impacts on populations in general". Hawaii's endemic finger coral makes the perfect sanctuary for the targeted juvenile herbivores, a maze to foil predators. For collectors to herd the fish into the apex of the collection net the collector must use an aggressive technique, the use of sticks to penetrate the finger coral depths and the collectors themselves crawling along the reef floor. In this photo, a rough count reveals 75 Yellow Tang and 80 Kole, this was one of four setups on the first of two dives by these collectors. One thousand fish may have been taken that day. This day most certainly had a significant impact on the reef ecosystem. Photo #4, the white broken tips of finger coral visible mostly to the right of the nets, this is a photo taken while the collectors were packing up gear upon completion of the dive. Photo #5 & 6, poaching, Collecting inside the boundaries of the Miloli'i Fish replenishment area (FRA), June 4, 2015</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The cumulative impact of poaching and underreporting has been added to Section 5.4.3.6 of the FEIS.</p> <p>Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference. Breaking or damaging coral will remain illegal under state law (HAR 13-95-70 and HAR 13-95-71) under any of the alternatives under consideration.</p>
Paul Cox	HI	1/7/2020	<p>DEIS 1.2.3.2 HAR 13-60.4 "Aquarium collection is prohibited within FRAs, FMAs, and MLCDS. I sent photo documentation and a report to DOCARE as the responding DOCARE officer was unable to respond before these three AQ collectors on this Miloli'i, South Kona based collectors' boat left the area. A follow-up call to Honokohau DOCARE revealed that the collectors in the photos had reported to the DOCARE office and apologized for unintentionally collecting AQ fish inside the FRA and no charges were filed. Would the collectors have reported to the DOCARE office if they hadn't known I photographed the violation? and should</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Under the Proposed Action, permit holders will continue to be required to comply with all permit conditions.</p>

Commenter	State/ Location	Date Received	Comment	Response
			<p>public trust, the taxpayers. Road construction, environmental study and the resulting protections to plant and wildlife, and monitoring personnel, these costs are covered before a tree drops. If an endangered or threatened species or a historical/cultural site is discovered the timber sale does not happen. During and after the timber harvest forest service monitoring persons are on site to document that environmental safeguards such as erosion control are satisfactory.</p> <p>For the most part the people in the logging industry love the woods and understand the importance of sustainability of our forests. But I can affirm that when profit is a factor shortcuts will be taken if the monitoring is not in place. More than one big Sugar Pine has made it to the mill with no evidence that it ever existed. Humans can justify actions and when something is gone it is often forgot.</p>	
Paul Cox	HI	1/7/2020	<p>DLNR Mission: "Enhance, protect, conserve and manage Hawaii's unique and limited natural, cultural and historic resources held in public trust for current and future generations of the people of Hawaii nei, and its visitors, in partnership with others from the public and private sectors."</p> <p>Public trust does not owe fourteen or four hundred individuals our natural resources. Until the removal of reef life can happen with assurances that such removal will enhance, protect and conserve the reef for future generations and the cost of those assurances, such as effective law enforcement, be paid for by the individuals removing that reef life, the moratorium needs to remain in place.</p> <p>Mahalo Nui Loa for your service,</p>	Your comment has been forwarded to the decision makers.
Paul Cox	HI	1/7/2020	<p>Last one! Photo #8, Anchor Chain in Coral</p> <p>On the Memorial Day holiday, May 29, 2017, an AQ vessel with three collectors was working in Papa Bay. I photographed the AQ vessels anchor, Photo #8, then continued on swimming with four other neighbors. Moments later the AQ vessel buzzed us at full 200hp throttle missing my wife by 15 feet, they knew we were there as one of the collectors was waving at us with her middle finger. A conflict between recreational use of a neighborhoods swimming and snorkeling area and AQ collectors on a holiday weekend, I am thankful no injuries occurred.</p> <p>Whats important to note in this photo is the 20 plus feet of the 9mm chain and the small claw anchor. Most AQ collectors, as most west side boaters in general use the chain to anchor not the actual anchor itself, enabling easy pull-up but damaging more square meters of coral as a result. A system of day-use mooring buoys has not been established in AQ collecting areas.</p>	Your comment has been forwarded to the decision makers.
Paul Juszcak	NY	12/17/2019	<p>Please support this draft. Do the right thing!</p> <p>Thank you</p>	Your comment has been forwarded to the decision makers.

Paul Kohman	N/A	1/7/2020	An environmental review done by an organization with the sole purpose of financial gain by its members should not be considered to be valid for environmental conservation purposes. Please do not allow this review to influence your decisions regarding the operation of the reef fish collecting trade trade in Hawaii. Reef wildlife is in dire need of protection by laws and enforcement.	Your comment has been forwarded to the decision makers.
Paul Moss	MN	1/6/2020	I am very concerned about the impact of fish collection for the aquarium trade on Hawaii's wild fish populations. I don't feel that the Pet Industry Joint Advisory Council's environmental impact statement is accurate in "surmis[ing that] the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem". Hawaii's native fish need and deserve effective legal protection and should be left in the wild. Please don't allow these fish to be collected. Thank you for your consideration of these comments.	Your comment has been forwarded to the decision makers. The commenter incorrectly states that the EIS surmises "that the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem". The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.
Penny Niederer	N/A	1/6/2020	Please, do NOT allow the reef fishing permits!!! I swim the Kailua pier, down at Magic Sands, and around Kua Bay. For 30 years, I've swum these waters and the changes are so devastating between the coral bleaching and the lack of fish. We need these reef fish, not more people fishing these reef fish. Please, please do NOT allow more permits. I'm completely opposed to any more permits so we can keep the few reef fish we have left to help balance our ecosystem. Thank you for listening, and a bigger thanks if permits are NOT issued	Your comment has been forwarded to the decision makers.

Peter Riva	NM	12/2/2019	PIJAC is a lobbying group for the commercial pet trade . PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on dire hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.	Your comment has been forwarded to the decision makers. The EIS was prepared using the best available science. PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC’s Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/
Philip Hayward	HI	1/7/2020	Considering: unwarranted culling native populations of fish in a challenged and changing finite reef resource area; aquarium fishing mortality is such a high percentage of catch; aquarium fishermen are highly unsupervised; extremely limited HI employment base propped up by aquarium fish; It should be apparent that this activity is not in the public's, nor in the malama-aina interest and should not be allowed in Hawaiian waters.	Your comment has been forwarded to the decision makers.
Rachel Silverman	HI	12/5/2019	I have been swimming and snorkeling with my husband and daughter on our beautiful coral reefs, in the last six years we have seen two major bleaching events in Hawaii. More than 80% of cauliflower coral colonies have died due to warmer temperatures caused by climate change. The White List fish species are all dependent on the health of the reef as it is their birthplace, nursery, and home. Just as the fish depend on the coral, the coral depends on the fish to help fight off the ever encroaching algae. We have seen the reef habitat for the fish, that this DEIS proposes we start collecting again, shrink and contract. The reef needs a healthy balance and right now there are so many factors that are impacting it that it would be harmful to the continued efforts to protect these vital habitats in West Hawaii. Our main industry is tourism, and harming this potential revenue stream for the benefit of a small number of people actually in Hawaii is inappropriate and reckless. Please leave the aquarium fish collection ban in place and protect these vulnerable resources for our communities and keiki!	Your comment has been forwarded to the decision makers. The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.
Ralph Jewell	HI	1/7/2020	I understand your office will be issuing permits for more fish collecting off the reefs here in Hawaii. In the early 70's, I witnessed the decline in reef fish population because of collection. I really do not see the reason why this has to continue to this day. There is so much conversation about the world's fragile reefs and the importance of them to civilization. Our glassbottom boat operation has witnessed a decline in tropical fish, over the last 20+ years. The 20 years before that, our snorkel operation saw the beginning of the decline, as a	Your comment has been forwarded to the decision makers. The EIS analyzed the impacts of issuing Aquarium Permits. The DLNR has not yet made a final decision on whether or not to issue the permits. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with

			<p>result of collecting, coral bleaching or other reasons. Permitting more destruction of the reef really does not make any sense, except for the companies that will take the resource away for their own profit. They will ship these fish elsewhere, where a huge percentage will die, even before they make it to a consumer's tank. Due to the decline, these companies only have a small window of operation and will eventually fold, as the resources disappear. What are you thinking? I wrote letters to the state in the early 70's and ended up being threatened by local collectors. The letter ended up landing in the hands of a individual who's son was a collector. This letter may simply land on deaf ears. I guess time will tell. I invite you, and your staff to join us on our tour, and see the reef now, and then come again in a year to see the change. This makes no sense. Please let me know why this is even considered. How about enforcing rules already in place. We see that enforcement is difficult as it is, and now you open up more need for enforcement. There is currently little enforcement to limits, or methods in collecting, or areas permitted. What are you thinking? Please reply.</p>	<p>population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>A discussion on post-collection mortality has been added to Section 5.4.2 of the EIS.</p>
Rebecca Canright	N/A	1/6/2020	<p>As a college student who cares deeply about Hawaii's wild marine life, I recently learned that our state is considering the impact that fish collection for the aquarium trade has on wild fish populations. I ask you respectfully to strongly limit the amount of native fishes that can be caught for the aquarium pet trade. Hawaii is expected to lose 70% of our coral reefs in the next couple of decades, thus it is our duty to steward and protect our state's incredible marine diversity from exploitation and over-harvesting.</p>	Your comment has been forwarded to the decision makers.
Renea Cooper	N/A	1/6/2020	<p>Extinction is forever—it's that simple. It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium</p>	Your comment has been forwarded to the decision makers.
Richard Farnham	HI	1/7/2020	<p>I completely support Maggie Brown in her concern for the coral reefs and indigenous fish in Kona waters. It seems almost criminal to further deplete our reefs for the benefit of a few collectors. I'm sure there are other places to collect fish with far less impact. Let's protect the local businesses that support the reefs, instead of supporting the businesses that exploit them.</p>	Your comment has been forwarded to the decision makers.
Richard Marks	MA	1/6/2020	<p>I swim in the ocean every day and have been shocked by the rapid decline of small tropical fish in our reefs. I understand they are being harvested commercially to be sold for aquarium fish.</p>	Your comment has been forwarded to the decision makers.

			<p>Is there anything that can be done about this on your side? Mahalo in advance!</p>	
Robert B. Smith	N/A	1/5/2020	<p>I was given your name to email and I assume you work with DNLR. I will try to call your office this week. As a taxpayer who pays your salary, I really don't appreciate you selling our natural resources. I snorkel on Maui everyday and even though if I understand correctly the permit is for the Big Island, I can only assume the waters and fish populations are somewhat similar. There are not abundant fish in our waters. You rarely see schools of fish or huge varieties so I find it hard to believe that someone could do a multi page study and come up with the notion that there are so many fish in Hawaiian waters that we can sell them off to who ever is paying you. I hear from many visitors, " where are the fish". It's depressing. Please tell me: 1. Your telephone number so I can discuss with you. 2. How this benefits the tax payer and the visitor. 3. What exactly is in it for the state.</p>	Your comment has been forwarded to the decision makers.
Robert E. Rutkowski	N/A	1/8/2020	<p>A coalition of Native Hawaiians and conservation groups has warned the Hawai'i Department of Land and Natural Resources (DLNR) that the agency could end up back in court if it doesn't end a policy allowing the practically unlimited extraction of reef fish and other aquatic creatures for the aquarium pet trade without any environmental review, circumventing a court injunction halting such activities until the review process is completed. The policy began after the Hawai'i Supreme Court ruled in September 2017 that aquarium collection under permits is an action subject to environmental review under the Hawai'i Environmental Policy Act (HEPA), and the circuit court subsequently voided all unexpired permits and placed a moratorium on renewing or issuing new permits pending the environmental review process. Under the new policy, DLNR has been renewing and issuing new commercial marine licenses to aquarium collectors without also requiring aquarium collection permits or HEPA review, as long as collectors don't use fine-meshed nets and traps. Yet, the agency does nothing to verify the methods collectors claim to be using. It would be extremely difficult to gather the types and amounts of animals that the industry has continued to collect without using fine-meshed gear, which has always been the primary means for gathering aquarium fish. DLNR's policy has enabled the aquarium trade to harvest more than half a million marine animals without any environmental review during the past two years. Instead of embracing the courts' rulings and ensuring that the</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The concept of "unlimited" collection is speculative and not reasonably foreseeable. 			<p>environmental effects of aquarium collection are properly considered, the agency has given the industry a free pass to continue collecting without any oversight. Deregulation for the benefit of private industry is completely contrary to DLNR’s constitutional mandate to safeguard our marine life for present and future generations.</p> <p>The policy violates HEPA, state aquarium collection laws, and the public trust doctrine under the Hawai’i Constitution.</p> <p>I was shocked to learn that under the agency’s watch, the industry has continued ravaging Hawai’i’s reefs without any assessment of environmental harm, despite the courts’ rulings. Taking hundreds of thousands of marine animals for private profits obviously requires vetting under the environmental review process.</p> <p>The collected animals are primarily herbivorous reef-dwellers that serve important functions in the coral reef ecosystem, such as helping to control algae growth. Studies have shown that reducing the abundance and diversity of reef fish and important invertebrates affects a reef’s ability to respond to stresses or disturbances.</p> <p>Telling the aquarium trade it no longer needs permits or HEPA review to continue operating makes a mockery of the agency’s duty to conserve and protect our reefs and fish populations so that they can support public purposes, including traditional and customary practices such as subsistence fishing.</p> <p>Hawai’i’s reefs are the lifeblood of kanaka maoli and their communities.</p> <p>The agency’s decision to deregulate the aquarium trade threatens Hawai’i’s precious reef ecosystems, which are already at risk due to climate change.</p> <p>DLNR is overseeing the ongoing court-ordered environmental review process, currently underway for West Hawai’i and O’ahu. But unless this policy is changed, the industrial-scale extraction of marine animals purportedly using non-fine-meshed gear will continue without any environmental review under HEPA.</p>	<p>species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p> <p>Legal commercial aquarium collection has continued outside of the WHRFMA using gear/methods other than fine mesh nets, which do not require an Aquarium Permit. No collection has been allowed in the WHRFMA since the supreme court ruling.</p>
Robert Kitsell	HI	1/7/2020	<p>I strongly object to the extraction of Hawaiian Reef fish by Aquarium fisherman.</p> <p>The fish need to be allowed to live on the reef where they belong.</p> <p>On many parts of the Big Island Reef fish are scarce please do not allow the permits.</p>	Your comment has been forwarded to the decision makers.
Robert Wintner	HI	12/2/2019	<p>THE AQUARIUM TRADE in cahoots with Hawaii DLNR appeals for livelihood in an “environmental review.” DLNR commissioned this report from the Pet Industry Joint Advisory Council (PIJAC). Did Hawaii taxpayers fund this report? Or did the aquarium trade pay for it?</p> <p>PIJAC is a lobbying group for the commercial pet trade and not in the best interests of Hawaii reefs or people. PIJAC FAILS to recognize the Hawaii Environmental Protection Act (HEPA) as required in the</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS is an Applicant-prepared EIS, and was not funded by the DLNR.</p> <p>Legal commercial aquarium collection has continued outside of the WHRFMA using gear/methods other than fine mesh nets, which do not require an Aquarium Permit. 			<p>HAWAII SUPREME COURT RULING.</p> <p>PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on dire hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.</p> <p>When the Hawaii Circuit Court ruled on this issue, in favor of the DLNR Director’s discretion, that director was William Aila, aquarium collector.</p> <p>When the Intermediate Court of Appeals ruled for the aquarium trade, DLNR Director/Nature Conservancy Director Suzanne Case said, “It’s been litigated!”</p> <p>THEN the Hawaii Supreme Court ruled that no further aquarium permits should be issued until Environmental Assessment, with injunctive relief to SHUT IT DOWN NOW! DLNR Director Case trumped that ruling with a new rule of her own: permits are no longer required. Aquarium collecting now takes only a commercial fishing license. Many Kona aquarium collectors never stopped collecting, with tacit support from Kona DAR and Hawaii DLNR. The vast majority of Hawaii people want the aquarium trade to end. And so do millions of visitors around the world, who hold Hawaii reefs in their hearts. Reef tourism supports many thousands more people, with revenue 400 (four hundred) times greater.</p> <p>DLNR Director Case scoffed the Supreme Court ruling and met with aquarium collectors to advise on speech and behavior in the 2017 legislative season. These meetings are in the public record. When the legislature passed Senate Bill 1240 to phase out the aquarium trade, Case prevailed again on Governor Ige to veto the bill. Ige knows nothing of ocean species or habitat.</p> <p>Spirit and intent in the Supreme Court ruling is clear. The PIJAC PROMO piece claims a surge in recovery, as if that should justify a new wave of reef carnage. Those claims are not based in reality. The PIJAC PROMO piece notes a catch limit on Achilles tangs of 5 per collector per day, down from 10 per day. Few people have seen 5 Achillies tangs in a single day in many years. All aquarium trade self-imposed catch limits are bogus, far beyond historical catch. This PIJAC Promo piece is not an environmental review but a commercial appeal to convert Hawaii reef species and habitat to money, to deny Hawaii and its people— especially its host culture—of iconic, endemic and economic treasures. The PIJAC PROMO piece supports a mainland amusement industry that condemns reef wildlife to a vicious cycle of replacement. THAT is what the aquarium trade calls “sustainable.” Enough!</p>	<p>WHRFMA since the supreme court ruling.</p> <p>The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.</p> <p>It should also be noted that Achilles Tang are also collected as part of other fisheries (e.g., food fishery), and commercial aquarium collection is currently the only fishery with an existing bag limit.</p> <p>PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC’s Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. Ron Hirschi	WA	12/27/2019	<p>I am a fish biologist and though I live in western Washington, I've spent many years snorkeling and fishing over on Kauai. I've also had the honor of doing research out on Midway with NOAA, The US Fish and Wildlife and the State of Hawaii. In addition, I write Hawaiian nature books for keiki.</p> <p>In my experiences observing and counting reef fish for more than 30 years, I've seen a sad decline in many species. I know there are many causes for population declines, but I've seen aquarium harvest and know many species are actually disappearing from our reefs due to the collecting of yellow tangs and many other fish valued by the aquarium trade.</p> <p>I urge you to ban the trade or greatly limit ability to collect our fish so that future generations can enjoy the diversity of fish once present when I first came to the islands.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>As stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. Additionally, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui.</p>
Ron Tubbs	HI	1/5/2020	<p>I am asking DLNR for the complete renewal of all aquarium small mesh permits for Hawaii. The 490 page environmental review and past DLNR fish counts have already proved the sustainability of the fishery at past full fishing takes.</p> <p>It was unfair for the fishery to be the only fishery or DLNR permitted ocean user to have to do an EIS. Please correct this by reinstating the issuance of all permits.</p> <p>This year has seen another large fish drop and ocean fish populations are very healthy. Any change in fish populations will be address by DLNR and the fishery. We strongly believe in a fluid ocean management approach.</p> <p>We did work with DLNR and West Hawaii Fishery Council in the past to create new rules in 2015 to ensure sustainability and health fish populations. We will continue to do so if any global warming issues need to be addressed in the future.</p> <p>Right now Hawaii fish populations are increasing, and reefs are healthy. Links below with the facts:</p>	<p>Your comment has been forwarded to the decision makers.</p>

			<p>http://hawaiitropicalsaltwateraquariumfish.com/index.html The Environmental review concludes that the fishery can reopen and it is not only sustainable but a model fishery! The link to the full 490 page environmental review: http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2019-11-23-HA-DEIS-Hawaii-Island-Commercial-Aquarium-Permits.pdf Those who oppose the fishery say we are unlimited in catch and the fishery can deplete the reefs, this is not true we are limited by many laws, catch limits, size limits, closed areas, limited holding on boats, limited to dive deco times, and recent 2015 rules were passed with even more laws to ensure sustainability of the fishery. Link to those laws: https://dlnr.hawaii.gov/dar/fishing/fishing-regulations/ The fishery is so well regulated and studied it is considered a model fishery because it has been proven sustainable. Thanks for your time and more info for your review: Hawaii's Fish Populations Increase (it is happening again this year 2019 and into 2020) Videos show tropical fish swarming state's reefs</p>	
Roz Downing	CT	1/6/2020	Native fishes need and deserve legal protection, and they should be left in the wild. Please do not cater to the self-serving aquarium industry.	Your comment has been forwarded to the decision makers.
Ryan Christopher	HI	12/4/2019	<p>Granting 14 people aquarium fish collecting permits, with loose rules, realistically policed by no one, is a terrible idea. 14 more people making a (potentially full-time) career out of stripping our reefs of "aquarium fish " is detrimental to the health of the ocean, The west side of Hawaii Island and our own existence (loss of species on the planet has a domino effect that does in fact affect human beings). There are already many challenges that wildlife on the Westside have had to endure: resort/golf course runoff, Gated community on cliffs' landscape run off, Bloom which is said to be caused by Energy Lab that killed off Honokahau Harbor, and it is said that the Kawaihae harbor's bad design has stifled the circulation in the region and sickened fish. What is frustrating is, in the past, it seems that the state has sided with aquarium fish trade collectors and flown the doors wide-open for their collecting while regulating sustenance fishing of the same fish. Aquarium fish trade collectors have already stripped other islands of the beautiful reef fish and coming to Hawaii Island to do the same, must not be allowed. Hawaii's resources should not be for sale. The County of Hawai'i has declared an emergency with the state of the climate (changing). And because we are experiencing extreme rains, run off, reef bleaching events, etc., I Believe that we need to give the ocean a well-deserved break. I cannot imagine that an EIS could be done with any accuracy if</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>

It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we bloody well can put a stop to aquarium collecting.</p> <p>The so-called "Environmental Review" consists of 500 pages of</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS was prepared using the best available science. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period. The EIS acknowledges that reefs and reef fish face many threats. The DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as</p>

			<p>soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii’s DLNR (to that department’s shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.</p> <p>But where is the traders’ credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii’s taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point.</p>	<p>the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>
Sandra Romer	N/A	1/7/2020	<p>I am writing to you today to encourage you & your team in the complete & final banning of fish collection (for ornamental purposes). I see no reason why the state of HI and the coastline of West Hawaii in particular should be such a source for aquarium fish around the world. Anyone who has spent time in the waters off HI will tell you about the dramatic decrease in the amount of fish life here. The excitement on various Facebook groups when a fish such as a Tinkers Butterfly fish is spotted while diving, should be enough of a sign that this collection industry is causing untold harm to our marine species.</p> <p>We need all these fish to have a complete functioning ecosystem...each creature plays it's part...now, we need to play ours & support those without voices.</p> <p>Collecting for home aquariums and to line the pockets of mainland sellers is not a valid use of any HI governmental permit. Surely, we should restrict collecting to only those needed for public/scientific aquaria. This can then be the inspiration for generations of fish lovers & marine enthusiasts.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>
Sari Kala	N/A	1/7/2020	<p>Stop aquarium trade !!!!</p>	<p>Your comment has been forwarded to the decision makers.</p>
Sera Bell	N/A	1/6/2020	<p>I am writing this email to inform you that I am opposed to the passing of the 14 new permits allowing the collection of Hawaiian reef fish on Hawaii Island.</p> <p>As a diver and general lover of the ocean, I have seen so much reef damage occurring over the past few years alone. Our reefs are already suffering so much, and the reef fish are an integral part of reef survival. The removal of these fish upset the natural ecosystem that allow the reefs to grow and heal, which they already need so much.</p> <p>Please take into consideration the state of the reefs, and the ocean at large, and do not pass the new fish collection permits.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>It is acknowledged that reefs face many threats and reef conservation is important; however, as stated in the EIS, from 2003 to 2017, mean coral cover declined less within Open Areas than within areas closed to commercial aquarium collection (though the difference was not statistically significant; DAR 2019a). The DAR (2019a) concluded that commercial aquarium collecting is not having any measurable negative impact on percent coral cover or change in coral cover over time. In addition, Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.</p>

Shannon (last name not provided)	N/A	1/7/2020	Our reefs are suffering and need the fish in the ocean to help preserve the symbiotic relationship needed for survival. I oppose issuing more permits for fish collections on Hawaii island. Thank you for your time, Shannon Velazquez	Your comment has been forwarded to the decision makers.
Sharon J. Langlois	N/A	1/6/2020	Please protect Hawaii's fish from the aquarium trade. Fish are sensitive, sentient beings and deserve to be allowed to swim free in the ocean. I have been to both the Big Island and Maui and have taken snorkeling trips on both islands. It was breathtaking beautiful. It was like being on a different planet. That is how fish should be viewed and enjoyed. Our oceans are dying due to exploitation. We need to keep ecosystems intact and thriving. Thank you for your time and attention.	Your comment has been forwarded to the decision makers.
Shayla Middleton	N/A	1/7/2020	The aquarium trade is being protected by DLNR at the expense of the reef species and habitat around our islands. Please discontinue this practice immediately. We are watching closely and will not relent on this issue!	Your comment has been forwarded to the decision makers.
Shayla Middleton	HI	11/28/2019	<p>PIJAC is a lobbying group for the commercial pet trade . PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on dire hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.</p> <p>This sneak attack on Hawaii reefs has a comment period that spans Thanksgiving, Christmas and New Years. When the Hawaii Circuit Court ruled on this issue, in favor of the DLNR Director's discretion, that director was William Aila, aquarium collector. When the Intermediate Court of Appeals ruled for the aquarium trade, DLNR Director/Nature Conservancy Director Suzanne Case said, "It's been litigated!" She scoffed the Supreme Court ruling. She met with aquarium collectors to advise on speech and behavior in the legislative season. These meetings are in the public record. When the legislature passed Senate Bill 1240 to phase out the aquarium trade, Case prevailed again on Governor Ige to veto the bill. Ige knows nothing of ocean species or habitat.</p> <p>The Hawaii Supreme Court ruled that no further permits should be issued until Environmental Assessment, with injunctive relief to SHUT IT DOWN NOW! DLNR Director Suzanne Case trumped that ruling with: permits are no longer required, for aquarium collecting. It takes only a commercial fishing license. Many Kona aquarium collectors never stopped collecting, with tacit support from Kona DAR and Hawaii DLNR. When an aq collector attacked a woman with a GoPro camera at at Keawaiki, DLNR visited Kona to comfort the aquarium collectors. Now DLNR Director/TNC Director Emeritus Suzanne Case promotes the TNC agenda, deferring to Big Fishing. The aquarium</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Legal commercial aquarium collection has continued outside of the WHRFMA using gear/methods other than fine mesh nets, which do not require an Aquarium Permit. No collection has been allowed in the WHRFMA since the supreme court ruling..</p> <p>The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.</p> <p>PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC's Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/</p>

			<p>trade is not fishing. It's a devastating commercial enterprise that trashes nearshore habitat and species. The vast majority of Hawaii people want the aquarium trade to end. And so do millions of visitors around the world, who hold Hawaii reefs in their hearts. Reef tourism supports many thousands more people, with revenue 400 (four hundred) times greater.</p> <p>Spirit and intent in the Supreme Court ruling is clear. The PIJAC PROMO piece claims a surge in recovery to justify a new wave of reef carnage. The PIJAC PROMO piece notes a catch limit on Achilles tangs of 5 per collector per day, down from 10 per day. Few people have seen 5 Achillies tangs in a single day in many years. This PIJAC Promo piece is not an environmental review but a commercial appeal to convert Hawaii reef species and habitat to money, to deny Hawaii and its people of iconic, endemic and economic treasures, to support a mainland amusement industry, to condemn reef wildlife in a vicious cycle of replacement. THAT is what the aquarium trade calls "sustainable." Enough!</p>	
Shelby Serra / Pacific Whale Foundation	HI	1/6/2020	<p>I left a message on your office phone regarding submitting comment so please let me know if you are not the right person or place. I am submitting comment on behalf of Pacific Whale Foundation (PWF) regarding the Issuance of Commercial Aquarium Permits for the WHRFMA. It is listed on the DEIS as HRS Chapter 343 Entry #622. You are the contact listed on this DEIS. Please let me know if there is an online portal that this needs to be uploaded to. Tomorrow (Jan 6) marks 45 days since the DEIS was published to public comment, and therefore the deadline for comment. Please find our attached comments.</p>	Your comment has been forwarded to the decision makers.
Shelby Serra / Pacific Whale Foundation	HI	1/6/2020	<p>Pacific Whale Foundation (PWF), a 501 (c)(3) nonprofit organization has a mission is to protect the ocean through science and advocacy and to inspire environmental stewardship. The objective of the proposed action is for the Department of Land and Natural Resources (DLNR) to issue 14 Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA). I am testifying in opposition of the issuance of the 14 aquarium permits and support a No Action Alternative, where no commercial aquarium collection would occur within the WHRFMA.</p> <p>Hawai'i's DLNR Division of Aquatic Resources has approved the Pet Industry Joint Advisory Council (PIJAC) to apply for the issuance of Commercial Aquarium Permits for the WHRFMA. This project involves review of both the use of state lands and the use of conservation districts that are involved in the proposed permitting areas.</p>	Your comment has been forwarded to the decision makers.

Commenter	State/ Location	Date Received	Comment	Response
Shelby Serra / Pacific Whale Foundation	HI	1/6/2020	The Preferred Alternative includes the issuance of 14 aquarium permits for the WHRFMA, and implementation of a reduced bag limit for Achilles Tang of 5 per day. Implementation of the Preferred Alternative, according to this DEIS, would ensure the lawful, responsible, and sustainable commercial collection of 40 fish species deemed "White List Species" from the WHRFMA. It is unclear why there is only a bag limit for Achilles Tang. Without a complete understanding of a sustainable catch limit, imposing a limit on one species leaves room for excessive take of all other species. Without a verification system to ensure accuracy of self-reported data, there is no way to know what the sustainable catch limit is. This draft outlines a large range for sustainable catch limits, capped at a high percentage (25%). Using the precautionary approach, the lowest estimated percentage of sustainable take should be applied (5%).	<p>Your comment has been forwarded to the decision makers.</p> <p>The Preferred Alternative has been revised to include issuance of 10 permits. Existing bag limits on other species are explained in Section 1.2.3.2 of the EIS, and would be implemented under any of the alternatives analyzed.</p> <p>Collection under the Preferred Alternative in the FEIS is below 2% for all of the 38 White List Species with a population estimate. The two species which do not have a population estimate, the Flame Wrasse and the Longfin Anthias, have been collected on average less than 175 individuals per year, even when the number of Aquarium Permits was unlimited.</p> <p>Furthermore, the DAR (2019a) has noted that 24 of the 40 White List Species have remained stable or significantly increased between 1999 and 2017, when commercial aquarium collection was at a higher rate than what would occur under the Preferred Alternative. For the 12 White List Species which had significant declines, as noted in Section 5.4.3, these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline (DAR 2019a). Because these declines are occurring in FRAs and/or MPAs as well (i.e., areas not open to commercial aquarium collection) it is reasonable to assume that banning commercial aquarium collection would not halt the declines.</p>
Shelby Serra / Pacific Whale Foundation	HI	1/6/2020	Pacific Whale Foundation acknowledges that the best available science indicates less than significant direct and indirect impact on reef fish populations with the preferred alternative outlined in this DEIS. Although the Coral Reef Ecosystem Program (CREP) data are the most comprehensive data publicly available in fish populations estimates, certain limitations of the surveys may lead to an underestimate of some populations. Short period of survey effort, exclusive survey zone and the misidentification of fish disallow this survey from collecting accurate fish population numbers. Determining actions based on these numbers can lead to an overestimating population numbers and misidentifying take limits.	<p>Your comment has been forwarded to the decision makers.</p> <p>The best available science was used in preparation of the EIS, and the limitations of both the CREP and WHAP survey methods are described in Section 4.4.7.</p> <p>If CREP populations are an underestimate, then actual impacts to the population will be even lower than anticipated.</p>
Shelby Serra / Pacific Whale Foundation	HI	1/6/2020	In review of this DEIS, it is unclear who are the interested parties involved in the issuance of these permits. A better understanding of interested parties within PIJAC would shed light on the intentions of this application. This draft outlines calculated economic benefits based on a 17 year time frame between 2000 and 2017 and created a 5-year analysis period, inflation-adjusted, to these permits which under the Preferred Alternative, work out to be approximately 0.01% of	<p>Your comment has been forwarded to the decision makers.</p> <p>See Section 2.0 of the EIS for the purpose and need of the proposed action. The EIS discloses impacts of the proposed action (regardless of magnitude), including socioeconomic impacts.</p>

Commenter	State/ Location	Date Received	Comment	Response
			Hawai'i's ocean economy, and an even smaller percentage of the overall economy in the State. With such a minute economic benefit, the purpose of this permit issuance is unclear.	
Shelby Serra / Pacific Whale Foundation	HI	1/6/2020	<p>There are a number of impacts outside of aquarium fisheries that are effecting coral reefs, including recreational aquarium fish collection, non-aquarium fishing, tourism and climate change. Under the climate change umbrella there includes additional stressors such as coral bleaching and ocean acidification, which lead to coral death. We believe that these cumulative impacts outweigh a single stressor. Using the precautionary principle, without a complete understanding of the environmental stressors on reefs in relation to climate change and other impacts, there should be no introduction of additional stressors to the reef ecosystem.</p> <p>Due to the near negligible economic benefit and the introduction of a new stressor on a currently stressed ecosystem, we oppose the issuance of the 14 aquarium permits and support a No Action Alternative, where no commercial aquarium collection would occur within the WHRFMA.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The commercial aquarium fishery has existed in Hawai'i since the 1940's, and does not represent a new stressor. Collection under the Preferred Alternative is anticipated to be lower than conditions prior to the October 2017 supreme court ruling.</p>
Sheryl Weinstein	N/A	1/7/2020	Please, please, please do what you can to help stop tropical fish collection in Hawaii—especially West Hawaii. As a scuba diver, I've seen a sad decline in reef fish populations everywhere I dive in the last 19 1/2 years.	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>
Shirley Spencer	HI	1/6/2020	<p>My name is Shirley Spencer. . I have lived on the Big Island for 45+ years and have enjoyed snorkeling and diving since moving here. The massive decline in marine life, mostly fish has declined immensely since then. I can compare underwater coral reefs/marine life from the 1970's- 80's to now and the change is incredible.</p> <p>I am writing to respectfully inform you, I oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish.</p> <p>Permitting 14 more companies to collect Hawaii's Tropical Fish for entertainment and take them from Hawai'i's Reefs is counter-</p>	Your comment has been forwarded to the decision makers.

Commenter	State/ Location	Date Received	Comment	Response
			effects to the biological and cultural resources that are part of the public trust the State of Hawaii has the responsibility to protect. Future serious impacts to the coastal near-shore habitat due to climate change are ignored in this document, and the proposed action alternatives do not address mitigation for the anticipated loss of coastal habitat. The DEIS preferred alternative proposes to exploit a public resource for the economic benefit of a few, (who have been non-compliant with past rules and regulations), at the expense of the subsistence communities, the resident public, the visitors, and the health of the state as a whole. Absent the documentation needed for a complete and accurate analysis, we ask that at the very least, a No Action Alternative be implemented.	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	Executive Summary p. ii Even if the collection rates of the 40 White List Species were closer to the maximum collection by the 14 fishers from 2000-2017, the annual collection of all species would be less than 3.5% of the island-wide population. Research suggests collection of between 5%-25% is sustainable for various reef species similar to those on the White List (e.g., tang, wrasse, butterflyfish, angelfish, triggerfish). Based on the low percentage of the overall populations collected annually by commercial aquarium fishers, which is spread throughout the year and across multiple areas, as well as the targeted collection of smaller, less fecund individuals, commercial aquarium collection likely has minimal impacts on populations in general. <i>Explain why the research is reliable if it is only based on similar species, not actual species.</i> <i>Calculations and evaluation of impacts should include catch of food fish which are also caught for aquarium collecting.</i>	Your comment has been forwarded to the decision makers. The sustainable thresholds provided by Ochavillo and Hodgson (2006) represent the best available science, as specific thresholds for the 40 White List Species (or for Hawai'i) are not available. Nevertheless, as concluded in the EIS, collection under the Preferred Alternative is below the lower limit of 5% for all 38 of the White List Species for which population estimates are available. The cumulative impacts of other fishing are discussed in Section 5.4.3 of the EIS.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p.iii Loss of the fishery would result in the loss of income, tax revenue, and jobs. <i>Recommendation by cultural practitioner Pelika Andrade was that the aquarium industry should invest in aquaculture, which would teach them how to grow and spawn their own supply and make contributions to replenishing the fish removed from our waters.</i> <i>Income tax revenue, and jobs from sustainable aquaculture could replace that of aquarium fish collecting from the ocean.</i>	Your comment has been forwarded to the decision makers.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	2.0 PURPOSE AND NEED p. 15 The need for the Applicant's action is to continue commercial aquarium fishers' livelihoods.. <i>The resources of the ocean and the nearshore waters are a component of the Public Trust held for the benefit of Native Hawaiians and the general public. When the public trust resources are "mined" for the</i>	Your comment has been forwarded to the decision makers.

Commenter	State/ Location	Date Received	Comment	Response
			<i>benefit of a few commercial collectors to enhance the pleasure of a few aquarists keeping open ocean animals in a closed and artificial environment, the sustainability of the habitat on which traditional practitioners depend is altered. The livelihoods of local fishers (and their families) for subsistence is a need that outweighs the needs of the applicant.</i>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	2.2 NEED FOR APPLICANT'S ACTION <i>Using fish for food meets a basic human need. Using fish for aquariums only provides pleasure, but there are many other options which do not involve animal cruelty and are more environmentally friendly.</i>	Your comment has been forwarded to the decision makers.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 16 2.5 SCOPE OF ANALYSIS p. 16 Regarding biological resources, this DEIS focuses primarily on the effects of aquarium fishing on wild populations of White List Species, as it is at the population level that DAR measures changes in White List Species and makes management decisions (e.g., issuance of harvest permits, implementation of bag limits). Therefore, because population effects have already occurred once an individual fish has been removed from the ocean, it is beyond the scope of this analysis to evaluate effects on individual fish once they are removed from the population. <i>The focus should be on impacts on specific West Hawai'i locations, not on the entire population around the island of Hawai'i.</i>	Your comment has been forwarded to the decision makers. While the FEIS maintains that the CREP population offer the best estimate to analyze impacts, the impact of collection on the WHAP Open Area populations, where collection would be occurring, has been added as Appendix B of the FEIS for comparison purposes. Because all alternatives include impacts in East Hawai'i (either collection using Aquarium Permits, or continued collection without the use of fine mesh nets), the impacts to the island-wide populations needed to be disclosed for all alternatives.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	2.5.1 Resources Evaluated and Dismissed from Further Consideration pp. 16 - 17 This DEIS evaluates the impacts of five commercial aquarium fish collection alternatives on the nearshore habitat (0-600 feet; 0-100 fathoms) in which commercial aquarium fishing (or lack thereof) would take place over a 5-year period. During the evaluation process, it was determined that some resources typically evaluated in an EIS would not be impacted by any of the alternatives under consideration. The evaluation includes past use and potential impacts by the commercial aquarium fishery because it has been a part of the baseline condition of these resources since the late 1940s. Because a significant increase in commercial aquarium fishing is not anticipated during the 5-year assessment period evaluated in this DEIS, and in fact a decrease when compared to historic conditions is anticipated due to the issuance of only Aquarium Permits, this DEIS does not anticipate a significant change in the current baseline condition of these resources. <i>It is not clear that the DEIS examines the condition set forth by DLNR to examine "The adequacy of the analysis presented in the DEA, including but not limited to removal and replenishment rates for vulnerable species; specifically, how is the estimated sustainable range of 5% to</i>	Your comment has been forwarded to the decision makers. The sustainable thresholds provided by Ochavillo and Hodgson (2006) represent the best available science, as specific thresholds for the 40 White List Species (or for Hawai'i) are not available. Nevertheless, as concluded in the EIS, collection under the Preferred Alternative is below the lower limit of 5% for all 38 of the White List Species for which population estimates are available.

			25% annual take of the estimated total population arrived at, and should the threshold be 5% or 25%."	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>The DLNR's issuance of 14 Aquarium Permits is not anticipated to result in significant beneficial or adverse impacts to water and air quality, geology and soil resources, aesthetics, noise, vegetation, terrestrial wildlife and avian species, threatened and endangered species, land use, public health and safety, communications, transportation, utilities, or population and demographics from the current baseline condition, therefore, these resources will not be evaluated further.</p> <p><i>In light of Judge Wilson's dissenting opinion on the Thirty Meter Telescope, which is incorporated by the reference below, identify any Federal and State laws which state that if resources are degraded, it's acceptable to degrade them further.</i></p> <p>https://www.courts.state.hi.us/wp-content/uploads/2018/11/SCOT-17-0000777disam.pdf</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>These resources were eliminated from further evaluation because the proposed action (issuance of Aquarium Permits) is not anticipated to result in significant impacts (beneficial or adverse). Therefore, there would be no further degradation. See Section 5.0 of the FEIS regarding the effects of the action on the environment.</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>The DEIS states...it is beyond the scope of this analysis to evaluate effects on individual fish once they are removed from the population. <i>The trade as proposed in DEIS violates Hawaii's Cruelty to Animals statute. The disclaimer on the scope to exclude what happens to these creatures after caught is inappropriate and omits critical information needed to evaluate alternatives. If all of the captured individuals died, under this analysis, it would not be considered, because it would be outside the scope.</i></p> <p><i>Fish may be brought up from reefs so quickly they suffer immediately. If their swim bladders are not punctured they can die. In several instances, fish have been found dead in trash cans (note the 500 dead at the harbor). Several Hawaiians interviewed complain that they see bags of dead reef fish and this is not pono. What measures are taken to ensure fish are treated humanely? We understand they are deprived of food at warehouses before shipping. Their fins are trimmed. What agency is charged with DOH and DLNR regulating care of fish? The effects on individual fish removed from the population matter. The manner of capture and care should be included in the analysis! These fish are not used for subsistence, they are used for ornamentation and fleeting pleasure. The impacts of trapping, finning, starving, enclosure in confined packaging, transporting and eventual placement of remaining live "specimens" in artificial conditions must be considered in the DEIS analysis.</i></p> <p><i>Hawaii Cruelty to Animals Statute</i> <i>§711-1109 Cruelty to animals in the second degree. (1) A person commits the offense of cruelty to animals in the second degree if the person intentionally, knowingly, or recklessly:</i> <i>(a) Overdrives, overloads, tortures, torments, beats, causes substantial</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The indirect impact of post-collection mortality has been added to Section 5.4.2 of the FEIS.</p>

			<p><i>bodily injury to, or starves any animal, or causes the overdriving, overloading, torture, torment, beating, or starving of any animal;</i> <i>(b) Deprives a pet animal of necessary sustenance or causes such deprivation;</i> <i>(c) Mutilates, poisons, or kills without need any animal other than insects, vermin, or other pests; provided that the handling or extermination of any insect, vermin, or other pest is conducted in accordance with standard and acceptable pest control practices and all applicable laws and regulations.</i></p>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>3.0 ALTERNATIVES p. 18 3.1 NO ACTION ALTERNATIVE No Action Alternative does not meet the Applicant's purpose and need to continue fishers' livelihoods participating in lawful, responsible, and sustainable commercial collection of approved fish species from nearshore habitats <i>Include the fact that collectors can pursue alternate livelihoods raising aquarium fish in captivity, working in commercial aquariums, fishing for food fish, and running boat and dive tours.</i> <i>In order to protect and ensure the sustained health of the reef and subsistence fishing practices of native communities, the Sierra Club requests that the DLNR accept the No Action Alternative.</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, under the No Action Alternative commercial aquarium fishers may no longer find it feasible to target aquarium fish and may begin to participate in other fisheries, but this is not possible to quantify at this time</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>3.5 LIMITED PERMIT ISSUANCE (PREFERRED) ALTERNATIVE This Alternative is based on the best available science, supports the DLNR's purpose to ensure Applicant's Actions do not lead to degradation of fish populations and the habitats in which they occur in the context of commercial aquarium collection. <i>The problem continues to be that DLNR/DOCARE do not demonstrate the capacity, funding or commitment to enforce the regulations as proposed. This statement is corroborated by the numerous interviews conducted in the cultural impact statement appended as Appendix A. Quotes from the Cultural Impact Assessment include the following:</i> [quotes omitted here, see comment letter or CIA] (Summary) As voiced by many of the consulted parties, the lack of support and funding have hampered DNLR- DAR's ability to fulfill its fiduciary responsibility, namely to enhance, protect, conserve, and manage Hawai'i's unique and limited resources, which are supposed to be held in public trust for the current and future generations of the people of Hawai'i nei, and visitors alike. (CIA P 135-6)</p>	<p>Your comment has been forwarded to the decision makers.</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>1.2.3.2 HAR 13-60.4 (p 13) In addition to applying any other penalties provided by law, the DLNR may revoke any West Hawai'i Aquarium Permit for any infraction of these rules or the terms and conditions of the permit, and any person whose permit has been revoked shall not be eligible to apply for another West Hawai'i Aquarium Permit</p>	<p>Your comment has been forwarded to the decision makers.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>(commercial or recreational) until one year from the date of revocation. <i>How has DLNR implemented enforcement to date? Have permits been revoked?</i> <i>If, under the preferred alternative, each of 14 permittees were assessed at least \$50,000 annual fee to cover the cost of a dozen enforcement officers, the boats and equipment to monitor the commercial collection activities, and staff to conduct population assessments in the collection areas, such a system might be within reason, but the institutional will and funding are not evident. For this and many other reasons, this is not a practical or sustainable alternative.</i></p>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>4.1.1 Socioeconomic Aspects of the Commercial Aquarium Fishery</p> <ul style="list-style-type: none"> • In 2017, the commercial aquarium fishery on the island of Hawai'i reported landings near \$1.4 million, with more than \$1.29 million coming from the WHRFMA (DAR 2018a). For the 14 fishers requesting commercial Aquarium Permits under the Proposed Action, 3 to 11 fishers reported catch in any given year between 2000 and 2017, contributing from 22.3% to 69.1% to the total overall WHRFMA fishery value (Table 4-1). (Emphasis added) • • In addition to incorporating Act 306 into the Hawai'i Administrative Rules, HAR 13-60.4 identified West Hawai'i Aquarium Permit Terms and Conditions by implementing the following provisions: <ul style="list-style-type: none"> • Aquarium collectors must submit each month's daily aquarium fishing trip reports before every 10th day of the following month. (Emphasis added) <p><i>According to table 4.1, barely 47 percent of permittees provided required reports, and of the 14 proposed permittees in the Preferred Alternative, only 3 to 11 provided reports during 2000-2017, so how does the DLNR expect to collect meaningful data, if those with permits are historically non-compliant?</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS in Section 5.2.1, to avoid duplicate fish catch reporting, only a principal diver is required to report the catch and effort for the dive team (DAR, pers. comm., 2018). This process ensures that reported catch data are not duplicated in the State's system. However, this reporting mechanism can lead to confusion by outside observers, as the total number of permit holders is higher than the number of permit holders reporting data (Table 4-1), giving the appearance of under reporting.</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>4.2 CULTURAL RESOURCES</p> <p>P 29 Commercial aquarium fish collection is not a part of Native Hawaiian culture; however, Native Hawaiians do participate in and support the fishery and Hawaiian culture has been a significant aspect of the fishery's management since the 1970's. Although the process has been contentious at times, the WHFC has been successful. <i>This section fails to acknowledge the significant impact of aquarium collecting on lawei`a (fishing and gathering) and its effect on Hawaiian traditional culture, contemporary practice and way of life.</i> Quoting a few passages from the Cultural Impact Statement: [quotes omitted here due to length, see comment letter or CIA]</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>A Cultural Impact Assessment was completed that includes a detailed analysis of cultural effects, and the complete report is provided in Appendix A of the EIS. The EIS summarized the conclusion of the CIA with regard to the impact of aquarium fishing. The rest of the cultural analysis is disclosed in Appendix A.</p>

Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>4.4 BIOLOGICAL RESOURCES</p> <p><i>The cultural significance of White list species are under-reported throughout the DEIS; for example, the DEIS section on Cultural Significance of the Achilles Tang states (p 36)</i></p> <p>The yellow tang, called lāʻī pala or lauʻī pala in Hawaiʻi, although small was considered a delicacy and also involved in healing rituals. It fails to provide this significant information:</p> <p>P117 of CIA, Kehau Springer stated that "Through her interactions with various communities in West Hawaiʻi, and in speaking with kamaʻāina of the areas, certain harvesting and fishing practices have changed due to a decrease in fish population and environmental changes as exemplified by the pākuikui (Achilles tang). Kehau shared that this is a favorite delicacy in South Kona. Elders of the area shared that this fish was highly favored for parties and gatherings. However, according to oral interviews with various community members, in the last decade, there has been a major population decline. As a researcher, she confirmed that she has observed a very small population of pākuikui in these areas and in comparing scientific monitoring data, statistics, and literature reviews, their numbers have decreased significantly over the years. She does contend that there are other factors that may affect the population, such as their monogamous behavior, urbanization, pollution, and overharvesting."</p> <p><i>While a decline in the abundance of Achilles Tang is described in the DEIS on p 76, the loss of the cultural resource is not addressed:</i></p> <ul style="list-style-type: none"> • Commercial aquarium landings of Achilles Tang have declined in West Hawaiʻi over the past two decades in association with a recent dramatic increase in its value (192% since 2008). This is strongly suggestive of declining availability (i.e., abundance). (Addressed in Section 5.4.1.2 – Achilles Tang). • Achilles Tang have declined significantly in FRAs and Open Areas over the last 20 years. Open Area populations have usually been higher than FRA populations in the past decade. Achilles Tang has had low levels of recruitment over the past two decades, and because of its popularity as a food fish as well as an aquarium fish, this species is harvested both as juveniles and adults. 	<p>Your comment has been forwarded to the decision makers.</p> <p>The decline in commercial aquarium landings for Achilles can be associated with the implementation of the current bag limit of 10 per day, enacted in 2014. The EIS agrees with the commenter that significant cultural resource impacts would be significant for the 12 White List Species that are declining. This significant impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>A Cultural Impact Assessment was completed that includes a detailed analysis of cultural effects, and the complete report is provided in Appendix A of the EIS. The EIS summarized the conclusion of the CIA with regard to the impact of aquarium fishing. The rest of the cultural analysis is disclosed in Appendix A.</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>4.4.2.1 Red Pond Shrimp</p> <p><i>Opae ʻula, referred to in the DEIS as Red Pond Shrimp, are in a group known to be endemic to the Hawaiian Islands. The Center for Biological Diversity(CBD) has sued the US Fish and Wildlife Service(USFWS) for not designating critical habitat for all endangered species recently designated for Hawai'i and this Red pond shrimp is one. The suit claims that by not designating critical habitat, USFWS is violating the Endangered Species Act because 14 of 15 of species recently designated are not protected. Max Phillips of CBD says"These special</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Red Pond Shrimp are not on the White List, and in addition, invertebrates can not be collected from the WHRFMA. In East Hawaiʻi, invertebrates can be collected, but do not require an Aquarium Permit. Therefore, collection of red Pond Shrimp is not anticipated to differ between alternatives, including the No Action Alternative.</p>

Commenter	State/ Location	Date Received	Comment	Response
			<i>species are found nowhere else...so if they disappear from here they'll be lost forever. Anchialine pool shrimp and the rest of the group needed habitat protection years ago but there not getting it from the anti-wildlife Trump administration. Species with habitat protections are twice as likely to be in recovery as those without".</i>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	4.4.3 Hawai'i Species of Greatest Conservation Need pp. 67-68 ...three White List Species occur on Hawai'i's SGCN list: 1. Psychedelic Wrasse 2. Tinker's Butterflyfish 3. Fisher's Angelfish <i>Since there is cause for concern about these species, they should not be collected.</i>	Your comment has been forwarded to the decision makers. As concluded in the EIS, the collection of any of these species is less than 5% of the island-wide population estimates, and all three species likely have larger population estimates than predicted due to their deep-water habits (beyond the area surveyed by CREP or WHAP). Therefore, actual collection is likely an even smaller portion of the populations.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 69 Ecosystem indicators related to benthic reef community integrity indicate a shift in West Hawai'i towards lowered reef accretion and reduced structural complexity. <i>Given the observations of cultural practitioners, over-fishing, pollution, damaged habitat, coral bleaching and climate change have all led to significant changes in the habitat for reef fish. There is no discussion in this section to address the significant degradation of the habitat both historically and contemporaneously.</i>	Your comment has been forwarded to the decision makers. The EIS does address the degradation of habitat. The sentence following the one quoted by the commenter states that hard coral declined from 44% to 31% between 2003 and 2014, and that the ratio between calcifying to non-calcifying organisms also declined.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	4.4.5 Reef Habitat Due to Hawai'i's extreme isolation, an estimated 25% of the coral reef species are found nowhere else...The ratio between the cover of calcifying to non-calcifying organisms – an indicator of coral reef community dynamics and the extent to which a given system is dominated by organisms that contribute to coral reef development and persistence – declined across West Hawai'i since 2003... <i>Removing herbivorous aquarium fish will not help in mitigating the decline of coral reef health. Reef fish from larval through juvenile stages have an extremely high natural mortality rate, this natural order is important to the life on the reef as well as the mid water feeders and even the pelagic predators An abundance of invasive algae will occur in a un-healthy ecosystem. A recent DAR announcement appealed to subsistence and recreational reef fishers to refrain from taking herbivorous fish off the reefs. This tacit recognition of the vital symbiotic service they perform in this delicate ecosystem is overdue and yet completely absent in the DEIS. The 'preferred alternative' in the document would allow (with one exception) for unlimited takes of many of these same important organisms.</i>	Your comment has been forwarded to the decision makers. It is acknowledged that herbivore conservation is important; however, please note the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
				<p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>4.4.7.1 West Hawai'i Aquarium Project (WHAP) Surveys The 2010 and 2014 Hawai'i Island aquarium catch report validation did not indicate substantial underreporting of catch by aquarium collectors. <i>This statement is not consistent with tables 4-1 and 4-2 that detail significant underreporting by permittees and proposed permittees over a multi-year period.</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS in Section 5.2.1, to avoid duplicate fish catch reporting, only a principal diver is required to report the catch and effort for the dive team (DAR, pers. comm., 2018). This process ensures that reported catch data are not duplicated in the State's system. However, this reporting mechanism can lead to confusion by outside observers, as the total number of permit holders is higher than the number of permit holders reporting data (Table 4-1), giving the appearance of under reporting.</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>Table 4-5. West Hawai'i Open Area population estimates... <i>Some catches as a percent of population seem high (30' -60' open area) This may indicate past mismanagement by DLNR. So perhaps DEIS assumptions that DLNR will enforce regulations are unfounded.</i> Achilles Tang 32.70% in 2013 – 2014 39.67% in 2017 – 2018 Yellow Tang 17.26% in 2013 – 2014 Black Surgeonfish 11.66% in 2013 – 2014 Shortnose wrasse 18.07% in 2017 – 2018 Psychedelic wrasse 55.78% in 2017-2018</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, around the island of Hawai'i, there is connectivity abetween FRAs and Open Areas, with fish from protected FRAs being documented to seed unprotected areas, highlighting the effectiveness of protected areas (Christie et al. 2010). Therefore, evaluating impacts on just the Open Area populations is not representative of the actual impact. Nonetheless, this analysis has been added to Appendix B for reference.</p> <p>Regardless, of the five species noted by the commenter, as shown in Table 5-4 and Table 5-8 of the EIS, two (Yellow Tang and Black Surgeonfish) have had significant increases in population between 1999/2000 and 2017/2018, in all areas (Open Areas, FRAs, and MPAs). The Psychedelic Wrasse and Shortnose Wrasse populations have stayed stable (no significant increase or decrease), and the Achilles Tang is the only species with a significant decline.</p> <p>For the Achilles Tang, WHAP transects are not located in all collection</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
				<p>zones found within the WHRFMA (Figure 4), including the two zones (100A and 108) with the highest percentage of the Achilles Tang collection, suggesting that the population of Achilles Tang in the WHRFMA is likely higher than estimated by the WHAP. This is supported by CREP (2018) data which show approximately 43% (approximately 79,000 individuals) of the island of Hawai'i Achilles Tang population (approximately 184,000 individuals) resides in collection zones 100 and 108.</p> <p>Lastly, under the Preferred Alternative, the number of Aquarium Permits would be limited to 10, and a reduced bag limit would be imposed on the Achilles Tang, decreasing impacts to this species.</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>p. 76 Achilles Tang have declined significantly in FRAs and Open Areas over the last 20 years. Open Area populations have usually been higher than FRA populations in the past decade. Achilles Tang has had low levels of recruitment over the past two decades, and because of its popularity as a food fish as well as an aquarium fish, this species is harvested both as juveniles and adults. <i>Pressure on food fish that are declining in numbers should not be increased by aquarium collecting.</i></p>	Your comment has been forwarded to the decision makers.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>p. 77 The Psychedelic Wrasse, Tinker's Butterflyfish, and Fisher's Angelfish are all listed as SGCN in Hawai'i...Adequate population estimates based on WHAP data (30-60 feet depth) are not available to assess the impact of continued aquarium collection on these three species due to their deeper water habitats. However, based on deep diver observations, Tinker's Butterflyfish and Psychedelic Wrasse are substantially more common in the long term protected areas (MPAs). Commercial aquarium fishers generally do not fish in the deeper waters in which these species occur. In 2017, there were 599 Psychedelic Wrasse, approximately 290 Tinker's Butterflyfish (n.d. in East Hawai'i), and 288 Fisher's Angelfish collected by aquarium fishers on the island of Hawai'i <i>See comments re. 4.4.3. Since two of the species seem to thrive when protected, they should not be collected. In particular, the wide range (5% -25%) of claimed 'sustainable' takes for a range of 'white list' species is never fully backed up with studies of the subject areas. Nor does this gross margin of 'sustainability' cohere with statements elsewhere such as, "The DAR (2019a) has noted significantly declining populations in one or more management area for 12 of the White List Species. However, as noted above and in Section 5.4.3, these declines are occurring in both areas open and closed to commercial aquarium fishing for all but</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Collection under the Preferred Alternative would be up to 1.06% of the Psychedelic Wrasse population, up to 0.87% of the Tinker's Butterflyfish population, and up to 0.04% of the Fisher's Angelfish population, all under the lower limit of the 5% to 25% threshold (Ochavillo and Hodgson 2006). In addition, as shown in Table 5-8 of the EIS, the Psychedelic Wrasse population has remained stable between 1999/2000 and 2017/2018, and the Fisher's Angelfish population has significantly increased within Open Areas. No population trend data are available for the Tinker's Butterflyfish, but as stated above, collection is less than 1% of the estimated population.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>one species, indicating that aquarium collection is not driving the decline (DAR 2019a). Because these declines are occurring in FRAs and/or MPAs as well (i.e., areas not open to commercial aquarium collection) it is reasonable to assume that banning commercial aquarium collection would not halt the declines.."</p> <p><i>We observe that any declines whether driven by or contributed to by the trade are simply not justified by the logic and necessity of sustainability. It is the larger abiding responsibility of DLNR, as specified in the State constitution, to preserve in abundance this resource.</i></p>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>4.4.7.3 WHAP and CREP Survey Comparison p. 81</p> <p>...due to the larger spatial coverage and greater range of depths surveyed by the CREP, CREP data were considered to be a better estimator of island-wide fish populations, and therefore serve as the primary basis for the impact analysis found in Section 5.0.</p> <p><i>See comments re. 2.5. WHAP should be used because it is specific to West Hawai'i.</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the FEIS maintains that the CREP population offer the best estimate to analyze impacts, the impact of collection on the WHAP Open Area populations, where collection would be occurring, has been added as Appendix B of the FEIS for comparison purposes.</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>5.2 SOCIOECONOMIC RESOURCES 5.2.1 Direct Impacts p. 84</p> <p>Total ex-vessel value (i.e., price received by a fisher for the catch) for the 14 fishers in the WHRFMA ranged from a low of \$164,040 in 2001 to a high of \$1,162,964 in 2016, with an average of \$793,352 (inflation- adjusted 2019 dollars...)...The 2017 ex-vessel inflation-adjusted value for the 14 fishers within the WHRFMA was \$932,735...It should be noted that the dollar value of these fisheries represents only the ex-vessel value, what the fishers are paid for their catch, and does not include the value which would be generated by additional dealer and retail sales.</p> <p>p. 21</p> <p>In 2001, Cesar et al. documented the annual recreational value of the coral reefs of the Hawaiian reefs for snorkelers and divers was estimated to be \$281 million and \$44 million, respectively. Although the direct expenditure per diver is much larger than the direct expenditures of snorkelers, the overall value related to the latter group is much larger due to their large numbers.</p> <p><i>The value of the coral reef ecosystem for tourism (snorkeling) appears to be is several orders of magnitude greater than the value of the reef-sustaining fish for "esthetically pleasing" aquaria on the continent. In addition, the process of collecting and transporting reef fish for sale on the continent constitutes animal cruelty and a waste of resources (fish die in transport or within a year many die in tanks. This) is detrimental to society in the long term.</i></p>	<p>Your comment has been forwarded to the decision makers.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/Location	Date Received	Comment	Response
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 85 Analysis by the DAR (2019a) has shown that actual underreporting of catch is small, with a 3.5% difference between the number of animals reported caught and sold in 2010 and a 0.4% difference in 2014, which likely represent live releases and mortality. <i>How reliable are reports of numbers caught and reports of numbers sold? The reporting process should be more fully described to back up the statement that "underreporting of catch is small".</i>	Your comment has been forwarded to the decision makers. The EIS used the best available science, which in this instance was information from the DAR (as cited).
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 85 The number of non-reporting permit holders is actually an indicator of industry growth and direct socioeconomic benefits. <i>The DEIS should explain this incongruous assertion. More information should be provided to explain and back up this statement.</i>	Your comment has been forwarded to the decision makers. This statement has been deleted from the FEIS.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.2.1.1 No Action Alternative p. 85 An increase in the East Hawai'i commercial aquarium fishery value may offset some of the loss from the WHRFMA fishery under the No Action Alternative, but the fishery as a whole would still add approximately \$6.3 million less to the economy over the 5-year analysis period than under the Pre-Aquarium Collection Ban Alternative, or \$1,250,611 less per year (on average). <i>The EIS should evaluate how much of this would be offset by an increase in populations of aquarium fish that are also caught for food, and by collectors changing to jobs catching food fish, doing boat and dive tours, working at public aquariums, and other employment.</i>	Your comment has been forwarded to the decision makers. As stated in the EIS, under the No Action Alternative, commercial aquarium fishers may no longer find it feasible to target aquarium fish and may begin to participate in other fisheries, but this is not possible to quantify at this time. There are no publicly available data that the Applicant is aware of indicating that catch of the White List Species as food fish would increase if commercial aquarium collection were halted.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.2.1.5 Limited Permit Issuance (Preferred) Alternative p. 87 <i>The analysis should factor in costs to collectors for boats, equipment, gas, insurance, maintenance, etc.</i>	Your comment has been forwarded to the decision makers.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 88 The Limited Permit Issuance (Preferred) Alternative would have a minimal, but beneficial direct impact on Hawai'i's overall and ocean socioeconomic resources... <i>Explain how removing fish from the ocean has beneficial direct impact on ocean socioeconomic resources.</i>	Your comment has been forwarded to the decision makers. As stated in the EIS, this would be through the addition of \$1.8 to \$3.7 million over the 5-year analysis period to the economy.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.2.2 Indirect Impacts p. 88 Indirect socioeconomic impacts of the commercial aquarium fishery would primarily involve the additional profits from the aquarium fish market (including freight and packaging), as well as other tourist businesses such as snorkel and dive operations that rely on seeing and interacting with a healthy reef ecosystem. The presence of a healthy reef ecosystem may also impact overall land/home values on the island of Hawai'i.	Your comment has been forwarded to the decision makers. The EIS acknowledges the importance of tourism in Hawai'i; however, available data do not suggest that the historical collection has impacted the tourism industry or land values in Hawai'i. Tourism has set new records, and the average sale price of homes has steadily increased. The impacts of collection on reef habitat is described in Section 5.4 of the EIS.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<i>Explain how removing beautiful fish helps snorkel and dive operations. Explain how taking herbivores off the reef makes the reef healthy. See comment re. "scientific data" in 5.2.2.1</i>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.2.2.1 No Action Alternative p. 88 ...approximately \$31 million in indirect economic benefits of this fishery would not occur over the 5-year analysis period... <i>See comment re. p. 87.</i>	Your comment has been forwarded to the decision makers. See response to previous comment.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 88 No scientific data exist to suggest that in the absence of aquarium fishers an increase in other tourist operations would occur. <i>The EIS does not rely on scientific data to make assumptions about tourist businesses in 5.2.2 (see above)</i>	Your comment has been forwarded to the decision makers.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 88 The loss of funding for reef fish conservation likely would impact the ability of the DAR to monitor and protect reef fish. <i>The DEIS does not explain how the No Action Alternative would lead to a loss of funding. What mechanisms are in place to currently to provide funding for monitoring and enforcement? How are reef fish protected currently? How much of this would be offset by the reduced need for monitoring with no collecting allowed in West Hawai'i?</i>	Your comment has been forwarded to the decision makers. This statement has been deleted from the FEIS.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.2.2.5 Limited Permit Issuance (Preferred) Alternative p. 91 The Limited Permit Issuance (Preferred) Alternative would have a less than significant impact on Hawai'i's tourist industry, and a minimal, but beneficial indirect impact on Hawai'i's overall economy through re-investment efforts in terms of equipment, maintenance, supplies, and personnel. <i>The DEIS does not explain how the Preferred Alternative would impact funding for equipment, maintenance, supplies, and personnel. What mechanisms are in place to currently to provide funding for monitoring and enforcement? How are reef fish protected currently?</i>	Your comment has been forwarded to the decision makers. The fishers would directly fund their own equipment, maintenance, supplies and personnel using income received from their collection activities, just as any business is run. The statement regarding the indirect funding of research and monitoring has been removed from the FEIS.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	P 125 of CIA Both Greg (Asner) and Gail confirmed fish population crashes at Pāpā Bay and have recorded collectors walking on and damaging coral, which they expressed is key to maintaining a healthy marine ecosystem. The group stated that they have seen aquarium collectors day after day collecting fish from the same areas and feels that this intensive harvesting does not give the fish and the ecosystem a chance to recuperate from previous biological removals. Greg believes that the destructive methods used by certain aquarium collectors are dismantling this integrated system. <i>Describe the economic impacts from reef degradation from loss of herbivores and collectors damaging coral.</i>	Your comment has been forwarded to the decision makers. It is acknowledged that herbivore conservation is important; however, please note that the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.

				<p>Breaking or damaging coral will remain illegal under state law (HAR 13-95-70 and HAR 13-95-71) under any of the alternatives under consideration.</p>
<p>Sierra Club, Hawai'i Island Group</p>	<p>HI</p>	<p>1/7/2020</p>	<p>5.3 CULTURAL RESOURCES 5.3.1 Direct and Indirect Impacts p. 92 As concluded in the CIA, cultural impacts would occur if issuance of Aquarium Permits under an alternative would cause a significant decline in the population of a White List Species considered to be a cultural resource, either directly through the collection of fish or indirectly through habitat impacts. P115 of CIA The Kailapa Community members and those from the Kohala Estates spoke openly against the collection of reef fish to supply the aquarium industry. Many stated that the practice of catching fish without intending to consume it goes against traditional belief and that this act is not pono (proper, morally fitting, beneficial). They expressed that all fish are part of the public trust and that removing fish to supply a "lucrative" industry undermines traditional practices and beliefs associated with the ocean. They urged people to view fish in their natural environment where their colors are bright and brilliant. Several community members expressed concern for the high mortality rates of aquarium fish. They believe that removing any part of the ecosystem alters the natural balance and that removing small fish disrupts the natural food chain. <i>Even if collecting does not cause a decline, cultural impacts occur because of aquarium industry practices and attitudes towards natural resources. Removing beautiful fish that consume algae threatens coral reefs that support many forms of aquatic life and protect the islands from storms...inflicting suffering for the animals and the people that love them for the convenience of the industry (fizzing, finning, starving, confining in tiny bags).</i> <i>Missing from the DEIS is an analysis of species are considered 'Aumakua (family guardians) the Native Hawaiian religious significance of each and every species collected must also be included in the EIS analysis and impact statement.</i> <i>Missing from the DEIS is graphical and other analysis of the socio-economic impact on native Hawaiian communities with high incidence of commercial aquarium trade and trafficking in their area, nor is there an Ahupua'a or place-based analysis. For example, and analysis of the impact this industry has on traditional Hawaiian communities such as Miloli'i.</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>A Cultural Impact Assessment was completed that includes a detailed analysis of cultural effects, and the complete report is provided in Appendix A of the EIS. The EIS summarized the conclusion of the CIA with regard to the impact of aquarium fishing. The rest of the cultural analysis is disclosed in Appendix A.</p>

			<p>the fish and other marine resources became more scarce. With the shift to a market economy and a commercial fishery these marine resources were valued mostly for their economic potential, and little to no regard was paid to the myriad of traditional values and more that emphasized the spiritual, cultural, familial, and ecological importance of the fish and other marine species. Maly and Maly (2003:ix) contend that “this trend has continued through the present-day and fostered the decline in health and well-being of the broad range and diversity of Hawaiian fisheries.”</p>	
<p>Sierra Club, Hawai'i Island Group</p>	<p>HI</p>	<p>1/7/2020</p>	<p>5.4.1.1 No Action Alternative p. 95 <i>Explain why it is not harmful to remove herbivorous aquarium fish, even though DLNR recently urged fishers to refrain from taking herbivorous food fish.</i> <i>“Avoid fishing for parrotfish, surgeonfish, and other herbivores.” coral_card.pdf dated November 2019</i> <i>Consider impacts on larger predator fish, commonly of high-value, when prey fish numbers are reduced by collecting.</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>It is acknowledged that herbivore conservation is important; however, please note that the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.</p>
<p>Sierra Club, Hawai'i Island Group</p>	<p>HI</p>	<p>1/7/2020</p>	<p>5.4.1.5 Limited Permit Issuance (Preferred) Alternative p. 124 The 14 fishers requesting Aquarium Permits collected up to a maximum of 293,845 fish in the WHRFMA in a single year during the period from 2000-2017 (see Table 5-2). Conservatively assuming collection in the first year of the 5-year analysis period started at this maximum, and then grew at 1.49% per year, a total of 1,513,665 fish would be collected over the 5-year analysis period, or an average of 302,733 per year. Impacts to individual species in the WHRFMA are shown in Table 5-11, using both the average and maximum number of each of the White List Species collected in the WHRFMA by the 14 fishers annually between 2000 and 2017, and what percent of the CREP population estimates those values represent. The impacts on individual species' populations is less than 2% for all species when looking at average collection rates, and less than 3% when looking at maximum rates. <i>As noted in Tables 4-1 and 4-2, permittees failed to report catches 47% of the time.</i> <i>Instead of only using averages, state what would happen for each species in the 5th year--how many fish would be collected at maximum rates, what percentage of the population would be collected, and whether this appears sustainable. How would the 5 year analysis be conducted?</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS in Section 5.2.1, to avoid duplicate fish catch reporting, only a principal diver is required to report the catch and effort for the dive team (DAR, pers. comm., 2018). This process ensures that reported catch data are not duplicated in the State's system. However, this reporting mechanism can lead to confusion by outside observers, as the total number of permit holders is higher than the number of permit holders reporting data (Table 4-1), giving the appearance of under reporting.</p> <p>Maximum annual collection rates are used in the analysis on populations provided in Section 5.5.1.</p>

Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 124 ...the bag limit for Achilles Tang would be implemented... <i>See comments re. Table 4-5, p. 74. The statement regarding impacts to individual species populations does not seem to correlate with the data presented.</i>	Your comment has been forwarded to the decision makers. See response to previous comment.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.4.2 Indirect Effects 5.4.2.1 No Action Alternative p. 125 ...data do not exist that would allow for a thorough analysis of such effects ... <i>Interviews should be done with people who frequent specific areas to help research changes in abundance of fish in these areas.</i>	Your comment has been forwarded to the decision makers. The EIS uses the best available science, including information on population trends within Open Areas and MPAs. Given that the No Action Alternative is a closure of the WHRFMA to commercial aquarium collection, the only data which would be relevant would be trend data since the October 2017 closure.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.4.2.5 Limited Permit Issuance (Preferred) Alternative p. 127 It is anticipated that collection of approximately 1.5 million fish would occur in the WHRFMA... <i>For all numbers in this section—do they cover one year, or the 5-year analysis period?</i>	Your comment has been forwarded to the decision makers. The 1.5 million value is based on the cumulative total over five years, as explained in the direct effects section in 5.4.1.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.4.3 Cumulative Impacts 5.4.3.1 Recreational Aquarium Fish Collection p. 128 The DAR collected recreational aquarium fish catch information from 1975 until 1985, after which, data collection was discontinued, and currently no reporting of catch is required for recreational aquarium permit holders. Historic recreational catch data were not digitized or processed into a database, and therefore, are not available for analysis (DAR 2018a). <i>Can DLNR do adequate enforcement without the ability to collect and store data?</i>	Your comment has been forwarded to the decision makers.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 129 ...studies conducted by Tissot and Hallacher (2003) found that aquarium collecting had no significant impact (beneficial nor detrimental) on reef habitat. In addition, 15 years of coral reef data collected and analyzed by the DAR (2018b) found no significant difference in coral cover in areas open to commercial aquarium fish collection. <i>Photo documentation and careful observation by community members indicate that coral damage is occurring regularly on the reef. More collecting photos at: https://www.atdarock.photography/Big-Island-Aquarium-collecting</i>	Your comment has been forwarded to the decision makers. Tissot and Hallacher (2003) statistically analyzed coral in areas open to collection versus areas closed to collection for signs of damage, and did not find a difference.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.4.3.2 Non-Aquarium Commercial and Non-Commercial Fishing (Non-Aquarium Fish) p. 130 ...unlike the aquarium fishery which targets mostly immature fish, the	Your comment has been forwarded to the decision makers.

Commenter	State/ Location	Date Received	Comment	Response
			commercial and recreational fisheries selectively target the larger breeding portion of the population which has profound implications for the sustainable usage of the resource (DAR 2019a). <i>Little fish taken by collectors cannot grow up to become the big fish sought by fishers. The ideal time to take fish sustainably may vary among species. With this in mind, review studies analyzing the impacts of taking each of the species collected in West Hawai'i at various points in their life cycle.</i>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 130 ...on the island of Hawai'i, commercial aquarium fish collection constitutes 25% of the total catch and 11% of the biomass (when excluding Yellow Tang...) <i>For West Hawai'i, how many fish, and how many pounds of fish, are taken on average per year, based on the last five years, by</i> <ul style="list-style-type: none"> • One commercial aquarium collector • One commercial non-aquarium fisher • One recreational non-aquarium fisher 	Your comment has been forwarded to the decision makers. The Applicant does not have all this data. Average collection of commercial aquarium collectors is included in the EIS.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.4.3.5 Climate Change p. 134 The extent and severity of impacts to White List Species from climate change have been ongoing for decades and are expected to increase in the foreseeable future. If environmental fluctuations resulting from climate change (e.g., tropical storms, coral bleaching episodes, acidification, etc.), or other natural or human factors, change habitat conditions, fishing mortality may present a higher risk to some White List and non-White List Species and SGCN. <i>Cite evidence that climate change will NOT put White List species at risk by changing habitat conditions.</i> <i>This DEIS is significantly deficient regarding impacts of climate change in coral systems and reef wildlife, as well as climate change impacts on run off, water diversion for development or and impacts when added to pollution and contamination for all run off sources; including golf courses, hotels, housing development and other projects that contribute to the destruction and or contamination of the reef and near shore eco-systems. All of these perturbations will have a cumulative impact on coral reef habitat and fish populations.</i>	Your comment has been forwarded to the decision makers. The EIS does not state that climate change will not impact these species, in fact, the EIS specifically says that impacts are expected to increase in the future. Furthermore, the EIS does not claim that climate change impacts, when combined with other cumulative impacts and the Preferred Alternative, will be less than significant. The EIS does say the following: "When the full range of impacts to White List Species are considered (e.g., recreational aquarium collection, non-aquarium commercial fishing, recreational fishing, tourism, climate change), there is a significant cumulative impact to some White List Species. However, the Preferred Alternative is not a significant contributor to the cumulative effect upon the environment. " Collection under the Preferred Alternative is less than 2% of any population of White List Species .
Sierra Club, Hawai'i Island Group	HI	1/7/2020	5.4.3.6 Cumulative Impact Conclusion pp. 134 - 135 The DAR (2019a) has noted significantly declining populations in one or more of the management areas for 12 of the White List Species, and cumulatively, all of the factors discussed above likely contribute to the declines...while commercial aquarium collection does contribute to the cumulative impact, it is a less than significant factor in the observed declines.	Your comment has been forwarded to the decision makers. The concept of "unlimited" collection is speculative and not reasonably foreseeable. Analyzing extreme possibilities is not helpful (and not what the law requires). The law requires an assessment of the "expected consequences" of a proposed action. The Preferred Alternative in the FEIS limits the number of permits to be issued to 10 permits, and limits the permits to the WHRFMA. The FEIS uses the

			<p><i>Since aquarium fish are only used for pleasure, relaxation and entertainment, not for food, and the economic benefits of aquarium collecting amount to less than 0.01% of the economic benefits of commercial marine activities, why add to the impacts?</i></p> <p><i>The DEIS fails to adequately address the interviews/testimony of Hawaiians and therefore dismisses the wisdom and observations of the culture. The DEIS claims there will be no significant loss of fish numbers with unlimited catch. Baseline should be before trade began, not 2018. Why should Hawaiians be denied the abundance their grandparents experienced? This is continued discrimination against indigenous people in order to profit from marine resources, and is evidence of a Western colonial mindset, and does not address social justice.</i></p>	<p>best available data (past commercial aquarium collection) to predict the reasonable outcome of issuance of permits for five additional years, and applies a reasonably foreseeable increase in collection each year of the analysis period.</p> <p>The Proposed Action is issuance of 10 Aquarium Permits within the WHRFMA. Within the WHRFMA, unlimited collection is not feasible for the following reasons: (1) Only the 40 White List Species may be collected by commercial aquarium fishers. No commercial aquarium collection of other fish species or invertebrates is allowed within the WHRFMA. (2) No commercial aquarium collection is allowed within the FRAs and MPAs (see Figure 1 of the EIS). Collection is only allowed within Open Areas, which are not a closed population. (3) The level of effort to collect all individuals of the 40 White List Species from the Open Areas is not reasonable, as collection by the 10 fishers who would receive Aquarium Permits under the Preferred Alternative would need to increase by 240% to 1,718,200% (depending on species) over the historic maximum collection that has occurred when the fishery was open to all collectors in order to take 100% of the Open Area population.</p> <p>The proposed action in the EIS is the issuance of 10 aquarium permits in the WHRFMA. Therefore, the proper baseline that reflects pre-project environmental conditions (i.e., conditions prior to issuance of the 10 permits) and is spatially relevant is harvest data and population data for the past 20 years since the creation of the FRAs and MPAs and bag limits along with the most recent population estimates available for these fish (2016 CREP population estimates and 2017/2018 WHAP population estimates).</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>5.5 SUMMARY OF IMPACTS Table 5-13. Summary of direct and indirect impacts by alternative over the 5-year analysis period. p. 136 Limited Permit Issuance (Preferred)...Collection of 1.5 million White List Species fish from the WHRFMA <i>How would the removal of 1.5 million juvenile eherbivorous fish from the ecosystem result in no loss of abundance?</i></p>	<p>Your comment has been forwarded to the decision makers.</p> <p>Since collection under the Preferred Alternative would collect less than 2% of any White List Species population, which is below the lower end of the 5% to 25% sustainable threshold, removal of these individuals is not anticipated to cause population declines.</p>
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>5.6 EVALUATION OF HEPA SIGNIFICANCE CRITERIA Significance Criteria #1: The Preferred Alternative (i.e., Limited Permit Issuance Alternative) does not involve an irrevocable commitment or loss or destruction of any natural or cultural resource. 			<p>since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time . <i>The use of an improper baseline, the minimization of potential collection rates under the proposed alternatives, and an expanded area to which the impacts would apply provide inaccurate and unverifiable data from which to make proposed actions and mitigations.</i></p>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p><i>Paul Cox took this photo of two aquarium fish collectors right out front of the Miloli'i subdivision in Papa Bay, South Kona March 18, 2014. The primary targeted fish are the juvenile fish that use the finger coral as protection from predation. By the way, finger coral (Porites Compressa) is endemic to Hawaii, found nowhere else in the world. The collectors set a fine mesh net in the shape of a V onto the coral. He has seen anywhere from 15' to 200' of net for this process. As you can see in this photo the net is acting as a wall due to the floats on its upper ridge, what you don't see is the net it is anchored to the reef with an equal amount of lead sinkers. Some collectors do not use lead instead they tie or pin the net to the reef. The next step is to herd the fish from out of their sanctuary that is in the depths of the finger corals towards the apex of the V in the net. This is accomplished by the use of the white sticks that you can see lying under the collector's feet. The sticks are poked into the corals aggressively as the collectors push and crawl on the coral themselves. The idea is to make this fish sanctuary a place for the fright-or-flight response. Why don't the fish just swim over the top of the net? these little guys have a hard time ascending rapidly due to their internal air bladders (the fish do use buoyancy control). The collectors do not use a buoyancy control vest, to keep themselves negatively buoyant which helps to stabilize themselves onto the reef itself while they work.</i></p>	Your comment has been forwarded to the decision makers.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>P 141 Significance Criteria #4 The Preferred Alternative does not substantially affect the economic welfare, social welfare, and cultural practices of the community or State... <i>MLG Sierra Club members have supported the Hawaii County Council resolution passed in 2008 to asking for a ban on the aquarium trade. 			<p>successful program "Where have all the Fishes Gone?" with attendance over 70. Speakers included Mike Nakachi, legislator Rep. Nicole Lowen, and Paul Cox. Members and leaders report seeing more reef fish on the West side decades ago.</p> <p>Members met with several Pebble Beach residents who reported more fish since Ka'ohē bay protected after prolonged fight. Some are divers and photographers. A small kayaking group going south from pebble beach about 2003 remarked how few fish could be seen under water. A friend, local to the area, said angrily that they were being taken by AQ collectors. This was during the time Pebble Beach community was fighting to stop collection in their area. They did get some protection but only about 1,000' right in front of their bay. They asked for 1 mile or so.</p> <p>We met with Kaimi Kaupiko in Miloli'i who is from subsistence fishing family. They oppose the trade and succeeded in getting the area designated FRA. They are teaching keiki cultural practices. A few were in the trade but they are trying to work that out. The culture is corrupted by money system but they want to preserve culture. I see mention of community involvement in DEIS but not since 1999. We also have met with Paul Cox, underwater photographer who presented at the program with photographs of many instances of violations of collectors damaging reef, unmarked buckets and equipment and using illegal nets as they walk on coral and rocks. We snorkeled with him at Papa Bay. He has made complaints that were ignored by DLNR or summarily dismissed.</p> <p>Democratic Party resolution drafted on 4/5/2018 states "The taking of reef wildlife purely for commercial purposes cannot be reconciled with the 'precautionary principle' nor the 'hierarchy of priorities' policy guidelines of Hawai'i State Department of Land and Natural Resources". They also affirm the resolution based on Public Trust doctrine as stated in Article XI, Section I of constitution. Furthermore "the Democratic Party calls for State legislation to end commercial harvesting of coral reef wildlife".</p> <p>The DEIS fails to address the concerns of the communities that are impacted by the actions of the aquarium collectors.</p>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<p>p. 142 Significance Criteria #8: The Preferred Alternative does not involve a commitment for larger actions. 			cumulative impact... <i>See comment re. pp. 134 – 135.</i>	
Sierra Club, Hawai'i Island Group	HI	1/7/2020	p. 143 Significance Criteria #9 The Preferred Alternative does not affect threatened or endangered species or their habitats nor does it have a significant impact on rare species. p. 77 The Psychedelic Wrasse, Tinker's Butterflyfish, and Fisher's Angelfish are all listed as SGCN in Hawai'i...Adequate population estimates based on WHAP data (30-60 feet depth) are not available to assess the impact of continued aquarium collection on these three species due to their deeper water habitats. However, based on deep diver observations, Tinker's Butterflyfish and Psychedelic Wrasse are substantially more common in the long term protected areas (MPAs). Commercial aquarium fishers generally do not fish in the deeper waters in which these species occur. In 2017, there were 599 Psychedelic Wrasse, approximately 290 Tinker's Butterflyfish (n.d. in East Hawai'i), and 288 Fisher's Angelfish collected by aquarium fishers on the island of Hawai'i <i>See comments re. 4.4.3. Since two of the species seem to thrive when protected, they should not be collected.</i>	Your comment has been forwarded to the decision makers. See responses to previous comments.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	P 143 No significant adverse effects would occur as a result of the Preferred Alternative. Therefore, mitigation for impacts is not warranted and no mitigation measures would be implemented. <i>The document states, "The Preferred Alternative does not substantially affect the economy but plays an important role as a nearshore fishery in the state." What role? We maintain the role is largely negative as evidenced by the history of conflicts, dissension and general retreat of the trade throughout the state.</i> <i>Elsewhere it states, "No scientific data exist to suggest that in the absence of aquarium fishers an increase in other tourist operations would occur." We say, although you can't prove a negative, the outspoken claims and concerns of recreational competitors such as Snorkel Bob would certainly beg to differ! And the disappointment registered by recreational users we regularly interact with on our Sierra Club snorkel outings is something we have noted as well.</i>	Your comment has been forwarded to the decision makers. The EIS acknowledges the importance of tourism in Hawai'i; however, available data do not suggest that the historical collection has impacted the tourism industry or land values in Hawai'i. Tourism has set new records, and the average sale price of homes has steadily increased. The impacts of collection on reef habitat is described in Section 5.4 of the EIS.
Sierra Club, Hawai'i Island Group	HI	1/7/2020	<i>Sierra Club Conclusion: Under the No Action Alternative issuance of Aquarium Permits would not occur and commercial aquarium fishing would not be permitted in the WHRFMA. Therefore, collection of all White List Species in the WHRFMA would be zero and reef habitat would not be affected.</i> <i>In the WHRFMA, where no fish would be collected, a minor, although</i>	Your comment has been forwarded to the decision makers.

			<p><i>unquantifiable, increase in number of White List Species, non-White List Species, and SGCN may occur over the 5-year analysis period, which may provide additional viewing opportunities for tourists, an increase in the prey base, additional individual herbivores to maintain the reef, and increased competition between species for available resources."</i></p> <p><i>Our constituency finds the 'No Action Alternative' to be logically and integrally the most compelling. This is clearly the superior plan! We urge decision making authorities to adopt this alternative. Thank you for the opportunity to comment.</i></p>	
Steve Moore	HI	1/7/2020	<p>Please just say no to the aquarium trade. All the critters on the planet are under enough duress due to the myopic vision of our species. There is no need to add insult to injury.</p>	Your comment has been forwarded to the decision makers.
Sulara James	HI	1/6/2020	The aquarium trade is devastating our sea life! Please end it now!	Your comment has been forwarded to the decision makers.
Susan Douglas	HI	1/6/2020	The aquarium trade is being protected by DLNR at the expense of the reef species and habitat around our islands. Please discontinue this practice immediately. We are watching closely and will not relent on this issue!	Your comment has been forwarded to the decision makers.
Susan Stoll	N/A	1/6/2020	<p>Please work to protect the fish that swim in the water that surrounds your islands. Your tourist trade depends on maintaining the natural beauty of your unique environment.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.</p>
Susie Cysewski	HI	12/9/2019	<p>I have been out of town a couple weeks, but see in the newspaper articles suggesting you are considering lifting a ban to allow commercial collection of Yellow Tang. I am completely against this! Fourteen collectors will deplete our yellow tang population in no time. DO NOT allow collection of our Yellow Tang. Leave them where they live. They are a beautiful part of Hawaii ecosystem and we need to preserve this treasure for future generations.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, the DAR (2019a) stated that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. Additionally, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui.</p>

Susie Jenkins	N/A	1/7/2020	<p>I've lived in Kona since 1970 off and on - on the beach & there used to be so many fish near the shore it looked golden. Please do not issue any more permits. The bad guys still do it illegally & who is check the permitted fish when they come in. We could see them from our house.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>An analysis of the cumulative impact of poaching and underreporting has been added to the FEIS.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>
Suzanne Lahl	HI	1/5/2020	<p>Extinction is forever—it's that simple. It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade. Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting. The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood. But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists. PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The EIS was prepared using the best available science. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p> <p>PIJAC respectfully disagrees with the characterization of its organization and membership. PIJAC's Mission is to represent the experience and expertise of the responsible pet care community to legislative, regulatory, and governing bodies in order PROMOTE animal well-being and responsible pet ownership; FOSTER environmental stewardship; and ENSURE the availability of healthy pets. For more information on PIJAC, please see https://pijac.org/</p>

			retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal. I implore you to do the right thing.	
Tanya T. Power	HI	1/7/2020	I am writing to let you know that I do NOT support the continued aquarium fishing on the Big Island. The Kona Coast from my childhood was called the "Gold Coast" because of all the beautiful yellow tangs that were in the waves. We missed them for years. And recently over the past year or so, they are beginning to return. It is such a treat. Please do not allow the aquarium fishing to start again on the Big Island!	Your comment has been forwarded to the decision makers.
Tina Jensen	HI	1/8/2020	I am a resident of the Big Island since 2003. I am writing to oppose issuing permits to collect Hawaiian reef fish. Our reefs in Hawaii have never been under more stress and need every single herbivore to help maintain their health. We need these reef fish to keep not only sustainable fishing but tourism. Long ago I was an avid aquarist. Then I learned how fish were collected and how unlikely they were to survive. We have a moral responsibility to preserve what we have. Aquarium collecting is not helping the island.	<p>Your comment has been forwarded to the decision makers.</p> <p>It is acknowledged that herbivore conservation is important; however, please note that as stated in the EIS the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). These trends occurred even with the pressure of commercial aquarium collection, which was occurring over the same time period.</p> <p>The EIS acknowledges the importance of tourism in Hawai'i and that Hawai'i tourism industry achieved new records in total visitor spending and visitor arrivals in 2017, marking the sixth consecutive year of record growth in both categories. Total spending by visitors to the Hawaiian Islands increased 5.6% to a new high of \$16.81 billion (HTA 2018). This occurred in the presence of commercial aquarium collection.</p>
Todd Naidl	N/A	1/6/2020	Please take care of our fish! The fish need to be taken care of and insure propagation. I don't believe fish should be taken out of our waters for an aquarium. Please help!	Your comment has been forwarded to the decision makers.
Traci Blezek	N/A	11/25/2019	Please do not go through with this. The area is already struggling r/t the increased warm of the ocean water. Do not allow permits for commercial aquarium fishing. We enjoy snorkeling and seeing all the fish, there, in their natural environment. There are no benefits to the ecosystem in this.	Your comment has been forwarded to the decision makers.
Valerie Weiss	HI	12/2/2019	I write requesting we deny marine aquarium fishing in our state until our reefs stabilize from the effects of overfishing and a warming ocean. With more coral bleaching than in the past, we are in dire need of our reef fish to help rehabilitate our reefs and keep our coral healthy.	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between</p>

			Taking the fish for the aquarium trade helps deplete our stocks and leaves less fish for us all to enjoy including our many visitors who enjoy snorkeling and seeing the fish we have remaining. Let's not sell our natural environment out for the gain of a few, when our reefs and the reef fish belong to us all.	1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.
Veda Stram	WA	1/6/2020	Please do not hesitate to use everything at your disposal to save the wild/native FISHES in your waters. Your constituents will appreciate your positive efforts on this. And your constituents will remember if you fail to use your office to save the fishes.	Your comment has been forwarded to the decision makers.
Vera Deryabina	N/A	1/6/2020	My name is Vera Deryabina. I work in a seafood industry in Alaska, and often visit Big Island for a vacation. I have been in love with the island since my first visit and have been lucky to be a part of such a breathtaking, unique and beautiful place that is clean and full of life which is so rare nowadays. I have met many people who call the Big Island their home and witnessed how they care for their island, its wild life and its nature. Working in seafood industry showed me how fishing can be harmful for the environment and how much Alaska has been suffering from it. The decline in many species has been so massive that the state had to close multiple fisheries - crab, herring, salmon, cod and other white fish. The ocean sustainability is in danger. The only thing that keeps Alaskan salmon runs is hatchery program. And we've seen a huge decline in the run of wild fish. Please, don't let it happen to Hawaii. It's one of the not many places in the world that is treasured by their residents and people from all over the world who admire it. Please, consider not issuing these fishing permits.	Your comment has been forwarded to the decision makers. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.
William Bennett	HI	1/6/2020	I have seen the number of reef fish decline drastically since 1975, when I first started snorkeling here. Please stop that practice now!	Your comment has been forwarded to the decision makers. While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.
William Graham	HI	1/2/2020	This draft EIS is clearly intended to assess the environmental impacts of resuming the aquarium fishery business in West Hawaii using fine	Your comment has been forwarded to the decision makers.

			mesh nets. The applicant is not a fisherman but a mainland based trade industry group. The DEIS describes its scope in this manner: "Regarding biological resources, this DEIS focuses primarily on the effects of aquarium fishing on wild populations of White List species." That is understandable but the DEIS is extremely deficient when it comes to looking at anything beyond those particular populations. The bulk of my comments will speak specifically to this deficiency.	
William Graham	HI	1/2/2020	We also need to better understand the aquarium fishing permitting rules in order to evaluate the reasonableness of future oriented assumptions employed in the DEIS. In particular, the permitting rules appear silent on issues of scale that seem very important. Must the permittee be an individual or could it be a corporation? May the permittee employ multiple boats for collecting the fish? Is there any limit on the number of divers that may deploy from a single collection boat? Above all, there is no present limit on the number of fish that can be taken with a single permit. I attach a copy of the aquarium fishing permit form used by the DLNR.	Your comment has been forwarded to the decision makers. Existing bag limits are described in Section 1.2.3.2 of the EIS. The Preferred Alternative includes a reduction in the Achilles Tang bag limit from 10 individuals per day to 5.
William Graham	HI	1/2/2020	Finally, the underlying structure behind this HRS 343 related program undertaken by the applicant is very confusing. This makes it difficult for myself and for the community to participate in a properly focused manner. The Pet Industry Joint Advisory Council was not initially applying for any permit. Rather, according to its environmental assessment, it was engaging in a "program" which is intended to facilitate the permitting process (for the apparent benefit of itself and others.) The activity of the Pet Industry group within this program was ostensibly to prepare this EIS. Was there a discretionary approval being sought? However the draft EIS now takes a different stance, and the discretionary approval sought is for "Commercial Aquarium Fishing Permits." That is a very consequential change. It would seem that the Pet Industry group now plans further actions beyond this EIS? Any forthcoming EIS or revised DEIS must prominently explain these matters in a thorough manner.	Your comment has been forwarded to the decision makers. The Proposed Action has changed between the EA and EIS process, and comments received during the EA process were taken into account, including a new Preferred Alternative with a limited permit issuance. PIJAC proposes the issuance of 10 Aquarium Permits, along with other required authorizations (CMLs and WHFMP permits), subject to the limitations described in the EIS. Any addition Aquarium Fishing permits beyond the proposed 10 permits would require further analysis under HEPA. See Section 3.0 of the FEIS for a description of the proposed action.
William Graham	HI	1/2/2020	My best guess is that the PIJAC recruited these 14 individuals to add on the ground substance to its decision to fund an EIS so that the aquarium trade worldwide could benefit. The 14 agreed provided that they remain anonymous. Of course I cannot substantiate this guess. But it surely fits the process we now see, which is a mess.	Your comment has been forwarded to the decision makers.
William Graham	HI	1/2/2020	1. Impacts on our coral reefs Today the primary ocean related concern in Hawaii should be the survival of our coral reefs. It is well-known that the ongoing and increasing threat is the warming and rising acidity of the oceans. Therefore coral survival is a worldwide problem but it's especially acute here in Hawaii where we depend so much on our ocean environment. When we discuss the populations of the inshore fishes	Your comment has been forwarded to the decision makers. As stated in the EIS, DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in

			<p>our focus must turn to their role in maintaining the health of our coral reefs. The DEIS tells us that the overwhelming majority of aquarium fish collection in Hawaii has been of fishes in the surgeon fish family, about 90% of the total take. We know that these fish are herbivores which graze on algae. And without sufficient grazing, algae will overtake coral colonies that have been killed or weakened by adverse ocean conditions. This unwelcome algae growth then eliminates the chance for coral polyps to recover or repopulate when ocean conditions improve. Plus, once getting a foothold in one location, algae and seaweeds tend to spread. The bottom line is that we must do whatever we can to maintain strong populations of all the herbivores on our reefs. How can removing large numbers of surgeonfish align with that goal? The DEIS must address this squarely.</p>	<p>herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.</p>
William Graham	HI	1/2/2020	<p>It is certainly not my conjecture that without aquarium fish collection the reefs would be able to maintain good health in the future. But the additional negative impact stemming from aquarium fish collecting will accelerate the loss of healthy reef. This is common sense reasoning. The Draft EIS presents no forward looking analysis of future reef health or herbivore populations. The herbivore populations will in turn be impacted by the prevailing condition of the reefs. Here is part of the DEIS response when the Humane Society asks for a more lengthy look into future effects: "While it is correct that individuals are removed from the population annually, it is also true that new individuals are added during that period, and therefore it is not certain that losses will accumulate over time." That is hardly reassuring. The DLNR needs to be certain that losses will NOT accumulate. The DEIS keeps its focus on population levels, whereas EIS law requires reporting on indirect and cumulative impacts, such as the coral reefs where the fish reside.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time.</p> <p>The DAR (2019a) has noted that 24 of the 40 White List Species have remained stable or significantly increased between 1999 and 2017, when commercial aquarium collection was occurring at the rates anticipated under the Pre-Aquarium Collection Ban Alternative. For the 12 White List Species which had significant declines, as noted in Section 5.4.3, these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline (DAR 2019a). Because these declines are occurring in FRAs and/or MPAs as well (i.e., areas not open to commercial aquarium collection) it is reasonable to assume that banning commercial aquarium collection would not halt the declines.</p> <p>Finally, indirect effects and cumulative effects (including the cumulative impacts of commercial aquarium collection, or accumulation of impacts over time) are both addressed in Section 5.0 of the EIS. In addition, the EIS applied a growth rate for socioeconomic and biological consequences based on historic trends.</p>
William Graham	HI	1/2/2020	<p>Prior to the massive 2015 bleaching event our most notable coral reef bleaching had occurred back in 1998. That was the time when the</p>	<p>Your comment has been forwarded to the decision makers.</p>

			<p>world truly became aware of the fragility of the coral reef ecosystem. More recently during the latter half of 2015, and again during September and October of 2019 we have sustained major damage to our reefs here in Hawaii. The draft EIS only briefly mentions this situation and does not address it in any depth. Addressed on pages 116-117 it simply states that overall mean coral cover in West Hawaii declined 19.6% in closed areas and 17.6% in the open areas between 2014 and 2016. On page 133 the draft EIS indicates that after the bleaching event of 2015 there was an average coral cover loss of 49.7% in the leeward reefs of Hawaii Island. I won't try to reconcile the divergent numbers offered, but the magnitude of the problem is most apparent. Since the 2019 bleaching is too recent to be reflected in the DEIS I refer readers to the website hawaiiicoral.org to visualize the magnitude of this most recent setback.</p>	<p>The difference in the numbers in the EIS is because these are two separate studies, looking at different reefs. Therefore, the numbers are not directly comparable.</p> <p>As stated in the EIS, the DAR (2018c) has statistically evaluated coral cover over time between Open Areas and areas closed to commercial aquarium collection, but has not found any statistically significant difference.</p>
William Graham	HI	1/2/2020	<p>It is commonly acknowledged within the research community and the general public that coral bleaching events will occur more frequently in the future, and with increasingly stressful water conditions. The impact of aquarium fishing on future reef health must be examined in full. A look at other reefs in other countries should also be included for developing a better understanding of forward looking prospects in Hawaii. On page 133 the DEIS does say that Great Barrier Reef studies conclude that fishing pressure had minimal effect on bleaching. First off there is very little fishing pressure on that reef which has lots of protections. Furthermore, any pressure specifically due to aquarium fishing would be next to nothing compared to the intensity of aquarium fishing that we have had in West Hawaii. For reading on impacts to the Great Barrier Reef I suggest Reef Life, chapter 13 by researcher Callum Roberts, published in 2019.</p> <p>I think it also should be acknowledged that numerous individuals have been involved for many years since 1998 in establishing and protecting the sizeable Fish Replenishment Areas in West Hawaii where aquarium fishing with fine mesh nets has been prohibited. This effort has been extremely valuable in my opinion. But we are now in a new era when the survivability of our coral reefs is clearly in dire jeopardy.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, the DAR (2018c) has statistically evaluated coral cover over time between Open Areas and areas closed to commercial aquarium collection, but has not found any statistically significant difference.</p>
William Graham	HI	1/2/2020	<p>2. From the ocean to the pet shop With its narrow focus on population levels the DEIS shows minimal attention to the fishing activity itself or the handling of the fish which follows. Others have brought attention to the direct effects of the collection process on the reef, coming from both the anchoring and the actions of the divers. I'd like to look at the effects on the fish while in the ocean and thereafter.</p> <p>To begin with, the most common fish collected is the yellow tang, and they run in tight schools of perhaps 20 to 40 fish as a rule. I dive and photograph in leeward North Kohala where yellow tang are still</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>By law invertebrates cannot be collected in the WHRFMA. Invertebrate collection in East Hawai'i is addressed in the EIS, but is not part of the proposed action (since it does not require an Aquarium Permit).</p>

			<p>common. Once I closely watched an aquarium collector doing his job on a school of yellow tang off Mahukona. I don't have any particular criticism of how he comported himself, he seemed careful to me. The boat anchored further offshore where it could find a sandy bottom. But I want to put attention on the fish and how things went for them. The DEIS on page 32 describes succinctly and accurately the usual process for collection in just three paragraphs. Much more information must be provided, including the collection methods used with species that do not readily school and also with any invertebrates that are collected. To that last point, is the collection of invertebrates so negligible as not to be included in the DEIS? Otherwise we expect to find data on the quantity and types of invertebrates collected along with the environmental consequences. I have no sense that there is a problem here, but it should be addressed in the DEIS.</p>	
William Graham	HI	1/2/2020	<p>Regarding the yellow tang collection which I witnessed, not all the fish in the school got trapped in the net. Some broke away and were free, and scattered. But not enough to form a new school, apparently. What happens to all those fish, who by nature want to be in a school? There were no other schools nearby to join and I have no idea if they would be accepted in a new school anyway. Are they out of luck, will they become easy prey? Or will little groups form and eventually join to make a new school? And how about those fish that were captured. The rules say that no more than 5 individuals longer than 4.5 inches can be taken in a single day. From my experience, only looking, I'd say adult yellow tang are generally maybe 6 inches long. And the schools do appear to contain fish that are of similar size. Does the collector make off-the-cuff judgments as to which to keep and which to release right away, due to size? Probably one develops a rather accurate eye with experience. Still I wonder about those that are perhaps too large. Do they get released after netted? Or do they arrive back at the boat and perhaps get released on the surface at that point? How do they fare thereafter? These are all issues that I think do not get addressed in the EIS. Specifically, is there loss of life of fish while in the collection activity that does not show up in any reporting?</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>As stated in the EIS, DAR (2019a) found that, since the FRAs were established, the population of Yellow Tang has increased 165% in the FRAs and 101% in the Open Areas (areas fished by commercial aquarium fishers), compared to 74% in the MPAs. Overall Yellow Tang abundance in the 30-60-foot depth range over the entire West Hawai'i coast had increased 150% (over 3.4 million fish) from 1999/2000 to 2017/2018 to a population of approximately 5.7 million fish. In addition, there were no significant differences in the abundance of adult Yellow Tang in open vs. closed areas in shallow water (10-20-foot depths). Total estimated coastwise population of adult Yellow Tang in this depth range was estimated to be >2.5 million individuals. West Hawai'i had a significantly greater percent change in Yellow Tang density within its planned networked MPAs (and Open Areas) as compared to two non-networked sites on Maui.</p> <p>In addition, a statement regarding incidental mortality has been added to the EIS, stating "it is acknowledged that, in addition to the number of fish collected, incidental mortality may occur in fish released. However, while there are no data available to analyze these impacts, it is assumed that the magnitude of these impacts would not change from what has historically been occurring, and thus these impacts are already accounted for in the analysis of population trend data."</p>
William Graham	HI	1/2/2020	<p>And then, how about the treatment of the fish once they arrive at the boat, come to the dock, go into storage, get prepared for shipping, get shipped. On page 16 in the scoping analysis the DEIS informs us: "Therefore, because population effects have already occurred once an individual fish has been removed from the ocean, it is beyond the scope of this analysis to evaluate effects on individual fish once they</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The impacts of post-collection mortality have been added to Section 5.4.2 of the EIS.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>are removed from the population." I would disagree, and I strongly believe the DEIS should not be so constrained. As evidence, consider state law in the matter of granting permits, HRS 188-31. Paragraph b reads: "Except as prohibited by law, the permits shall be issued only to persons who can satisfy the department that they possess facilities to and can maintain fish and other aquatic life alive and in reasonable health." Although the DLNR may not even be able to properly enforce this provision, clearly the welfare of the fish is important to the department. Furthermore, the Pet Industry Joint Advisory Council (which is the applicant) has expressed their Mission Statement on their website, pijac.org/who-we-are. The first mission is to "PROMOTE animal well-being and responsible pet ownership." In this DEIS, by choosing to neglect any consideration of the well-being of the animals caught, PIJAC doesn't conform to their professed mission.</p>	
William Graham	HI	1/2/2020	<p>3. Absence of meaningful alternatives My understanding is that the role of alternatives within the EIS process is one which pertains to possible courses of action by the applicant. Alternatives are not proposals for possible changes in agency rules, although they can be useful towards that end. I believe this is an accurate understanding. In the DEIS I found there to be no alternatives of any consequence under consideration. It is also notable that the DLNR chairperson explicitly called out this failure in her letter of July 26, 2018 to the OEQC. That letter was referring to the alternatives considered in the Environmental Assessment, and it specifically suggested three consequential alternatives that might be analyzed. None of those three alternatives are examined in this DEIS. A look at the subject matter of the 5 alternatives that are considered in the DEIS should reinforce my conclusion.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The Preferred Alternative in the EIS is actually based on one of the alternatives recommended by the DLNR, with a limited number of permits being issued.</p>
William Graham	HI	1/2/2020	<p>First, reducing the Achilles Tang daily take limit down from 10 to 5 is a very modest change to just one of the forty species open to aquarium fishers. A second minimal alteration would limit collection by permit to just the West Hawaii area, designated as WHRFMA. It is already understood that the WHRFMA is where most aquarium fishing now occurs and is the primary area of environmental concern. Probably this is where the 14 proposed permittees have fished in the past. So that potential offering is of minor importance. Finally, limiting requested permits to just 14 individuals is not representing an alternative, it's just the scope of action related to the current application. That plus the alternative of no action essentially completes the alternatives considered.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>The Preferred Alternative is limited to the WHRFMA. The Applicant has no control over the continued collection of aquarium fish using other methods in East Hawai'i.</p>
William Graham	HI	1/2/2020	<p>The applicant could easily present and evaluate meaningful alternatives that might lessen the environmental impact of the proposed issuance of permits to the 14 seeking to use fine mesh</p>	<p>Your comment has been forwarded to the decision makers.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>netting for fish collection. The applicants might agree to conditions like the following: A sizeable subset of the 40 species could be considered off limits to their collection activity. They could abide by a closed season of some duration. They could offer further cooperation to ensure accurate reporting of fishes collected as well as survival statistics. They could constrain themselves to annual limits on the total take of any one licensee. The presentation of such alternatives is not detrimental to the interests of the potential licensees, it merely looks more broadly before recommending the preferred alternative. This also gives the DLNR valuable information towards determining how it might handle its licensing task in the future.</p>	
William Graham	HI	1/2/2020	<p>Hawaii's EIS rules suggest the range of alternatives which are sought in a Draft EIS. Referring to 11-200-17, after citing the no action alternative the rule goes on to suggest: "Alternatives requiring actions of a significantly different nature which would provide similar benefits with different environmental impacts." I find the DEIS unacceptable since no significantly different alternatives for the proposed activities of the 14 are presented or evaluated.</p>	Your comment has been forwarded to the decision makers.
William Graham	HI	1/2/2020	<p>4. Underlying structure of this application It is important to keep in mind the process by which this DEIS has arisen. First Hawaii's court system ruled in early 2018 that current aquarium permits are invalid and new permit issuance must await a full study of the environmental impacts of collecting for aquariums. Obviously it is too expensive for a single fisherman to bankroll the preparation of an environmental impact statement. However, worldwide the aquarium industry is sizeable, with retailers and wholesalers and shippers all involved. So a trade group, the Pet Industry Joint Advisory Council located in Alexandria, Virginia has chosen to proceed with the environmental impact statement. Keeping things in perspective, it would be a net positive for Hawaii residents to get a comprehensive, fair minded environmental impact study of aquarium fishing and our reef life without spending taxpayer dollars. Let us hope that is forthcoming. However there are striking oddities involved in the current process. The draft EIS (DEIS) lists the Pet Industry Council as the applicant who has initiated the EIS process. But the "applicant" hasn't applied for any aquarium permits yet, although I believe that the DLNR is not currently accepting applications. It's not clear that the Council has officially applied for anything. But within this DEIS the Project Summary section reads: "Proposed Action: issuance of 14 Commercial Aquarium Permits" Note that HRS343-2 defines applicant thus: "Applicant means any person who, pursuant to statute, ordinance, or rule, officially requests approval for a proposed action." Clearly there is a mismatch here, the proposed action cited by the applicant is not</p>	<p>Your comment has been forwarded to the decision makers. PIJAC is the applicant who is officially requesting approval of the proposed action, which is issuance of 10 Aquarium Permits.</p>

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			being officially requested by the applicant. Furthermore, this DEIS action is a big change from the original "program" as described in the EA of March 13, 2018 under the section entitled "Project Summary". These are not mere housekeeping issues. Perhaps the HRS 343 process should be restarted with a clearly defined action maintained throughout.	
William Graham	HI	1/2/2020	There are 14 specific individuals who form the basis for significant parts of the data cited in the DEIS. Yet those 14 individuals have not been identified publicly nor have they applied for new permits. The Humane Society asked the DEIS authors for identification of the 14 applicants by name and business name after the issuance of the Environmental Assessment. Here is the response they received: "Comment noted. The applicant information is provided in the DEIS." This is a clear example of how the irregular situation here has brought about unnecessary confusion. We should hear in a forthright manner why the 14 are not identified. I can imagine reasons why those individuals might not want to be publicly singled out and I can respect their decision. But the DEIS itself suffers without full disclosure. In fact the permit application form used by the DLNR specifically asks for the name of the applicant and much more. See attached AquariumPermit.pdf. Furthermore one finds that some of the data within the EIS is purportedly based upon the historical records of those 14 specific individuals. Examples would include tables 5.2 and 5.11 in the DEIS. Absent specific disclosure of the 14, why should the public have confidence in the accuracy of that data when commenting on the DEIS? No verification is possible.	Your comment has been forwarded to the decision makers.
William Graham	HI	1/2/2020	Also, the DEIS attempts to make use of the ambiguity that revolves around the 14 individuals and their role in the current application for which the DEIS has been prepared. On one hand, page 19 in section 3.5 Limited Permit Issuance (Preferred) Alternative, one reads: "Under the Limited Permit Issuance Alternative, the DLNR would issue Aquarium Permits to 14 aquarium fishers in the WHRFMA,"). Note that it does not say anything about any constraint on the DLNR from also issuing permits to other applicants. Then on page 135 in section 5.44, Mitigation, the second paragraph reads as follows: "Nevertheless, the Preferred Alternative includes mitigative measures (see section 5.0) such as a reduction in the number of Aquarium Permits that would be issued, ..." So here the ambiguity is clearly exposed. Nowhere is the DLNR asked to limit its overall issuance of permits to only 14, since that is clearly not the proper role for the applicant. (Why would these 14 qualify as preferred over others, anyway?) The EIS must either explain how their proposal constrains the DLNR from further issuance of permits or else discontinue using the 14 number as a valid alternative to unlimited issuance.	Your comment has been forwarded to the decision makers. The EIS is not an application for a permit. It is only disclosing the effects of issuing 10 permits. If additional fishers wish to apply for an Aquarium Permit beyond the 10 permits that would be issued under the Preferred Alternative they would need to complete their own HEPA review before additional permits could be issued. PIJAC would not act as an agent of the DLNR. Permits would still be issued by the DAR, PIJAC is simply requesting approval for the issuance of 10 Aquarium Permits.

Comments and Applicant Responses to All Other Comments Received on the DEIS

Commenter	State/ Location	Date Received	Comment	Response
			<p>With this EIS, if the PIJAC plans to get an approval of some nature which allows it to act as an agent of the DLNR insofar as issuing permits, that would be unusual. There is no indication that these 14 individuals are current applicants for permits. If this so-called application for 14 permits constrains the DLNR in any manner from deciding to whom it will choose to issue permits (such as to these 14) if and when the DLNR resumes issuance of permits, the public should be made aware of that right now, in this document.</p>	
William Leisk	HI	1/4/2020	<p>The Hawaii reef fish populations are in decline. Adding commercial net collection of those same fish is obviously bad policy. Aquarium fish collection is like selling the seed before planting.</p>	<p>Your comment has been forwarded to the decision makers.</p> <p>While the EIS acknowledges that reefs and reef fish face many threats, the DAR (2019a) concluded that 24 of the 36 White List Species with population trend data have remained stable or increased between 1999/2000 and 2017/2018, when commercial aquarium collection was occurring. For the 12 species that have had significant declines, this impact would occur under any of the alternatives, including the No Action Alternative, as the DAR (2019a) has noted that these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline.</p>

RE: Submittal Form for HRS Chapter 343 Publications in the Periodic Bulletin : Entry # 622

http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2019-11-23-HA-DEIS-Hawaii-Island-Commercial-Aquarium-Permits.pdf

December 15, 2019

I read with genuine sadness and horror, this application and DEIS.

This application should be DENIED, and our public employer & employee time (and thusly, our tax dollars) should not (now or ever again) be wasted entertaining similar inhumane, immoral, unethical applications.

These are NOT "aquarium fish" these are indigenous fellow residents of our shared island home. I am one of MANY who would be harmed by allowing this permit to be approved. Like others, I swim and snorkel frequently, to simply be amongst these beautiful creatures. It is an important part of my personal, recreational, and spiritual experience where I live and work.

Using a more accurate and appropriate name, the "tropical fish enslavement industry" has a HORRIBLE history and record of capturing our indigenous, native tropical fish, and enslaving those FEW that survive capture, packaging, shipping, and wholesale and retail sales into foreign environments.

Our Native Hawaiian tropical fish BELONG in Hawaii, in their native habitat - NOT LIVING A MISERABLE EXISTENCE ENSLAVED IN FISH TANKS FOR THE CRUEL "ENTERTAINMENT" OF HUMANS who somehow think they have a RIGHT to freely enslave others.

WHO and WHAT gives ANYONE this right to enslave our beautiful, innocent, fellow indigenous island inhabitants?

There is NOTHING “Sustainable” about this practice. It is narcissistic, selfish enslavement of our fellow creatures who have an inherent right to live free in their habitat - all in the perpetual lust for dollars.

This is the EXACT same barbaric ENSLAVEMENT scenario played out throughout human history: Capture the indigenous innocents,
Destroy their connection with family, community, home, and steal their freedom,
Force those innocents into inhumane conditions for the rest of their once beautiful - now brutally cruel, exploited lives,
and IF they survive capture, packaging, transportation, wholesale and retail “sale” -
End their lives enslaved in an unknown foreign containment.

With Hawai'i's history of colonization and stolen freedoms, lands and culture - does the reality of this cruelty - this theft and enslavement - not effect your conscience...? There is a very sick irony here.

For too long, our standard EIS (and DEIS) protocols and process has looked at ONLY a narrow and limited number of “factors” upon which decisions are manipulated and rendered.

Therefore, I formally ask that you correct this shortsighted error, and that the MORAL and ETHICAL DIMENSIONS AND CONSEQUENCES of this proposal, application, permit request, deliberation and decision NOW BE ADDED AND INCLUDED IN THIS EIS process and decision.

Hope for human survival on our ailing earth will remain questionable at best until we recognize our past mistakes and our arrogantly presumed dominion mentality - and change our behavior. I can think of no better opportunity than now - this decision - to change our destructive course determining our collective future.

We need gratitude and respect for the lives of all beings with whom we share our home, island, and planet - in this decision.

Subject: [EXTERNAL] Aloha please stop the stealing of tropical aquarium fish from our reefs!
Date: Monday, January 6, 2020 9:10:08 PM

Aloha David,

I swim in the ocean every day and have been shocked by the rapid decline of small tropical fish in our reefs.

I understand they are being harvested commercially to be sold for aquarium fish.

Is there anything that can be done about this on your side?

Mahalo in advance!

With warmest aloha,

Richard

Subject: [EXTERNAL] AQ EIS comments
Date: Friday, December 13, 2019 8:01:07 PM

1) The EIS contains disingenuous use of averages. For example "% of their overall island of Hawaii populations", the sample population size is arbitrary, why not local (collection area) populations (that would look overly extractive) or Pacific populations (that would look obviously misleading).

2) The EIS contains disingenuous use of generalities "minimal impacts on populations in general". Nicely hiding that aquarium collecting is an economic activity biased towards higher priced (less common) species. The decimation of uncommon species does indeed have little short term impact on the population in general, but destroys species diversity - a key indicator of ecosystem health.

3) As a society we try to limit anthropogenic stresses on the reef, such as pollution. It would be inconsistent to allow an anthropogenic stress such as fish collection. If a polluter said the pollution is only 1% of what they could pollute we would not accept this as a justification, if a fish collectors says it is 1% of what they could collect we should not treat this as a justification.

4) No Aquarium Permits is the only practical solution.

Subject: [EXTERNAL] Aquarium collection licenses for west hawaii
Date: Monday, January 6, 2020 5:15:48 PM

Aloha David,

I'm writing to voice my concerns regarding the possible reversal of the tropical fish collection ban that's been in place for a few years. As a scuba diver in the south Kona, Captain Cook area over the last 11 years I've seen first hand how some species were decimated, particularly in the Milolii area where some of the collectors operate. Since the ban went into effect I've noticed some of the species start to appear in juvenile form. As the tropical fish population starts to recover, it seems an odd time to lift the ban. The argument that 14 licenses won't hurt isn't valid, as many divers can operate under one license. Also determining which collectors are legitimate and which are not will be impractical given DNLRs limited resources. While I personally think a permanent ban is the right thing, certainly leaving the ban in place for the next few years only makes sense as the reef fish are only starting to recover. The reef fish are also vital to the health of the coral reefs which have been struggling due to bleaching. Further stressing the coral at this time doesn't make sense. As someone who worked in the tourism industry until this year, I received many comments from visitors that they don't see as many fish (yellow tang, clown fish, butterfly fish etc) as they used to. Knowing how important tourism is to this island, it seems foolish to deplete what keeps visitors coming back for snorkel adventures. Even if you remove the moral element to this situation, it seems like taking from the many to benefit the few financially. Again, having seen the collection operations of the past first hand, I'm quite sure bringing them back will be very harmful to our ecosystem and our livelihoods.

I appreciate you time

Mahalo

I am a resident of the Big Island since 2003. I am writing to appose issuing permits to collect Hawaiian reef fish. Our reefs in Hawaii have never been under more stress and need every single herbivore to help maintain their health. We need these reef fish to keep not only sustainable fishing but tourism. Long ago I was an avid aquarist. Then I learned how fish were collected and how unlikely they were to survive. We have a moral responsibility to preserve what we have. Aquarium collecting is not helping the island.

Dear Sir,

I have been actively diving and snorkeling in Hawaii for over twenty years and I know that the aquarium trade most definitely has a VERY negative impact on the reefs. I produced a documentary in 2005 about Hawaii's near shore reefs and the animals that live there, and it is devastating to me to STILL see a steady decline in the health of ALL Hawaii's reefs.

Our native fishes need and deserve effective legal protection, and should be left in the wild!

Please help make the PONO choice! NO MORE FISH COLLECTING! If you'd like to view my film, you can find it here: <https://www.youtube.com/watch?v=9NciCVLt3nY>

Subject: [EXTERNAL] Aquarium fish environmental impact statement
Date: Wednesday, January 8, 2020 1:01:47 AM

Aloha David,

I have followed the aquarium fish issue for over 15 years now, conducted fish counts with my students, taught many classes on climate change, and done research on the effects of the removal of aquarium fish as revealed by the scientific literature. I am currently the interim dean of the school of natural sciences and math at Chaminade University. I would like to make testimony on the environmental impact statement re the aquarium fish industry.

As I am sure you are aware, coral reefs all over the world are being lost and degraded by increasing water temperatures and polluted runoff that causes algae to grow. Most of the fish that are removed from the ocean for the aquarium trade are algae eaters, so they help defend the reef. We are now at a point with climate change so severe that most of the worlds reefs, including Hawaii's, have bleached multiple times recently and we are at risk of losing the keystone species that defines them - the coral.

Because of this we need to leave all of the variables that help protect and defend the reef intact and the aquarium fish are one of those. I know it is sad that some will lose their jobs but there are many jobs right now and there is much room for new careers in aquaculture. I find that the EIS is just another statement allowing further use of a resource that the reef cannot afford to lose.

Please opt for the cessation of the collection of these important fish that have nothing to do with food and are only about money. They may make some money in the short term but they will cost us all in the long term when we lose our Reefs and all of the food fish and eco tourism and aesthetic value that they create.

Thank you for your time and consideration.

Dear DLNR:

Accepting the EIS with its obviously skewed manipulation of data in order to find 'no significant impact' would be an insult to all the Native Hawaiian cultural practitioners who oppose the permits for commercial reef fish collections.

I am strongly OPPOSED to the Draft EIS for commercial reef fish collections because healthy reefs depend on the fish that live on them, and because commercial fishing of reef fish is a wasteful, destructive, and unnecessary industry.

One has to wonder why those who wrote the EIS purposefully chose to manipulate the data, and what connection there may be to the proponents of such a destructive industry.

Thank you for your kind consideration of rejecting the EIS.

To whom it may concern,

I am writing to say that I think that working on repairing & building up healthy coral reefs is MUCH MORE important than supporting the aquarium fishing industry. If we continue to take and damage and not replenish then in the future this will be a moot point because we will have no reef or fish left. I do not think ANY aquarium collecting permits should be issued until our reefs ecosystem is fully replenished to a point of over abundance. Any taking before that point will be harmful.

Thank you for taking time to read and consider this.

Dear Mr. Sakoda,

I am a Hawai'i resident since 1995. As an ocean swimmer and scuba diver, I have noticed a remarkable decrease in the numbers of colorful reef fish in the 30 years I have been utilizing our beautiful waters. Most of my ocean swimming has been on the south shores of Maui, on a weekly basis, over these years. The quantities of fish used to take my breath away, now I can do a 1 1/2 hour swim and sometimes see less than 20 fish total. Please do not allow aquarium fishing in our fragile waters.

Thank you for your attention to this matter.

Sincerely,

Lisa Thomas

Subject: [EXTERNAL] Aquarium Harvesting
Date: Sunday, January 5, 2020 7:26:18 PM

Mr. Sakoda!

As a fairly recent home owner on Maui, I do not understand allowing the local reefs to be harvested of fish with very little benefit to the Hawaiian islands and the Hawaiians. The Islands' main industry is tourism and this needs to be protected. Most tourists enjoy snorkeling and scuba diving to see the local colorful fish population. Loss of numbers and varieties of fish could negatively impact the tourism industry.

It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,

PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.

I implore you to ban aquarium collecting in Hawaii.

Many Thanks

Attention Mr Sakoda

I am a resident of Maui and want to express my strong opposition to the way that the aquarium trade has been given so much access to the wildlife on our reefs, depleting them in ways that are absolutely unacceptable.

The aquarium trade is a devastating commercial enterprise that trashes near-shore habitat and species. The vast majority of Hawaii people want the aquarium trade to end. And so do millions of visitors around the world, who hold Hawaii reefs in their hearts. Reef tourism supports many thousands more people, with revenue 400 (four hundred) times greater.

The Environmental Review by the Pet Industry Joint Advisory Council is not relevant, not accurate, not pono and not legal. The aquarium trade is not fishing, it's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

David,

I am a fish biologist and though I live in western Washington, I've spent many years snorkeling and fishing over on Kauai. I've also had the honor of doing research out on Midway with NOAA, The US Fish and Wildlife and the State of Hawaii. In addition, I write Hawaiian nature books for keiki.

In my experiences observing and counting reef fish for more than 30 years, I've seen a sad decline in many species. I know there are many causes for population declines, but I've seen aquarium harvest and know many species are actually disappearing from our reefs due to the collecting of yellow tangs and many other fish valued by the aquarium trade.

I urge you to ban the trade or greatly limit ability to collect our fish so that future generations can enjoy the diversity of fish once present when I first came to the islands.

Sincerely,

Please just say no to the aquarium trade. All the critters on the planet are under enough duress due to the myopic vision of our species. There is no need to add insult to injury.

Respectfully,
Steve Moore
Captain Cook, HI

The Environmental Review by the Pet Industry Joint Advisory Council is not relevant, not accurate, not pono and not legal. The aquarium trade is not fishing, it's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

Wildlife is best left in the wild.

Sincerely,

Haley Van Noord

7th grade life science teacher and former marine naturalist

Aloha, Mr. Sakoda!

Extinction is forever—it's that simple.

It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting.

The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.

But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,

PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.

I implore you to do the right thing.

RE: Proposed Draft Environmental Impact Statement for Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area.

Respectfully, please accept my comments on this proposed Draft Environmental Impact Statement (DEIS), which totally fails to meet the legal requirements specified by HRS Chapter 343.

It's difficult to comment on this document because almost nothing was done properly and the underlying assumptions and status quo are simply wrong.

For one, the consultation process was incomplete and is invalid, because many people, organizations and agencies were not consulted or notified of the proposed action. There is information that was not considered as a result. For example, regularly beach goers, park users and many Native Hawaiians who access the beaches and nearshore waters in West Hawai'i were not given notice or consulted. I wonder who is advising PIJAC and if anyone on the Hawai'i State Environmental Council was notified of this issue. I personally was not made aware, given notice or consulted even though I have been publicly outspoken and actively involved in the aquarium collection policy and regulatory compliance issues for more than 5 years and, as the former Director of the Office of Environmental Quality Control (OEQC) agency, authored the October, 2015 letter advising the Governor and DLNR that it was critical to put an immediate moratorium on commercial collection of reef wildlife until the HEPA process could be completed. In addition, the proposed DEIS treats the action as being relevant to people and interests on the island of Hawai'i in West Hawai'i only, yet there are statewide implications.

Two, there is no clear applicant - just a commercial trade association that profits off of trafficking Hawai'i reef wildlife, asserting that it represents 14 unnamed permittees; nothing and nobody, not even a corporation connected to Hawai'i, is identified as having a role or responsibility.

The “applicant” tries to assert all alternatives are similar and there is no significant difference between any alternative, including the illegal activities occurring under the status quo,¹ and so no mitigation is necessary.²

There is no valid regulatory system for a West Hawaii, 14 permittee option. The old, illegal regulatory system (that was in place prior to the Hawaii Supreme Court ruling in *Umberger*) is a statewide and unlimited permit system that does not fit the proposed action (to allow exclusive use by 14 West Hawaii unnamed “permittees” to collect nearly unlimited reef wildlife for the aquarium industry in West Hawai‘i using small mesh nets). There is so much missing. What is the system? What are the rules? What are the limits? How is anything enforced? Who profits? Who pays?

Perhaps most offensive, the proposed DEIS asserts that the no alternative and baseline is essentially the continued unlimited collection of reef wildlife. There is no alternative evaluated that does not include unlimited collection of reef wildlife.³ The alternatives are a wish list of the options PIJAC would like, not the options that are legal or available, and no option examines “no action alternative” as in, no commercial collection of reef wildlife by aquarium profiteers.

The document is totally incomplete in myriad ways. It’s as if someone got about 1/50th of the way through a final exam then hurriedly turned it in. Essentially, the document does not evaluate environmental impacts but simply claims there are none and proposes no mitigation.

When it comes to data, the document includes references and charts with some remnants of some data collected but it’s not clearly sourced, accurate or peer reviewed and is admittedly incomplete in many circumstances. It’s as if the authors’ shrugged their shoulders, looked around real quick, found most data was missing or scarce, and conclude it’s not important to know much, including numbers and habitat availability as climate change impacts increase for each species, cumulative impacts, effects on subsistence fishers, economic costs and benefits or interactions and impacts on

¹ The proposed DEIS explains as follows: “Given the long history of commercial aquarium collection in Hawai‘i, it is reasonably foreseeable that commercial aquarium collection will continue. Based on available data regarding species abundance and yearly commercial aquarium catch over the past 18 years, it is expected that in the reasonably foreseeable future, commercial aquarium collection will proceed generally at the same rate and have the same level of impact as in the past 18 years. To the extent new data regarding the impacts of commercial aquarium collection on biological resources becomes available in the future, DLNR may consider those data and, to the extent necessary, supplement this impacts analysis.

² This is so indicative of the larger problem here, the applicant has no concept of “give back”, “take care” or “respect” (e.g., *malama aina*).

³ For example, the applicant states “During the evaluation process, it was determined that some resources typically evaluated in an EIS would not be impacted by any of the alternatives under consideration. The evaluation includes past use and potential impacts by the commercial aquarium fishery because it has been a part of the baseline condition of these resources since the late 1940s. Because a significant increase in commercial aquarium fishing is not anticipated during the 5-year assessment period evaluated in this DEIS, and in fact a decrease when compared to historic conditions is anticipated due to the issuance of only 14 Aquarium Permits, this DEIS does not anticipate a significant change in the current baseline condition of these resources.”

commercial food fishing (just some examples). Also, the limited scope in time (5 years) is too short, the document does not analyze the alternatives, impacts on corals or climate change implications, for example.

The document ends with the Cultural Impact Statement, which was clearly tacked on in the end of the proposed DEIS when it should have been relevant from the beginning. The DEIS itself needs to incorporate what was described in the CIA from the start. It is impossible to conclude the proposed action would have no significant impacts. The cultural and environmental (and economic) impacts are inextricably intertwined and they were not analyzed in this document.

The application for 14 unnamed permittees to be able to obtain a permit to use a small mesh net to collect reef wildlife, presumably for the trade organization PIJAC, if granted, would result in a total incoherent management philosophy that permits the use of small mesh nets in West Hawaii and prohibits them everywhere else, and prohibits the use of small mesh nets everywhere but West Hawaii. This bizarre outcome is the result of the wacky illegal activities still occurring outside West Hawaii that the State Executive branch has sanctioned.

In summary, this DEIS is a total sham and throughout reveals what appears to be an illegal deal between the Executive Branch and the applicant, PIJAC, the trade association for the reef wildlife trade (now trafficking) industry. As the recent Hawai'i Supreme Court in the 2016 *Umberger v. DLNR* decision, the Hawaii Environmental Policy Act (HEPA), the OEQC and EC letter make clear (in addition to numerous statutes and the Hawai'i State Constitution Sections 11.1, 11.2, 11.6, 12.4 and 12.7), the state government cannot allow unlimited collection of reef wildlife until and unless the environmental review process under HRS Chapter 343 is complete, if at all.

It's almost impossible to further comment on this document because every aspect of it is devoid of relevant facts and information. The focus is generally on the benefits of aquariums and zoos, for example, not on the environmental impacts due to removal of reef wildlife from nearshore waters. I can't help but want to elaborate and provide some examples.

Despite the very clear rule of law that there should be no commercial aquarium collection of reef wildlife absent compliance with HEPA, an illegal scheme to get around the review and disclosure laws was devised once again. So at this moment, unlimited numbers of collectors continue to be able to capture unlimited numbers of reef wildlife from our islands' nearshore waters (except in West Hawai'i due to specific permit rules, Maui due to County prohibitions based on cruelty to animals and a few small protected areas).⁴ One irony is commercial collectors are collecting plenty of

⁴ Under the new illegal scheme and status quo, any person can apply and receive a commercial license to sell (export) reef wildlife, with no limits. There are no regulations, limits or boundaries save a few tiny geographically excluded areas (e.g., Hanauma Bay) and the requirement that you report what you catch. There is no enforcement or it is miniscule. Any person with a license can use any technology they want except a small mesh net to capture the native and wild reef animals, bring them to the surface and, if they survive, export them to make some money.

animals and being told they can use any kind of technology except a small mesh net. So under the current administration, during these most important times to be paying attention to coral reefs, wildlife and climate change challenges, the most harmful collection techniques for capturing our underwater wildlife are proliferating, hurting reef wildlife and habitat.

Who knows what is happening? No one, is the answer, because anything goes.⁵ It appears to be a policy and goal to take what can be taken to maximize profits regardless of the law, people, animals, bigger economy and long-term consequences; hurry up, before numbers drop, someone realizes the wild populations are in jeopardy, climate changes make collection impossible for whatever reasons (e.g., the reefs are dead) or some group figures out how to more cheaply raise captive bred animals for aquariums.

Although the commercial aquarium collectors were permitted to exploit the reef wildlife resources all these decades in violation of the law as HEPA (authorized in 1970) was never even initiated, the trade industry and apparently the Executive Branch continue to operate like the illegal activity is legal. In addition, the applicants are trying to say the the nearly 50 years of illegal activity that occurred and the status quo of unlimited collection is now the baseline for all studies moving forward. The applicants are trying to normalize the illegal activity of unlimited collection by claiming it is the status quo.⁶

This proposed DEIS is a sham,⁷ like the regulation of the industry itself for the last 50 years. It reveals the applicant's total misunderstanding of reef wildlife issues as well as the State Executive branch's willingness to collude with corporate commercial interests to evade environmental review requirements. Does DLNR continue to claim that there is

⁵ Please note that now, like previous years, the DLNR has been non transparent and developed an ad-hoc system for the aquarium industry to be able to collect as much as collectors can get, of any and all species (except live corals and rock). This can make it difficult to explain how it's possible that the State Executive allows unlimited, unmonitored and unstudied commercial collection of all reef wildlife species (save corals and rock). It makes the description of what's happening a little vague and unbelievable.

⁶ Let's say there have been a minimum of 50 million Hawaii animals removed from our reefs over about 50 years without ever having the impacts on the economy, the environment, the culture or the animal abundance itself studied or potential impacts discussed or disclosed with the public. And this year, about a million more animals will be found, removed from their reef homes, brought to the surface and sold, if they survive the journey. At the same time, *kupuna* describe how 50 years ago, the reefs provided dinner to families throughout the islands. Not so long ago, there was reef wildlife abundance like you still see in the Northwest Hawaiian Islands. Now, not only is there no dinner to find, the commercial fishermen themselves are barely able to find fish for the market. There is just not much left. Now the aquarium collection trade industry group PIJAC wants all of us to believe that there is no significant socioeconomic, environmental or cultural impact when the collectors are allowed to take unlimited reef wildlife— never has been a significant impact and never will be? 50 million animals don't matter? How many would it take to matter?

⁷ In this bizarre world, the rule of law appears meaningless — just words thrown around, as the Executive Branch will do whatever it takes to accommodate commercial corporate profiteers; in this instance, reef wildlife traffickers. Despite the ruling by the Hawaii Supreme Court, the Hawaii Constitution, agency and board urgings and official letters, legislative action and grave public concern for decades, the Executive Branch has totally ignored the rule law, the public trust and well being of our island people.

no problem with unlimited commercial collection of reef wildlife because the commercial collectors are not complaining?

How does this document comply with HRS Sections 1 - 853, HRS Chapter 342, 343, 344, 345 in particular? What are the agencies tasked with prioritizing natural resources, the public trust or protecting the environment? Who are the Governor's Cabinet members, who advise him on environmental issues? Is there no agency funded and tasked with advising the Executive Branch or advocating primarily for the protection of environmental resources?

Even if all the illegal issues were ignored and the government were to accept this Draft EIS on its face, as being accurate, what are the consequences for violations? What happens when we discover various species populations have been depleted, perhaps beyond recovery? We could be there already. Are there any penalties for violations? Is there any plan for enforcement?

For there to be a valid draft EIS to evaluate potential environmental impacts from commercial aquarium collection, there must be a state program in place that ensures cumulative impacts are evaluated before individual permits are granted or the applicant must provide that cumulative analysis. There has yet to be a programmatic evaluation of actions by the Executive Branch to grant permits and/or licenses so the applicant must do it themselves to meet the statutory requirements. Where is that?

There is no legal permit system for commercial aquarium collection of reef wildlife. The State has the authority to set up a permit program, similar to the program the Hawaii Supreme Court found illegal, after the program goes through the environmental review process. This is an important point to understand. Based on this proposed DEIS, it appears PIJAC wants to be a quasi-agency, pre-determining government actions statewide. It appears PIJAC is proposing to be the exclusive applicant throughout the state, e.g., this is an application for PIJAC to get sole use and control over all nearshore water permits. Please explain the concept envisioned here.

This is the use of conservation land adjacent to county and state parks. Have all park users been notified if the proposed actions by PJAC in the conservation district and associated activities in the shoreline area? Are any county shoreline access authorizations relevant and do they need to be applied for?

How is a pet association trade group planning to be responsible for the actions of the collectors? Are they employees? Why are their names not revealed? What is being hidden? Are there any other situations where an environmental review process has been complied with that are similar, e.g., with a trade association acting as the agent for collectors? Has there ever been an environmental review document with such anonymity?

What PIJAC business interests and in-state business addresses exist and where locally can the applicant be found? Does the applicant have any experience, responsibilities, connections or obligations in the State of Hawaii? If so, please list and specify all.

Does the consultant preparing the draft EIS have any experience, responsibilities, connections or obligations in the State of Hawaii? If so, please list and specify all.

Is Section 1.2.3.1, a complete list of opportunities provided throughout the history of the commercial aquarium fishery for citizen participation, as alleged?

The action summary is “to ensure that commercial aquarium fish collection allows for the lawful, responsible, and sustainable commercial collection of various fish species from nearshore habitats” by getting 14 permits. However, there is no definition of what is lawful, responsible or sustainable for any species. And again, under what program do these definitions exist?

Please explain when and how the State Executive has been working with PIJAC, to try to explain the regulatory system and/or figure out ways around it. The DEIS states “The DLNR has been working with stakeholders (e.g., public, various fishing and tourism industries, local governments) since the 1970’s, and continues to work with them to ensure the commercial aquarium fishery is environmentally sustainable and prevents degradation of fish populations and the habitats in which they occur. “ When has the DLNR worked with the public, environmental groups or Native Hawaiians? When has the DLNR worked with the various fishing, snorkeling, scuba diving and tourism industries? When has the DLNR worked with local governments? What are the actions that have been taken for all of the above?

Table 3-1 demonstrates how PIJAC and DLNR are trying to present a false sense of choices — alternatives — the choices PIJAC would like, and has dictated in the past. These are not the legally allowable choices.

What, if any, of the data and studies referred to in this proposed DEIS have been peer reviewed? Please provide details if there is any data or are any such studies. For the data that is not peer reviewed, are there alternative data or studies that have been evaluated? If not, why not?

What ethical, transparency or accountability rules or limits exist to ensure the state government employees are not making money from the industry or being paid by the collectors and/or trade industry agents or given gifts or, at least if they are, there is public disclosure?

In a footnote, the proposed DEIS acknowledges there is very little information on 4 unique species that the proposed action would allow to be collected in unlimited numbers. Like so often in this document and Executive agency documents, the authors of this document rely on what commercial collectors reported they were able to catch to conclude that not much would be collected. In other words, because collectors

could not find very many, we shouldn't worry about the impacts, despite the fact that this very information is an indication that the species is unusual, rare, perhaps it should be an endangered species but we don't know much. Please explain and, I hope, prove me wrong.

It's difficult to make comments or ask questions of this document, so please go ahead and put a "why" before each statement, so that it is read as a question. For example, when I state "The document totally fails to meet the legal requirements specified by HRS Chapter 343." Please read it as "Why does this document totally fail to meet the legal requirements specified by HRS Chapter 343?" ⁸

I'm hopeful PIJAC will see the light and stop selling Hawai'i reef wildlife and begin to invest in captive-bred options to create reef wildlife abundance and a world-class aquarium industry in Hawai'i that is respectful and gives back to Hawaiian culture and the environment.

Sincerely,

Jessica Wooley

⁸ Here is a conclusion I agree with but it looks like a typo, FYI. "Given that Open Areas did not see a more severe decline than areas closed to commercial aquarium collection, **it is not anticipated that commercial aquarium collection has a less than significant impact on coral declines.**"

Mr. Sakoda, DLNR staff, HI legislature,

Considering:

unwarranted culling native populations of fish in a challenged and changing finite reef resource area;

aquarium fishing mortality is such a high percentage of catch;

aquarium fishermen are highly unsupervised;

extremely limited HI employment base propped up by aquarium fish;

It should be apparent that this activity is not in the public's, nor in the malama-aina interest

and should not be allowed in Hawaiian waters.

David Sakoda, Program Specialist
Division of Aquatic Resources
Department of Land and Natural Resources
1151 Punchbowl Street, Room 330
Honolulu, HI 96813-3088

Dear Mr. Sakoda,

Fish Feel is a 501(c)3 organization that promotes respect and consideration for fishes and other animals. The following comments are submitted on behalf of our thousands of constituents, and in regard to the Pet Industry Joint Advisory Council (PIJAC)'s draft environmental impact statement.

Hawaiian wildlife is invaluable, and among the state's greatest treasures. Hawaii's native fishes are cherished by many residents, and the ability to see them in their natural habitat is a great attraction to many others, too. Public perceptions of nonhuman animals are increasingly improving, and many people now recognize that these fellow beings deserve consideration as individuals with their own lives to live, which should be free from gratuitous human interference and cruel exploitation. Science has shown what many people have intuitively realized: that fishes are sentient beings who can suffer fear and pain: <http://fishfeel.org/resources/facts/#accordion-1-3> Their well-being is deserving of our moral consideration.

Taking animals from the wild to be kept in captivity for human amusement is increasingly recognized as an inhumane and unethical thing to do. Removing them diminishes wild populations and disrupts social structures. Even the largest zoos and aquariums cannot truly replicate natural conditions, let alone for home aquariums to do so. Few people will seek veterinary care for an ailing fish, and there are relatively few veterinarians who can capably treat fishes, especially exotic fishes. Many wild-caught fishes perish before even arriving at their final destination, and many if not most perish within their first year there.

No one needs to collect or keep wild-caught fishes, instead it is a luxury pursuit. They should not be caught for private profit and pleasure but instead left in nature to be enjoyed by all and perform the invaluable ecological services they provide there. It is absurd for PIJAC to claim that continued removal of fishes as it has proposed will not affect species populations, and it is insulting to the intelligence of any reasonable person. They should not be removing *any*, for the sake of the fishes, the other animals who are genuinely dependent on them, and of the public. This is all the more important given the grim state of flux the oceans are in, and the hardships that coral reefs are experiencing – environmental changes which are only expected to worsen.

Thank you for your consideration of these comments. Please act in the best interests of Hawaiian wildlife and the public by upholding the ban on commercial aquarium fishing.

Respectfully,
Mary Finelli

Subject: [EXTERNAL] Comments about native reef fish
Date: Monday, January 6, 2020 10:26:35 AM

Mr. Sakoda,

I am very concerned about the impact of fish collection for the aquarium trade on Hawaii's wild fish populations. I don't feel that the Pet Industry Joint Advisory Council's environmental impact statement is accurate in "surmis[ing that] the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem".

Hawaii's native fish need and deserve effective legal protection and should be left in the wild. Please don't allow these fish to be collected.

Thank you for your consideration of these comments.

Subject: [EXTERNAL] Comments on Aquarium Fish Trade EIS
Date: Wednesday, December 18, 2019 12:52:06 PM

To whom it may concern:

I am OPPOSED to the Draft EIS for commercial reef fish collections. Commercial aquarium fish collection permits are detrimental to our reefs and the survival of the populations of fish that care for them.

Please do not accept this flawed EIS that suspiciously finds no significant impact caused by commercial fishing of reef fish. It is a wasteful and destructive industry, and anyone who truly cares about our reefs will not exploit the fish for their own financial gain, or allow it to happen.

Sincerely,
Kim Jorgensen
Honolulu

Subject: [EXTERNAL] Comments on Aquarium Fish Trade EIS
Date: Friday, December 6, 2019 11:24:23 PM

Dear Mr. Sakoda,

I am writing to urge DLNR to select the "NO ACTION" alternative listed in the draft Environmental Impact Statement. Nothing in this report should convince an unbiased person that it is in the best interest of the people of this state to continue the wasteful and destructive Aquarium 'fishery' for the sake of just 14 recalcitrant collectors. Indeed, fishery it is not! It is a highly lucrative criminal enterprise that happens to specialize in our all too important reef maintaining organisms.

Furthermore, it is highly ironic and the height of hypocrisy to ask, as DAR has recently, recreational and subsistence fishers to refrain from taking herbivorous reef fish while encouraging a select few collectors, the applicants of this report, to gain special license for the unlimited taking of many of the same species of fish!

How sad is it that your agency tasked with conserving vital and imperiled resources such as still exist, would even entertain the perpetuation of this abominable business?

Shall we bring back shark-finning while we are at it?

Ua Mau Ke Ea O Ka Aina I Ka Pono!

 Sincerely and sorrowfully,

Mark Tang

Subject: [EXTERNAL] Comments on the Aquarium Trade EIS
Date: Tuesday, January 7, 2020 12:49:49 AM

Aloha Mr. Sakoda,

DLNR made a serious mistake in engaging the Pet Industry Joint Advisory Council to assess the environmental impacts of the aquarium trade in Hawaii. It was a huge mistake to engage a lobbying group for the commercial pet trade and not a professional group dedicated to the study of coral reef ecosystems. This grave miscalculation has unfortunately left the Department susceptible to contested cases and even more. This is a shame because I am personally a huge supporter of the mission of DLNR and truly appreciate some of the heroic efforts made by some of your employees. This particular issue has, as far as I can see, not been given the important consideration it deserved. An anthropocentric view point has regrettably obscured what is the duty of DLNR and all of us that are fortunate enough to call Hawaii home.

Frankly, the "livelihoods" of wildlife collectors are not an environmental impact. Livelihoods, are, by their own definition, a business impact. The few people employed in the taking of wildlife from our reefs are well equipped with material, skills, technology and experience to be able to repurpose themselves to a more positive "livelihood" related to the ocean. That is the "win win" solution here.

Arguments of an educational value to privately held aquariums are false. Animals in tanks and cages engage in very little of their natural behavior and what is the educational value of that? As a teacher I can confidently tell you - none.

There are obviously reasons why the Supreme Court closed the taking of wildlife from our reefs. We should be following in the footsteps of forward thinking jurisdictions such as Palau and ban commercial fishing or harvesting of any kind, in our territorial waters. We do not allow the taking of coral, why would it be OK to take other animals from the reef? In an era of overfishing, ocean warming, sea level rise, changing currents, habitats, and acidification why would we allow any more stressors to our reefs? Any taking of reef wildlife out of their habitat to die, without reproducing is an impact that cannot be entertained in 2020.

I have reviewed many EISs over the years. Many are poor efforts. Nearly all comments are routinely "dealt with". However, this particular EIS egregiously disregards the importance of the diverse array of animals that would be affected by their trafficking to isolation tanks (if they survive long enough to get to them).

The results of this "review" are not only biased and inadequate, the whole document is largely irrelevant and misses the point completely. The removal of wildlife from coral reefs to be sold as decorations has no place in Hawaiian culture or ecosystems.

Thank you,

Angela Huntemer M.Ed.

Subject: [EXTERNAL] commercial aquarium fishing trade in West Hawai'i
Date: Tuesday, January 7, 2020 11:54:27 AM

Dear Mr. Sakoda,

I am writing this letter to oppose the aquarium fishing trade in West Hawai'i.

For many years of my life I kept marine fish as pets and also worked at a fish store which specialized in marine corals and fish. I can tell you from first hand experience that most of the fish that are shipped off the reefs die premature deaths. Even if the fish survive the shipment process, many are not adequately cared for by the individuals that buy them.

I do support marine fish and coral aquaculture which has made many break throughs in recent years. It is my belief that the marine fish and coral industry needs to move in this direction and create jobs through aquaculture and not through harvesting wild marine fish and coral.

As an avid snorkeler here in West Hawai'i, I can say without a doubt that the collection of marine fish species would have a deleterious impact on our coral reefs. As an example, a popular aquarium fish, *Arothron meleagris*, the spotted or guinea fowl puffer, doesn't appear in large numbers on our reefs. When my wife and I snorkel for a few hours over a reef we may see one. Should a commercial aquarium company remove that one puffer from the reef, it would leave a huge hole in that ecosystem. Each species plays a part and is integral to the health of the reef.

My wife and I worked for Sea Shepherd Conservation Society and so we have seen this issue play out in many other countries around the globe. If Hawaii does not protect its reefs and the creatures that inhabit it, tourism will soon wane. I have snorkeled extensively in the Caribbean and I have seen coral reefs that have been devastated by overfishing and a lack of protection. Once the fish are gone, the corals suffer and the algae takes over. Once the algae takes over it becomes an alternate stable state, and the reef cannot recover.

It is my sincere hope that no fish collection permits will be issued for West Hawai'i, or at any reef in the Hawaiian Island chain. Our reefs are delicate enough with the pressures of climate change, and removing key species from our reefs would only precipitate their demise.

Thank you,

Charles Humphrey

Please. Do not allow our reef fish to be removed for commercial fishing interests. They are our precious resource and belong to all of us who call the islands home. Visitors want to see them as well. Healthy and abundant. The fish they desire can be found nearby uninhabited islands as well. They should go there.

Date: Monday, January 6, 2020 7:34:03 PM

Good evening

I am writing to you to say that here at Earth Warrior Project we are devastated to learn about the 14 new permits for fish collection in Hawaii. This is unacceptable since the coral reef is already being destroyed due to the current environmental issues which is plaguing our oceans. Action like this is like taking 10 steps in the opposite direction , we must move forward and help life on this planet flourish. I hope you consider the long term effects of what this will do to not only Hawai'i but the world.

Subject: [EXTERNAL] Defend Hawaii's Reefs from Aquarium Collecting
Date: Friday, December 27, 2019 5:30:53 PM

Aloha Mr. Sakoda,

In October 2017, when the Hawaii Supreme Court issued injunctive relief and shut down all aquarium collecting pending environmental review, it was disturbing to see Kona aquarium collecting persist with support from Kona DAR and Hawaii DLNR. Hawaii's people have spoken, but no one's listening.

And now, the "environmental review" supplied by DLNR with heavy support from PIJAC (Pet Joint Advisory Council) advocates for aquarium collectors' livelihood. This isn't an environmental review, it's a transparent lobby for Big Island and Oahu collectors who believe Hawaii's reefs are their private reserve, to trash and sell for personal gain. Aquarium collecting isn't fishing, it's a debilitating commercial enterprise ravaging Hawaii reefs.

Don't sell out Hawaii reefs to the a handful of collectors and mainland interests. Stand firm and defend Hawaii reefs for Hawaii reef wildlife, Hawaii people, and Hawaii's economic future which has far more to gain by preserving this public trust.

Thanks and Aloha,
Joan Lloyd

Subject: [EXTERNAL] DEIS Aquarium fish collection Hawai'i island in support of No Action Alternative
Date: Monday, January 6, 2020 3:19:44 PM

Dear Mr Sakoda,

I urge you not to side with the special interest industry over the welfare and rights of the Hawai'i people and reef fish.

I first snorkeled in the islands before statehood and have visually noted the continued decline of reef fish until present. I am a concerned member and outings leader of the Sierra Club on Hawai'i island. We received numerous reports from members on coastal hiking, kayaking, and snorkeling outings that reef fish numbers were declining. We weren't sure why but in 2003 kayaking off Pebble beach a resident of the area advised us aquarium fish collectors were taking many fish. So much so that we weren't seeing them from land or in the water as abundantly as we had years before. The Gold Coast was gone. The beautiful under water view plane was gone. Subsistence fishing for native Hawaiians was impaired. Our Group supported a successful resolution by County Council asking the State to ban the trade in 2008. We have continued to support a ban on the trade and sponsored a program, 'Where Have All the Fishes Gone' one year ago. We met with Kaimi Kaupiko down in Miloli'i to learn how the trade affected his fishing village and were told they supported a ban. We snorkeled Honomolino, Puako, 2 step, and Papa Bay with Paul Cox. Rarely do we see more than 20-40 Tang at a time whereas we remember seeing large schools of Tang decades ago.

We invited Mike Nakachi, Rene Umberger and Paul Cox to our program. Paul Cox showed photos of collectors damaging the reef, Mike Nakachi had me in tears as he spoke of the taking and selling of black coral and other species. This trade is unnecessary and profit based for a Pet industry mostly off island. It does not benefit local residents who have shown time and again they do not support the trade. It violates the Public Trust Doctrine, Article XI of the constitution and precautionary rule.

The trade is inhumane and violates Hawaii State Cruelty Statute: [711-1109 Cruelty to animals in the second degree](#). (1) A person commits the offense of cruelty to animals in the second degree if the person intentionally, knowingly, or recklessly:

- (a) Overdrives, overloads, tortures, torments, beats, causes substantial bodily injury to, or starves any animal, or causes the overdriving, overloading, torture, torment, beating, or starving of any animal;
- (b) Deprives a pet animal of necessary sustenance or causes such deprivation;
- (c) Mutilates, poisons, or kills without need any animal other than insects, vermin, or other pests; provided that the handling or extermination of any insect, vermin, or other pest is conducted in accordance with standard and acceptable pest control practices and all applicable laws and regulations.

The trade as proposed in DEIS violates this statute. Is this why Stantec has made a disclaimer on the scope to exclude what happens to these creatures after caught? Truth is, many are brought up from reefs so quickly they suffer immediately. If their swim bladders are not punctured they can die. I suspect that is why they are found dead in trash cans (the 500 dead at the harbor). Several Hawaiians interviewed complain that they see bags of dead reef fish and this is not pono. We can ask what measures are taken to ensure fish are treated humanely. They are deprived of food at warehouses before shipping. Their fins are trimmed. Is the DOH and DLNR regulating care of fish? My sister is a vet tech and says they are susceptible to disease and handling by humans. If treated humanely maybe not so many would be taken. They are sentient beings, not a commodity. Sierra Club members met with Keith Dane from Humane Society USA. I notice plaintiffs are not named in DEIS

d) For each of the 14 applicants, please note which collectors engage in the following practices in contradiction to HRS 711-1109:

- withholding of food (starvation) and for what period of time;
- fizzing or puncturing of the swim bladder;
- cutting of spines or dorsal fins;
- body compression (squeezing animal to force out ejection of fecal matter

DLNR has called for food fishers to reduce the take of herbivorous fish species but has remained silent on the hundreds of thousands of herbivorous animals the aquarium trade takes for commercial purposes.

"except for bag limits for a limited number of species, nothing prohibits these collectors from taking every single fish from every single reef in the state," said Earthjustice attorney Kylie Wager Cruz. "It's common sense that this level of unrestricted take can't be sustainable."

The DEIS was prepared by Iowa-based Stantec Consulting, the same consulting group that dismissed the protests of Native Americans and claimed that the Keystone Pipeline would similarly have minimal environmental impacts.

"The DEIS is based on the false premise that aquarium collecting doesn't impact fish populations on the reefs where the trade operates," said Inga Gibson, policy director of Pono Advocacy. "Nothing could be further from the truth. This false premise lays the foundation for this extremely flawed study, and prevents DLNR from ultimately accepting the DEIS." The DEIS skews data by comparing catch numbers to estimates for fish populations on the entire island and concludes that the trade would be taking just 1%, which misleadingly minimizes impacts to localized reef ecosystems.

For years, DLNR has allowed the trade to pillage Hawai'i's treasured coral reef wildlife, in violation of HEPA.

The DEIS dismisses testimony from dozens of Native Hawaiian cultural practitioners, and

instead summarily concludes that collection for the aquarium industry has no cultural impact as long as the populations of the reef animals are not substantially reduced from current numbers in spite of advocating for unlimited take of all but one fish, Achilles Tang.

“We participated in this process in good faith, hoping for change by sharing our deeply personal, spiritual and cultural histories and concerns with this destructive trade. Instead, we’ve been slapped in the face—summarized into a one-liner that the trade has no significant cultural impact. The truth is, this industry harms our ability to gather the food we’ve relied on for generations, and it’s time for the state to protect these resources from commercial exploitation,” said Kaimi Kaupiko of Miloli‘i.

Subject: [EXTERNAL] DEIS Aquarium fish collection permit comment
Date: Thursday, December 5, 2019 11:07:46 PM

Aloha David,

I have been swimming and snorkeling with my husband and daughter on our beautiful coral reefs, in the last six years we have seen two major bleaching events in Hawaii. More than 80% of cauliflower coral colonies have died due to warmer temperatures caused by climate change. The White List fish species are all dependent on the health of the reef as it is their birthplace, nursery, and home. Just as the fish depend on the coral, the coral depends on the fish to help fight off the ever encroaching algae. We have seen the reef habitat for the fish, that this DEIS proposes we start collecting again, shrink and contract. The reef needs a healthy balance and right now there are so many factors that are impacting it that it would be harmful to the continued efforts to protect these vital habitats in West Hawaii. Our main industry is tourism, and harming this potential revenue stream for the benefit of a small number of people actually in Hawaii is inappropriate and reckless. Please leave the aquarium fish collection ban in place and protect these vulnerable resources for our communities and keiki!

Subject: [EXTERNAL] DEIS Aquarium Fish Trade Comment
Date: Thursday, December 5, 2019 11:39:17 PM

Aloha,

I am an avid snorkeler, underwater photographer and I snorkels every chance I get. Over the last 6 years I have watched many coral populations along the Kona coast die due to climate change and a warming ocean. These corals that are stressed need every fish they can to help keep them clean of the onslaught of ever growing algae. It does not make any sense to sell these fish for novelty pets so a few people can make a buck. These islands make money from tourist dollars, people come here to see these essential, beautiful, native fish.

Last night I read the passage below on an underwater photography guide for travelers to Kona and it made me very sad.

"Hawaiian Fish Life

Some people report that the aquarium trade has taken its toll on the fish life here, and the reef fish around Kona do tend to be on the smaller side. However, there are still plenty of fish to see,

especially on the less-dived sites south of Kona."

The word is out. Fish collection takes it's toll. Please leave the aquarium collection ban in place and move to stop the collection of reef fish in all of Hawaii. This does not line up with the pono practices of caring for the 'aina in Hawaii. You would never sell a I'iwi or Nene to a pet store, these fish are our native wildlife as well, and they deserve protection.

Subject: [EXTERNAL] DEIS Comment, West Hawaii Commercial Fish Collection
Date: Wednesday, January 1, 2020 5:51:41 PM

January 1, 2020

Dear Mr. Sakoda:

I appreciate the opportunity to comment.

Applicant Seems Ineligible

The Applicant, Pet Industry Advisory Council, is named only once in the DEIS on an unnumbered page at the start. This page scarcely seem to be included in the document. Other EISs submitted in Hawaii, for example "The Village at Aina Lea,"(September 2010) which I checked, describe the Applicant in at least some detail. The cause in this instance may be that the Applicant is inappropriate for this Action.

The statutory definitions in HRS 343, the state's environmental law, of Applicant and Action appear to be somewhat circular but in any case show the two to be inseparably linked. The Applicant undertakes the Action which in turn is a project or program undertaken by the Applicant. But in this case the two appear not to be so linked unless the Action is construed to be preparation of an EIS. But the effects described in the DEIS concern the collection of reef fish. This activity will not be undertaken by the Applicant, which appears to be a trade industry advocacy group. Thus, this EIS submittal does properly represent a portion of its membership--aquarium industry wholesalers, retailers, etc. Information about the PIJAC is readily available on its main web site and a handful of related sites such as that for its Aquatics Committee, where a FAQ about donations is partly answered in this manner:

"If you are a PIJAC member, consider the connection between ensuring access to live organisms and the success or failure of your enterprise."

This appears closer to the purpose for PIJAC's involvement in the EIS preparation than the frequently cited purpose of ensuring the livelihood of 14 fish collectors.. Hawaii's Supreme Court had stopped commercial aquarium fishing in West Hawaii as of 2018. Yet the DEIS acknowledges that West Hawaii is among the state's richest sources of reef fish for collection. In any case, in this instance the Applicant does not undertake the Action. The Action may not properly be seeking the issuance of 14 permits from the DLNR. If the DNLR undertakes that action, it is an agency action and this instance is not an agency EIS process.

Probable Consequences for Yellow Tang

Yellow tang are a pleasing yellow in color and according to saltwaterfish.com, a retail dealer with web pages very similar to Amazon's, "is among the most popular of all marine species" for aquariums. Its prices per individual, depending on size from 1.5 to 4.5 inches, vary on this site from \$62.99 to \$162.99. These high prices will drive up collection rates. According to the DEIS, about a quarter million individuals were collected in 2013-14 and again in 2017-18, some recent years for which figures were cited (page 74). Further, the West Hawaii commercial aquarium fishery depends over 80% on yellow tang collection (page 74)..

Actually, the take may have been higher, one reasons, because according to a table on page 24, the percentage of statewide collectors who submitted the DLNR-required monthly reports of their takes was about 30% in 2017, about 40% in 2016 and about 42% in 2015. (I have interpolated figures given.)

The DEIS describes all sales in Hawaii after collection as valued at about \$5 million annually while noting in the same sentence that most sales are to the US mainland, Europe and Asia (pages 24-25). It becomes clear that this market is very large, and for the popular yellow tang, quite overbearing. In 2017 the chair of PIJAC's board of directors described it thus:

"Ninety-three percent of the world's Yellow Tangs found in aquariums come from Hawaii. This is at risk thanks to ... the Hawaii court decision."

(reef2rainforest.com/2017/11/09/aquarium-industry-under-siege)

The commercial aquarium take from other islands--Maui, Kauai, Oahu--has not been described in the DEIS, so what proportion of total collection is yellow tang could not even be inferred .. The DEIS does say Hawaii Island represents well over half of State of Hawaii collection. Given the relatively high retail price for yellow tang, and the apparent size of the market relative to the West Hawaii grounds, it is unreasonable to suppose this species will survive the five-year period envisioned in the DEIS without serious depletion. Serious depletion *can* occur and can be attributable to commercial aquarium collection as stated in the Humane Society's comment herein pertaining to the loss of butterfly fish off Oahu.

In one instance, the DEIS has used an island-wide CREP count of the yellow tang base population, instead of a regional West Hawaii count, to infer no significant diminishment (page 100). But that is erroneous, and in this instance collection would be augmented by the factors mentioned above--beauty, price, size of market. It is hard to see how the DLNR, given its mandate, could accept a program or project that did not clearly address this jeopardy to yellow tang. The current DEIS unfortunately does not address it,

A Question

Would a conservation district use application be required?

Sincerely,

Judith Graham

Subject: [EXTERNAL] Do Not Let The Pet Industry Joint Advisory Council (PIJAC) Bamboozle You!
Date: Sunday, January 5, 2020 3:35:04 PM

Dear Honorable David Ige,

Most people of Hawaii, and the millions of people from around the world that visit our most unique and amazing state, are worried about the health and viability of our reefs.

The reefs are suffering. There are many reasons why. Some are out of the control of one person to fix, but there is one reason that one person can affect, and that person is you.

You are a smart man, Governor Ige, so you know I am talking about shutting down the aquarium trade people.

Your constituents depend on you to do what is best for the state. To do what will ensure a healthy ocean for the livelihood of all who live here and also for those who spend millions and millions of dollars to come here and enjoy the biggest draw our state has to offer, our island reefs.

I appeal to your love of the state and your desire to do the right thing, to stop the ravage of the reefs. The reefs will not survive without the fish and without the reefs our biggest tourist attraction will disappear along with the tourists.

The state is not benefiting from the aquarium trade and it is not in our best interest.

When the fish are gone, and the aquarium trades people you are working to protect move on to other Polynesian islands...when our reefs are dead and barren because the fish have been scooped up and shipped away, when tourism declines, and the livelihood of Hawaii's people is impacted, they will look to you and ask why you didn't stop it when you had the chance.

This is your time Governor, to make a difference, to impact in a most positive way, the future of Hawaii's tourism, and the future of the aina and kai, and to live up to the righteous way that you swore to uphold, according to our state motto "Ua Mau ke ea o ka Aina i ka pono." The eyes of the people of your state look to you to stop the destruction of the reef caused by aquarium trade desperados.

Do not be misled, manipulated or fall for the smoke and mirrors of the PIJAC. When you entered politics, did you want to serve the people, make a change, make a difference? Be that guy, Governor, be the hero you always wanted to be. Let your legacy reflect you took a stand and did the right thing, for your people and the land of your birth.

Please stop the aquarium trade. Please stop every advantage they currently have. Please end this wanton destruction to our reefs once and for all.

Most respectfully.

Hi David,

My name is Dan Dolaptchieff.

Im a liscensed tropical fish collector. It unconstitutional for only 14 persons to fish that water in west hawaii,

I have fished. On Big island for most of my 28 years here for tropical fish in west hawaii and on hilo side.

My Boat shop burnt down in 2006 due to Mac. Nut operation next door. I was diving west hawaii. I had to sell my house and move to east side , it was all i could afford with my family.

I was eagerly waiting for the west side to open so i could make a good living again. I could never afford to give the 14 guys 20 k to help with the lawsuit. I did give funds to PIJAC.
(Im a disabled Veteran)

I humbly request that the council looks at my situation and acts appropriately.

U would be excluding many already liscensed trop divers already
Living and working on the big island.

Not a very good situation. How can a small group of fisherman have exclusive rights to fish one area. What is the hawaiian trop divers gonna say? Discrimination against hawaiians?

Aloha

Dear Mr. Sakoda:

Hawaiian Supreme Court made their decision clear two years ago, regarding precious marine life, but it has been circumvented.

Those of us here on the mainland, tourists, divers, lovers of Nature and Beauty ask that the Hawaiian Paradise be protected. The aquarium trade is sadly voracious and greed driven.

I ask that the long term lure of dollars from tourists, such as myself, take priority over destructive short term dollar gains to be made by plundering precious Hawaiian reefs for the aquarium trade.

Aloha, Mr. Sakoda.

My name is Ali and my wife and I moved to the island of Hawaii about two years ago. The driving motivation for us to leave our corporate jobs behind and move here was to learn from the Hawaiian's peoples' perspective and relationship with nature to help us reconnect with the land and the natural resources that the island has to offer. So I was a bit dismayed when I learned that there was a push to reinstate the practice of catching fish from the ocean waters here to place in aquariums. I'm sure that you've received many comments regarding the potential impact that this type of activity can have on natural and cultural resources so I want to bring up the unjustified idea that we as men feel that we have the right to capture and remove any living beings from their homes solely for the purpose of our enjoyment and profit, even if some try to disguise it as for educational purposes. It's one thing, although almost just as appalling, that we've become ok with breeding various animals in captivity to accommodate a very inhuman pet industry. But the thought of capturing creatures who have known nothing but freedom in the beautiful open waters of Hawaii and to all of a sudden place them in small closures to be transported and placed in even smaller closures for our enjoyment is just heart wrenching for me. Regardless of what your views on animals may be and whether they can feel emotions like fear and sadness, do you honestly feel that we should have the right to remove and displace any free roaming beings from their natural habitats for our enjoyment?

I feel that this is not only a cultural and environmental issue but also an important moral issue. We need to be honest with ourselves and re-evaluate how we view the vast natural beauty that surrounds us and our place within that environment. Do we want to see ourselves living in balance and harmony within this place that we all call home or do we view ourselves as more important than the other creatures around us and therefor giving us the right to remove and displace any creatures that we see fit?

Since moving here, my wife and I have learned much about the idea of kuleana, particularly when it comes to the land and natural resources. Im sure that you and your colleagues at DLNR will agree that it is everyone's kuleana to appreciate and protect what is here. And I hope that you also agree with me that removing and displacing any creatures from their homes simple for our enjoyment and benefit definitely does not fit anywhere within the concept of kuleana.

I appreciate but certainly don't envy the tough decisions that you and your colleagues have to make from time to time. Thank you for taking the time to read and consider my comment on this particular issue.

Mahalo.

Dear Mr. Sakoda,

My name is Bill Coney, I am the co-founder of Legacy Reef Foundation, based on the Big Island at NELHA. We are a privately funded coral preservation and restoration lab dedicated to protecting and restoring our coral reefs here in Hawaii and around the world. I grew up here in Hawaii and have for over 50 years been actively involved in Hawaii's coral and marine life. After a long and successful career as a business entrepreneur, I retired 7 years ago and I decided to open the foundation. We now have some of the best scientists in the world working with us and I feel I have a good understanding of situation with the aquarium trade and its impact on our reefs.

First, let me say I am pro-business and would never want to stifle any one's ability to make a living. Having said that, finding a balance between the collector's interest and the coral reefs that supports their trade is key to the long term success of the aquarium trade. Proper limits need to be set and enforced. One option would be to have the state give out, or sell, a preset number of "AQ fish catch certificates" (like tax stamps on alcohol and cigarettes). These certificates could be given to the collectors monthly that specify what and how many organisms can be collected and shipped off island. This is a simple and easy to implement system that allows them to collect and earn a living and while creating a "managed" fishery. Compliance is critical to the success of any program, and this system facilitates enforcement. Your agency could task the shipping entities to ensure every shipment has a "AQ fish catch certificate" before they can accept and ship them. Large fines for allowing non-compliant shipments should keep the shippers in line. Since there are only a few companies that ship fish the burden on the state would be manageable.

I would suggest waiting two years to develop the "AQ fish catch certificate" program. This would give the corals some time to recover from the recent bleaching event. Our corals health depend on those same aquarium trade fish to recuperate and stay healthy. This year they are so stressed now, and we expect another bleaching event next summer. Our fear is if the coral loses any of the herbivores that keep them alive in the next year, the chances are high we will lose all our coral. They really need another 2 years to be safe. Without the corals to house, feed and act as nurseries, the aquarium fish will be endangered. Giving the ecosystem two years more years to stabilize, and time to establish a responsible and business friendly program, will result in ~~Then~~ an acceptable equilibrium between collectors and the reef that supports the fish of their trade, and all stakeholders win.

Thank you for considering this as an option. Please feel free to contact me with questions or assistance in building this program,

Aloha,

Bill Coney & Dr. Sussanne Otero

Aloha Mr. Sakoda,

My name is Michael Bell. I have been a resident of Hawaii Island for nearly 30 years. I am writing to you voicing my strong opposition to the issuance of reef fish collection permits.

I am a proud employee of Body Glove Cruises. We are an ocean adventure company that provides snorkeling, SCUBA, whale watching and historical dinner cruises. During my years living on the island and working in the ocean industry I have noticed fewer and fewer reef fish. Issuing permits for collections of our island's dwindling fish populations would negatively impact our fragile ecosystem. Not only have I personally noticed a decline in reef fish populations, we also have guests who complain about our dwindling populations.

Working for a company that provides island guests a safe, ecologically friendly opportunity to enjoy our island's natural resources is a great honor. Body Glove Cruises donates a portion of its proceeds towards the preservation, restoration and education of our coral reefs.

Please make your island's preservation contribution by not issuing fish collection permits. Making the "right" decisions now will make a huge difference in our future.

Mahalo for your consideration.

Subject: [EXTERNAL] Fish Collection Objections - Jan. 7th Deadline
Date: Monday, January 6, 2020 12:29:49 PM

Aloha Mr. Sakoda,

My name is Maggie Brown, I am owner of Body Glove Ocean Adventures. I have lived on the Big Island for 45+ years and have been operating commercial snorkeling and SCUBA diving tours since 1974. The massive decline in marine life, mostly fish has declined immensely since then. Between the Black Water run off along the West Coast of Hawaii Island and the recent coral bleaching, our reefs are in disrepair. I compare underwater pictures of our BI coral reefs/marine life from the 1970's- 80's and the devastating change would make a grown man cry.

I am writing to respectfully inform you, I oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish.

I invite you to view my page on TripAdvisor and see how many complaints we get, due to lack of fish and the condition of our coral reefs. We at Body Glove donate portion of our ticket sales to Legacy Reef Foundation and other non-profit organizations for the for the preservation, restoration and education of our coral reefs. Permitting those to collect Hawaii's Tropical Fish and take them from our Reefs is counter-productive.

Thank you for taking the time to read my comments.

Subject: [EXTERNAL] Fish Collection Permits opposition
Date: Monday, January 6, 2020 4:41:52 PM

Aloha Mr. Kakoda,

My name is Heather Howard. I am the Co-Founder of the Coral Reef Education Institute located on the Big Island. I am in extreme opposition to issuing any permits for fish collection for the aquarium trade in the state of Hawaii and especially the Big Island. Our coral reefs are in extreme decline and allowing fish collectors to remove our herbaceous fish from our reefs is negligent. Coral reefs are stressed more than they have been from the ever more frequent bleaching events. The state's new initiative 30% by 2030 should never allow our reef fish to be removed for resale and should focus on MPA's to protect our reef fish so they may become geriatric and produce more spawns for rehabilitation.

Please do not allow the fish collection to restart in Hawaii.

Aloha David,

I was asked to write to you concerning fish collection in Hawaii. I thought that the ban on fish collecting was still in effect, but several people have contacted me saying that it was

coming up for discussion again. Already? It hasn't been very long since the ban went into effect and it took years to get it passed. There must be some fish collectors pressuring

someone to let them have free rein on our poor reefs. I am a longtime resident / scuba diver and I have seen a few more yellow tangs that were very much depleted just a couple of

years ago. They are trying to come back but the numbers are still low. There are still so many endemic species that we don't even see anymore. We desperately need our algae

eaters as with the coral bleaching we had this year (we really dodged a bullet with our rain we got that cooled the water temps just enough) . I swim, snorkel , and dive the whole

west side of Hawaii Island (with several others) . Our waters here are the best in the state for scuba diving and snorkeling . People that are relying on the businesses around the

waters are seeing less fish also.

Please don't let a few greedy fish collectors ruin the reefs for everyone . We need at least 10 more years of untouched reefs to get back to our old Hawaii. There is poaching going on

too and we realize that the DLNR can't be everywhere .

We are so far removed from the rest of the world that we can't replenish our fish like they can in Indonesia . Help us save what we have because once it's gone, there's nothing at all

we can do. If I can help you in any way , don't hesitate to call on me.

Aloha Mr. Sakoda,

I am writing this email to inform you that I am opposed to the passing of the 14 new permits allowing the collection of Hawaiian reef fish on Hawaii Island.

As a diver and general lover of the ocean, I have seen so much reef damage occurring over the past few years alone. Our reefs are already suffering so much, and the reef fish are an integral part of reef survival. The removal of these fish upset the natural ecosystem that allow the reefs to grow and heal, which they already need so much.

Please take into consideration the state of the reefs, and the ocean at large, and do not pass the new fish collection permits.

Thank you for your time,
Sera Bell

Hello,

I came across a public notice bringing light to policies concerning the removal of native fish from reefs in Hawaii for the aquarium trade which recommended contacting this email to urge that limitations on the policy be put in place. The Pet Industry Joint Advisory Council has apparently said that whatever extent of collection of these animals would only have a negligible impact on the ecosystem, but this is clearly a dismissal of the practically inevitable consequences virtually unrestricted collection will have. This is not a matter to take lightly simply at the first claim that it is "harmless".

Aloha, Mr. Sakoda!

Extinction is forever—it's that simple.

It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium

Howz it aloha everyone
my name is Dane many in the business know who I'm those new divers will know who I'm by the end of this evening..

Before we begin I'd like to bring the public's attention to exactly who these divers are and some of the pet shops that are buying these fish...

Names:

I've seen a lot of divers come and go...most leaving damaged reefs and pure destruction in their methods...

Ahh the New divers
This is where problems began and has changed our reefs forever.

During my time or tenure as a collector I would consistently catch 200 to 400 yellow tangs several times a week. I've caught as many as 2000 yellow tangs in a day...I've caught tons of variety... for public knowledge variety is any fish but the yellow tangs...

These numbers are excessive, alarming and frightening.

I would dive a reef and leave it to recover 14 to 18 months... that's on a short window....New divers would come in and dive on reefs which I had just dove the day before claiming there we're still hundreds of fish still to be caught.

arguments would leave me with TRO's against me ... having to go to courts to continue my arguments...

These new divers collecting tropical fish are hunters, relentless predators with the fish as their prey

Today's diver are continuing to rape and pillage our reefs
They are now diving on prestine virgin reefs, untouched until now... over on the east side of our island.

Those Reefs I dove from upolu point north to south point, were prestine virgin and untouched... and now... gone... it's beyond recovery...it will take Mother Nature....all of her might to undo what we have done to her reefs... yes her reefs it's not ours... we're uninvited guests...

There are pet stores and divers who claim things are fine... those claims are false.

Fish Survival

Survival rate is zero

All fish I have caught have already died. Life expectancy less than a third in captivity.

Fish recognize vibration... they hear like deer... they can hear the motors of the tropical boat, this automatically triggers a stress response to survive...
from that exact moment, through the entire ordeal of swimming from capture to being caught in nets, then scooped... fins all the while being cut, scraped smashed and damaged... skin and scales removed
Causing sickness and fever to set in...

People we can't let this continue... we must all get involved and expose these divers names and pet companies... let our people know who they are and begin fighting back...

Please feel free to call me... I have a lot more stories to share about what is really going on with the industry...and

our reefs.

Subject: [EXTERNAL] from Animal Interfaith Alliance in Britain
Date: Tuesday, January 7, 2020 12:31:15 AM

Dear Mr. David Sakoda, Program Manager of Commercial Fisheries at the Division of Aquatic Resources - aloha!

I write on behalf of The Animal Interfaith Alliance, an international alliance of faith groups founded in Britain concerned about the welfare of animals. Our member organisations and individual members include Buddhists, Christians, Hindus, Jains, Jews, Muslims and Sikhs. We are all united by our common concern for animals, based on our various faiths. Our member organisations are listed below.

We send our compliments and refer to the report that Hawai'i is considering the impact that fish collection for the aquarium trade has on wild fish populations.

We read that The Pet Industry Joint Advisory Council has submitted an environmental impact statement "surmis[ing that] the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem".

We cannot understand this complacent and dangerous assertion. On three occasions in 2017, when SB 1240 was on Governor Ige's desk for signing, we wrote to urge him to do so, fearing that unlimited fishing on the reef would decimate populations of native fishes and destroy the pristine marine environment of which you should be proud.

We read that Earthjustice attorney Kylie Wager Cruz states: "It's common sense that this level of unrestricted take can't be sustainable," and further notes that the state shouldn't ignore "that except for bag limits for a limited number of species, nothing prohibits these collectors from taking every single fish from every single reef in the state."

Maxx Phillips, Hawai'i director with the Center for Biological Diversity, an excellent group some of our members support, says: "Hawaii is expected to lose 70% of our coral reefs in the next couple of decades, so we don't have time for aquarium industry-sponsored justifications for raiding the reefs" -.

This is appalling and we hope that you agree. We are appealing to you to accept that your native fishes need and deserve effective legal protection, and should be left in the wild where they belong, not exploited for human amusement.

Best regards,

Marian Hussenbux, Secretary International Campaigns

Subject: draft EIS

Dear Mr Sadota,

Review of: DEIS

As a resident and snorkeler on the island of Hawai'i for 25 years, I see a big decrease in the fish population. I have been snorkeling all around the island, Hilo, Kapoho, Kona, and Kohala, Before living here, I lived on Molokai for several years and there I had the wonderful experience of getting to eat small fresh fish, other than the few expensive varieties, available in grocery stores today. Fish is one of best food sources and should not be wasted as often happens in the aquarium fish capture, shipping off island, and then mismanagement in home aquariums resulting in early deaths.

Given the severe planetary climate crisis, "There Were More Than 100 "Billion Dollar" Climate Disasters in the Past Decade," we need to do all possible to become more sustainable in food and fish. The island of Hawai'i also had major fish losses with the recent lava flows in the Puna area covering beautiful Kapoho coral reef and covering the only boat ramp for Puna fishermen. We need to do all possible to protect and replenish our fisheries.

Although I am college graduate, getting through the draft EIS was a horrendous task and often seemed to make statements contradictory, confusing, and unclear. However the interviews with long time Hawaiian residents, was very interesting and they repeatedly spoke of how there used to be many more fish. I think that it should be our goal to do everything possible to increase fish populations.

The EIS seems to claim studies show we have not lost in fish population in last 20 years so no problem with continuing aquarium collection, but my personal observation does not indicate that. And certainly much of the coral has died in last few years and how that will affect the future of the fishes is unknown, but probably badly. I used to see schools of fish, I rarely see that now.

I do not find the draft EIS clear or acceptable. I oppose the continuation of aquarium collection other than for educational facilities that can care for the fish properly.

Dear Mr Sakoda,

I urge DLNR not to accept the preferred alternative of the biased DEIS payed for by special interest industry trumping the welfare and rights of the Hawai'i people and reef fish.

For years, DLNR has allowed the trade to pillage Hawai'i's treasured coral reef wildlife, in violation of HEPA. I am a simple person with a deep connection to nature who values the Hawaiian ecosystems. I have volunteered 25 years on numerous including Hakalau, Mauna Kea Forest Project's Palila critical habitat to HVNP and also Kiholo Bay fishpond with TNC to preserve and restore habitats for future generations.

I first snorkeled in the islands before statehood and have visually noted the continued decline of reef fish until present. I am a concerned member and outings leader of the Sierra Club on Hawai'i island. We received numerous reports from members on coastal hiking, kayaking, and snorkeling outings that reef fish numbers were declining. We weren't sure why but in 2003 kayaking off Pebble beach a resident of the area advised us aquarium fish collectors were taking many fish. So much so that we weren't seeing them from land or in the water as abundantly as we had years before. The Gold Coast was gone. The beautiful under water view plane was gone. Subsistence fishing for native Hawaiians was impaired. Our Group supported a successful resolution by County Council asking the State to ban the trade in 2008. We have continued to support a ban on the trade and sponsored a program, 'Where Have All the Fishes Gone' one year ago. We met with Kaimi Kaupiko down in Miloli'i to learn how the trade affected his fishing village and were told they supported a ban. We snorkeled Honomolino, Puako, 2 step, and Papa Bay with Paul Cox. Rarely do we see more than 20-40 Tang at a time whereas we remember seeing large schools of Tang decades ago.

We invited Mike Nakachi, Rene Umberger and Paul Cox to our program. Paul Cox showed photos of collectors damaging the reef, Mike Nakachi had me in tears as he spoke of the taking and selling of black coral and other species. This trade is unnecessary and profit based for a pet industry mostly off island. It does not benefit local residents who have shown time and again they do not support the trade. It is in conflict with the Public Trust Doctrine, Article XI of the constitution and precautionary rule.

The trade is inhumane and violates Hawaii State Cruelty Statute: [711-](#)

1109 Cruelty to animals in the second degree. (1) A person commits the offense of cruelty to animals in the second degree if the person intentionally, knowingly, or recklessly:

(a) Overdrives, overloads, tortures, torments, beats, causes substantial bodily injury to, or starves any animal, or causes the overdriving, overloading, torture, torment, beating, or starving of any animal;

(b) Deprives a pet animal of necessary sustenance or causes such deprivation;

(c) Mutilates, poisons, or kills without need any animal other than insects, vermin, or other pests; provided that the handling or extermination of any insect, vermin, or other pest is conducted in accordance with standard and acceptable pest control practices and all applicable laws and regulations.

The trade violates this statute and looks the other way, not wanting to regulate just reap "socio-economic benefits" touted in the DEIS. Is this why Stantec has made a disclaimer on the scope to exclude what happens to these creatures after caught? Truth is, many are brought up from reefs so quickly they suffer immediately. If their swim bladders are not punctured they can die. I suspect that is why they are found dead in trash cans (the 500 dead at the harbor). Several Hawaiians interviewed complain that they see bags of dead reef fish and this is not pono. What measures are taken to ensure fish are treated humanely? They are deprived of food at warehouses before shipping. Their fins are trimmed. Is the DOH and DLNR regulating care of fish? My sister is a vet tech and says they are susceptible to disease and handling by humans. If treated humanely maybe not so many would be taken. They are sentient beings, not a commodity. Sierra Club members met with Keith Dane from Humane Society USA. I notice plaintiffs are not named in DEIS. Why?

DLNR has called for food fishers to reduce the take of herbivorous fish species but has remained silent on the hundreds of thousands of herbivorous animals the aquarium trade takes for commercial purposes.

"Except for bag limits for a limited number of species, nothing prohibits these collectors from taking every single fish from every single reef in the state," said Earthjustice attorney Kylie Wager Cruz. "It's common sense that this level of unrestricted take can't be sustainable."

The DEIS was prepared by Iowa-based Stantec Consulting, the same consulting group that dismissed the protests of Native Americans and claimed that the

Keystone Pipeline would similarly have minimal environmental impacts. The most recent oil spill was over 300,000 gallons.

The DEIS skews data by comparing catch numbers to estimates for fish populations on the entire island and concludes that the trade would be taking just 1%, which misleadingly minimizes impacts to localized reef.

The DEIS dismisses testimony from dozens of Native Hawaiian cultural practitioners, and instead summarily concludes that collection for the aquarium industry has no cultural impact as long as the populations of the reef animals are not substantially reduced from current numbers in spite of advocating for unlimited take of all but one fish, Achilles Tang. Why should native Hawaiian fishers accept the diminished fish numbers after decades of the trade taking unlimited numbers of fish as a base line for sustainability? The cultural background provided is detailed and explains why Hawaiians have connections to places their ancestors frequented and fished. If that place is now diminished by the trade, they are deprived of the bounty their ancestors enjoyed. Thus the colonial overlordship of lands and ocean taken and regulated by the state continue to marginalize the people and the culture.

“We participated in this process in good faith, hoping for change by sharing our deeply personal, spiritual and cultural histories and concerns with this destructive trade. Instead, we’ve been slapped in the face—summarized into a one-liner that the trade has no significant cultural impact. The truth is, this industry harms our ability to gather the food we’ve relied on for generations, and it’s time for the state to protect these resources from commercial exploitation,” said Kaimi Kaupiko of Miloli‘i.

Finally, I have a great interest in protecting anchialine pond habitats. One or two of the DEIS so called "Red Pond Shrimp" are now endangered (*Vetericaris chaceorum* and *Procaris hawaiana*). *V. chaceorum* is found in Ka'u. The DEIS claims no endangered species are collected. Why? There is no limit on take of shrimp and the numbers taken are a "guess" but likely over 20,000 per year. Do the chosen collectors know the difference between the species of 'opae? Are endangered species caught and how many? The Center for Biological Diversity has another current lawsuit against USFWS for not designating critical habitat for anchialine ponds in violation of ESA. According to the Ka'u Calender (December 2019) Maxx Phillips of BCD says "These special species are found nowhere else...so if they disappear from here they'll be lost forever. Anchialine pool shrimp and the rest of the group needed habitat protection years ago but there not getting it from the anti-wildlife Trump administration. Species with habitat protection are twice as likely to be in recovery as those without". Dr. Scott Nelson researcher from Auburn University spoke at After Dark in the Park, 2011, stating they have found Hawaiian endemic 'opae'ula world wide, and "...has also garnered the interest of aquarists and companies in the pet trade industry. Over the last few years, closed ecosystems containing these shrimp have been marketed under a variety of trademarked names in retail stores and on the World Wide Web...Thus, habitat destruction and modification, as well as the potential for over-harvesting, could ultimately lead to the extinction of some *H. rubra* populations." Quote is from Molecular Ecology.

I have empathy for those who have depended on the trade for income as I was forced to change professions due to health concerns. There are many pono possibilities such as tours,

monitoring reef and fish or removing invasives which I believe the state could do to improve and protect the reefs.

With respect,

Subject: [EXTERNAL] Hawaii's native fishes need and deserve effective legal protection, and should be left in the wild.
Date: Monday, January 6, 2020 4:28:55 PM

Dear Mr. Sakoda,

Hawaii is considering the impact that fish collection for the aquarium trade has on wild fish populations.

The Pet Industry Joint Advisory Council has submitted an environmental impact statement "surmis[ing that] the unlimited collection of Hawaii's reef animals has a minimal impact on the state's coral reef ecosystem"!

"It's common sense that this level of unrestricted take can't be sustainable," explains Earthjustice attorney Kylie Wager Cruz, who further notes that the state shouldn't ignore "that except for bag limits for a limited number of species, nothing prohibits these collectors from taking every single fish from every single reef in the state."

"Hawaii is expected to lose 70% of our coral reefs in the next couple of decades, so we don't have time for aquarium industry-sponsored justifications for raiding the reefs" - Maxx Phillips, Hawaii director with the Center for Biological Diversity.

Hawaii's native fishes need and deserve effective legal protection, and should be left in the wild.

Sincerely,

Jonathan Boyne

Subject: [EXTERNAL] Issue 14
Date: Monday, January 6, 2020 6:39:02 PM

Aloha Mr. Sakoda,

My name is Margaret Kahoilua. I am a Native Hawaiian, past Expedia Local Expert, member of The Coral Reef Alliance, Bail Bondsman, and a current participant on the Vibrant Hawaii Leadership Team.

I am concerned w/the condition of our coral reefs. In September of 2019, I joined some guests on a snorkeling tour to Kealekekua Bay. My heart was broken by the vast difference/depletion of diversity among our reef fish. Given the fact that this area is a conservation area, it was surprising to observed the devastation.

There are many factors already impacting the health of our local reefs. Allowing the collection/removal of our reef fish only exacerbates an existing crisis & may lead to the depletion of essential reef species.

Please ensure any decisions made regarding permits to collect fish are made with the sustainability of our coral reef ecosystems as TOP PRIORITY. Mahalo...

Best Regards,
Margaret Kahoilua

Aloha Mr. Sakoda,

My name is Kathy Boyd, I am the Lead Concierge for our on Island Expedia Local Expert Team. I have lived on the Big Island for 12+ years and have worked in the travel industry since day one. Those of us that call the island home have sadly seen the massive decline in marine life. Between the Black Water run off along the West Coast of Hawaii Island, chemical spraying along the coastlines to keep golf courses green and weed free and the recent coral bleaching, our reefs are in disrepair.

I am writing to respectfully inform you, I STRONGLY oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish. I understand that some would argue that this would provide some jobs, but what about those of us that already work in the industry, and our past, present and future visitors. It seems very short sighted to not consider how you are impacting all our current ocean operators (and supporting resort staff like myself) that take people out to see our natural underwater wonderland.

Permitting 14 more companies to collect Hawaii's Tropical Fish for entertainment and take them from Hawaii's Reefs is counter-productive. We tell our visitors to enjoy Hawaii here, don't take the lava rocks, the shells, the multi-colored sands from our beaches, why would you condone this? Our oceans are dependent on people like yourself to do what is Pono. Please choose to do the right thing, our community will be watching.

Thank you for taking the time to read my comments.

Mahalo,

Kathy Boyd

Subject: [EXTERNAL] NO to Commercial aquarium fishing
Date: Tuesday, January 7, 2020 2:44:39 PM

Aloha Mr. Sakoda,

I'm a scuba instructor, I work in the ocean every day.

Commercial aquarium collection hurts Hawaii in so many ways. I'll list a few examples here:

People come to Hawaii to enjoy the ocean and see beautiful tropical fish. Eco-tourism is ever growing, but with no bright and beautiful reef fish (such as Tangs and all other herbivores) the reef will be dead, which means less people will travel to Hawaii to enjoy it.

Commercial aquarium fishing will bring irreversible damage to already harmed reef and its habitants. As we know from many studies reef is a very complex and precisely balanced system, with all links of the chain equally important in keeping that balance. All reef fish play major roles in keeping reef healthy and with recent coral bleaching events our reef needs to be left alone more than ever. Taking reef fish will only increase the damage which will lead to an end of the reef as we know it.

The riches of Hawai'i are in the ocean, please don't let them to be taken away. Especially knowing that about 80% of collected reef fish dies during the process and never makes it to aquarium.

Sincerely,

Mike Rudenko, North Kohala, Big Island

Subject: [EXTERNAL] NO!! Aquarium collecting
Date: Tuesday, January 7, 2020 2:45:15 AM

Dear Mr. Saduko;

It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

Anyone who sees the near-shore reefs on a daily basis, as I have done for over the past 20 years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we bloody well can put a stop to aquarium collecting.

The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.

But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point.

Sincerely,
Sandra Greene

Re: Ongoing Illegal Aquarium Collection Under Commercial Marine Licenses
and Request for Meeting

Dear Chair Case, Administrator Neilson, and Mr. Sakoda:

A coalition of Native Hawaiians and conservation groups has warned the Hawai'i Department of Land and Natural Resources (DLNR) that the agency could end up back in court if it doesn't end a policy allowing the practically unlimited extraction of reef fish and other aquatic creatures for the aquarium pet trade without any environmental review, circumventing a court injunction halting such activities until the review process is completed.

The policy began after the Hawai'i Supreme Court ruled in September 2017 that aquarium collection under permits is an action subject to environmental review under the Hawai'i Environmental Policy Act (HEPA), and the circuit court subsequently voided all unexpired permits and placed a moratorium on renewing or issuing new permits pending the environmental review process.

Under the new policy, DLNR has been renewing and issuing new commercial marine licenses to aquarium collectors without also requiring aquarium collection permits or HEPA review, as long as collectors don't use fine-meshed nets and traps. Yet, the agency does nothing to verify the methods collectors claim to be using. It would be extremely difficult to gather the types and amounts of animals that the industry has continued to collect without using fine-meshed gear, which has always been the primary means for gathering aquarium fish. DLNR's policy has enabled the aquarium trade to harvest more than half a million marine animals without any environmental review during the past two years.

Instead of embracing the courts' rulings and ensuring that the environmental effects of aquarium collection are properly considered,

the agency has given the industry a free pass to continue collecting without any oversight. Deregulation for the benefit of private industry is completely contrary to DLNR's constitutional mandate to safeguard our marine life for present and future generations.

The policy violates HEPA, state aquarium collection laws, and the public trust doctrine under the Hawai'i Constitution.

I was shocked to learn that under the agency's watch, the industry has continued ravaging Hawai'i's reefs without any assessment of environmental harm, despite the courts' rulings. Taking hundreds of thousands of marine animals for private profits obviously requires vetting under the environmental review process.

The collected animals are primarily herbivorous reef-dwellers that serve important functions in the coral reef ecosystem, such as helping to control algae growth. Studies have shown that reducing the abundance and diversity of reef fish and important invertebrates affects a reef's ability to respond to stresses or disturbances.

Telling the aquarium trade it no longer needs permits or HEPA review to continue operating makes a mockery of the agency's duty to conserve and protect our reefs and fish populations so that they can support public purposes, including traditional and customary practices such as subsistence fishing.

Hawai'i's reefs are the lifeblood of kanaka maoli and their communities.

The agency's decision to deregulate the aquarium trade threatens Hawai'i's precious reef ecosystems, which are already at risk due to climate change.

DLNR is overseeing the ongoing court-ordered environmental review process, currently underway for West Hawai'i and O'ahu. But unless this policy is changed, the industrial-scale extraction of marine animals purportedly using non-fine-meshed gear will continue without any environmental review under HEPA.

Yours sincerely,
Robert E. Rutkowski

Dear David Sakoda,

Places as near as Waipio Valley and as far away as the Mediterranean sea are dealing with unintended consequences arising from cultivating tropical fish and other non-native aquatic species and relocating them, inflicting damage that no one yet seems able to ameliorate,

The “neat idea” of growing escargot snails in Waipio has left taro farmers dealing with a nightmare infestation of snails that has increased farmers expenses and workloads, and diminished their harvests and profits. The Mediterranean is clogged with underwater flora flushed down toilets from home aquariums, seriously damaging native aquatic plant and fish species.

The project under consideration is laden with risks of similar and worse catastrophes, not to mention the fact that few of the fish captured here for marketing elsewhere can survive the ordeal. We urge you to oppose this project.

In Gratefulness,

David Pettus

Subject: [EXTERNAL] Ornamental Fish Trade in Hawaii
Date: Tuesday, January 7, 2020 1:11:25 PM

Aloha Mr. Sakoda,

I am an avid diver and also volunteer for coral restoration in Kona. The ornamental fish trade should NOT be allowed. Hawaii needs to keep its waters healthy, beautiful and bountiful. Without a healthy reef and fish to look at. The tourists will stop coming and that would be detrimental to the entire economy. The negative environmental impacts should be obvious. The waste is horrendous in the collection process. The dumpsters at Honokohau Harbor used to have giant trash bags full of dead yellow tangs that didn't survive collecting. That absolutely must STOP.

Mahalo for your time,

Laura Roberts
PADI professional of 10 years
Kona Hawaii

From: [Dominic Romer](#)
To: [Sakoda, David](#)
Subject: [EXTERNAL] Ornamental fish trade.
Date: Tuesday, January 7, 2020 10:48:07 AM

Good Morning,

I'm writing asking you to please keep the ban on the West Hawaii ornamental fish trade active. I first moved to the Big Island in 2001. Before that I was living in Oahu. When I moved to the big Island I was amazed at the variety and numbers of fishes and coral compared to what I'd seen on Oahu. I got my scuba certification and began to dive almost every day after work. After a few years I moved to the mainland for a job opportunity. I just move back to the Big Island in July 2019. I began snorkeling my 2nd day off the plane. I was shocked at what I saw. There was so much dead coral. The fish life was nothing like it was, In fact I can name specific fish..Since I've been back I've seen 3 scrawled file fish...I used to see numerous scrawled file fish every dive. The amount of parrot fish is also down an immense amount. Tinkers butterfly fish used to be common in large swarms all over the reefs. Now due to fish collection the only place to see them is either in south point or on very deep reefs well beyond the recreational diving limits.

So what I'm asking is to please to not allow ornamental fish collection in West Hawaii. The reefs are in trouble and need the herbivores to keep them clean and healthy, the tourists comes to see the reefs and the fishes. There is only one West Hawaii there will be a tipping point where the fish populations are too small to reproduce effectively and like the Tinkers butterfly fish they will disappear. The science that the fisherman are using does not take into account the coral bleaching events of 2015 and 2019 and future events. Please don't let the greed of a few individuals ruin the precious underwater environment of West Hawaii.

Date: Tuesday, January 7, 2020 12:39:54 PM

Good Morning Mr. Sakoda,

I am writing to you today to encourage you & your team in the complete & final banning of fish collection (for ornamental purposes).

I see no reason why the state of HI and the coastline of West Hawaii in particular should be such a source for aquarium fish around the world.

Anyone who has spent time in the waters off HI will tell you about the dramatic decrease in the amount of fish life here. The excitement on various Facebook groups when a fish such as a Tinkers Butterfly fish is spotted while diving, should be enough of a sign that this collection industry is causing untold harm to our marine species.

We need all these fish to have a complete functioning ecosystem...each creature plays it's part...now, we need to play ours & support those without voices.

Collecting for home aquariums and to line the pockets of mainland sellers is not a valid use of any HI governmental permit. Surely, we should restrict collecting to only those needed for public/scientific aquaria. This can then be the inspiration for generations of fish lovers & marine enthusiasts.

Thank you for your efforts, Sandra Romer.

Subject: [EXTERNAL] Our state's fish are precious.
Date: Monday, January 6, 2020 6:57:17 PM

Hi there!

As a college student who cares deeply about Hawaii's wild marine life, I recently learned that our state is considering the impact that fish collection for the aquarium trade has on wild fish populations.

I ask you respectfully to strongly limit the amount of native fishes that can be caught for the aquarium pet trade.

Hawaii is expected to lose 70% of our coral reefs in the next couple of decades, thus it is our duty to steward and protect our state's incredible marine diversity from exploitation and over-harvesting.

Have a wonderful day,
Rebecca Canright

Aloha David,

I left a message on your office phone regarding submitting comment so please let me know if you are not the right person or place.

I am submitting comment on behalf of Pacific Whale Foundation (PWF) regarding the Issuance of Commercial Aquarium Permits for the WHRFMA. It is listed on the DEIS as HRS Chapter 343 Entry #622. You are the contact listed on this DEIS. Please let me know if there is an online portal that this needs to be uploaded to. Tomorrow (Jan 6) marks 45 days since the DEIS was published to public comment, and therefore the deadline for comment.

Please find our attached comments.

Thank you,
Shelby

Tuesday January 7th 2019
RE: Issuance of Commercial Aquarium Fishing Permits for the West Hawai'i Regional Fishery
Management Area
HRS Chapter 343 Entry #622

Pacific Whale Foundation opposes the issuance of commercial aquarium fishing permits for WHRFMA outlined in HRS Chapter 343 entry #622

Pacific Whale Foundation (PWF), a 501 (c)(3) nonprofit organization has a mission is to protect the ocean through science and advocacy and to inspire environmental stewardship. The objective of the proposed action is for the Department of Land and Natural Resources (DLNR) to issue 14 Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA). I am testifying in opposition of the issuance of the 14 aquarium permits and support a No Action Alternative, where no commercial aquarium collection would occur within the WHRFMA.

Hawai'i's DLNR Division of Aquatic Resources has approved the Pet Industry Joint Advisory Council (PIJAC) to apply for the issuance of Commercial Aquarium Permits for the WHRFMA. This project involves review of both the use of state lands and the use of conservation districts that are involved in the proposed permitting areas.

The Preferred Alternative includes the issuance of 14 aquarium permits for the WHRFMA, and implementation of a reduced bag limit for Achilles Tang of 5 per day. Implementation of the Preferred Alternative, according to this DEIS, would ensure the lawful, responsible, and sustainable commercial collection of 40 fish species deemed "White List Species" from the WHRFMA. It is unclear why there is only a bag limit for Achilles Tang. Without a complete understanding of a sustainable catch limit, imposing a limit on one species leaves room for excessive take of all other species. Without a verification system to ensure accuracy of self-reported data, there is no way to know what the sustainable catch limit is. This draft outlines a large range for sustainable catch limits, capped at a high percentage (25%). Using the precautionary approach, the lowest estimated percentage of sustainable take should be applied (5%).

Pacific Whale Foundation acknowledges that the best available science indicates less than significant direct and indirect impact on reef fish populations with the preferred alternative outlined in this DEIS. Although the Coral Reef Ecosystem Program (CREP) data are the most comprehensive data publicly available in fish populations estimates, certain limitations of the surveys may lead to an underestimate of some populations. Short period of survey effort, exclusive survey zone and the misidentification of fish disallow this survey from collecting accurate fish population numbers. Determining actions based on these numbers can lead to an overestimating population numbers and misidentifying take limits.

In review of this DEIS, it is unclear who are the interested parties involved in the issuance of these permits. A better understanding of interested parties within PIJAC would shed light on the intentions of this application. This draft outlines calculated economic benefits based on a 17 year time frame between 2000 and 2017 and created a 5-year analysis period, inflation-adjusted, to these permits which under the Preferred Alternative, work out to be approximately 0.01% of Hawai'i's ocean economy, and an even smaller percentage of the overall economy in the State. With such a minute economic benefit, the purpose of this permit issuance is unclear.

There are a number of impacts outside of aquarium fisheries that are effecting coral reefs, including recreational aquarium fish collection, non-aquarium fishing, tourism and climate change. Under the climate change umbrella there includes additional stressors such as coral bleaching and ocean acidification, which lead to coral death. We believe that these cumulative impacts outweigh a single stressor. Using the precautionary principle, without a complete understanding of the environmental stressors on reefs in relation to climate change and other impacts, there should be no introduction of additional stressors to the reef ecosystem.

Due to the near negligible economic benefit and the introduction of a new stressor on a currently stressed ecosystem, we oppose the issuance of the 14 aquarium permits and support a No Action Alternative, where no commercial aquarium collection would occur within the WHRFMA.

Thank you,

Shelby Serra

Subject: [EXTERNAL] Permit to Collect Fish for Aquariums
Date: Sunday, January 5, 2020 1:43:14 AM

Dear Mr Sakoda

I was given your name to email and I assume you work with DNLR. I will try to call your office this week.

As a taxpayer who pays your salary, I really don't appreciate you selling our natural resources.

I snorkel on Maui everyday and even though if I understand correctly the permit is for the Big Island, I can only assume the waters and fish populations are somewhat similar.

There are not abundant fish in our waters. You rarely see schools of fish or huge varieties so I find it hard to believe that someone could do a multi page study and come up with the notion that there are so many fish in Hawaiian waters that we can sell them off to who ever is paying you.

I hear from many visitors, " where are the fish". It's depressing.

Please tell me:

1. Your telephone number so I can discuss with you.
2. How this benefits the tax payer and the visitor.
3. What exactly is in it for the state.

Sincerely,
Robert B. Smith

Subject: [EXTERNAL] Permits for fish collection
Date: Monday, January 6, 2020 10:38:26 PM

Aloha Mr. Sakoda,

My name is Vera Deryabina. I work in a seafood industry in Alaska, and often visit Big Island for a vacation. I have been in love with the island since my first visit and have been lucky to be a part of such a breathtaking, unique and beautiful place that is clean and full of life which is so rare nowadays. I have met many people who call the Big Island their home and witnessed how they care for their island, its wild life and its nature.

Working in seafood industry showed me how fishing can be harmful for the environment and how much Alaska has been suffering from it. The decline in many species has been so massive that the state had to close multiple fisheries - crab, herring, salmon, cod and other white fish. The ocean sustainability is in danger. The only thing that keeps Alaskan salmon runs is hatchery program. And we've seen a huge decline in the run of wild fish.

Please, don't let it happen to Hawaii. It's one of the not many places in the world that is treasured by their residents and people from all over the world who admire it. Please, consider not issuing these fishing permits.

Regards,

Vera Deryabina

Subject: [EXTERNAL] Permits for Fish Collections
Date: Tuesday, January 7, 2020 3:30:14 AM

Mr. Sakoda,

Please do not issue any more Permits for Fish Collections....

I worked on the Spirit of Adventure dive boat off Kailua Kona in 1978.

I returned as a passenger in 1985 and saw a huge difference underwater.

My brother, sister and I went to Hawaii in 1985 and went out on the Body Glove Hawaii boat.

I was devastated by the lack of fish and the terrible condition of the coral...

Issuing more Fish Collections permits will only make the situation worse...

It appears to me that Hawaii cannot continue to be a dive destination if even more fish are gone.

PLEASE do not issue any more permits....

Thanks for your time

Date: Monday, January 6, 2020 3:38:00 PM

Aloha Mr. Sakoda,

My name is Shirley Spencer. . I have lived on the Big Island for 45+ years and have enjoyed snorkeling and diving since moving here. The massive decline in marine life, mostly fish has declined immensely since then. I can compare underwater coral reefs/marine life from the 1970's- 80's to now and the change is incredible.

I am writing to respectfully inform you, I oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish.

Permitting 14 more companies to collect Hawaii's Tropical Fish for entertainment and take them from Hawai'i's Reefs is counter-productive.

Thank you for your time

Mahalo,
Shirley Spencer

To: [Sakoda, David](#)
Subject: [EXTERNAL] PIJA Review Concerns
Date: Sunday, January 5, 2020 7:31:27 PM

Aloha, Mr. Sakoda,

I am very concerned about losing most of our reef fish to the pet trade. To quote Snorkel Bob, "It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting.

The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.

But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,

PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.

I implore you to do the right thing."

Please do not facilitate this trade in our marine heritage!!

Mahalo!

Subject: [EXTERNAL] Please do not allow any more permits to collect tropical fish
Date: Tuesday, January 7, 2020 12:49:42 AM

Aloha Mr. Sakoda,

My name is Ilene Harrington and I am absolutely confused why you would consider issuing 14 permits to allow our beautiful and unique tropical fish to be collected. Sometimes it not about the money but about what's right for our oceans and earth.

I own and operate two million dollar businesses and two non-profits in Kona and Waimea. I have lived on the Big Island for 14+ years and I snorkel up and down the North and West Hawaii coastline. I have sadly seen the massive decline in marine life. Between the Black Water run off along the West Coast of Hawaii Island, chemical spraying along the coastlines to keep golf courses green and weed free and the recent coral bleaching, our reefs are in disrepair.

I am writing to respectfully inform you, I STRONGLY oppose issuing permits to collect Hawaiian Reef Fish. I'm having a hard time understanding that this subject is even a topic. This is so wrong, in so many ways. Our Hawaiian coral reefs live symbiotically with tropical fish to nurture and flourish. I understand that some would argue that this would provide some jobs, but what about those of us that already work in the industry, and our past, present and future visitors. Its seems very short sighted to not consider how you are impacting our natural underwater wonderland.

Permitting 14 more companies to collect Hawaii's Tropical Fish for entertainment and take them from Hawai'i's Reefs is counter-productive. Shouldn't we tell our visitors to enjoy Hawaii here, don't take the lava rocks, the shells, the multi-colored sands from our beaches, why would you condone this? Our oceans are dependent on people like yourself to do what is Pono. Please choose to do the right thing, our community will be watching.

Thank you for taking the time to read my comments.

Subject: [EXTERNAL] Please Protect Hawaii Fish From Pet Trade
Date: Tuesday, January 7, 2020 10:13:58 PM

Dear Mr. Sakaoda,

As an animal and nature lover, I urge you to keep the fish who live in reefs off Hawaii's coast in their natural habitat where they belong. They are adapted to live in these reefs and are integral to them.

Hawaii's reefs nurture life as well as protect its coasts from erosion. Over 500 species of plants and animals are found only in Hawaii coral reefs. These coral reefs depend on fish to eat algae that, left unchecked, can smother coral, rob it of nutrients or promote the growth of harmful algae that may kill it.

Marine biologist Mike Gil has observed that fish only feel comfortable entering risky feeding grounds abundant with algae when they see other fish doing the same and, that, when fewer fish are present, fish are more risk averse and eat less which can allow algae to grow unchecked. Thus, removing fish from a reef ecosystem threatens the reef itself.

And fish are living, feeling creatures, not commodities. Allowing them to be torn from their natural home to live in the confines of a tank at the mercy of humans is cruel as well as environmentally unsound.

As someone who oversees Hawaii's natural heritage, please protect its fish and the reefs they protect from unnecessary exploitation.

Thank you for considering my concerns.

Dear Gov. Ige,

I have been diving the beautiful reefs of Hawai'i since 1979. I used to go there at least 3 times a year because it was a short jaunt from my home in California. I stopped going there altogether around 1996, because the once abundant reef fish were mostly gone. I started visiting again in 2014 because my organization was asked by Hawaiian's to help clean up the reefs of all the fishing gear that is smothering the reefs. While I still don't see the fish in the abundance I once did, protected areas like Hanauma Bay, remind me of what wonders Hawai'i could still hold if we just STOPPED letting the aquarium trade remove the fish. Please put a stop to it NOW!! The tourism industry will reap the rewards, which bring much need money into the local economy AND the government gets all the taxes that come with it.

Date: Tuesday, January 7, 2020 1:10:27 PM

Dear Mr. Sakoda,

One of the most memorable experiences of my life was snorkeling in the Kapoho tide pools on the Big Island. The tide pools are gone now--not because of human exploitation, but due to natural forces.

The aquarium industry, by contrast, takes Hawaii's native fishes and turns them into toys for aquarium hobbyists and a profit center for businesses. This is wrong.

Even with take restrictions, people can and will break the rules. This planet is facing unprecedented environmental crises, including the loss of coral reefs. Hawaii can't afford to let the aquarium industry plunder its reefs.

Hawaii's fishes need and deserve real legal protection. They should be left in the wild.

Please do the right thing and help create real, substantive protection for Hawaii's treasures.

Subject: [EXTERNAL] Protecting wild FISHES from the aquarium trade
Date: Monday, January 6, 2020 3:53:58 PM

Dear Governor Sakoda!

Please do not hesitate to use everything at your disposal to save the wild/native FISHES in your waters.

Your constituents will appreciate your positive efforts on this.

And your constituents will remember if you fail to use your office to save the fishes.

Subject: [EXTERNAL] Public Comment Regarding Aquarium Trade
Date: Tuesday, January 7, 2020 4:21:45 PM

Dear Mr. Sakoda,

Thank you for the opportunity to comment on this issue. Recently, on a visit to Two Step I had the wonderful opportunity to see how much the beloved yellow tangs have recovered since the ban on the aquarium trade went into effect. The last time I had been there, I saw hardly any at all. We should keep in place efforts to protect these creatures in their homes, and not allow them to be taken away to be used as a ornament in someone's living room in Kansas. Folks who live and visit Hawaii deserve to see these creatures in their homes in the ocean. We should be using each opportunity we have to protect Hawaii's resources from further degradation, especially considering climate change.

Do we truly believe that Hawaii's sea life will be able to battle both aquarium trade collectors and warming temperatures, not to mention trash and people who don't always know the rules to respect the reefs? In short, our planet--including the oceans--is in crisis, as we are all aware. If we believe that allowing a trade to continue taking fish is going to help our fragile planet, we are sadly wrong. We have to keep our priorities logical. It's not logical to allow this trade to wreak further havoc on Hawaii's wildlife. There are plenty of people who live and visit here to scuba dive and snorkel who contribute much more to Hawaii's economy than an aquarium owner ever will. What happens when there's nothing left to see scuba diving or snorkeling? Will we have to start planning vacations to go visit Hawaii's sea life in aquariums on the mainland, or to some other islands where they loved their natural resources instead of taking them for granted? Let's focus on supporting the trades that boost the economy while leaving nature intact.

Sincerely,

Leigh Bowles
Hilo, HI

RE: Submittal Form for HRS Chapter 343 Publications in the Periodic Bulletin : Entry # 622

http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2019-11-23-HA-DEIS-Hawaii-Island-Commercial-Aquarium-Permits.pdf

December 15, 2019

I read with genuine sadness and horror, this application and DEIS.

This application should be DENIED, and our public employer & employee time (and thusly, our tax dollars) should not (now or ever again) be wasted entertaining similar inhumane, immoral, unethical applications.

These are NOT "aquarium fish" these are indigenous fellow residents of our shared island home. I am one of MANY who would be harmed by allowing this permit to be approved. Like others, I swim and snorkel frequently, to simply be amongst these beautiful creatures. It is an important part of my personal, recreational, and spiritual experience where I live and work.

Using a more accurate and appropriate name, the "tropical fish enslavement industry" has a HORRIBLE history and record of capturing our indigenous, native tropical fish, and enslaving those FEW that survive capture, packaging, shipping, and wholesale and retail sales into foreign environments.

Our Native Hawaiian tropical fish BELONG in Hawaii, in their native habitat - NOT LIVING A MISERABLE EXISTENCE ENSLAVED IN FISH TANKS FOR THE CRUEL "ENTERTAINMENT" OF HUMANS who somehow think they have a RIGHT to freely enslave others.

WHO and WHAT gives ANYONE this right to enslave our beautiful, innocent, fellow indigenous island inhabitants?

There is NOTHING "Sustainable" about this practice. It is narcissistic, selfish enslavement of our fellow creatures who have an inherent right to live free in their habitat - all in the perpetual lust for dollars.

This is the EXACT same barbaric ENSLAVEMENT scenario played out throughout human history: Capture the indigenous innocents, Destroy their connection with family, community, home, and steal their freedom, Force those innocents into inhumane conditions for the rest of their once beautiful - now brutally cruel, exploited lives, and IF they survive capture, packaging, transportation, wholesale and retail "sale" - End their lives enslaved in an unknown foreign containment.

With Hawai'i's history of colonization and stolen freedoms, lands and culture - does the reality of this cruelty - this theft and enslavement - not effect your conscience...? There is a very sick irony here.

For too long, our standard EIS (and DEIS) protocols and process has looked at ONLY a narrow and limited number of "factors" upon which decisions are manipulated and rendered.

Therefore, I formally ask that you correct this shortsighted error, and that the MORAL and ETHICAL DIMENSIONS AND CONSEQUENCES of this proposal, application, permit request, deliberation and decision NOW BE ADDED AND INCLUDED IN THIS EIS process and decision.

Hope for human survival on our ailing earth will remain questionable at best until we recognize our past mistakes and our arrogantly presumed dominion mentality - and change our behavior. I can think of no better opportunity than now - this decision - to change our destructive course determining our collective future.

We need gratitude and respect for the lives of all beings with whom we share our home, island, and planet - in this decision.

From: [Support Oceanpro](#)
To: [Sakoda, David](#)
Subject: [EXTERNAL] Re: Information
Date: Wednesday, January 8, 2020 9:48:10 AM

Aloha David,

Once again, I want to express that my position hasn't changed regarding Commercial Aquarium Reef Fishing. I still believe that Aquarium Reef Fishing along Hawaii coastal reefs should be prohibited, and I provide two reasons.

First, the largest economic industry is tourism. It is estimated the tourism industry led to over \$16Billion in visitor spending ("[Annual visitor report](#)" (PDF). [files.hawaii.gov](#). 2017.) Tourist come to our islands to see all the beauty of the land and her oceans. Risking this industry for the sake of an industry est. to be under a \$1Million, lacks common sense and proper stewardship.

Second, ornamental reef fish contribute to the overall health of our reefs and waters. Further, collection methods have inadvertently damaged the reefs. As we deal with water quality and safety issues for our residents and visitors, it would seem neglectful to allow potential damage to our reef balance.

While I know the EIS discusses sustainability, I caution trusting in the data that benefits the parties with a vested interest.

An additional point I will make regards the aquarium fish industry. As I'm sure you are aware. They had a similar fight in Florida regarding taking of fish off the coastal Florida waters. They claimed that it would have a devastating impact to the aquarium industry and that the fish in question COULD NOT BE farmed economically. But, the truth was they never needed to try because they were getting the fish for free off the coast. When Florida denied their request and shut down the removal of this species, they figured out a way to farm them and, over time, it was actually cheaper and safer to do so. So, they have a track record of fighting to take from the wild and environment risking an eco system, when a potential safer and more lucrative solution is in front of them. It is common knowledge that the closer the fish are raised to the potential customer / market, the more likely of survivability of the fish. So, if you can farm the fish on the mainland, where the market is, you will save the long shipping and potential harm to the fish.

I'm sure I don't need to tell you any of this. As someone in your position, I'm sure has seen the decline in ornamental fish and water quality over the years on our reefs and in our waters. You know, first hand the reality and while we can discuss legal fishing, there is another issue of illegal fishing.

The issue is fundamental. When we wake up in the morning and look at our families, and ourselves in the mirror, we only have one real responsibility. It is to be true in our convictions and responsibilities. We know what is right. We know we want a better future for our keiki. They deserve, especially from the DLNR, to have their lands, waters, reefs, and fish, protected.

Aloha,

Eric Moreno

On Aug 16, 2018, at 10:40 PM, Sakoda, David <david.sakoda@hawaii.gov> wrote:

A person is required to have a Commercial Marine License to take marine life for commercial purposes. Commercial Marine Licensees are required to submit monthly reports of all fishing activity and marine life harvested. This applies both to food fish and aquarium fish.

There is a state law that generally prohibits the use of fishing nets with a mesh of less than 2 inches stretched mesh.

HRS 188-31 allows the Department to issue permits to use fine meshed traps and nets for the taking of marine life for aquarium purposes. The Court recently ruled that the "actions" authorized by these permits (i.e., the use of fine meshed traps and nets to take marine life for aquarium purposes) are subject to environmental review requirements under HEPA. To comply with this ruling, a group of aquarium collectors completed a pair of Draft EAs and then Final EAs, which assessed the significance of the impacts of the "actions" on the environment. After reviewing the Final EAs, the Department determined that there may be a significant impact, and the preparation of EISs is required. Until this requirement is met, the Department cannot issue any Aquarium (fine mesh net) permits.

There are no other restrictions on collecting marine life for aquarium purposes using other gear, such as larger mesh nets (2" or greater), slurp guns, or by hand harvest. Although the EAs and EISs primarily focus on the fine mesh net "activity," they do consider aquarium collection using these other gears as part of the cumulative impact analysis.

There are no restrictions under the CML regarding the numbers of licenses issued or number of marine life that can be taken.

I know it can be confusing, so let me know if you have any more questions.

Aloha,
David

Subject: Re: Information

David it helps but doesn't answer what other gear/methods are allowed under this "Commercial Marine License".

I did not see an article published today, so I don't know about the misleading info and that's why I'm trying to understand it directly from the source.

If I understand you, this license was always available to them as another option, but requires a different method of catching. If this is true, then it would seem there EA misrepresented the amount of fish potentially collected and didn't account for numbers taken under this type of license.

Either way, wouldn't you consider it an end around the DLNR intent to study with an EIS?

What restrictions are they under with the "Commercial Marine License" if any for collection numbers and are these licenses capped by number?

Thanks again for your answers. I understand I'm asking a fair amount, but I want to support your efforts and want to make sure I have a clear understanding.

Aloha

DLNR will agree with the Preferred Alternative. DLNR is currently accepting comments on the DEA. At the close of the 30-day comment period, the applicant will compile and respond to the comments received and prepare a Final EA. Based on the comments, DLNR will make a determination whether to accept the Final EA with a finding of no significant impact, or to require the applicant to prepare an EIS.

Subject: [EXTERNAL] Reef Fish Collection
Date: Wednesday, January 8, 2020 2:32:43 PM

Dear Sir,

My name is Danielle Bunnell, and I have been a Captain and submarine pilot with Atlantis Adventures for 17 years. I see approximately 25 acres of reef several times a day as part of my job. We must do EVERYTHING POSSIBLE to protect this fragile resource for generations to come. I realize that our dive site has been in a protected area, and that no fish collection has been allowed there since the year 2000.

Reef fish belong on the reef. It is very difficult to monitor the take from permitted activities. DLNR simply does not have the resources to oversee this program. Period. I see egregious behaviors on the water on a weekly basis that go unchecked due to lack of resources and personnel. This will be no different. I do support the traditional and cultural practices of subsistence fishing, but that certainly does not apply here. The only people benefiting are the ones with the permit.

I respectfully request that we continue to ban reef fish collection from the Island of Hawaii. Thank you very much for your time and consideration.

I completely support Maggie Brown in her concern for the coral reefs and indigenous fish in Kona waters.

It seems almost criminal to further deplete our reefs for the benefit of a few collectors. I'm sure there are other places to collect fish with far less impact. Let's protect the local businesses that support the reefs, instead of supporting the businesses that exploit them.

Subject: [EXTERNAL] Reef fish permits
Date: Monday, January 6, 2020 9:20:22 PM

Dear Mr. Sakoda,

It has come to my attention that the DNLR is set to issue 14 more permits for Fish Collections on the Big Island within areas Ka'u to Kohala West Shores.

With the unprecedented climate changes occurring globally, allowing "reef raping" of Hawaii's natural sealife will undoubtedly create even more instability of our natural global world. For what? Money?

The short term focus on monetary gain is what has produced the overwhelming climate and environmental problems we are seeing today and what will occur in the future.

It is time to fully embrace Hawaii's Aina and reject profit and honor the land.

My family has lived on the islands for over 50 years and I want the land and ocean to thrive, flourish, and be preserved for future generations.

Do not issue any permits for Fish Collections.

Mahalo,

Kristina

From: [dotti branch](#)
To: [Sakoda, David](#)
Subject: [EXTERNAL] Reef fish
Date: Sunday, January 5, 2020 11:45:45 AM

Aloha, Mr. Sakoda!

Extinction is forever—it's that simple.

It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting.

The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.

But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,

PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.

I implore you to do the right thing

Thank you,
Dorothy Branch

Date: Tuesday, January 7, 2020 1:45:38 AM

Aloha Mr Sakoda,

I have lived on the Big Island for 43 years. The ocean has always been a big part of my life. Working on boats over the years I was able to observe the “trop collectors” always with disdain. My belief is that there are too many people and visitors who live and vacation here to spend their time in our beautiful ocean. I have witnessed firsthand the decline of our reef fish.

I ask you to please consider this before granting more permits for tropical fish collectors.

Thank you,

Kristy Knudsen

Date: Monday, January 6, 2020 5:27:16 PM

Please, do NOT allow the reef fishing permits!!! I swim the Kailua pier, down at Magic Sands, and around Kua Bay. For 30 years, I've swum these waters and the changes are so devastating between the coral bleaching and the lack of fish. We need these reef fish, not more people fishing these reef fish. Please, please do NOT allow more permits. I'm completely opposed to any more permits so we can keep the few reef fish we have left to help balance our ecosystem.

Thank you for listening, and a bigger thanks if permits are NOT issued

Mr. Sakoda,

Please, if it is in your power, do not go along with the commercial exploitation of this limited beautiful resource. I have lived here in West Hawaii for 15 years and have seen the drastic decline of reef fishes here.

Please do not allow the decimation of this beautiful resource, for the financial benefit of the commercial fish industry. The fish count is just too low and too slow to recover from this kind of threat.

Sincerely,
Dan Swenson

Subject: [EXTERNAL] Save Hawaii's Reefs
Date: Monday, January 6, 2020 12:30:00 AM

Aloha, Mr. Sakoda!

Extinction is forever—it's that simple.

It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting.

The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.

But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,

PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.

I implore you to do the right thing.
Aloha!

Dear Mr. Sakoda,

I urge you to right action for saving Hawai'i's reefs!

A 500-page lobbying piece does not deserve the title "Environmental Review" - a false and misleading designation. "Environmental impact review" is the term used for PUBLIC REVIEW AND HEARINGS on a proposed project, allowing typically at least 6-12 months for input from concerned citizens and relevant scientists in the public interest. (Which includes environmental interest.)

The way this type of review was initially conceived was NOT to give equal time to the developer; it was to allow all necessary time for citizen input especially local, plus research developed in the public interest to consider potential hazards. The onus was on the developer/commercial interest to prove the project was safe, or to make changes that adequately addressed safety, quality-of-life, and environmental considerations. Failing that, the project would not be permitted to proceed. The "need" of any commercial interest to make profits is utterly bogus.

Yours sincerely,

Madolin Wells, Kihei

Aloha David,

I have been swimming almost daily in the water off south Maui for over 30 years. During that time I have seen a huge decline in the tropical fish population and the degradation of the coral reef. Now I know that the aquarium trade is not solely responsible for the decline in tropical fish but it has been a contributing factor. How can it not be? With the aquarium trade removing tropical fish from the ocean, they are also removing all the future fish those collected fish would have created. The math just doesn't add up to 'no-impact' which the aquarium trade would like us to believe.

As a long term resident of Maui County and an avid ocean swimmer, I urge you to reject any Environmental Review which supports aquarium collection. Please protect Maui's fish and thus our ocean.

Dear Mr. Sadoka,

I would like to submit this letter from my friend, David Hunt, as my testimony, as it expresses my own feelings as well.

Thank you,

Matt Binder
Waimea, Big Island

I read with genuine sadness and horror, this application and DEIS.

This application should be DENIED, and our public employer & employee time (and thusly, our tax dollars) should not (now or ever again) be wasted entertaining similar inhumane, immoral, unethical applications.

These are NOT “aquarium fish” these are indigenous fellow residents of our shared island home. I am one of MANY who would be harmed by allowing this permit to be approved. Like others, I swim and snorkel frequently, to simply be amongst these beautiful creatures. It is an important part of my personal, recreational, and spiritual experience where I live and work.

Using a more accurate and appropriate name, the “tropical fish enslavement industry” has a HORRIBLE history and record of capturing our indigenous, native tropical fish, and enslaving those FEW that survive capture, packaging, shipping, and wholesale and retail sales into foreign environments.

Our Native Hawaiian tropical fish BELONG in Hawaii, in their native habitat - NOT LIVING A MISERABLE EXISTENCE ENSLAVED IN FISH TANKS FOR THE CRUEL ”ENTERTAINMENT” OF HUMANS who somehow think they have a RIGHT to freely enslave others.

WHO and WHAT gives ANYONE this right to enslave our beautiful, innocent, fellow indigenous island inhabitants?

There is NOTHING “Sustainable” about this practice. It is narcissistic, selfish enslavement of our fellow creatures who have an inherent right to live free in their habitat - all in the perpetual lust for dollars.

This is the EXACT same barbaric ENSLAVEMENT scenario played out throughout human history: Capture the indigenous innocents,

Destroy their connection with family, community, home, and steal their freedom,
Force those innocents into inhumane conditions for the rest of their once beautiful - now
brutally cruel, exploited lives,
and IF they survive capture, packaging, transportation, wholesale and retail “sale” -
End their lives enslaved in an unknown foreign containment.

With Hawai'i's history of colonization and stolen freedoms, lands and culture - does the
reality of this cruelty - this theft and enslavement - not effect your conscience...? There is a
very sick irony here.

For too long, our standard EIS (and DEIS) protocols and process has looked at ONLY a
narrow and limited number of “factors” upon which decisions are manipulated and rendered.

Therefore, I formally ask that you correct this shortsighted error, and that the MORAL and
ETHICAL DIMENSIONS AND CONSEQUENCES of this proposal, application, permit
request, deliberation and decision NOW BE ADDED AND INCLUDED IN THIS EIS process
and decision.

Hope for human survival on our ailing earth will remain questionable at best until we
recognize our past mistakes and our arrogantly presumed dominion mentality - and change our
behavior. I can think of no better opportunity than now - this decision - to change our
destructive course determining our collective future.

We need gratitude and respect for the lives of all beings with whom we share our home,
island, and planet - in this decision.

Subject: [EXTERNAL] Support Comment for EIS aquarium fishery.
Date: Sunday, January 5, 2020 11:37:33 AM

Aloha David Sakoda,

From Ron Tubbs B.S. N.D. Oahu

I am asking DLNR for the complete renewal of all aquarium small mesh permits for Hawaii. The 490 page environmental review and past DLNR fish counts have already proved the sustainability of the fishery at past full fishing takes.

It was unfair for the fishery to be the only fishery or DLNR permitted ocean user to have to do an EIS. Please correct this by reinstating the issuance of all permits.

This year has seen another large fish drop and ocean fish populations are very healthy. Any change in fish populations will be address by DLNR and the fishery. We strongly believe in a fluid ocean management approach.

We did work with DLNR and West Hawaii Fishery Council in the past to create new rules in 2015 to ensure sustainability and health fish populations. We will continue to do so if any global warming issues need to be addressed in the future.

Right now Hawaii fish populations are increasing, and reefs are healthy. Links below with the facts:

<http://hawaiitropicalsaltwateraquariumfish.com/index.html>

The Environmental review concludes that the fishery can reopen and it is not only sustainable but a model fishery!

The link to the full 490 page environmental review:

http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2019-11-23-HA-DEIS-Hawaii-Island-Commercial-Aquarium-Permits.pdf

Those who oppose the fishery say we are unlimited in catch and the fishery can deplete the reefs, this is not true we are limited by many laws, catch limits, size limits, closed areas, limited holding on boats, limited to dive deco times, and recent 2015 rules were passed with even more laws to ensure sustainability of the fishery.

Link to those laws:

<https://dlnr.hawaii.gov/dar/fishing/fishing-regulations/>

The fishery is so well regulated and studied it is considered a ***model fishery*** because it has been proven sustainable.

Thanks for your time and more info for your review:

Hawaii's Fish Populations Increase (it is happening again this year 2019 and into 2020)

Videos show tropical fish swarming state's reefs

HONOLULU (HawaiiNewsNow) -

It's being called a spawning event of "Biblical" proportions -- a summer swarm of fish over Hawaii's reefs. Aquarium fisherman and underwater photographer Ron Tubbs shot video off Oahu's coastline showing the population explosion.

I made a special trip last week to see it and video it myself. It really is unlike anything anyone has ever seen," Rene Umberger said. Even **dive shop owner**, anti fishing activists agree there

lots tons of reef fish right now all across Hawaii.

"In 35 years this is the most fish I have ever seen. For most species, it's just incredible. It's just amazing. Areas where you see hundreds of fish normally, that's a lot of fish for an area, you're seeing thousands of fish," Ron Tubbs said "This year the numbers are just exceptional."

What about Aquarium fishing in Hawaii?

January 2014 saw the new Kona aquarium fish rules go into law. Aquarium fishermen and Kona DLNR scientists created stricter laws for an already sustainably fishery. Dr. Bill Walsh now advocates for these fishermen due to their cooperation and efforts to maintain fish populations.

The same thing has been done on Oahu with the DLNR researchers there. The Oahu DLNR scientists also believe we are already sustainable but agree further regulations can help to protect our reef fish. The Oahu rules should go in to effect sometimes in 2015. As a result we have wide spread support from many members of Hawaii's legislature, DNLNR and UH scientists and even private eco groups who once opposed us. Aquarium fishermen continue to work with researchers to make it the greatest sustainably fishery in the world. The oceans belong to all and to protect them and preserve it wonders is the job of all ocean users.

What do Hawaii's ocean researchers say about aquarium fish collecting?

Here are some shortened quotes from Public testimony Hawaii County Council testimony 2014, Hawaii news now and West Hawaii Today news excerpts.

Dr. Bill Walsh October 2014:

In my capacity as the West Hawai'i Aquatic Biologist for the Division of Aquatic Resources I have been involved in the management and biological monitoring of the West Hawai'i aquarium fishery for over 15 years.

I would like to share with you some of the results of our latest monitoring efforts as they relate to the issue at hand. Two species, the Yellow Tang and Kole make up over 93% of all aquarium fish caught in West Hawai'i. Since the no-aquarium collecting Fish Replenishment Areas (FRAs) were established in 1999 (protecting 35% of the coastline), the numbers of Yellow Tang have increased in the FRAs by almost 65% while not significantly decreasing in the remaining Open Areas. In the 30'-60' depth range alone, the numbers of Yellow Tang in West Hawai'i have increased by 1.3 million fish. Similarly Kole populations have increased not only in the FRAs (by 24%) but also in the Open Areas as well (by 28%). Kole populations in the same depth range have increased by over 2 million fish! Clearly resource management efforts are working in West Hawai'i.

Scientific studies which have indeed found high levels of mortality among aquarium fishes have typically been conducted in remote areas with poor handling capabilities. That is clearly not the case in Hawai'i.

~ Dr. William Walsh

**Division of Aquatic Resources
State of Hawaii DLNR**

Dr. Dan Polhemus:

It is a good thing for folks to scrutinize and ask questions about what's going on in our fisheries and on our reefs. These are important to all of us. A realistic perspective does need to be maintained however. Let me elaborate. On Maui in 2009 there were a total of 16,300

aquarium animals caught, representing 82 different species. Yellow tangs accounted for 69% while Kole was 7% of the catch. During that same year non-aquarium commercial fishers captured (and killed) 319,491 reef fishes of 75 species. While yellow tangs weren't caught to any degree there was considerable overlap in a number of the other species. To the commercial food catch one can add another 480,000 reef fish taken by recreational/subsistence fishers (extrapolated from 2006 NOAA Rec Fishing Survey data). So, in the grand scheme of things, the aquarium take on Maui is literally a drop in the bucket, representing less than 2% of the total mortality of reef animals that year. This serves to point out that undue focus and hyperbole about aquarium collecting and its impact on the reefs is dangerously shortsighted and counterproductive. We need to think and act holistically.

Hope I didn't overwhelm you with numbers. (as of 2014 no aquarium fish collectors were taking fish on Maui and the number of collectors state wide have decreased and so has catch.)

~ Dr. DAN A. POLHEMUS
Division of Aquatic Resources
State of Hawaii DLNR

Emily S. Munday, M.S.

For my master's research at Washington State University, I studied the West Hawaii aquarium trade from 2010-2012. Part of my study focused on holding and transport of live yellow tang in the West Hawaii aquarium trade.

My research on fish holding and transport indicated that the practices implemented by Hawaiian fish exporters do not cause mortality in yellow tang. In June of 2012, I collaborated with fishers and exporters in Kona, and caught 60 yellow tang from the reef, held them in a working export facility, and shipped them from Kona, HI to Portland, OR. The fish were then transported to the Hatfield Marine Science Center in Newport, OR where they resided for 6 months. My study shows 100% survival rate of these tangs during collection, holding in the export facility, air transport, and after a 6-month holding period. In fact, the fish have now become part of an exhibit at the Hatfield Marine Science Center about sustainability in the aquarium trade and I have received no reports of mortality after 2.5 years.

~Sincerely,
Emily S. Munday, M.S.
Washington State University

As far as aquarium related mortality in Hawaii goes here's a quote from a Cesar 2002 study "Mortality rates of aquarium fish are low and have gone down considerably since the last survey in 1984. Currently, mortality rates from collection to wholesaler are estimated at 0 to 1 percent. In the wholesaler's tanks, mortality rates range from close to 0% up to 2%. During shipment, rates range from 0.75% to 2%. This give a current total of between 1% and 5%, down from a range of 5% to 8% in the early 1980's (van Poolen and Obara, 1984; estimates of wholesalers and collectors, own study).

~ Dr. DAN A. POLHEMUS

These studies quoted are old and much better technology and care techniques now exist so we are sure it is an even lower rate today. Decreased transport times due to better roads and

more airline flights make it even easier to ship shipments with no DOA at all. Life extension techniques are used by the hobbyist at all times. Customers demand such care. Life spans of fish can be greatly increased in captivity. Many aquarium fish hobbyists tout their ability to increase fish pets life spans. Several cases have pet fish owners keeping fish alive for 15 years.

Life span of the average fish in the wild can be very short. Without enough food and the predators eating many smaller fish survivability to adult breeding state is only 2%. In 2014 a much bigger percentage survived due to increases in plankton due mainly to changes in currents. If the food is there the 1-5 million fry per adult pair spawning can result in astronomical population growth. This has resulted in biblical increases in fish populations in fall of 2014.

A few species like Angels only produce 10,000 fry per spawning which is way below the norm for most reef fish. Even those species are doing great in population numbers. Fish are very efficient breeders.

**~ Ron Tubbs B.S. N.D.
University of Hawaii**

Tina Owens executive director of the LOST FISH Coalition, Member West Hawaii Fisheries Council says:

A great deal of the “sky is falling” news you’ve heard about the reef recently is just plain not true.

Try giving credit to the thousands of volunteer hours given by your neighbors to the West Hawaii Fisheries Council to get the gains you are now free to enjoy. (done with the help of Aquarium Fishermen on the council who agreed to the laws)

Lost Fish Coalition, through the venue of the West Hawaii Fisheries Council, has been working with many stakeholders to get a reasonable settlement to the long-standing problem of the aquarium industry harvest. In almost 16 years, we have accomplished the following management actions:

- We have 55-plus miles of coastline where reef fish cannot be taken. These areas allow the fish to grow large enough to be very successful breeders. These areas — Fish Replenishment Areas — are the nurseries for the reef fish to spread out to the rest of the reefs.*

Thanks to these measures, West Hawaii has more fish than most every other widely accessed reef in the state, especially the beautiful ornamentals that give tourists and residents so much delight. If someone says that nothing has been done in West Hawaii, they are either lying, unaware or are being duped by someone else’s lies about the situation. There are a few “outsiders,” by which I mean people who don’t live here, who have decided that West Hawaii doesn’t know what it’s doing. This group, headed by Maui resident Robert Wintner, and Wintner’s frontman Rene Umberger, decided it was going to be the ones to get aquarium collecting banned, to make themselves the “rescuers of the reef.”

Clearly if the goal is to get rid of the industry and management prevents that goal being reached, then discrediting the benefits and successes of management would seem the only way left to go. And so they have taken that path.

They have held community meetings and displayed a lot of false or twisted data, quoting from papers outdated by more than 15 years, and “re-interpreting” data from scientific papers. They have been telling people that “there are no fish left,” which is patently untrue. I once had a woman tell me with great passion and assurance that there are no fish left anywhere in West Hawaii. I asked her why she thought that, and she replied that everyone knew it. I asked if she swam in the ocean. No. Did she dive? No. Did she know anything about the management

strategies in place? No. She had, however, just come from an “information session” in which she heard these things from Wintner’s frontman Rene Umberger.

Which brings me back to the wide-screen TV. The TV runs a 90-minute loop of undisturbed, natural activity of fish on the reef. Apparently, the footage was filmed on West Hawaii reefs. The article states: “Wintner praised the videos. ‘It shows what abundance looks like,’ Wintner said.”

At least he got that right.

~ Tina Owens, executive director of the LOST FISH Coalition, Member West Hawaii Fisheries Council and resident of Kailua-Kona.

Subject: [EXTERNAL] The Aquarium Trade and Reef Fish
Date: Friday, January 3, 2020 8:06:53 PM

Aloha,

I swim and paddle our reefs several times a week and the changes over the years is stunning. The Environmental Review by the Pet Industry Joint Advisory Council is not relevant, not accurate, not pono and not legal. The aquarium trade is not fishing, it's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

Save our Reef fish!

Mahalo,
Elizabeth Colwell

Subject: [EXTERNAL] Theft of our
Date: Monday, January 6, 2020 5:33:02 PM

I am outraged by the decimation of our fish. How dare you allow businesses to come here and take our sea life? This is wrong on so many levels: this is their home and it is traumatic for them to be captured & transported. And did you know that fish are sentient beings? They have emotions & have families... And a good many of them never make it to their destination having died along the way. Not to mention the damage to our tourist industry here on Maui.

AND also, coral reefs and fish have a symbiotic relationship: coral reefs supply a home to the fish...& an algae food source...and w/out the fish eating the algae there would be overgrowth, preventing coral larvae from settling down to grow up...adding to the destruction of our reefs...just one of the forces that are attacking them, including global warming & pollution.

So it would be totally irresponsible & negligent & inhumane... (not to mention greedy -someone must be making money off this insane deal), to allow this theft to happen.

Thank you, (I hope),

Subject: [EXTERNAL] This is not an environmental review
Date: Wednesday, December 11, 2019 11:57:36 PM

Dear David Sakoda, This so-called environmental review is actually a commercial appeal to convert Hawaii reef species and habitat to money, to deny Hawaii and its people of economic treasures, to support a mainland amusement industry, and to condemn reef wildlife in a vicious cycle of replacement.

PIJAC is a lobbying group for the commercial pet trade . This Environmental Review is not relevant, not accurate, and not legal.

When the Hawaii Circuit Court ruled on this issue, in favor of the DLNR Director's discretion, that director was William Aila, an aquarium collector. I see that as a conflict of interest. When the legislature passed Senate Bill 1240 to phase out the aquarium trade, DLNR Director Suzanne Case prevailed on Governor Ige to veto the bill.

The Hawaii Supreme Court ruled that no further permits should be issued until Environmental Assessment, with injunctive relief to close it down. DLNR Director Suzanne Case trumped that ruling with: permits are no longer required, for aquarium collecting. It takes only a commercial fishing license. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes nearshore habitat and

species. The vast majority of Hawaii people want the aquarium trade to end. And so do millions of visitors around the world, who travel to Hawaii to relish the reef kingdom.. Reef tourism supports many thousands more people, with revenue 400 (four hundred) times greater than the aquarium trade.

This environmental review is a farce.

Sincerely,

Deirdra Rogers

Subject: [EXTERNAL] Time to End the Aquarium Trade in Hawaii
Date: Tuesday, January 7, 2020 2:07:43 PM

Aloha

I am a resident of South Maui and a frequent visitor to the reefs in our area. I have noticed a depletion of our beautiful fish over the years, especially the yellow tangs. The difference between protected Molokini Crater and our near shore reef is stunning, as one is teeming with fish and the other is scant at best.

Please take all steps necessary to stop this harmful practice, which I understand is being subsidized by my tax dollars through the DLNR. For the sake of the reefs and our tourism, this should have been addressed years ago.

Subject: [EXTERNAL] Time-Sensitive Advisory Council Issue
Date: Tuesday, January 7, 2020 2:55:23 PM

Aloha Mr Sakoda!

I hope it's not too late for my two cents about the Pet Aquarium trade. I'm very concerned about the disappearance of many species of beautiful local fish here in Maui and in these islands. Please do whatever is necessary to prevent any further losses, including stopping further losses that would result from supplying the pet trade outside Hawai'i. The reefs are dying and they too need the fish to keep them from disappearing faster.

I heard this was the deadline for testimony including emails. Please add my voice to the others you've heard from. A moratorium or permanent ban seems like what's necessary to protect the wildlife here.

Thanks for your consideration.

Subject: [EXTERNAL] Totally opposed to the disruption disturbances by the human impact of the Hawaiian Ocean marine ecosystem by the capture of tropical fish for pet trade profit.
Date: Tuesday, January 7, 2020 11:21:05 AM

Each species removed disrupt this ecosystem that is maintained by these species. Eventually, if there is no protection it will collapse. The web of life is disrupted enough by ocean warming with coral reefs dying right now in Hawaiian waters. The vanity of aquarium fish hunters collapsed many species in Amazonian waters. This industry is fueled by ignorance, vanity. Capturing these species that are in Hawaiian waters may bring a money flow to some, there is no value in captivity except for those who profit from this. Captivity, containment, and removal from waters where these species were born and adapted to subjects fish species to stress, for the ones that survive, removes the genetic pool from the natural environment. It will leave what reefs that are left in jeopardy and cause a collapse of the natural ecosystem which is valued much more for the natural beauty, even more than the aquarium trade. When you become aware of the biology and interdependence of these species remaining intact then you will understand that profiting by removing certain species will result in a serious impact on the entire ecosystem, and perhaps the eventual extinction of these species. It is disheartening to know that you support this in your position.

Subject: [EXTERNAL] Tropical Fish collection- Oppose!
Date: Tuesday, January 7, 2020 12:55:05 AM

Aloha Mr. David Sakoda,

I am part of a third generation family owned snorkel business in Kona Hawaii that began in 1971. We have 50 employees and entertain over 80,000 customers each year. We feel privileged to be in the marine tourism industry where we share the natural beauty of Hawaii everyday. We have visited this topic of controlling aquarium fishermen's take many times before. The West Hawaii Fisheries Council worked to protect our coastline from the daily extraction of our critically important tropical fish. Prior to this aquarium fishermen were going out and bringing in igloo's full of yellow tangs, many different species of butterfly fish, moorish idols, etc. I've seen photographs of hundreds of fish lying dead near garbage cans at the harbor. These fish are part of an intrical reef system, all together making a reef that can help protect shoreline damage from storms, providing a healthy coral infrastructure and home for hundreds of marine life.

Educate people that these fish should be in the wild not in tanks. Tanks are prison for these fish, they have no space, no natural life. The high percentage of these fish that die in transit is horrendous and then the chance that they will survive in someone's home is not high either. Let's just realize we are better than this and should not decorate our homes with tropical fish in tanks. As many countries have stopped trophy hunting, people have learned not to put Zebra skins on our floors, or lion heads on walls. Hawaii needs to stop the collecting and killing of tropical fish. This is how a population evolves, little by little we learn and teach one another not to kill or be cruel to other living beings, especially when they are critical in our survival too. Fish keep the reefs healthy and coral reefs rival the Amazon in producing oxygen for the world.

We have seen a huge decline in the reefs here in Kona over the past decades and we all need to do our part to repair the damage and protect the reefs for our future generations. Please do not allow the fish collectors to make this trade their livelihood. It is time for them to find a new avenue for their living by not taking the lives of the fish and our reefs to oblivion.

Sincerely,
Mendy Dant

Aloha Mr. Sakoda:

I understand your office will be issuing permits for more fish collecting off the reefs here in Hawaii. In the early 70's, I witnessed the decline in reef fish population because of collection. I really do not see the reason why this has to continue to this day. There is so much conversation about the world's fragile reefs and the importance of them to civilization. Our glassbottom boat operation has witnessed a decline in tropical fish, over the last 20+ years. The 20 years before that, our snorkel operation saw the beginning of the decline, as a result of collecting, coral bleaching or other reasons. Permitting more destruction of the reef really does not make any sense, except for the companies that will take the resource away for their own profit. They will ship these fish elsewhere, where a huge percentage will die, even before they make it to a consumer's tank. Due to the decline, these companies only have a small window of operation and will eventually fold, as the resources disappear. What are you thinking? I wrote letters to the state in the early 70's and ended up being threatened by local collectors. The letter ended up landing in the hands of a individual who's son was a collector. This letter may simply land on deaf ears. I guess time will tell. I invite you, and your staff to join us on our tour, and see the reef now, and then come again in a year to see the change. This makes no sense. Please let me know why this is even considered. How about enforcing rules already in place. We see that enforcement is difficult as it is, and now you open up more need for enforcement. There is currently little enforcement to limits, or methods in collecting, or areas permitted. What are you thinking? Please reply.

If said permits will be allowed then you will be **REQUIRED** to also consider opening all fma-fish management areas to commercial bottom fishermen-it is an unfair practice to allow these permits and not allow bottom fishermen to do the same

In the case of a net versus a hook-there will be more collected by net-both legal and illegal-then any bottom fisherman can catch in a day by hook

In closing: you have not regulated the tropical fish industry as stringent as you have the commercial fish side-and unless regular inspectors are at the pier upon the return of these collectors-there will be irreparable damage to the reef fish and coral-if you can control the sunblock industry then this should be controlled and regulated also

Regards

Date: Monday, January 6, 2020 5:23:31 PM

Good day,

I am writing out of concern for wild fish populations there. I have received word that the Pet Industry Advisory council has submitted an environmental impact statement that states that the unlimited collection of Hawaii's reef animals will have little effect on the state's coral reef ecosystems. Of course they are going to say that because that means more fish thus more money for them. It is common sense that too much of something is never good. The ocean, like the rest of nature, has a balance and if too many fish are removed that balance will be upset and cause great harm to the coral reefs and there is an expected loss of those of 70% in the next couple of decades according to the Center of Biological Diversity. What is to stop the Pet Industry from practically depleting the amount of fish there? They do not care about the environment or fish but only about what they want. It is up to you to do what is right for Hawaii and the health of its ecosystems which includes not letting anyone have carte blanche for their own purposes. People who visit and want to see coral reefs and fish will be sorely disappointed when there are few to see.

I thank you for your time,

From: [Pamela Small](#)
To: [Sakoda, David](#)
Subject: [EXTERNAL]
Date: Tuesday, January 7, 2020 1:23:15 AM

To Mr. Sakoda:

I am writing to let you know that I am opposed to issuing any permits for aquarium collection on Hawaii Island. I am opposed for myriad reasons: the health of the reefs is foremost, the symbiotic relationship between coral and reef fish (ALL reef species) that lead to a healthy reef system, The fact that a healthy coral reef system leads to a healthy land environment, the tourism industry, the pleasure of scuba diving and snorkeling in a diverse marine environment with healthy coral and reef fish, abundant aquatic life, a pristine ocean, the list goes on and on...

You may not currently be aware, but the aquarium collectors did not stop their collecting under the current restrictions. The collectors began unlimited taking of fish from the east side of Hawaii Island and truck it to the west side where they ship it out. I have witnessed three collectors at a warehouse in Kona myself. They have no sign on their warehouse door and try not to let anyone know what they are doing. They show up with a truck full of tanks of fish and routinely get 20 foot containers of shipping materials delivered. Hawaii Island CAN NOT sustain this industry!

We are a state that relies on TOURISM. Tourists want to snorkel and scuba dive with fish. They want to see healthy coral reefs teeming with reef fish. When I tell guests at my house that Hawaii allows collections for the aquarium trade they are appalled. Utterly appalled.

It is your job to protect our oceans. Our reefs. Our aina. Our reef fish. I ask that you not give in to the demands of a few people here and on the Mainland who want to exploit our natural resource.

Mark Koppel
Hawaii Island

Mahalo

Aloha,

Granting 14 people aquarium fish collecting permits, with loose rules, realistically policed by no one, is a terrible idea. 14 more people making a (potentially full-time) career out of stripping our reefs of “aquarium fish “ is detrimental to the health of the ocean, The west side of Hawaii Island and our own existence (loss of species on the planet has a domino effect that does in fact affect human beings).

There are already many challenges that wildlife on the Westside have had to endure: resort/golf course runoff, Gated community on cliffs’ landscape run off, Bloom which is said to be caused by Energy Lab that killed off Honokahau Harbor, and it is said that the Kawaihae harbor’s bad design has stifled the circulation in the region and sickened fish.

What is frustrating is, in the past, it seems that the state has sided with aquarium fish trade collectors and floun the doors wide-open for their collecting while regulating sustenance fishing of the same fish.

Aquarium fish trade collectors have already stripped other islands of the beautiful reef fish and coming to Hawaii Island to do the same, must not be allowed.

Hawaii’s resources should not be for sale. The County of Hawai’i has declared an emergency with the state of the climate (changing). And because we are experiencing extreme rains, run off, reef bleaching events, etc., I Believe that we need to give the ocean a well-deserved break. I cannot imagine that an EIS could be done with any accuracy if it says that it is an OK thing to have harvesting of reef fish happen at this

time.

Subject: Aquarium Fishing Impacts
Date: Monday, December 2, 2019 6:40:35 PM

Aloha Mr Sakoda.

I write requesting we deny marine aquarium fishing in our state until our reefs stabilize from the effects of overfishing and a warming ocean. With more coral bleaching than in the past, we are in dire need of our reef fish to help rehabilitate our reefs and keep our coral healthy.

Taking the fish for the aquarium trade helps deplete our stocks and leaves less fish for us all to enjoy including our many visitors who enjoy snorkeling and seeing the fish we have remaining. Let's not sell our natural environment out for the gain of a few, when our reefs and the reef fish belong to us all.

Subject: Aquarium Trade in Hawaii
Date: Friday, November 29, 2019 3:51:29 PM

For the record.

My name is Keith Christie and I am a 35 year resident of Maui and have been an active underwater sports enthusiast for that entire time.

I strong oppose the Aquarium Trade in Hawaii. It devastates the reefs by removing/extracting the very lives that are required to maintain a healthy and complete ecosystem for our reefs. The reefs are dying and we need all fish present and accounted for on our reefs, **NOT IN AQUARIUMS AROUND THE WORLD FOR ENTERTAINMENT.**

These are wild animals and are part of the larger ecosystem that requires all inhabitants to maintain balance and health.

The financial situation for the handful of these aquarium collectors is irrelevant to the health of our reefs. They can get other livelihoods and be retrained. The reefs cannot afford this very harmful practice.

I have seen the affects first hand and and hear to tell you that it must stop at all costs.

Please answer me this if you have the information: How is it that the trade has continued even in the face of a Hawaii Supreme Court ruling to halt all collecting? Who has allowed this?

Thank you,
Keith Christie
Maui Resident

From: [Lanny Sinkin](#)

Subject: Comment
Date: Tuesday, December 3, 2019 6:22:12 PM

To: David Sakoda

Aloha David.

As an attorney whose primary area of practice has been environmental law, I sometimes feel like really bad ideas impacting the environment surface almost every day.

As a broad context for any environmental discussion these days, we have to start with the tsunami of climate chaos that is already appearing now with fires, floods, "rain bombs," droughts, ecosystems collapsing,

Of particular concern are the changes taking place in the ocean. The temperature of the ocean is rising, contributing to coral bleaching. That temperature increase is causing the ocean to expand in volume, contributing to ever more destructive hurricanes and storm surge. Ocean acidification is steadily increasing.

The bottom line is that the ecosystems on Earth, and particularly the ocean, are under great stress. As one of the primary causes of that stress, humans have an obligation to those alive today and to future generations to take every possible step to reduce such stress.

Which brings me to the terrible proposal to issue commercial aquarium fishing permits. Having been in the waters around Hawai'i Island for more than 25 years, I see far fewer fish today than in the past. While I know my observations are anecdotal, they are at least suggestive that something is going on.

You will receive a number of comments that will detail the cruel and wasteful nature of the aquarium industry that is happy to strip mine our local fish population for private profit. That permit application highlights (again) the issue of why people come to our islands. There are those who come out of love and extend that love to protecting the 'Aina. Then there are those who come to exploit the 'Aina. The Hawaiian ways of sustainability have been supplanted by avaricious greed that apparently cares for nothing other than short term benefits not matter how destructive their actions are in terms of long term sustainability.

I urge you to deny the permits based on the need to protect what is left of wildlife populations.

Mahalo.

Subject: Comments against the "environmental assessment" prepared by the Pet Industry Joint Advisory Council
Date: Monday, December 2, 2019 6:17:32 PM

December 2, 2019

To Whom it May Concern:

THE AQUARIUM TRADE in cahoots with Hawaii DLNR appeals for livelihood in an "environmental review." DLNR commissioned this report from the Pet Industry Joint Advisory Council (PIJAC). Did Hawaii taxpayers fund this report? Or did the aquarium trade pay for it?

PIJAC is a lobbying group for the commercial pet trade and not in the best interests of Hawaii reefs or people. PIJAC FAILS to recognize the Hawaii Environmental Protection Act (HEPA) as required in the HAWAII SUPREME COURT RULING.

PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on dire hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.

When the Hawaii Circuit Court ruled on this issue, in favor of the DLNR Director's discretion, that director was William Aila, aquarium collector.

When the Intermediate Court of Appeals ruled for the aquarium trade, DLNR Director/Nature Conservancy Director Suzanne Case said, "It's been litigated!"

THEN the Hawaii Supreme Court ruled that no further aquarium permits should be issued until Environmental Assessment, with injunctive relief to SHUT IT DOWN NOW! DLNR Director Case trumped that ruling with a new rule of her own: permits are no longer required. Aquarium collecting now takes only a commercial fishing license. Many Kona aquarium collectors never stopped collecting, with tacit support from Kona DAR and Hawaii DLNR. The vast majority of Hawaii people want the aquarium trade to end. And so do millions of visitors around the world, who hold Hawaii reefs in their hearts. Reef tourism supports many thousands more people, with revenue 400 (four hundred) times greater.

DLNR Director Case scoffed the Supreme Court ruling and met with aquarium collectors to advise on speech and behavior in the 2017 legislative season. These meetings are in the public record. When the legislature passed Senate Bill 1240 to phase out the aquarium trade, Case prevailed again on Governor Ige to veto the bill. Ige knows nothing of ocean species or habitat.

Spirit and intent in the Supreme Court ruling is clear. The PIJAC PROMO piece claims a surge in recovery, as if that should justify a new wave of reef carnage. Those claims are not based in reality. The PIJAC PROMO piece notes a catch limit on Achilles tangs of 5 per collector per day, down from 10 per day. Few people have seen 5 Achillies tangs in a single day in many years. All aquarium trade self-imposed catch limits are bogus, far beyond historical catch. This PIJAC Promo piece is not an environmental review but a commercial

appeal to convert Hawaii reef species and habitat to money, to deny Hawaii and its people—especially its host culture—of iconic, endemic and economic treasures. The PIJAC PROMO piece supports a mainland amusement industry that condemns reef wildlife to a vicious cycle of replacement. THAT is what the aquarium trade calls “sustainable.” Enough!

Date: Monday, December 2, 2019 6:07:22 PM

Of the listed alternatives, the No Action alternative is preferable to any of the others as written. However, I would support the Limited Permit Issuance alternative with the following modifications: 1) Collecting is limited to the White List species statewide, not just in the WHRFMA only; 2) The following species are removed from the White List: flame wrasse, *Cirrhilabrus jordani*; psychedelic wrasse, *Anampses chrysocephalus*; longfin anthias, *Pseudanthias hawaiiensis*; Tinker's butterflyfish, *Chaetodon tinkeri*; These endemic (near-endemic in the case of *C. tinkeri*) species do not have sufficient population data to determine a safe level of take, while anecdotal evidence indicates that collection has severely reduced populations in waters shallow enough for recreational scuba diving.; 3) Collection of harlequin shrimp, *Hymenocera picta*, is prohibited statewide. The genetically distinct Hawaiian population segment of this species is an obligate commensal of the coral *Pocillopora eydouxi*, which suffered >90% mortality in the bleaching event of 2015-2015, followed by extremely high mortality of newly recruited colonies in the 2019 bleaching event. The loss of critical habitat severely threatens the survival of harlequin shrimp in Hawaiian waters.

Thank you for considering my comments.

Subject: Comments regarding commercial aquarium fishing permits for West Hawaii
Date: Monday, November 25, 2019 2:49:52 PM

I write in firm opposition to any new aquarium fishing permits being issued for West Oahu.

1. **CLIMATE CHANGE** Our islands just saw another serious bleaching event this summer which persisted with warmer than average ocean temps through the fall and winter. This is expected to continue and worsen in the years ahead. Our reefs are struggling under unprecedented pressure right now, and for the foreseeable future, with global warming ramping up *bleaching, ocean acidification, and more frequent and intense storms*. This is not the time to be taking fish off our reefs, fish that contribute to keeping our reefs healthy.

2. **OVERTOURISM** Our reefs also suffer from overtourism, with record numbers of tourists trampling our reefs, and coating and killing our reefs with toxic sunscreens. While some bans have been enacted on wearing sunscreens with ingredients like oxybenzone that we know cause damage, most visitors arrive with their own sunscreen and have no awareness of any ban. More people in the water means more harm to our fish and corals.

3. **OCEAN PLASTIC** Recent reports revealed that even the tiniest fish are consuming masses of plastic waste, micro plastics that mimic plankton and other foods. Their health and survival are now endangered in ways we can't foresee yet. 14 commercial fishers out grabbing fish, causing stress and upsetting feeding patterns is not what our marine keiki need

right now.

4. **LACK OF ENFORCEMENT** You can set all the bag limits you want, for yellow tang or other species, Fact is the state has proven unable to enforce these limits. Aquarium fishing often happens on weekends or at night when no one is watching. I've spoken personally to commercial aquarium fishers who told me they intentionally go out at night to avoid scrutiny. Without the capacity to enforce limits a permit becomes essentially permission to raid our reefs.

5. **NOT A NEED** Aquarium fishing takes fish purely for decoration, The vast majority of these fish die in transport and./ or have their lives cut short swimming endlessly in tanks that poorly replicate their ecosystem or meet their needs. These fish are not providing sustenance to families that survive on fish for food. This is purely for fun. With all the stress our fish are under now commercial aquarium fishing seems to me the place to cut back. Researchers are learning to breed certain fish in captivity. While I'm not a fan of that either this would be preferable to raiding our reefs.

I grew up in Hawaii, live on Oahu currently, and my parents lived on the Big Island for 11 years. I spend nearly every weekend snorkeling and diving and have seen first hand the deterioration of our reefs and drop in fish species. Please **DO NOT** issue 14 new aquarium fishing permits for West Hawaii.

Thank you for the opportunity to comment.

PIJAC is a lobbying group for the commercial pet trade . PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on dire hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.

Please do not go through with this. The area is already struggling r/t the increased warm of the ocean water. Do not allow permits for commercial aqarium fishing. We enjoy snorkeling and seeing all the fish, there, in their natural environment. There are no benifits to the ecosystem in this.

Thank You,

Subject: Draft EIS Proposes 14 Commercial Aquarium Fishing Permits For West Hawaii
Date: Wednesday, December 4, 2019 3:05:20 AM

Aloha Mr. Sakoda,

I strongly oppose the granting of 14 aquarium collecting permits for West Hawaii for many reasons.

Currently Hawaii's coral reefs are under great strain. Agricultural runoff, boat traffic, heavy storms and climate change all damage the reefs and harm fish. If reefs are struggling to survive this means the fish which inhabit the reef are also under threat.

Among the threats to reef fish is the mass bleaching of their habitat, coral and in particular staghorn coral. Some estimates of bleaching in 2016-2017 are as high as 70% of corals on West Side.

Without a healthy coral reef habitat, many reef fish are already struggling to survive and don't need additional threats such as collecting.

With the loss of reefs along Kapoho coastline it's even more critical to protect the intact reefs and wild fish that remain.

The bottom line is that Hawaii has more to gain from conserving its ocean wildlife than it does from its short-term exploitation. I'm not advocating a reliance on tourist \$\$, but a large percentage of tourists want to dive/snorkel when they visit. Keeping our reefs healthy with plenty of reef fish is a draw for tourists and their revenue.

At the end of the day we must consider the greater good for our communities which comes from a healthy ocean ecosystem which sustains us in so many ways. Protecting jobs of aquarium collectors who exploit our oceans is foolish and short-sighted. Ban aquarium collecting on Hawaii island!

Aloha,

Re: Draft Environmental Impact Statement - Pet Industry Joint Advisory Council

Aloha David Sakoda,

I am a long time resident of Hawai`i Island and know first hand on the conditions of the impact of fish collection on my island. First, the seriousness of the loss of our coral on the Hawai`i coasts are listed as severe and may not recover anytime soon. The State of Hawai`i has a responsibility to protect Hawai`i's natural resources. The tropical fish of Hawai`i are declining year after year. and I have seen the decline from 1988 through 2020. Yellow tang swam along the Kailua Pier and their visual presences created the name "Gold Coast" of the Big Island.

The effects of environmental conditions have to be taken into consideration for the future of maintaining the population of our tropical fish populations. The recent Draft Environmental Impact Statement from Pet Industry Join Advisory Council is completely flawed. First, there is an impact of collection of tropical fish collecting on the population. The population of reef fish is declining due to over collecting reef fish from past years. The damage was sever to our coral from the warm waters this summer and need to recover, if its possible. Our coral reef live symbiotically with tropical fish to flourish and nurture.

The Supreme Court in 2017 held that collection without environment review violates the Act, and DLNR later ordered to cease issuing further aquarium collection permits until the environment effects of aquarium collection is fully and publicly vetted through the HEPA process. The heaviest impact to our fish collection is the lack of holding the permit holders with a limit to their taking aquarium fish.

Today, the same permit holders want to be able to take aquarium fish with no limits. This most definitely will not support what the Supreme Court ruled. There is no management of the fish collection limits.

The most startling outcome of this Draft Environment Impact Statement written by Pet Industry Joint Advisory Council is this Council has a conflict of interest in presenting a proposal for the whole benefit for the retailing of our reef fish. They support aquarium fish pet stores throughout the mainland. Their impact statement is false, their statements do not prove the actual outcome of the fish population with fish collections with no limits. There is no study that would support their statements.

In their DRAFT, there is no mention of who the 14 permit holders are and who they represent. Are these permit holders, actual residents of Hawai`i. Are we seriously trusting this Council with what they will do when the permit holders gain access to our reef fish every day of the year. Our fish population will dwindle to a server depletion, and could not recover.

I oppose any fish collections on the Island of Hawai`i, especially as the Draft indicates from Ka`u to Kohala. Our island depends on economic sustainable tourism where tour operators bring visitors to snorkel, dive and swim and view our pristine waters. We can not have fourteen permit holders taking our natural resources for their economic benefit. Its true, third world countries protect the collection of their reef fish, and Hawai`i must continue the restriction on any fish collection for years to come.

Thank you for reading my comments and recording the receipt of this letter.

Mahalo

Respectfully,

Marie Aguilar

Subject: Oppose Commercial Aquarium Permit-draft EIS

Aloha Mr. Sakoda

I am writing to oppose the draft EIS.

1. There is not enough DOCARE officers to check on infractions as is.
2. There is an unfair advantage to shoreline fishermen who fish for food sustenance. In South Kohala especially, there is a challenge to access favorite areas because of many gated communities and resort Limitations to shoreline fishing.
3. There is a disproportionate amount to catch from vessels versus from shore.
4. There is no acknowledgment of spawning seasons when collecting is prohibited. Much information about how the fish spawn, but nothing about replenishment and prohibited times to fish.

Even though the amount of Permits has been reduced, the amount of Fish and revenue seems more important than the responsibility of the State of Hawaii to protect, preserve and restore Hawai'i's natural resources. Please respond.

Aloha,

I have been out of town a couple weeks, but see in the newspaper articles suggesting you are considering lifting a ban to allow commercial collection of Yellow Tang. I am completely against this! Fourteen collectors will deplete our yellow tang population in no time. DO NOT allow collection of our Yellow Tang. Leave them where they live. They are a beautiful part of Hawaii ecosystem and we need to preserve this treasure for future generations.

EXECUTIVE SUMMARY

The Pet Industry Joint Advisory Council submitted a Draft Environmental Impact Statement (DEIS) to the State of Hawai'i Office of Environmental Quality Control on their analysis of the ecological and cultural impacts of reissuing aquarium collection permits for West Hawai'i Island. Our review focuses on the scientific integrity and validity of data and conclusions provided in the DEIS as it pertains to West Hawai'i. We address three particular subject areas in Parts (I) Hawai'i ocean climate, (II) Fish resource trends and reporting, and (III) Coral reef damage.

Part I: A new ocean climate regime in the Hawaiian Islands renders the historical fish data collected by NOAA and State of Hawai'i Division of Aquatic Resources (DAR) scientifically unpredictable of the reef ecosystem in 2020 or into the future. NOAA and DAR fish count data span only one marine heatwave in 2014-2015, and the response of the ecosystem continues to evolve and is in strong disequilibrium. Subsequent marine heatwaves such as the 2019 event will continue to repeat, negatively impacting coral, fish and invertebrate communities, and these heatwaves will be increasing in frequency to near-annual events by 2035. A pivotal issue determining the ability of Hawai'i's coral reefs to persist in the new ocean climate rests in the abundance and diversity of the herbivore fish community under repeat heatwaves. Herbivore fish are primary determinants of reef algal cover, which competes directly with slow-growing corals for space during and between marine heatwaves. Reef science demonstrates that the probability of a marine heatwave generating a shift from coral to algal dominated reef is reduced to 20% - a key target threshold for management – at an herbivore fish biomass level of 250 kg per hectare. As of 2018, 74% of shallow coral reefs of West Hawai'i are near or below this threshold, and the biomass of deeper portions of the reef are insufficiently known. Beyond marine heatwaves, West Hawai'i development has rapidly expanded over the past two decades, resulting in numerous additional stressors to the reef ecosystem. A recent study of the shallow water fishery of West Hawai'i indicated that the two main sources of resource fish decline from 2008 to 2018 are nitrogen-rich effluent and commercial fishing. West Hawai'i's reefs are not well prepared for repeated marine heatwaves from an herbivore fish standpoint.

Part II: The DEIS utilizes two different datasets to estimate fish populations along the west coast of Hawai'i Island: (i) Division of Aquatic Resources (DAR) West Hawai'i Aquarium Project (WHAP) surveys and (ii) NOAA Coral Reef Monitoring Program (CREP) surveys. The WHAP data are not spatially representative of West Hawai'i because they are not taken from randomly selected sites. The majority of the WHAP survey sites lie within geographically-limited marine managed areas and thus these surveys do not accurately represent fish populations across all of West Hawai'i. The DEIS report bases the majority of its estimations using the WHAP surveys, even while acknowledging that the CREP data would be more representative. The DEIS should present both datasets similarly to understand if the same trends in fish populations seen at the WHAP long-term monitoring sites also agree with the island-wide CREP surveys. Our analysis suggests that the WHAP and CREP data tell different stories of aquarium fish trends over time, including weakening fish population trends in CREP compared to those reported for WHAP by the DEIS. Meanwhile, another State of Hawai'i DAR report indicates major declines in fish abundance, ranging from a small relative decline in Yellow Tang (-9%) to an enormous decline in Achilles Tang

(-97%). Additionally, State of Hawai'i DAR monitoring of shallow water reefs show major declines of certain herbivore fish species from 2008 to 2018.

The DEIS uses invalid estimates of percent catch from the aquarium trade to evaluate the impacts of alternative actions. In particular, the DEIS claims that percent catch should be based on island-wide population estimates for each species by citing evidence for habitat connectivity between protected and open fishing areas around all of Hawai'i Island. This is incorrect, and past studies using drifters, larval sampling, genetic analysis, and oceanographic modeling indicate high local retention of larvae, and juvenile and adult fish populations, in West Hawai'i. As a result of this major error in the DEIS, the reported percent catch is erroneously low. It should be based on relevant West Hawaii Regional Fishery Management Area sub-populations considering the realistic home ranges of each species, not on island-wide populations.

Part III: The DEIS makes several broad and unsubstantiated claims that aquarium collection does not negatively impact the reef ecosystem. A key question is whether or not aquarium fish collectors make physical contact with the reef via their equipment and their bodily movement. Reports from the public and the conservation community, combined with our own *in-situ* observations, broadly point to common and persistent issues of aquarium collector contact with the reef. The DEIS makes no recommendation to provide third-party oversight of collector activities, and goes as far as to suggest that there is no impact from collection on corals or reef structure. Physical, biological, and chemical damage needs to be documented and prevented. Prevention is the only scientifically sound pathway, either by strong *in-situ* oversight of the industry or via banning of collections.

INTRODUCTION

On November 12, 2019, the Pet Industry Joint Advisory Council submitted a Draft Environmental Impact Statement (DEIS) to the State of Hawai'i Office of Environmental Quality Control on their analysis of the ecological and cultural impacts of reissuing aquarium (AQ) collection permits for West Hawai'i Island. Our review focuses on the scientific integrity and validity of data and conclusions provided in the DEIS as it pertains to West Hawai'i, defined as the area spanning the west or leeward side Districts of N. and S. Kohala, N. and S. Kona, and Ka'u. We do not address cultural issues in our review of the DEIS.

Our investigation of the DEIS content required the focus and expertise of a panel of marine ecologists and biologists with a collective experience on West Hawai'i reef ecosystems of more than 50 person-years. Our review presented here is limited to three particular subject areas, two of which are directly addressed in the DEIS, and one that was not addressed in the document. These subject areas are organized into Parts (I) Hawai'i ocean climate, (II) Fish resource trends and reporting, and (III) Coral reef damage.

PART I: HAWAI'I OCEAN CLIMATE IN 2020 AND BEYOND

Like many regions of the world, the Hawaiian Islands have entered a new ocean climate regime that is less favorable to coral reefs as a whole. As a result, building resilient coral reefs must be a focal point for resource management to give reefs the best chance for persistence. One of the major limitations of the DEIS rests in its narrow analysis of the West Hawai'i coral reef ecosystem. Spanning a distance of about 180 km of coastline, the reef is extremely heterogeneous in terms of benthic substrate, coral cover, habitat condition, fish abundances, and accessibility by fishers. These issues alone raise serious concerns about the critically important limitations of an environmental impact study based solely on fish counts.

Adding the new ocean climate regime to the natural complexity of the West Hawai'i reef, historical fish data alone are not predictive of the reef ecosystem in 2020 or into the future, whether exposed to aquarium collection or not. Hawaiian reef ecosystems are part of the new ocean climate system that continues to rapidly expand in the Pacific and worldwide. In 2014 and 2015, the Main Hawaiian Islands underwent their first major system-wide ocean climate event, called a marine heatwave, that caused increased water temperatures resulting in large-scale coral bleaching and impacts on fish and invertebrate populations (Bahr et al. 2017; Couch et al. 2017). About half of the corals that bleached in 2015 ultimately died and became algal covered (Kramer et al. 2016). The 2019 marine heatwave again engulfed the Hawaiian Islands, causing up to 50% coral bleaching in some areas, and an average of 10% mortality in West Hawai'i (ASU GDCS 2019). Marine heatwaves are the new norm, and will be increasing in intensity and/or frequency in the years to come (Frolicher et al. 2018), putting enormous additional stress on coral reefs of Hawai'i.

Ocean temperature in West Hawai'i is projected to increase as a result of climate change. By the middle of the century, average monthly sea surface temperature will be $\sim 1^{\circ}\text{C}$ (1.8°F) warmer than present-day, and for about 6 months of the year will be warmer than the present-day summertime maximum (27°C ; 80.6°F). This increase in ocean temperature is projected to influence the frequency and severity of coral bleaching. For example, severe bleaching is projected to occur on an annual basis in West Hawai'i beginning as early as 2035 (van Hooijdonk et al. 2016).

A pivotal issue determining the ability of Hawai'i's coral reefs to persist in the new ocean climate rests in the abundance and diversity of the herbivore fish community. Herbivore fish are primary determinants of reef algal cover, which competes directly with slow-growing corals for space. Regular marine heatwaves not only cause coral bleaching and mortality, they also promote algal growth that colonizes dead coral and responds well to increased water temperature (Jessen et al., 2013; Graham et al., 2015). Herbivore fish biomass and diversity have become important combaters of algal growth during and between marine heatwave events.

In a scientifically-acclaimed global analysis and synthesis, Graham et al. (2015) found that the probability of a reef switching from a coral-dominated to an algal-dominated system was more than 50% when herbivore fish biomass dropped below 100 kg per hectare. Importantly, the probability of a regime shift from coral to algal domination decreased to 20% - a key target threshold for management - at an herbivore fish biomass level of 250 kg per hectare (**Figure 1**).

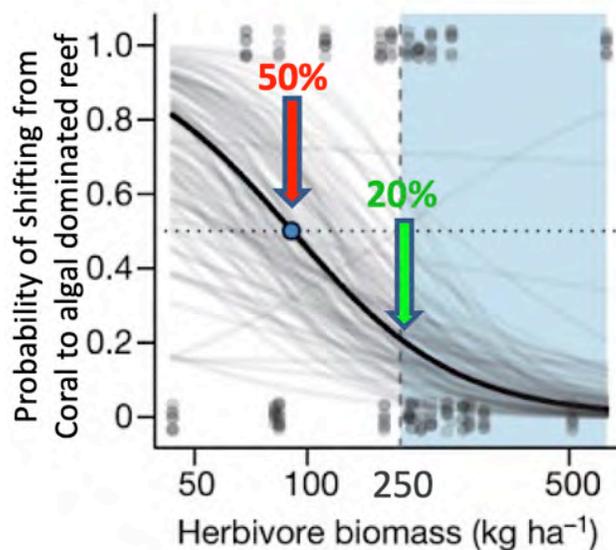

Figure 1. Effects of herbivore fish biomass on the probability of a reef switching from coral to algal dominated during and immediately after a marine heatwave (Graham et al. 2015).

Based on the State of Hawai'i Division of Aquatic Resources shallow water fish survey data, current herbivore biomass levels vary enormously along the coast of West Hawai'i (**Figure 2**). Among 72 sites included in this 2018 survey, 21% are near or below the super-critical 100 kg per hectare threshold for a 50:50 chance of coral-to-algal domination caused by a marine heatwave.

Approximately 64% of sites are currently near or below the critical 250 kg per hectare threshold for a 20% chance of coral-to-algal change from a marine heatwave. Only 19 of 72 sites (26%) are well above this guiding 250 kg per hectare minimum for good herbivore fish management. Numerous countries and jurisdictions are using the 250 kg threshold as the target for increasing reef resilience in the new ocean climate. However, West Hawai'i's reefs are not currently in such a state and are not well prepared for repeated marine heatwaves from an herbivore fish standpoint.

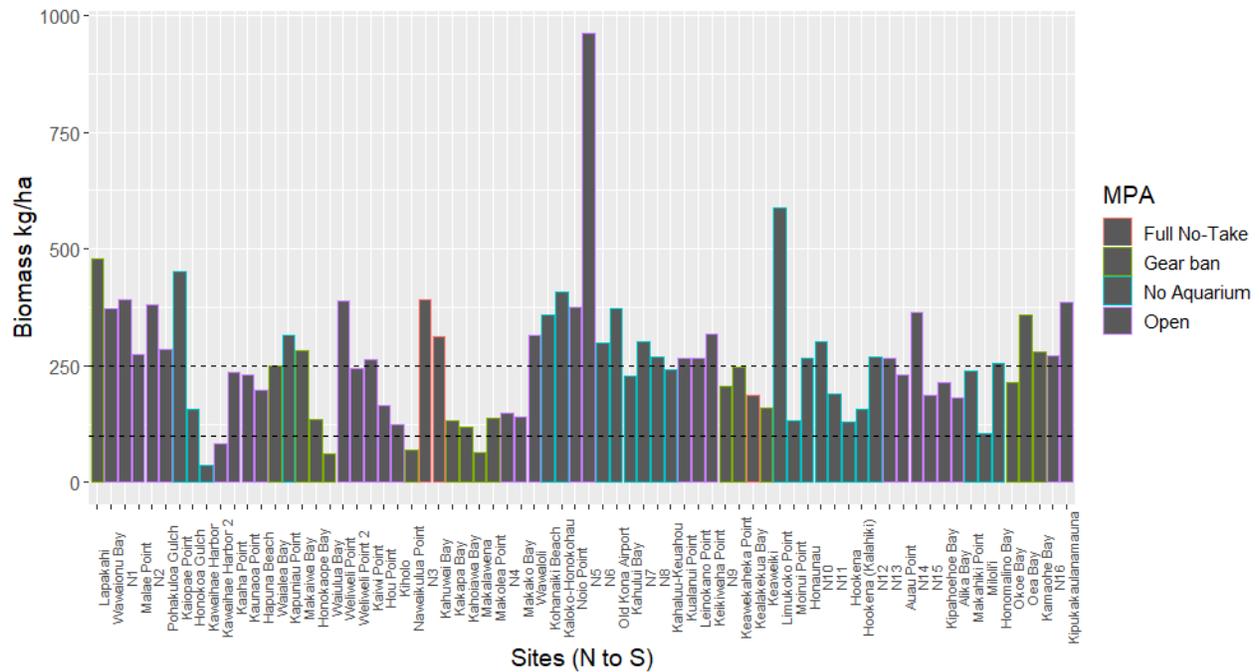

Figure 2. Herbivore biomass in kg per hectare across 72 sites surveyed in 2018 in West Hawai'i. The dashed lines indicate the 100 and 250 kg per hectare levels, the 50% and 20% probability thresholds that Graham et al. 2015 identified. The protection status of each site is indicated in the legend.

Beyond marine heatwaves, development in West Hawai'i has rapidly expanded over the past two decades, resulting in numerous additional stressors to the reef ecosystem (Gove et al. 2019). These include nitrogen-rich effluent from both commercial and non-commercial wastewater discharge and over-fishing. In 2017, West Hawai'i released a total of 680 million gallons of effluent per year and a total of 400,000 pounds of nitrogen per year (Gove et al. 2019). A recent study of the shallow water fishery indicated that the two main sources of resource fish decline from 2008 to 2018 (including four species on the aquarium White List) are nitrogen-rich effluent from onshore disposal sites and commercial fishing. Importantly, non-commercial fishing was not correlated with observed long-term declines in fish biomass in shallow water habitats (Foo et al. in review; *available upon request*). Only commercial fishing was statistically linked to herbivore fish declines.

In accounting for the new ocean climate regime with an increasing number of regional stressors, it has become clear that a new approach to the management of coral reefs in West Hawai'i, including the interactive role of herbivore fish and corals, is paramount to their near- and long-term survival. Whether the aquarium industry can guarantee that herbivore fish biomass levels remain above the critical 250 kg per hectare threshold is highly unlikely, but such levels of management will be needed moving forward to ensure that West Hawai'i reefs remain intact and biologically productive.

PART II: FISH RESOURCE TRENDS AND REPORTING

Assessment based on inadequate data coverage of West Hawai'i

The DEIS utilizes two different datasets to estimate fish populations along the west coast of Hawai'i Island: (i) Division of Aquatic Resources (DAR) West Hawai'i Aquarium Project (WHAP) surveys and (ii) NOAA Coral Reef Monitoring Program (CREP) surveys, which we will refer to as WHAP and CREP to distinguish between the two survey types.

The WHAP surveys represent the same 25 study sites surveyed annually from 1999 to 2018. These WHAP sites were originally established to monitor different protection levels – Marine Protected Area (MPA), Fish Replenishment Area (FRA), and Open or unprotected – in order to determine the effectiveness of protected areas on aquarium fish species. The WHAP data are not spatially representative of West Hawai'i because they are not taken from randomly selected sites. In fact, the majority of the survey sites lie within marine managed areas and thus WHAP surveys likely do not accurately represent fish populations across all of West Hawai'i, especially since FRAs and MPAs have very limited coverage (**Figure 3**, which is Figure 4 in the DEIS, page 79). The CREP data, on the other hand, represent randomly distributed fish surveys of Hawai'i Island, with 257 survey locations measured between 2010 and 2016. To ensure better representation of fish populations across West Hawai'i, both datasets should be considered equally. A strength of the WHAP surveys is that, because they are permanently monitored sites, the data can be used to track changes over time, but the fact that the data from these sites are not representative of West Hawai'i is not discussed in the DEIS. A comparison of the WHAP and CREP data is essential to document the ecological status of fish populations of West Hawai'i and needs to be included in the DEIS.

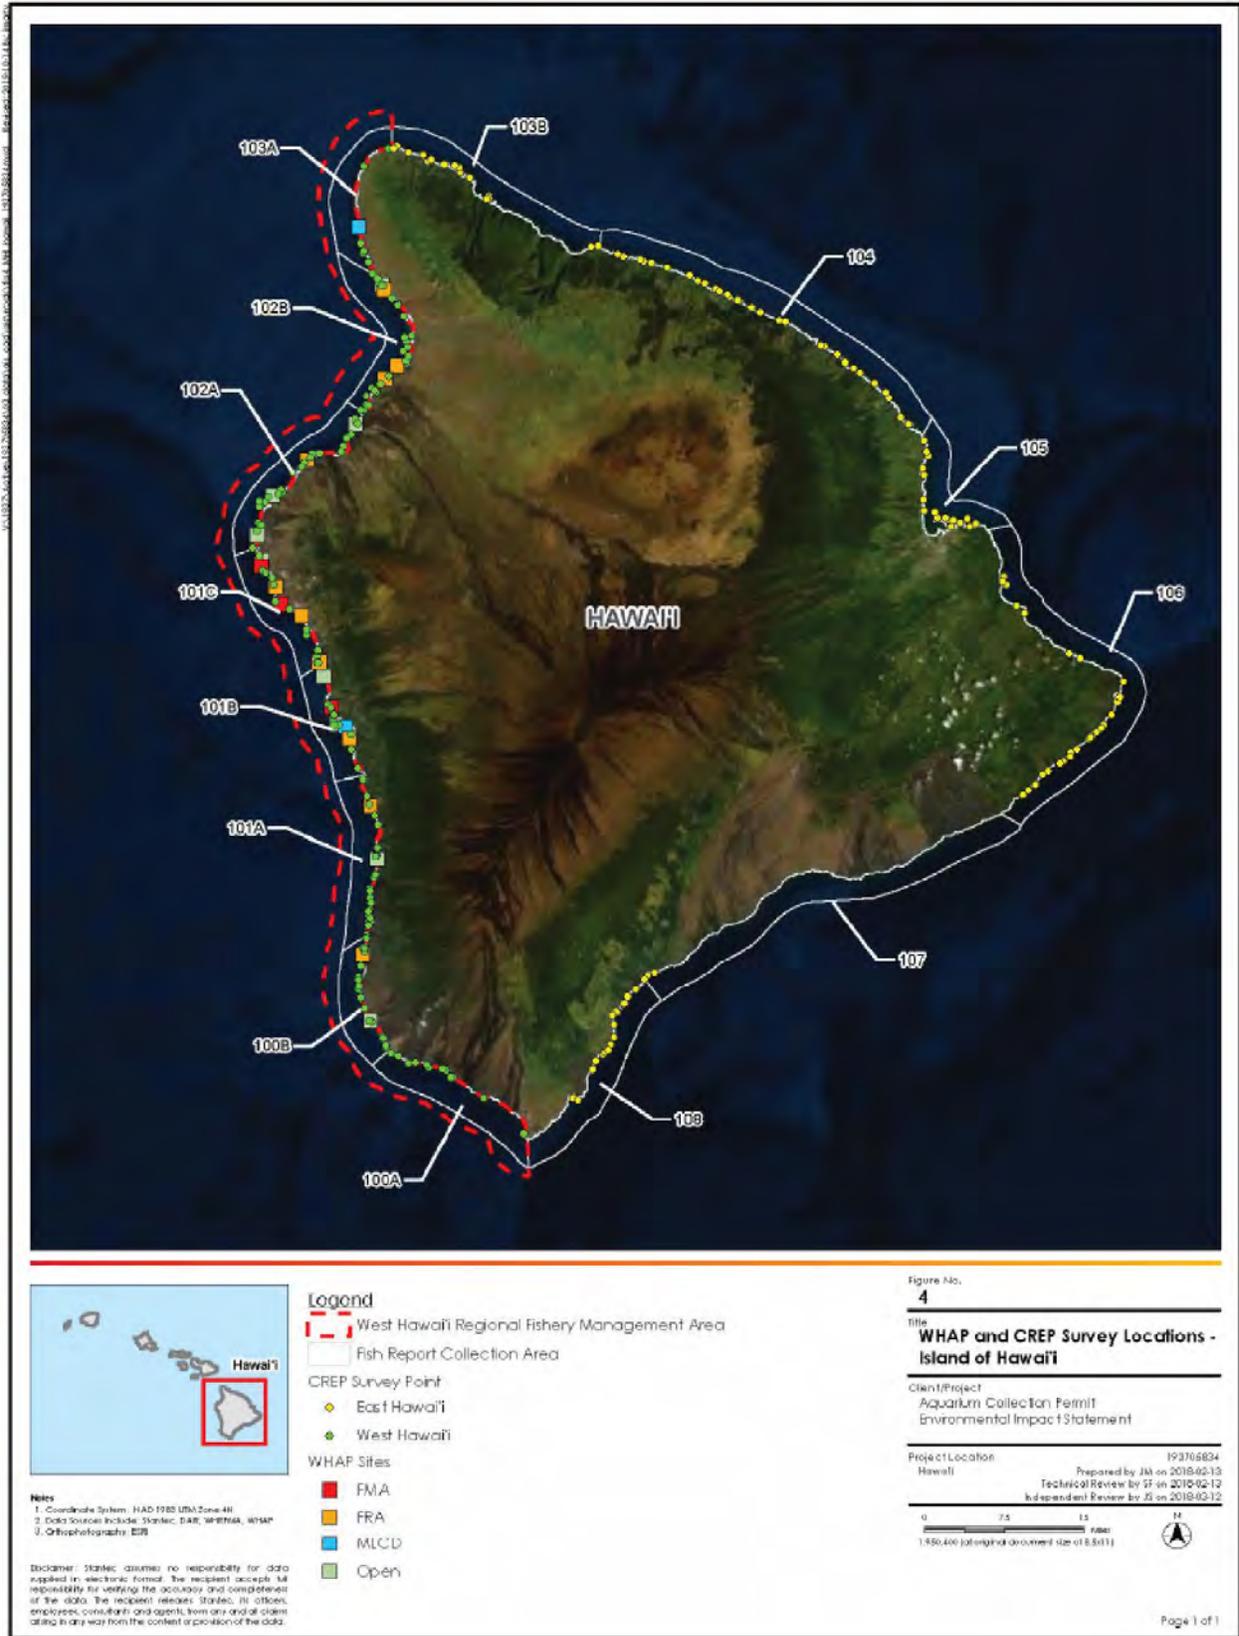

Figure 3. WHAP and CREP survey locations – Island of Hawai‘i. This is Figure 4 in the DEIS.

The DEIS report bases the majority of its estimations using the WHAP surveys, even while acknowledging in the executive summary of the report that the CREP data are more representative: “Both data sets are presented and analyzed in this DEIS. However, due to the larger spatial coverage and greater range of depths surveyed by CREP, these data are a better estimator of island-wide fish population size, and therefore serve as the primary basis for the impact analysis in this DEIS.” Herein lies the first problem with the data cited in the DEIS: The authors acknowledge the shortcomings of the WHAP surveys yet base the estimations and justifications for aquarium fishing limits mainly on the WHAP surveys.

The DEIS presents the trends in fish biomass for the WHAP permanent monitoring sites, summarized as percentage increases and decreases in fish biomass between the start and end of the monitoring time (**Table 1**, which is Table 5-4 in the DEIS, page 99). On the other hand, the DEIS only reports 2016 CREP surveys for each aquarium fish species, although surveys from 2010 to 2018 do exist and were available to the DEIS authors. The DEIS should present both datasets similarly to understand if the same trends in fish populations seen at the WHAP long-term monitoring sites also agree with the island-wide CREP surveys.

Presented here in **Figure 4** and **Table 2**, we have calculated the average number of aquarium species counted across surveys for each year of CREP data to facilitate the comparison with the WHAP data that was left out of the DEIS. Comparing **Table 1** (Table 5-4 from the DEIS), and **Table 2** provided here, CREP data show moderate overall changes in fish abundance, as well as important decreases in species abundances, which directly contradicts results from the WHAP data alone, which show mostly large fish abundance increases in protected areas. The DEIS had equal access to the CREP data yet decided not to provide these summaries. It appears that the DEIS data have been targeted to show only large increases in fish biomass.

Note also from **Figure 4** that there exists enormous variation in annual patterns of fish abundance. It would be more appropriate for the DEIS to consider annual trends rather than differences between the start and end of surveys, to assess whether long-term increases or decreases in fish populations occur or not.

Table 1. Change in the density of the top 10 collected species in the WHRFMA based on WHAP data. ‘Before’ = Mean of 1999-2000; ‘After’ = Mean 2017-2018. Young-of-year (YOY) not included. Bold = statistically significant t-test (DAR 2019a). Table 5-4 in the DEIS.

Brown Surgeonfish	29.9	50.4	+68.6

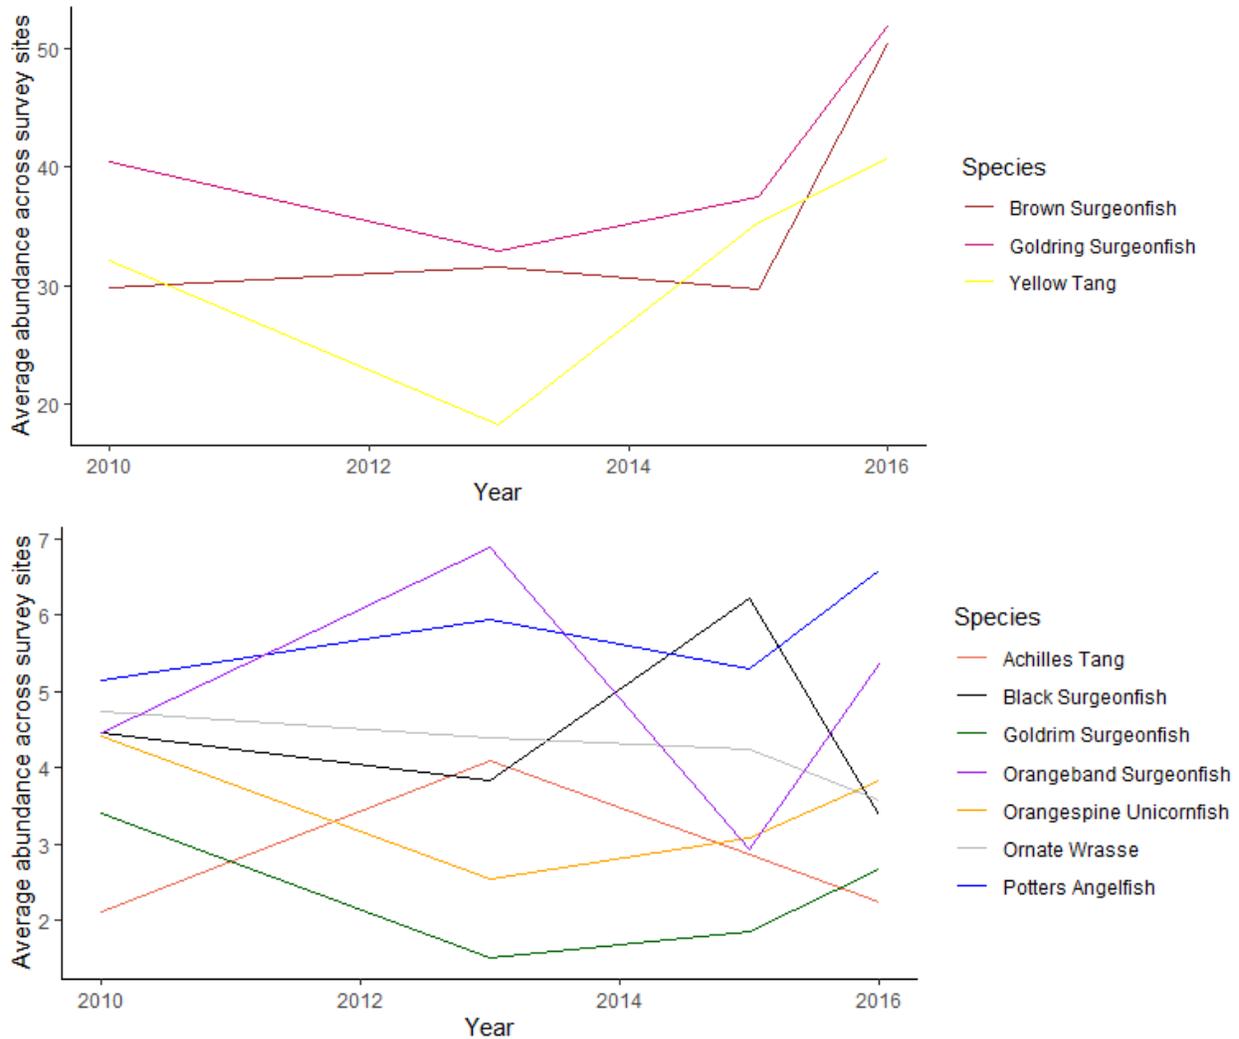

Figure 4. Summary plots of the average abundance across survey sites per year in the CREP surveys. The species are separated to facilitate interpretation as the top panel displays species with a much greater abundance.

There is also a multitude of reports of West Hawai'i fish biomass provided by the Division of Aquatic Resources, available online at <https://dlnr.Hawaii.gov/dar/reports/>. For example, one report by Walsh et al. (2018) presents the continued, long-term decline of coral reef biota and associated fauna at key sites in West Hawai'i. This report notes major declines in fish abundance between the two survey periods, ranging from a slight relative decline in Yellow Tang (-9%) to an

enormous decline in Achilles Tang (-97%); Both are two key aquarium fish species. The report also includes information on aquarium fish abundance. **Table 3** below (Table 6 in Walsh et al. 2018) shows major declines for most aquarium fish species.

Table 3. Abundance (#/100m²) of the top ten most abundant aquarium fish species at Puako and Pauoa. Collection rankings were based on FY 2009 aquarium data. The standard error for 2007-2008 surveys is included in Appendices 3 and 5. Δ is the numerical change in density and Δ (%) is the percent change between the two study periods. Species whose abundances have increased at one or both sites are shown in bold. Table 6 from Walsh et al. (2018).

Species	Puakō				Pauoa			
	1979-81	2007-08	Δ	% (Δ)	1979-81	2007-08	Δ	Δ (%)
<i>Zebrasoma flavescens</i>	9.89	9.01	-0.88	-8.9%	5.86	6.73	+0.87	+14.8%
<i>Ctenochaetus strigosus</i>	21.00	8.14	-12.86	-61.2%	29.04	8.53	-20.51	-70.6%
<i>Naso lituratus</i>	2.54	0.43	-2.11	-83.1%	0.91	0.29	-0.62	-68.1%

<i>Forcipiger flavissimus</i>	1.45	0.44	-1.01	-69.7%	1.24	0.21	-1.03	-83.1%
<i>Acanthurus nigrofuscus</i>	21.13	4.23	-16.9	-80.0%	31.68	5.63	-25.93	-82.2%
<i>Chaetodon multicinctus</i>	3.56	0.49	-3.07	-86.2%	4.22	0.46	-3.76	-89.1%
<i>Zanclus cornutus</i>	0.52	0.04	-0.48	-92.3%	0.52	0.05	-0.47	-90.4%
<i>Ctenochaetus hawaiiensis</i>	0.03	0.04	+0.01	+33.3%	0.00	0.03	+0.03	na
<i>Centropyge potteri</i>	2.68	0.18	-2.50	-93.3%	2.33	0.04	-2.29	-98.3%

Here, the top ten most collected aquarium fishes declined at both sites, except for Yellow Tang, and that aquarium fishing likely contributed to these declines. It is also stated that additional aquarium fish species are not included because of extremely low abundance and the inability to make any meaningful conclusions on changes in abundance over time.

Shallow water resource fish surveys from 2008 to 2018 conducted by DAR include four aquarium species. These data show very different trends in aquarium species population dynamics, all with much less biomass in 2018 in comparison to 2008 (**Figure 5**). As also seen in **Figure 4**, annual trends differ greatly, and whether a population is increasing or decreasing depends on which years are being compared. As discussed earlier, we advocate for the inclusion of annual trends in the DEIS to determine truly whether a species is increasing or decreasing over time.

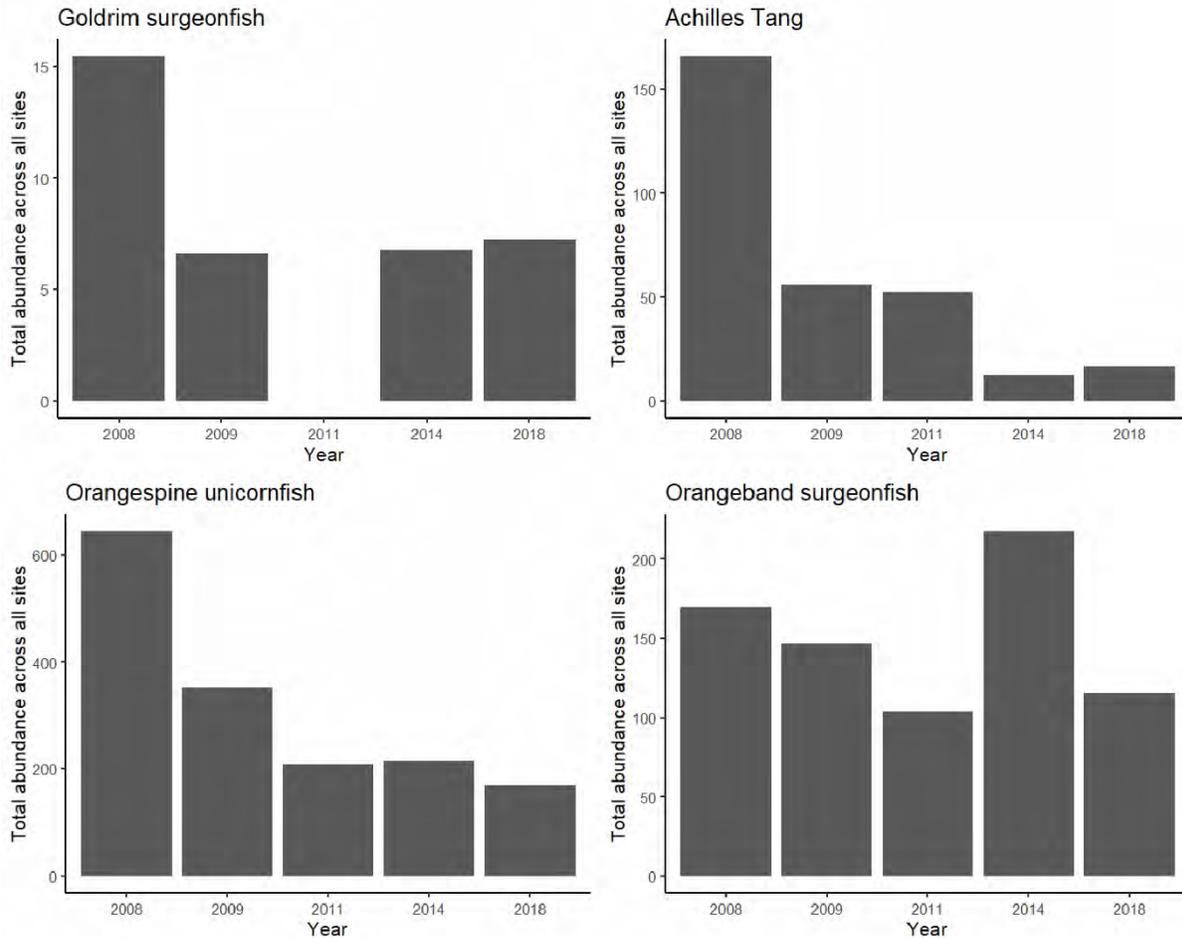

Figure 5. Fish biomass for four aquarium species surveyed between 2008 and 2018 in the shallow water resource fish surveys conducted by DAR.

Changes in aquarium fish populations differ between survey types, locality, and by which years are compared. We have presented two other datasets that show contrasting patterns to those presented in the DEIS. The DEIS should provide summaries of population dynamics for both CREP and WHAP data, as well as an analysis to assess whether individual species agree in the annual population trends observed across both datasets. It is crucially important to assess whether the WHAP long-term surveys at the 25 permanent monitoring sites show the same population patterns as those reported in CREP surveys. This will be key to determining whether the effects of an aquarium ban have only been effective locally, or across all of west Hawai'i.

If aquarium fish species show both a clear increase in abundance through WHAP's different management systems and also increases in abundance in the CREP surveys, an alternative to the proposed aquarium fishing plan could be a greatly reduced White List with strict limits on catch of certain fish species. If no data or not enough data exist, a species should not be included in the white list.

Fish populations are extremely variable in time and space depending on reef rugosity, depth, temperature, currents as well as population dynamics such as season, mortality and recruitment. Consideration of the full body of scientific literature available for West Hawai'i and then a systematic analysis is needed, instead of basing catch limits on 25 sites across the west coast. Cherry-picking scientific findings to support aquarium fishing will, in the end, lead to poor outcomes for the most extensive reef system in Hawai'i.

Assumption of connectivity of fish populations across West Hawai'i

The DEIS uses invalid estimates of percent catch from the aquarium trade to evaluate the impacts of alternative actions. In particular, the DEIS claims that percent catch (**Table 4**, which is Table 5-11 from the DEIS) should be based on island-wide population estimates for each species because “There is evidence for connectivity between FRAs and Open Areas around the island of Hawai'i (Christie et al. 2010).” This is incorrect: while neighboring FRAs and Open Areas may display high connectivity, the entire island of Hawai'i does not, and limited connectivity exists between East and West Hawai'i. The DEIS misinterprets Christie et al. (2010), which demonstrates connectivity across South/West Hawai'i. Past studies using drifters, larval sampling, genetic analysis, and oceanographic modeling indicate high local retention of larvae in West Hawai'i (Christie et al. 2010; Lobel 2011; Vaz et al. 2013). Critically, and as a result of this major error in the DEIS, the report's percent catch is erroneously low. It should be based on relevant West Hawaii Regional Fishery Management Area sub-populations considering the realistic home ranges of each species, not on island-wide populations.

Table 4. Summary of CREP (2018) population estimates, disclosed catch data from East and West Hawai'i since 2000 (DAR 2018a), and the impact of average and maximum annual collection by species for the 40 White List Species. n.d. = Not Disclosed (Section 5.1); NA = Insufficient data available. Table 5-11 from the DEIS.

Common Name	Island of Hawai'i Pop. Mean (lower-upper estimate limit) (CREP 2018)	East Hawai'i (DAR 2018a) (numbers from 14 fishers in parenthesis; DAR 2019b)				WHRFMA (DAR 2018a) (numbers from 14 fishers in parenthesis; DAR 2019b)				Island of Hawai'i (DAR 2018a) (numbers from 14 fishers in parenthesis; DAR 2019b)			
		Average Catch per year	Maximum Catch per Year	Average Percent of Hawai'i Pop.	Max Percent of Hawai'i Pop.	Average Catch per year	Maximum Catch per Year ¹	Average Percent of Hawai'i Pop. Achilles Tang ³	231,377 (113,989-348,765)	703 (337)	1,525 (1,746)	0.30% (0.15%)	0.66% (0.75%)	5,600 (4,058)	5,757 (5,027)	2.42% (1.75%)	2.49% (2.17%)	6,303 (4,395)	7,282 (6,773)	2.72% (1.90%)	3.15% (2.93%)
Bird Wrasse	877,224 (686,135-1,068,313)	n.d. (1)	n.d. (6)	NA (<0.01%)	NA (<0.01%)	345 (146)	624 (224)	0.04% (0.02%)	0.07% (0.03%)	345 (147)	969 (230)	0.04% (0.02%)	0.11% (0.03%)
Black Durgon	1,354,454 (991,054-1,717,854)	n.d. (0)	n.d. (1)	NA (0.00%)	NA (<0.01%)	64 (25)	143 (86)	<0.01% (<0.01%)	0.01% (<0.01%)	64 (25)	207 (87)	<0.01% (<0.01%)	0.02% (0.01%)
Black Surgeonfish	549,462 (355,535-743-388)	n.d. (33)	n.d. (181)	NA (0.01%)	NA (0.03%)	3,535 (2,334)	8,598 (4,711)	0.64% (0.42%)	1.56% (0.86%)	3,535 (2,367)	12,133 (4,892)	0.64% (0.43%)	2.21% (0.89%)
Blacklip Butterflyfish	131,260 (53,712-208,807)	n.d. (0)	n.d. (4)	NA (0.00%)	NA (<0.01%)	72 (33)	129 (88)	0.05% (0.03%)	0.10% (0.07%)	72 (33)	201 (92)	0.05% (0.03%)	0.15% (0.07%)

The DEIS also fails to consider that connectivity between FRAs and Open Areas is not absolute. Some areas are more connected than others based on the strength and direction of ocean hydrodynamics (Vaz et al. 2013). Additionally, the DEIS does not mention where fishing will be allowed—if fishing occurs in “upstream” areas that are sources of fish larvae for downstream reefs, this can heavily deplete downstream fish stocks across large areas (Crowder et al. 2000). Lastly, referring back to **Figure 2**, we can see great variability across the different MPA types and across all of West Hawai‘i. The DEIS assumption that fish connectivity is high is flawed.

To evaluate the *Preferred Alternative*, the DEIS compares its aforementioned, invalid percent catch estimates to a study by Ochavillo and Hodgson (2006) that itemized Total Allowable Catch for reef fish species in the Philippines—species that do not correspond to Hawai‘i’s target aquarium species. However, Total Allowable Catch must always be based on the unique growth and mortality rates and reproductive traits of target species, in this case, for those in West Hawai‘i, not on non-target species in a distant region. It is an irresponsible false equivalency to base wide-reaching policy decisions on “rules of thumb” for non-target species. In sum, a complete evaluation of the life histories and sustainable catch limits of West Hawai‘i’s target species should underlie this DEIS, weighed against percent catch of relevant, connected populations.

Data analysis is incomplete and insufficient to support DEIS recommendation

In addition to the lack of and bias-selected data cited in the DEIS, the only statistical analysis presented are simple t-tests. The DEIS makes major claims and states multiple times that commercial aquarium fishing is not driving a decline in fish biomass or coral cover. However, the DEIS fails to back up these claims with statistically valid analyses. The DEIS fails to account for confounding variables, biases, tests of the strength and direction of relationships – critical factors that are not captured by bar and line graphs. For example, a generalized linear mixed model considering the abundance of specific aquarium fish species, and the collection of aquarium fish (with year and site as random factors), would show more conclusively whether aquarium fishing impacts fish abundance.

The DEIS biases its selection and use of data to very specific indicators of fish biomass, particularly from Gove et al. (2019) – a comprehensive report on West Hawai‘i. Specifically, the DEIS states from this report that herbivore biomass increased more in open areas than in FRAs (page 116, 139, 140 of DEIS). However, this was not a significant finding (J. Gove, NOAA, Pers. Comm., Gove et al. 2019) and is one of the instances that the DEIS vacillates between using statistical significance to support their messaging in some cases and then dismisses statistical significance in other instances.

Most importantly, if we examine the fish indicators from Gove et al. (2019), specifically Total Fish Abundance, Total Fish Biomass, Mean Adult Fish Length, and Juvenile Yellow Tang, each indicator had significant increases that were greater in FRAs compared to Open Areas from 2003 – 2017. This directly contradicts what was stated in the DEIS to support their statement that aquarium fishing does not impact fish abundance. These data that were specifically ignored from Gove et

al. (2019) strongly contradict the argument that aquarium fish collection had no impact on the fish community.

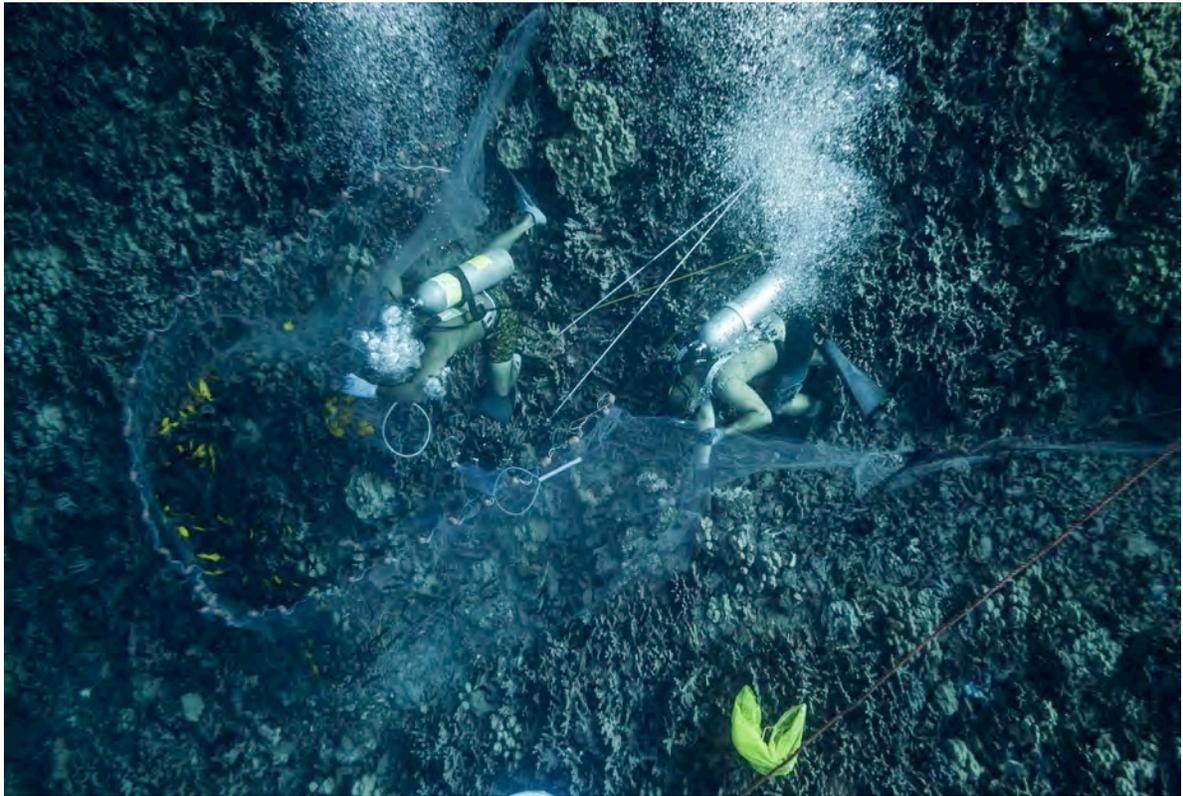

A failure to utilize other highly-available datasets for Hawai'i will result in inaccurate estimates of fish populations upon which the DEIS bases its claims. Misrepresentation and selective use of science is dangerous and has the potential to harm Hawaiian ecosystems. These very basic tenets of scientific analysis have not been considered properly in the DEIS.

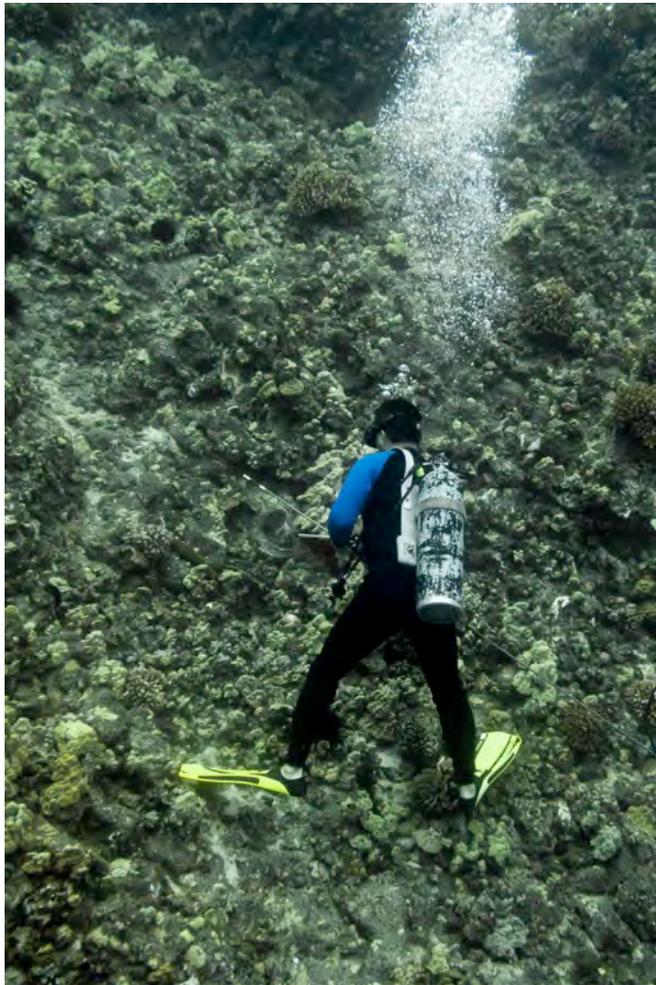

III. CORAL REEF DAMAGE

The DEIS makes several broad and unsubstantiated claims that aquarium collection does not negatively impact the reef ecosystem. However, a large body of scientific study indicates that making contact with the reef, especially its corals, generates major negative impacts on all aspects of reef condition (Rubec et al. 2001; Barclay and Berkes, 2017; Nichols et al. 2018; Gove et al. 2019). The question then becomes whether or not aquarium fish collectors make physical contact with the reef via their equipment and their bodily movement.

Reports from the public and the conservation community broadly point to common and persistent issues of aquarium collector contact with the reef. Our scientific observations of areas frequented by collectors also indicate areas of increased smashed coral, "troughing" for mesh fencing, staking, and finning. Hard data are challenging to generate since the aquarium industry maintains a semi-clandestine culture and does not offer opportunities for third-party oversight. Nonetheless, numerous photos have been taken of aquarium collector methods in West Hawai'i, which reveal divers making direct contact with live corals. The photos below provide a few examples taken from West Hawai'i embayments.

The DEIS makes no recommendations regarding third-party oversight of collector activities, and goes as far as to suggest that there is no impact from collection on corals or reef structure. Physical, biological, and chemical damage needs to be documented and prevented. Mitigation of reef damage after it occurs has proven to be both financially prohibitive or ecologically unviable (Jokiel and Naughton 2001). Prevention is the only scientifically and financially sound pathway, either by strong *in-situ* oversight of the industry or via banning of collections.

Issuance of Commercial Aquarium Fishing Permits for the Island of Hawaii.

David Sakoda.....Division of Land and Natural Resources

david.sakoda@hawaii.gov

Mission Statement: Enhance, protect, conserve and manage Hawaii's unique and LIMITED natural resources held in PUBLIC TRUST for current and future generations of the people of Hawaii Nei and its visitors in partnership with others from public and private partnerships.

This Mission Statement of the Division of Land and Natural Resources is in its essence from Hawai'i Constitution Article XI section 1. To promote the development and utilization of these resources in a manner consistent with their conservation and in furtherance of self-sufficiency of the State. Furthermore "All public natural resources are held in Trust by the State for the benefit of the people".

All this being said, when one considers what is happening climatically on our planet; our coral reefs are bleaching, there is sea level rise in evidence around our State (Hauula), unheard of rainfall events and to round it out, over 200 record High temperatures were broken around the State is past 2019 year. "Australia today is ground zero for the climate catastrophe. It's glorious Great Barrier Reef is dying, its world-heritage rainforests are burning, its giant kelp forests have largely

vanished, numerous towns have run out of water or about to, and now the vast continent is burning on a scale never before seen.” (The New York Times) It is no longer disputed within the scientific community that our current situation concerning the climate is Homo sapiens (man) induced (caused).

Our Hawaiian Reefs and its Species have evolved and developed over millennia in time. Do people think there were too many fish on the Hawaiian reefs before Kanaka first arrived? The first Kanaka had a good working knowledge of their nearshore reefs and species therein; through a system of Kapus and understanding of the species were able to maintain a very healthy reef and fishery. (in furtherance of self-sufficiency of the State) Our State has no fishing license requirement and no ocean/reef education program even though we are surrounded by reef and ocean. This however is on the people of Hawaii for accepting this situation. This then brings us to the handing out of 14 special permits for the collection of reef fish from west Hawaii waters. How does letting 14 special entities extract natural resources benefit the reefs first and the public trust? There are no Ecosystem Services Fees in place, Climate change is a real threat and our reefs may need all their components and species in tack to with stand the onslaught of climate change. Our State Dept. of Conservation and Resource Enforcement has but three people on duty at any one time on Hawaii

Island and they struggle to deal with that. So let us saddle them with monitoring and enforcement in reef collecting of 14 different permits. So it will turn to self-regulation and enforcement by the Aquarium industry itself and that is tantamount to the proverbial Fox guarding the Hen House. Public Trust will be broken. There will be no benefit or reward to the people of Hawaii or to the Natural Resource. (Hawaii Constitution Article XI section 1.)

We should not grant these permits. We do not have the capability of enforcing or monitoring. We should not grant these permits. We have no idea of what climate change will visit upon us way out here in the Pacific Ocean and what we may need to survive; We the people and our Natural Resources. [P]romote the development and utilization of these resources in a manner consistent with their CONSERVATION and in furtherance of SELF-SUFFICIENCY of the State. Hawaii Constitution Article XI, section 1; I in the strongest terms urge you to deny this Application for Commercial Aquarium Fishing Permit on Hawaii Island. I further encourage you to rescind all previously issued permits within the entire State at this time. Please look down the road to where we are heading and remember we are the most isolated place on the planet. We must look out for our collective best interests; the Public Trust is in your hands.

Sincerely,

John R Replogle

I am a HI voter & resident. I am shocked and dismayed by this recent submission for permits. This is in violation of UN Development Rights Article 41/128 adopted in 1986 & affirmed by the 1993 Vienna Declaration and Programme of Action. This needs to be brought before the Hawaii Supreme court to obey the law.

Exploitation by greedy investors abound in Hawai'i. Our coral reefs and all animal life surrounding are dying or dead. No limu, kupipi, manini, kaunaoa, wana, gobi's, or hinalea to be found. Coral shelf at Kahalu'u beach is bleached out. Dive and see that this destruction is beyond tragic! This reef needs to be protected not pillaged. These sea life needs time to return to safe numbers. This area should not be allowed for permits.

Dear friend,

Please stop permitting our fish for sale.

I have been snorkelling on big island for years. I have seen very sad declines in both creatures and corals.

Let's please put an end to this to help our seas recover

Thank you very much,

Noelle Prasada

Subject: [EXTERNAL] Unscrupulous Practice of Reef Fishing for Aquariums Abhorrent and Greedy Industry
obliterating and killing Hawaii's reefs and aquatic life

Aloha, Mr. Sakoda!

Extinction is forever—it's that simple.

It's my understanding that a so-called Environmental Review by the Pet Industry Joint Advisory Council has been put forward in support of aquarium collecting in Hawaii. This report is not relevant, not accurate, not pono, and not legal. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes near-shore habitat and species. Don't export Hawaii reef wildlife to feed the mainland aquarium trade.

Anyone who sees the near-shore reefs on a daily basis, as I have done for the past nine years, knows that the number of fish, the variety of fish, the size of fish are all in precipitous decline. It's truly heart-breaking. Many factors conspire in this tragedy. Maybe we can't combat global warming locally. But we bloody well can put a stop to aquarium collecting.

The so-called "Environmental Review" consists of 500 pages of soulless propaganda promoting the interest of aquarium collectors. It is in no sense an environmental review. In cahoots with Hawaii's DLNR (to that department's shame), the aquarium trade would now justify their theft of common property and depredation of the aina on the grounds of aquarium-collector livelihood.

But where is the traders' credibility? The Pet Industry Joint Advisory Council (PIJAC) is a lobbying group for the commercial pet trade. The interests of PIJAC are in no way aligned with those of Hawaii's taxpayers, whose quality of life and economic well-being depend in tremendous measure on the health of our near-shore reefs—as battered as they are at this point. The more we encroach on our near-shore reefs, the worse our quality of life becomes, and the less desirable Hawaii is as a destination for tourists,

PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.

I implore you to do the right thing.

I strongly urge you NOT to allow the collecting and selling of West Hawaii's reef fish.

The reef is in dire need of protection.

A healthy reef is a huge money-maker in Hawaii as many tourists come to snorkel and view the coral and fish.

However the reef is very unhealthy presently due to the recent high temperatures of the sea (climate change), pollution, sunscreens and other damaging aspects of human disrespect and lack of education and knowledge. Taking the reef fish will hurt the reef even more.

A healthy reef is extremely important. The fish are an important part of the ecosystem.

The reef fish must be protected.

Please protect our beautiful reefs!

Subject: revised comments on PIJAC DEIS for Hawaii Aquarium Fishery
Date: Tuesday, December 3, 2019 2:51:46 PM

Please discard my previous comments (sent yesterday), which contained a factual error.

Revised Comments on PIJAC DEIS for Hawaii Aquarium Fishery.

Of the listed alternatives, the No Action alternative is preferable to any of the others as written. However, I would support the Limited Permit Issuance alternative with the following modifications: 1) Collecting is limited to the White List species statewide, not just in the WHRFMA only; 2) The following species are removed from the White List: flame wrasse, *Cirrhilabrus jordani*; psychedelic wrasse, *Anampses chrysocephalus*; longfin anthias, *Pseudanthias hawaiiensis*; Tinker's butterflyfish, *Chaetodon tinkeri*; These endemic (near-endemic in the case of *C. tinkeri*) species do not have sufficient population data to determine a safe level of take, while anecdotal evidence indicates that collection has severely reduced populations in waters shallow enough for recreational scuba diving.; 3) Collection of harlequin shrimp, *Hymenocera picta*, is banned statewide. The preferred habitat of the genetically distinct Hawaiian population segment of this species is the coral *Pocillopora eydouxi*, which suffered >90% mortality in the bleaching event of 2015-2015, followed by extremely high mortality of newly recruited colonies in the 2019 bleaching event. The loss of critical habitat severely threatens the survival of harlequin shrimp in Hawaiian waters.

Thank you.

Subject: Stop the Madness!!!
Date: Thursday, November 28, 2019 4:07:01 PM

Aloha Mr. Sakoda-

PIJAC is a lobbying group for the commercial pet trade . PIJAC was recently in the news for lobbying Congress on puppy mills, because a ban on puppy mills would work a dire hardship on pet shop retailers. PIJAC uses the same tactic here, focusing on dire hardship for aquarium collectors, who claim Hawaii reefs as their private reserve. This Environmental Review is not relevant, not accurate, not pono and not legal.

This sneak attack on Hawaii reefs has a comment period that spans Thanksgiving, Christmas and New Years. When the Hawaii Circuit Court ruled on this issue, in favor of the DLNR Director's discretion, that director was William Aila, aquarium collector. When the Intermediate Court of Appeals ruled for the aquarium trade, DLNR Director/Nature Conservancy Director Suzanne Case said, "It's been litigated!" She scoffed the Supreme Court ruling. She met with aquarium collectors to advise on speech and behavior in the legislative season. These meetings are in the public record. When the legislature passed Senate Bill 1240 to phase out the aquarium trade, Case prevailed again on Governor Ige to veto the bill. Ige knows nothing of ocean species or habitat.

The Hawaii Supreme Court ruled that no further permits should be issued until Environmental Assessment, with injunctive relief to SHUT IT DOWN NOW! DLNR Director Suzanne Case trumped that ruling with: permits are no longer required, for aquarium collecting. It takes only a commercial fishing license. Many Kona aquarium collectors

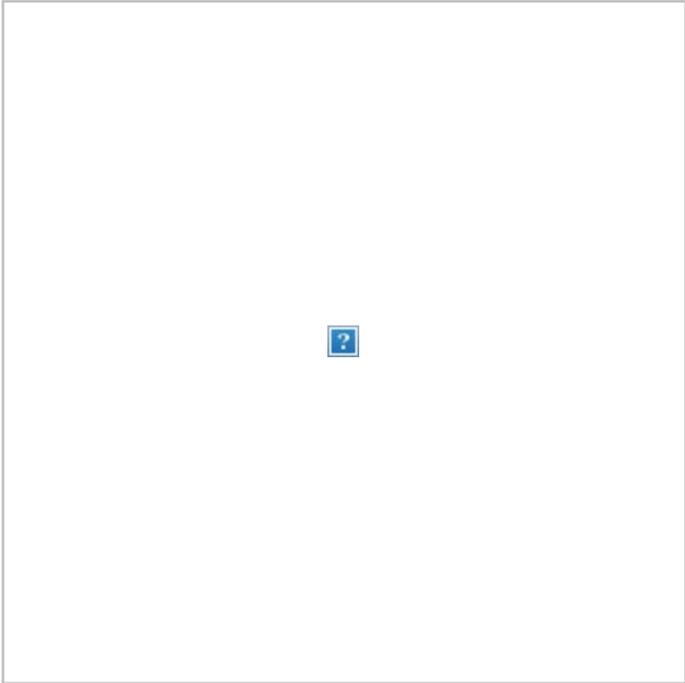

never stopped collecting, with tacit support from Kona DAR and Hawaii DLNR. When an aq collector attacked a woman with a GoPro camera at at Keawaiki, DLNR visited Kona to comfort the aquarium collectors. Now DLNR Director/TNC Director Emeritus Suzanne Case promotes the TNC agenda, deferring to Big Fishing. The aquarium trade is not fishing. It's a devastating commercial enterprise that trashes nearshore habitat and species. The vast majority of Hawaii people want the aquarium trade to end. And so do millions of visitors around the world, who hold Hawaii reefs in their hearts. Reef tourism supports many thousands more people, with revenue 400 (four hundred) times greater.

Spirit and intent in the Supreme Court ruling is clear. The PIJAC PROMO piece claims a surge in recovery to justify a new wave of reef carnage. The PIJAC PROMO piece notes a catch limit on Achilles tangs of 5 per collector per day, down from 10 per day. Few people have seen 5 Achillies tangs in a single day in many years. This PIJAC Promo piece is not an environmental review but a commercial appeal to convert Hawaii reef species and habitat to money, to deny Hawaii and its people of iconic, endemic and economic treasures, to support a mainland amusement industry, to condemn reef wildlife in a vicious cycle of replacement. THAT is what the aquarium trade calls "sustainable." Enough!

Mahalo,

Shayla Middleton

Subject: The Reefs of Hawaii
Date: Tuesday, December 3, 2019 2:58:30 PM

Dear Mr. Sakoda,

I do not know where you stand on this issue, but I do know this: I come to Hawaii for one reason, and one reason only, to snorkel the reefs, to see the gorgeous reef fish of Hawaii alive and healthy in their natural habitat. The divers who vacation in Hawaii would say the same thing.

You must know that reef ecosystems are delicate. Hawaii is the tourist destination that it is, not only because of the beautiful beaches, but also because of the reefs off those beaches. It is absurd to posit that the ecosystems of the reefs can serve as a cash cow for the aquarium trade and survive. There is no such thing as "sustainable" harvest from the reefs. You cannot "harvest" from the reefs and expect them to survive. No reefs = no tourists. Please stop any and all permits, now and in the future. The aquarium trade has no business in Hawaii. Please protect the reefs and the creatures that call them home.

If you have any questions for me, please feel free to contact me:

Re: Draft Environmental Impact Statement for Issuance of 14 Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area

Dear Mr. Sakoda:

For the Fishes, Center for Biological Diversity, The Humane Society of the United States, and the other undersigned individuals and organizations (collectively, "Commenters"), are conservation and animal protection organizations and individuals with strong interests in preserving the State of Hawai'i's natural resources and protecting its delicate coral reefs. Commenters submit these comments on the Pet Industry Joint Advisory Council's (PIJAC's, or "Applicant's") Draft Environmental Impact Statement (DEIS) purporting to analyze the environmental impacts of commercial aquarium fish collection by 14 permittees in the West Hawai'i Regional Fishery Management Area (WHRFMA).¹

The DEIS was required to fully analyze the environmental impacts of commercial aquarium collection in the WHRFMA and specifically address the significance criteria in HAR § 11-200-12, including, but not limited to:

¹ Office of Environmental Quality and Control, The Environmental Notice at 3 (Nov. 23, 2019), http://oeqc2.doh.hawaii.gov/The_Environmental_Notice/2019-11-23-TEN.pdf; PIJAC, Draft Environmental Impact Statement for the Issuance of Commercial Aquarium Permits for the West Hawaii Regional Fishery Management Area (2019), http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2019-11-23-HA-DEIS-Hawaii-Island-Commercial-Aquarium-Permits.pdf.

- Involving an irrevocable commitment to loss or destruction of any natural or cultural resource;
- Curtailing the range of beneficial uses of the environment;
- Conflicting with the state’s long-term environmental policies or goals and guidelines as expressed in Chapter 344, HRS, and any revisions thereof and amendments thereto, court decisions, or executive orders;
- Substantially affecting the economic or social welfare of the community or State;
- Involving a substantial degradation of environmental quality;
- Cumulatively has considerable effect upon the environment or involves a commitment for larger actions;
- Substantially affects a rare, threatened, or endangered species, or its habitat;
- Affects or is likely to suffer damage by the activity/activities being located in an environmentally sensitive area such as a beach, erosion-prone area or coastal waters.

To this end, we expected the Applicant to comply with the requirement “to develop a fully acceptable EIS prior to the time the EIS is filed with the office, through a full and complete consultation process, and . . . not rely solely upon the public review process to expose environmental concerns.”² However, the Applicant failed to conduct the required early consultations prior to submitting its Draft and Final Environmental Assessments, despite the HEPA requirement that the application must “at the earliest practicable time, . . . consult with . . . those citizen groups and individuals which the approving agency reasonably believes to be affected.”³ In this case, it is clear from the long history of litigation that Commenters, at the very least, should have been consulted. The Applicant should also have consulted Native Hawaiian groups (outside of those contacted as part of CIA).

Further, we expected our substantive comments on the FEAs to be incorporated and consultation to be responded to in writing and incorporated into the DEIS by the Applicant prior to the filing of the DEIS with the Hawai’i Department of Land and Natural Resources (DLNR) and Office of Environmental Quality Control (OEQC). We also expected that the responses would not be merely self-serving recitations of benefits and/or rationalizations of the proposed actions. However, these expectations were not met. See Appendix 1 for a detailed description of how the Applicant’s responses to the questions we raised during consultation process were inadequate. As a result of this failure to abide by HEPA’s mandate of early consultation, the DEIS fails to adequately analyze all impacts, and is skewed toward a favorable result for the trade.

Most importantly, we expected the DEIS to accurately and adequately evaluate the HEPA significance criteria, to disclose any and all effects (beneficial and adverse) to biological, socioeconomic, and cultural resources and traditional cultural practices, stemming from the proposed alternatives, and, to propose mitigation measures to reduce impacts, as set forth in HAR § 11-200-17.

² HAR §11-200-15 Consultation Prior to Filing a Draft Environmental Impact Statement.

³ HAR § 11-200-9(b)(1).

However, serious, fundamental errors in various factors used to determine impacts render the DEIS fatally flawed. They include, but are not limited to: the use of an incorrect baseline, an expanded and exaggerated spatial scale, minimization of catch levels, overestimations of fish populations and other omissions in determining impacts. These missteps have contributed to erroneous conclusions and improper evaluations of HEPA significance criteria.

Finally, we also expected the DEIS to factor climate change into the analyses, as envisioned by HAR § 11-200.1-13 Significance Criteria, Criterion 11 (based on the December 2017 Climate Change Mitigation and Adaptation Commission report) to address concerns related to climate change adaptation, such as impacts from increased hurricane frequency and/or intensity, potential endangered species migration, impacts on areas likely to experience wave inundation, increased exposure to hurricanes, or flooding, and further impacts discussed below.

I. Introduction

DLNR has the authority to issue permits for the taking of fish and other aquatic life for aquarium purposes.⁴ While these permits are limited in duration to one year, neither the aquarium collection statute nor DLNR places any limits on the number of animals that can be captured per commercial permit, nor on the number of permits the Agency issues.⁵ In fact, prior to court mandated compliance with HEPA, DLNR automatically granted *every* commercial aquarium permit application, and allows the collection of *unlimited* numbers of animals under those permits.⁶ DLNR also automatically granted every recreational permit application, which effectively allowed for unlimited recreational collection of nearly 2,000 fish per year per collector.⁷ In addition, DLNR also automatically grants commercial marine licenses for aquarium collecting issued pursuant to HRS § 189-2, but does so without HEPA review as required by law. Furthermore, while commercial collectors are required to report their collections (but in practice, do so inaccurately), there is no similar requirement for recreational permits.⁸ Therefore, there are no definitive data on how many of each type of fish or other aquatic animal is taken from the State's delicate coral reef ecosystem each year, nor on what level of take would be sustainable.

The DEIS is entirely inadequate under the Hawai'i Environmental Policy Act (HEPA, Haw. Rev. Chapter 343) and its implementing regulations. The DEIS fails to address these and other notable flaws that we outlined in our prior comments on the Environmental Assessments:

- The DEIS fails to analyze the impacts of collection over time (i.e. the expanded 5-year scope of the analysis, beyond one year, is still inadequate);

⁴ Haw. Rev. Stat. § 188-31(a).

⁵ Haw. Rev. Stat. § 188-31(a); HAR § 13-75-14(4).

⁶ See *Umberger v. Dep't of Land and Nat. Resources*, 403 P.3d 225, 300, 304 (Haw. 2017).

⁷ HAR § 13-75-14(4); *Umberger*, 403 P.3d at 300, 304.

⁸ See Haw. Rev. Stat. § 189-3; *Umberger*, 403 P.3d at 283, 295.

- The DEIS fails to accurately analyze the environmental consequences (i.e. direct, indirect, and cumulative impacts) of unlimited collection of aquatic life to biological, cultural, and socioeconomic resources in the WHRFMA;
- The DEIS fails to accurately analyze the environmental consequences (i.e. direct, indirect, and cumulative impacts) of unlimited collection of aquatic life to biological, cultural, and socioeconomic resources in East Hawai'i and other parts of the State that may be connected via larval dispersal patterns;
- The DEIS fails to accurately analyze the cumulative impacts of commercial collection along with recreational collection;
- The DEIS fails to accurately analyze impacts on cultural resources;
- The DEIS fails to accurately analyze the alternatives presented;
- The DEIS fails to accurately analyze the impacts of collection practices harmful to corals;
- The DEIS relies on inaccurate, misleading, and incomplete data;
- The DEIS fails to propose and analyze mitigation measures; and
- The DEIS fails to adequately incorporate input of Native Hawaiian groups, experts, affected citizens and consulted parties.

The Applicant's Preferred Alternative does not ensure that commercial aquarium fish collection is lawful, responsible, and sustainable for any of the White List fish species from nearshore habitats in the WHRFMA nor for any species taken elsewhere in the state where collection is allowed under the current geographic scope of the aquarium permits. The DEIS's continued conclusion that the aquarium fishery in the WHRFMA has "no significant impact" on targeted reef fish species, coral reefs, and the human communities that rely on them is unsupported. The DEIS fails to accurately evaluate the true primary, secondary, cumulative, short-term and long-term effects of the Preferred Alternative and fails to propose any proper mitigation.

II. Reliance on Flawed and Inadequate Science and Data

As previously mentioned, fundamental errors in the DEIS's impact analysis resulted in patently false findings of no significant impacts and improper evaluations of HEPA significance criteria. Those errors include, but are not limited to, the use of an improper baseline, the minimization of potential collection rates under the proposed alternatives, and an expanded area to which the impacts would apply. A properly conducted DEIS would focus on impacts to the area(s) where the subject activity is to take place. This DEIS is fundamentally flawed in that it fails to do so. In addition, the DEIS ignores the true evidence of impacts, including the most important one: the magnitude of depletion to targeted species in the areas from which they are taken as determined by a comparison to the baseline.

A. The use of an improper baseline.

A critical component in any DEIS is the establishment of proper baseline against which to compare the impacts of the proposed action. Any analysis stemming from an improper baseline cannot be considered accurate or relevant. A proper baseline reflects pre-project environmental conditions, and is spatially relevant. In this case, a proper baseline is found in the conservation districts and managed areas, collectively referred to as Marine Protected Areas (MPAs), within the WHRFMA where aquarium collecting has been prohibited for nearly 30 years.

Rather than using a proper baseline, free from the impacts of aquarium collecting, the DEIS incorrectly incorporates the effects of prior aquarium collecting into the baseline, and states in sections on the scope and affected environment, “the evaluation includes past use and potential impacts by the commercial aquarium fishery because it has been a part of the baseline condition of these resources since the late 1940s,” and “permitted commercial aquarium fishing has been a part of the socioeconomic, cultural, physical, and biological resources for decades and is considered a part of the baseline condition of the affected environment.”⁹

The important role MPAs serve as a baseline for fish populations in the WHRFMA is underscored by their use as such in reports and papers that seek to document the effects of aquarium collecting on targeted fish populations. For example:

- Six MPAs were among the 25 study sites established by West Hawai‘i Aquarium Project (WHAP) to measure the effects of aquarium collecting in the WHRFMA as part of the WHAP design, because at the time (1999), they had been closed to aquarium collecting for at least 9 years (now 28 years as of 2018) and were presumed to have close to “natural” levels of aquarium fish abundances and, thus, “serve as a reference or ‘control’ to compare with the [Fish Replenishment Areas] FRAs and open areas.”¹⁰

They further noted, “changes in FRAs and *open areas* can best be estimated by comparing them to other areas which have been protected for relatively long periods of time. These areas (MPAs) serve as control areas against which the FRAs are measured both before and after the closure of the FRAs. This rationale is derived from a well-known statistical procedure known as the BACI (Before-After-Control-Impact) procedure (Tissot et al, 2004) which is an especially appropriate and statistically powerful method . . .” (emphasis added).¹¹

- Two MPAs were used in 1997-1998 to document the magnitude of the effect of aquarium collecting on natural populations:
 - “The magnitude of the effect was estimated by comparing fish abundance at collection sites where aquarium fish collecting was known to occur and control sites where collecting was prohibited. Because the study was initiated after collection had begun, we assumed there were no differences between control and collection

⁹ DEIS at 16 and 20.

¹⁰ DEIS at 72; Walsh et al. (2010).

¹¹ Walsh et al. (2010).

sites in the abundance of aquarium fishes *prior to the onset of aquarium harvesting* (i.e. their natural abundances were similar.” (emphasis added).¹²

B. Flawed Impact Analysis

In determining the level of impact to targeted (i.e. White List) species that would occur under the preferred alternative, the DEIS compares reported catch from “the 14 fishers” (presumably the 14 unidentified collectors who are seeking aquarium permits) to the estimated *island-wide* populations of those species. When used properly, the basic analysis – catch as % of population – is useful in describing impacts and has been employed since at least 2010 as one method for doing so in the WHRFMA.¹³

The analysis would be properly conducted by comparing the estimated population of a given species in the area of interest to the average reported catch of that species during the same time frame. Unfortunately, the analysis is easily manipulated, and in the DEIS, the impacts are minimized as described below:

1. Affected Environment/Directly Affected area

The use of island-wide fish populations in determining impacts of the proposed action to targeted (i.e. White List) species, which would occur in the WHRFMA, minimizes the appearance of impacts by expanding the population. Proper analyses use the WHAP data to assess aquarium collecting impacts via catch as % of population, because, as noted in the DEIS, the WHAP was designed to “gauge the effects of the aquarium fishing industry” in the WHRFMA.¹⁴ In those analyses, the impacted populations have appropriately been defined as those within the WHRFMA open areas, and more narrowly, within the 30’-60’ depth range, because those are the areas and depths from which the fish are taken (i.e. the directly affected area).¹⁵

The DEIS includes an example of a WHAP catch as % of population analysis, but discards it for the impact analysis in favor of island-wide population estimates.¹⁶ The DEIS expands the affected environment in the impact analysis to include the fish populations in the nearshore reefs of the entire island of Hawai’i which is inappropriate, irrelevant, and wrong. The proposed action is for 14 aquarium permits to be issued in the WHRFMA, as stated throughout the document and as identified in the TMK (tax map key) sections in the Applicant submittal and publication forms. The action would not occur throughout the WHRFMA, but, specifically, on reefs and other areas *only* within the open areas of the WHRFMA. These open areas are where the direct (and greatest) impacts occur. Other indirect impacts likely occur to the closed areas of the WHRFMA, and possibly to East Hawai’i (i.e. Hawai’i Island as a whole), but they would be eclipsed by the impacts in the actual areas where the activity would take place.

¹² Tissot and Hallacher (2003)

¹³ Walsh et al. (2010); Walsh et al. (2013); Walsh (2010); Walsh (2015).

¹⁴ DEIS at 72.

¹⁵ Walsh et al. (2010); Walsh et al. (2013); Walsh (2010); Walsh (2015).

¹⁶ DEIS at 74 and 80.

2. Inaccurate Projected Levels of Catch

The DEIS determines the level of impact by comparing the projected annual average catch of the White List Species by “14 aquarium fishers” to the island-wide populations of those species, per Tables 5-11 and 5-14.¹⁷ In those tables, and elsewhere throughout the DEIS “the 14 fishers” is used to describe past and potential future aquarium catch and values that would occur under the alternatives. However, per the DEIS, “the 14 commercial fishers who are part of this proposed action made up 3 to 11 of the WHRFMA fishers in any given year from 2000 – 2017.”¹⁸ DLNR data shows that, on average, the actual number of collectors represented by “the 14” fishers/collectors in the tables was 7.6 (see Appendix 2 for this data showing the actual numbers of “the 14” collectors represented in Tables 5-2, 5-11, and elsewhere). Therefore, both past and future average and maximum rates of collection and impacts are grossly underestimated.

C. Flawed Threshold for “Sustainable” Collection

The applicant bases the DEIS on the premise that fish collection is considered sustainable if it removes less than 5% to 25% of the entire island-wide population (annually), but the reasoning behind this threshold is entirely flawed. The DEIS states that “While specific research into sustainable levels of collection has not been conducted for the 40 White List Species, Ochavillo and Hodgson (2006) suggest collection between 5% and 25% is sustainable for various reef species in the Philippines that are similar to those on the White List (e.g., tang, wrasse, butterflyfish, angelfish, triggerfish).¹⁹ However, the DEIS should not use these thresholds because:

- These thresholds for sustainable ornamental fish collection are species-specific based on estimated natural mortality rates (M) and fishing mortality at maximum sustainable yield (F_{MSY}) or year-per-recruit analysis. Natural mortality rates for reef fishes are based on growth rates and length and thus are also area-specific. Mortality is based on catch data. Yield-per-recruit analysis should be derived from several annual surveys. Thus, these parameters should be specifically calculated for Hawaiian reef fish targeted by the aquarium industry as highlighted in Ochavillo and Hodgson (2006).
- These thresholds were developed to calculate total allowable catch (TAC) in comparatively small “collection areas” that are orders of magnitude smaller than Hawai‘i Island. Specific collection areas used by Ochavillo and Hodgson (2006) to develop the methodology are adjacent to Bohol island in the Philippines, which is close in size, though smaller, than Hawai‘i Island. One collection area, Clarin, is part of a coastal town of the same name that has a coastline of approximately 6 linear km. Another, Batasan Island, lies approximately 6.4 km off the coast of Clarin. Applying the 5%-25% threshold to the entire island of Hawai‘i far exceeds the parameters it was developed for.

¹⁷ DEIS at 118 and 136.

¹⁸ DEIS at 20.

¹⁹ DEIS at 122.

- The 5%-25% threshold indicates “a good rule-of-thumb of collection limit” for coral reef fishes in the Philippines.²⁰ This does not mean it is a good rule of thumb for collecting reef fishes in Hawai‘i.
- Most ornamental fish species in Ochavillo and Hodgson (2006) are species different from those on the White list. Only a few species share the same genus or species (butterflyfish, a couple of wrasses, one angelfish, a couple of damselfish, one tang and one triggerfish). Thus, it is questionable whether this fairly wide threshold (5%-25%) is representative and applicable to Hawaiian species.
- Finally, this report is not peer-reviewed research, it is a field manual: Marine Aquarium Trade for Coral Reef Monitoring Protocol with a Data Analysis and Interpretation Manual. This field manual was designed in part to: “provide a scientific basis for recommending sustainable levels of collection.”²¹

The DEIS continues to assert that current fish abundance for target species is the baseline, and thus 1% to 5% of individuals removed from the population would be considered sustainable. But this is wrong. The DEIS fails to acknowledge that current population abundance of most of these fish species is already depleted due to in part to heavy exploitation by the aquarium trade since at least the 1980’s and habitat degradation. The total allowable catch for each species must be calculated based on information on natural mortality rates and the available and limited information on catch records, specific to the geographic areas and locations where they are taken in the WHRFMA.²² Additionally, an analysis of larval dispersal and connectivity patterns for White List species on Hawai‘i Island is key to preventing local extirpation of heavily targeted and/or rare species.

D. Unrepresentative Data Used

The Coral Reef Ecosystem Program (CREP) data used in the DEIS for the entire Island of Hawai‘i (based on 2010-2016 surveys) are not representative of regional population abundance such as in East Hawai‘i and the WHRFMA, and should not be used to estimate regional proportions of fish catch.

Population abundance estimates for fish species for the entire island of Hawai‘i²³ are not representative of regional fish abundances such as East Hawai‘i and WHRFMA. The CREP data collect fish data from 257 stationary point count locations around Hawai‘i between depths of 0-98 feet. In contrast, the West Hawai‘i Aquarium Project (WHAP) collected data from 25 transect survey sites from WHRFMA area between depths of 30-60 feet.

It is well established that population abundances of reef fish species in Hawai‘i, especially relatively small-size species that are targeted by the aquarium industry, are highly variable in space depending on reef complexity, depth and wave exposure, and in time (within and among years)

²⁰ Ochavillo & Hodgson (2006), at 12.

²¹ Ochavillo & Hodgson (2006).

²² See Ochavillo and Hodgson (2006) for step by step guidance on using natural mortality rates for this analysis.

²³ CREP (2018).

depending on the season, mortality, recruitment to the population, and environmental factors.²⁴ The relative proportion of fish species taken annually by the aquarium industry should be based on regional total abundances and regional catch records (e.g., aligned with the aquarium fish trip report zones). Allowable levels of take should be determined in conjunction with the wishes of Hawai'i residents and visitors who strongly desire that fish populations are restored to their naturally occurring (i.e. unfished) levels of abundance on the majority of Hawai'i reefs.

The allowable number of individuals that could be collected from aquarium fish populations must be substantially less than those proposed in the DEIS Preferred Alternative, because most of these species are already depleted. Fishing effort has substantially increased for aquarium fish species on the Island of Hawai'i.²⁵ Prime-targeted species have significantly declined due to overharvesting.²⁶ For example, population abundance of one of the most heavily exploited species, Yellow Tang (*Zebrasoma flavescens*), on the west coast of the island of Hawai'i (West Hawai'i) declined 45% due to exploitation in areas open to fishing/collection from 1999 to 2007.²⁷ Yellow Tang abundance is closely tied to annual levels of recruitment, and after good recruitment levels from 2008 – 2013, Yellow Tang abundance in the Open Areas improved, but was still 4.7% lower than the 1999 – 2000 Open Area baseline.²⁸ As noted earlier, an anomalous recruitment pulse in 2014 is likely behind the increase in abundance seen since then.²⁹

Even when including marine managed areas (MMAs) such as FRAs, where collection is prohibited and abundances are five times higher than in open areas, the population abundance of Yellow Tangs on West Hawai'i is substantially less than historical levels.³⁰ The established networks of MMAs have definitely worked to increase Yellow Tangs and some other fish species in the West Hawai'i FRAs,³¹ but not all species have responded positively, and some have actually decreased overall since the FRAs were established. The extent to which collection pressure—whether in the Open Areas or due to poaching—is driving the decline of heavily targeted aquarium species in the areas closed to the trade must be studied. While the DEIS attempts to minimize the impacts of collection pressure by proposing that factors other than aquarium collecting are also affecting their populations, it remains highly likely that the main cause is collection pressure. An example of the effect of collection pressure on populations in MMA's is found in the significant decline of Yellow Tangs in those areas from 2004-2009 which coincided with Yellow Tang reported catch during that period that was substantially higher (e.g. in 2004 and 2006 it was more than double that reported in 2002).

²⁴ Friedlander & Parrish (1998a, 1998b).

²⁵ DLNR Catch Reports.

²⁶ Williams et al. (2009); Walsh et al. (2004).

²⁷ Williams et al. (2009).

²⁸ Walsh (2015).

²⁹ Gove et al. (2016).

³⁰ Williams et al. (2009).

³¹ Tissot et al. (2004); Williams et al. (2009).

Given the relative long life-span of Yellow Tangs (>40 yrs.) and increasing fishing intensity, these MMAs are just becoming sources for the aquarium fishing industry. The recovery of this species to past levels is unlikely if fishing/collection intensity continues or increases in the future.

The commercial aquarium fishery in the Island of Hawai'i has grown over the last three decades, particularly after the O'ahu aquarium fishery substantially declined in the early 1990s due to hurricanes and localized overfishing.³² It is thought that the expansion of the Island of Hawai'i aquarium fishery was due to new collectors and relocation of collectors from O'ahu.³³ Scientific evidence shows that collecting activities substantially affect targeted species in Hawai'i³⁴ and fishing intensity remains high even when stocks are depleted or recruitment is weak.³⁵

Therefore, the current estimates of population abundance of fish species for the entire Island of Hawai'i (from 2010 to 2016)³⁶ should not be used as regional/local reference abundances (e.g., East Hawai'i, WHRFMA) to estimate minimum and maximum percentage of fish taken per year.³⁷ This is because these calculations underestimate the proportion of fish collected by region (East and West Hawai'i) and assumes fish populations of the entire Island of Hawai'i are distinct or discrete. A more accurate calculation of allowable catch would be based on regional population abundance, using the aquarium trip report zones, and by using the WHAP data estimates obtained from the depth ranges where the fishes are captured, rather than by regions.

Finally, sustainable fishable abundance for target species must take into consideration the fact that most target species are depleted in comparison with historical levels. The EIS fails to analyze the impact of collection/fishing on current population abundance and fails to consider that these populations are far below the historical baselines as represented in the MPAs, or otherwise.

E. Catch Is Grossly Underreported

As mentioned above, there is no requirement for recreational aquarium collectors to report catch. For commercial collectors, while reports are required, catch report compliance is substantially low. As such, the impact of the aquarium fishing industry is likely larger than is reported, which has been discussed in the scientific literature.³⁸

As a former DLNR employee succinctly wrote regarding aquarium catch reports: "The reliability of the data depends upon the sincerity of the permittees."³⁹ There is no verification system, such as that provided by independent observers, to ensure the accuracy of self-reported data. One additional major impediment to accurate data stems from the lack of a license requirement for marine dealers and/or exporters. Currently there is a requirement for dealers (i.e. those who buy directly from aquarium collectors) to report their purchases. According to DLNR, the effect is that "dealer reporting is essentially on a voluntary basis and a few dealers are not reporting in whole or

³² Walsh et al. (2004); Friedlander et al. (2008).

³⁸ Friedlander et al. (2008).

³⁹ Katekaru (1978).

in part.⁴⁰ DLNR cannot know whether a “few” or a dozen dealers are not reporting, without a requirement for these businesses to have licenses, thus, these businesses operate beneath the radar and serve as a conduit for moving unreported catch out of the state.

Establishing a marine dealer/exporter license has long been a priority for those within DLNR concerned about Hawai‘i’s marine resources, because it would enable the department to verify catch reports, identify unlicensed collectors (and all commercial fishers), identify dealers and helped with generating economic data about the fisheries. Without this information, DLNR/DAR has no accurate data on health of fish populations. According to a former DAR Commercial Fisheries manager, Karl Brookins, the process of establishing the license was abandoned due to lack of funding.⁴¹

F. Further Necessary Data Excluded is Needed for an EIS

As discussed above, there is no reliable data on how many fish and other species are actually taken pursuant to aquarium permits in any given year. The DEIS repeatedly refers to a lack of data for numerous species. For example:

- “Most of the Flame Wrasse population occurs below the 60-foot depth surveyed by the WHAP and below the 98-foot depth surveyed by the CREP, and therefore the species is not observable by the methods of either survey. As such, data are not available to produce a reliable WHRFMA or island-wide population estimate.”⁴²
- For Psychedelic (Redtail) Wrasse, Tinker’s Butterflyfish, Longfin Anthias, Flame Wrasse, Fisher’s Angelfish, and Eyestripe Surgeonfish (Palani), open area populations and catch as a percent of the open area populations are not available, because species “occur[] in habitats not adequately surveyed by transects.”⁴³

This data is necessary in order for the EIS to properly assess impacts. Furthermore, the Agency must conduct stock assessments of species before it is able to determine a sustainable rate of take. Clearly the Agency has not done so, as DLNR personnel have stated that to do so would take over a decade for just 40 fish species, out of the more than 287 fish and invertebrate species the Agency identifies as targeted by the trade (found at Appendix 5).⁴⁴ Without such data, the Agency cannot meaningfully assess the environmental impacts of commercial aquarium collection. Such assessments must be completed prior to the issuance of the EIS, and in the face of any uncertainty, the EIS’s analyses must err on the side of caution to protect these vulnerable species.

G. Examples of Proper Impact Analyses

Other comparisons of reported catch to estimated populations reveal that upwards of 80% of Achilles tangs and 60% of yellow tangs in the WHRFMA open areas have been taken by commercial

⁴³ DEIS at 44.

⁴⁴ DLNR (2017); Eagle (2017); Aquarium Fishing Trip Report.

aquarium collectors in some years and concluded that “aquarium collecting is having a major impact on Achilles and yellow tang.”⁴⁵ Although these estimates are imperfect, because they do not factor under-reporting, they are still more accurate than presented in the DEIS because they are spatially relevant. Still, the extremely high levels of take are reflected in the difference between populations where they are taken (i.e. the open areas) and baseline areas where they have not been taken for decades (i.e. the MPAs). For yellow tangs, it has resulted in a 62% reduction in natural abundance in those areas, on average, compared to the MPA baseline since researchers began documenting the differences in 1999 in the three management areas comprising the WHRFMA.

H. Other omissions, and misleading and incorrect data sets used

The DEIS ignores the largest single year surge in fish abundance that has ever been recorded in the WHRFMA which has occurred in the open areas in 2018 after aquarium collecting was prohibited in the area (Fig. 17). Note that the increase occurred solely in the areas recently closed to aquarium collecting: a similar increase did not occur in the areas long closed to the trade. This significant increase, once collection pressure is removed, is further indisputable evidence of major aquarium collecting impact on heavily targeted species.

At the foundation of every determination made in the DEIS is the flawed conclusion that aquarium collecting takes less than 5% of the populations of targeted species on Hawai‘i Island. The DEIS fails to consider cumulative impacts, both short- and long-term. HEPA requires that “agencies shall consider the sum of effects on the quality of the environment and shall evaluate the overall and cumulative effects of an action.”⁴⁶ Furthermore, the Agency must consider “both primary and secondary” consequences, “and the cumulative as well as short-term and long-term effects of an action.”⁴⁷ Notably, “cumulative impact” is defined as the impact resulting from “the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions,” and “[c]umulative impacts can result from individually minor but collectively significant actions taking place over a period of time.”⁴⁸

III. All Impacts Improperly/Inadequately Analyzed

A. Failure to Adequately Analyze Long-Term Impacts

The Applicant unlawfully limited its analyses to the time period of five years.⁴⁹ PIJAC’s provides no reasoning for this 5-year period, while noting that each permit lasts only one year, and therefore a new HEPA analysis would need to be completed on an annual basis.⁵⁰ However, while Commenters agree that it is critical for the Agency to continue to monitor the impacts that aquarium collection is having over time, the relatively short time period of the activity itself does not nullify HEPA’s clear

⁴⁵ Walsh et al. (2010)

⁴⁶ HAR § 11-200-12.

⁴⁷ HAR. § 11-200-12.

⁴⁸ HAR. § 11-200-2.

⁴⁹ See DEIS at 16

⁵⁰ DEIS at 16

requirement for considering the long-term effects of that activity.⁵¹ For example, a large excavation project could destroy habitat in an area of an island that takes decades to regrow—and even if the excavation itself was only for a year, HEPA would clearly require consideration of the impacts to the environment during the decades of regrowth. Similarly, the use of a pesticide could have known impacts on a species where serious or lethal effects are felt far beyond the time frame of the actual application of the pesticides—yet HEPA would clearly require consideration of those expected impacts. Thus, PIJAC’s logic simply does not hold up. Additionally, stating that the Agency can simply reevaluate the consequences of a year-long permit *after* that year is up entirely contradicts HEPA’s mandate to evaluate the potential consequences of an action *before* the Agency authorizes the action.

Additionally, a 5-year timeframe that analyzes impacts is inadequate because the impact of fish removal will accumulate over time. For example, though collection pressure has been removed from the White List species in the FRAs, populations of once heavily targeted species in those areas, such as yellow tangs, have yet to return to natural levels of abundance, as reflected in the baseline MPAs, even after 20 years of protections. For very long-lived species such as the yellow tang and other surgeonfishes heavily targeted by aquarium collection, which have lifespans measuring decades, and which may not reproduce until they are at least 5 years old, a 5-year analysis period is far too short.

In addition, studies show that catch numbers from the commercial aquarium fishery in Hawai‘i have significantly increased over the last few decades and are likely to increase even more, despite the limited request for 14 permits.

DLNR data shows a strong correlation between the number of permits issued and the level of catch (Fig. 2); however, historically commercial aquarium collectors have reported catching fish just three days per week.⁵² There is nothing preventing them from increasing that effort, via increasing the number of hours and/or days they collect, in response to perceived scarcity from, for example, impacts to habitat from storms and climate change, or from additional collectors seeking permits through the HEPA process (i.e. the “get it while you can” mentality); or, in order to meet the high demand for aquarium reef fish and their increasing market value.⁵³

⁵¹ See HAR. § 11-200-12.

⁵² Stevenson et al. (2011).

⁵³ Friedlander et al. (2008); Stevenson et al. (2011).

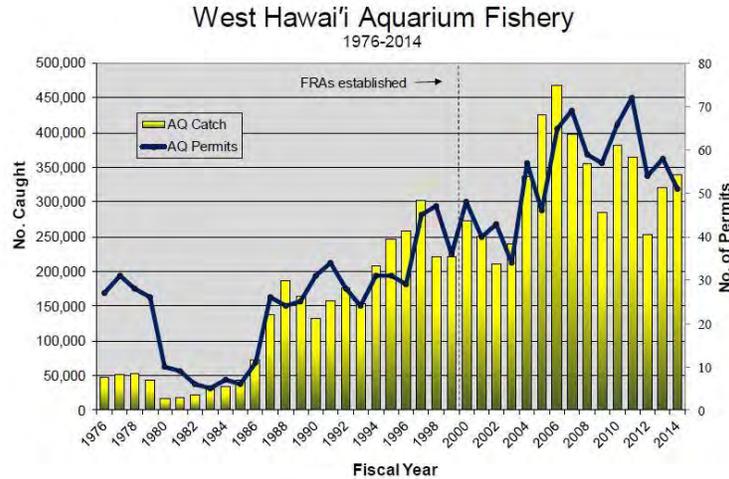

Fig. 2. Number of aquarium animals caught and number of commercial permits in West Hawai'i for Fiscal years 1976-2014.⁵⁴

Furthermore, the Hawai'i Supreme Court has made clear that the proper inquiry under HEPA is “the outer limits of what the permits allow”⁵⁵ The outer limits allowed by the permits are the take of every fish and every invertebrate from every reef in the state of Hawai'i that isn't in a protected area. Permits issued under this DEIS would allow just that without a new law, rule, or permit condition, defining geographic and take limits. Further, as there are no limits on the number of commercial marine licenses (CML) issued for aquarium collecting, in the rest of the state and East Hawai'i, the issue of aquarium trade impacts to Hawai'i's coral reefs remains unresolved.

The DEIS analyzes the effects of issuing aquarium permits to 14 people in the WHRFMA, however permits are issued statewide, with no geographic limits, other than those pertaining to managed areas, which are regulated by other statutes. The DEIS fails to identify this unresolved issue, to discuss how it will be resolved prior to commencement of the action, or describe any overriding reasons for proceeding without resolution of the issue, though legally required to do so.⁵⁶ Currently the use of fine mesh nets for aquarium purposes is prohibited everywhere, and with the issuance of any geographically limited permits, DLNR would likely be unable to enforce those geographic limits given their extremely limited resources.

Furthermore, the DEIS is for 14 fishers, however nothing prevents more fishers from seeking permits through additional HEPA reviews. In addition, pursuant to HRS § 189-2, DLNR is currently issuing an unlimited number of commercial marine licenses for aquarium collecting. The relationship between the number of participants in a fishery and impacts to fish populations is well-established in the literature. The importance of restricting access to fisheries has been acknowledged and used for thousands of years to conserve and help sustain fish populations.⁵⁷

⁵⁴ DLNR (2014).

⁵⁵ *Umberger*, 403 P.3d at 294.

⁵⁶ See HAR 11-200-17 (n)

⁵⁷ Dewees and Weber (2001).

The DEIS failed to take into account how increasing demand and increasing market value will affect already depleted targeted reef fish species in the coming years, thus resulting in significant environmental impact. For example, the market value of tropical reef fish (e.g., Yellow Tang) has increased and thus collection/fishing pressure is also likely to increase in the near future. The commercial aquarium fishery in Hawai'i reports annual landings of over 579,000 organisms (fish and invertebrates combined).⁵⁸ The number of aquarium fish caught on the island of Hawai'i since 1976 has substantially increased by 645%.⁵⁹ Similarly, the adjusted value of the Hawai'i Island aquarium fishery increased by over 280% between 1976 and 2003.⁶⁰ The DEIS fails to properly analyze this relationship, and fails to propose mitigation to reduce population declines. The DEIS claims that the high fecundity and long lifespans of reef fishes combined with the limited targeting of adult brood-stock by the trade removes the certainty that the losses will accumulate over time is false. Studies show that populations of heavily targeted species, such as Yellow Tangs, are neither annually replenished, nor restored over time to their natural levels of abundance, even 20 years after collection pressure has been removed. On the contrary, they have been severely depleted over time, especially in the areas where they are collected. While the DEIS noted that for Yellow Tang and *kole*, which represent two of the top three collected species, population trends are stable or increasing, it failed to acknowledge that the increase in fish abundance is due to an anomalous recruitment pulse that coincided with warming waters in 2014.⁶¹ Typical recruitment pulses, such as those that occurred in 2002 and 2009, have resulted in short-lived increases in fish populations that were followed by prolonged or short and steep population declines.⁶²

More importantly, the 2017 and 2018 increases in populations of White List species in the Open Areas was due to the total prohibition of aquarium collecting in the WHRFMA as of January 5, 2018. In fact, the 2018 surge in yellow tang abundance was the largest ever recorded in the WHRFMA and occurred only in the Open Areas while populations in the FRAs declined in 2018, and were slightly, but insignificantly higher in the MPAs (i.e. they cannot be attributed to anything other than the removal of collection pressure).

Thus, the DEIS not only fails to acknowledge the evidence of depletion caused by collection activities that is apparent when using the proper baseline, but also fails to acknowledge the beneficial impact that would occur in the WHRFMA under the No Action Alternative.

The failure of the DEIS to conduct a proper analysis, as described above, is not only a legal flaw but also the main reason that the DEIS does not find a significant impact of the aquarium fishing industry on targeted species and their habitat. In addition, by limiting the timeframe of their analysis to five years, the DEIS fails to accurately consider the impacts of one-year collection permits cumulatively with other "past, present, and reasonably foreseeable actions" "over a period of time."⁶³

⁶¹ Gove et al. (2016).

⁶² Hawai'i FEA Fig. 5.

⁶³ HAR. § 11-200-2.

B. Failure to Analyze Indirect and Cumulative Impacts

Coral reefs are connected by currents which carry and disperse fish larvae to other areas, both near and far. Most fishes on Hawai'i's reefs are the result of other fishes upstream of that reef.⁶⁴ The currents and conditions that control larval connectivity and dispersal processes are complex. The larvae of some species are able to travel between islands, while others do so to a lesser extent. For example, in one study, some yellow tang larvae on Hawai'i Island travelled on ocean currents for 15 km before settling on a reef while others traveled 184 km.⁶⁵

Recent research into two species of small bodied surgeonfishes, including kole which is heavily targeted by the aquarium trade, has determined that populations of these fishes are genetically distinct on each of the main Hawaiian Islands. This means that, for at least these two species, there is little genetic mixing between islands, and once species are depleted on any given island, there is no other source for population replenishment. Further, connectivity and dispersal studies on the island scale for certain species have identified important spawning source areas that are essential for maintaining populations on other reefs across the island.

This larval connectivity between coral reefs serves to highlight areas where secondary or indirect impacts of the Applicant's actions will manifest. Regardless of whether larval connectivity exists mainly intra-island or extends inter-island, reduced populations of reef fishes in their source areas will seriously impact reef fish abundance in their downstream, sink reefs, and thus the entire island.⁶⁶ The DEIS fails to account for this critically important reproductive strategy used by Hawai'i's reef fishes. The precautionary approach requires the determination of source areas for the 40 White List species on Hawai'i Island and the establishment of protections for those populations to ensure local species survival, which was not provided in the DEIS.

Additionally, the DEIS fails to properly address the true nature of what the Applicant is requesting in its Preferred Alternative whereby:

"DLNR would issue Aquarium Permits to 14 aquarium fishers in the WHRFMA...No Aquarium Permits would be issued for areas outside of the WHRMA (in East Hawai'i aquarium collection using legal gear or methods other than fine-mesh nets could continue but use of fine mesh nets would not be allowed). Permittees would abide by all rules and regulations set forth in HRS 189-2,3 (Commercial Marine Permit), HRS-188-31 (Section 1.2.1), governing Aquarium Permit use, and would obtain a West Hawai'i Aquarium Permit as required under HAR 13-60.4 (Section 1.2.3.2). These rules and regulations include restrictions on equipment, restrictions on access to various areas, bag limits on various collected fish species, collection in the WHRFMA restricted to 40 White List Species only, and reporting requirements. In addition, under this alternative, the daily bag limit for commercial aquarium collection of Achilles Tang within the WHRFMA would be reduced from 10 per day to 5 per day."⁶⁷

⁶⁴ Noland (1978); Christie et al. (2010); Coleman (2019).

⁶⁵ Christie (2010).

⁶⁶ Coleman (2019).

⁶⁷ DEIS at 19.

In other words, the Applicant's Preferred Alternative continues to be the collection of an *unlimited* number of fish, with one exception for the Achilles Tang—the limits of what regulation allows. Yet, the DEIS considers only very *limited* collection. HEPA requires that an EIS assess the potential cumulative impacts of what State regulations allow, not just what some permittees may claim they *intend* to do, or have historically done, with their permits. As the Hawai'i Supreme Court clearly stated, "the properly defined activity for the purposes of the HEPA analysis must encompass the outer limits of what the permits allow and not only the most restrictive hypothetical manner in which the permits may be used."⁶⁸ The DEIS failed to address this.

Relatedly, the DEIS assumes that aquarium collection without the use of fine-mesh gear will continue "legally" in East Hawai'i; however, as indicated in a letter dated January 7, 2020, from Earthjustice to DLNR (attached as Appendix 8), such collection also requires HEPA review, which currently is not being conducted. If this purportedly "legal" collection were halted pending environmental review, then the 14 collectors would have even greater incentive to increase collection levels in West Hawai'i in the meantime. The DEIS fails to consider this effect.

Likewise, although the DEIS purports to analyze impacts cumulatively with those of recreational collection permits, the DEIS still does not account for the fact that the Agency issues a permit for *every* application that is submitted, and therefore the take under recreational permits is potentially unlimited as well.⁶⁹ And the DEIS admits that, as there is no required reporting for recreational permits, it is currently impossible to know how many of each species are taken under those permits, and therefore, the impact of collection under these permits on species collected under these permits cannot be quantified.⁷⁰ This lack of data is not properly addressed in the EIS.

The analysis of cumulative impacts included the impact of the commercial aquarium fishery, regardless of the gear used to capture the marine life, combined with non-aquarium commercial and recreational fisheries and other activities that impact population abundance, but reached a conclusion that is erroneous. Commercial and recreational fishing combined with the aquarium fishery have a substantial impact on targeted species. The EIS fails to determine cumulative impact of all fishing on target species. In addition, the EIS fails to analyze indirect impacts from collection such as vessel traffic and accumulated reef damage due to vessel anchoring and collection practices.

The DEIS fails to adequately evaluate the potential of cumulative impacts of climate change (warming, coral bleaching, and ocean acidification) on targeted fish species such as decline of coral coverage which have been demonstrated to influence reef fish species diversity and abundance.⁷¹ The EIS recognizes that climate change poses serious threats to Hawai'i's coral reefs and the species targeted by the Applicant, yet ironically claims that climate change impacts coupled with the impacts of implementing the Preferred Alternative is expected to be less than significant. These statements completely dismiss the research and data that demonstrate what is stated, that climate

⁶⁸ *Umberger*, 403 P.3d at 294.

⁶⁹ Hawai'i DEA at 88; O'ahu DEA at 60.

⁷⁰ DEIS at 129.

⁷¹ Jones et al. (2004); Friedlander et al. (2018).

change impacts, specifically ocean warming, acidification and coral bleaching events will continue, thus further analysis of impacts and exacerbation of impacts due to climate change is required.⁷²

It is clear from an analysis of cumulative impacts that many of HEPA's "significance criteria" apply.⁷³ Had proper analyses been conducted, the Preferred Alternative most certainly would have shown significant effects on the environment due to at the least, the following: the loss or destruction of natural and cultural resources; curtailing the range of beneficial uses of the environment; substantial degradation of environmental quality; cumulative effects on the environment; and potentially substantially affecting rare, threatened or endangered species, or its habitat.⁷⁴

Flawed analyses prevented the DEIS from accurately assessing and addressing these effects, in part, because the DEIS uses as a baseline, current conditions, which have been impacted by decades of the aquarium collecting activity.⁷⁵ Therefore, the scope fails to factor the impacts of collection pressure over time. Proper examination of the magnitude of the effect of aquarium collecting on natural populations and the coral reef ecosystem over time requires a proper baseline such as occur in MPAs, which reflect natural populations, before they were depleted by this activity, and have been used as such in numerous studies.⁷⁶

IV. Failure to Adequately Analyze and Address Significance Criteria and Other Areas of Concern Proposed by DLNR in NOD

DLNR, in the Final Environmental Assessment, Notice of Determination, described five HEPA significance criteria and eleven additional areas requiring further analysis by the Applicant. Here too, the DEIS is totally inadequate, falls far short of providing proper analyses, and fails to reach conclusions that are supported by the evidence.⁷⁷

- A. HEPA Significance Criteria #1: To the question of "whether the annual take of cumulative numbers of fish as a percentage of estimated population results in irrevocable loss or destruction of populations of fish," the DEIS wrongly concludes "the Preferred Alternative (i.e., Limited Permit Issuance Alternative) does not involve an irrevocable commitment or loss or destruction of any natural or cultural resource."

Fish Populations: Any and all substantial reductions in natural abundance of White List species in West Hawai'i indicate lost natural and cultural resources. While it may be true that a potential *revocable* loss may be indicated by increasing populations of some White List species when aquarium collecting is halted, such as occurred for yellow tangs in the FRAs after their establishment in 2000 and in the open areas after collection was prohibited in 2018, there is no evidence that natural abundance will ever return. The reduced populations of yellow tangs in

⁷² DEIS at 329.

⁷⁴ Haw. Rev. Stat. § 11-200-12(b)(1), (2), (7), (8), (9).

⁷⁵ DEIS at 20

⁷⁶ Walsh et al. (2010); Walsh et al. (2013); Walsh (2010); Walsh (2015).

⁷⁷ DEIS at 329 - 337

the FRAs, compared to baseline, natural populations found in the MPAs, even after 20 years of no aquarium collecting, is further evidence of an irrevocable loss that has occurred.

Furthermore, severe coral bleaching caused by climate change has already reduced coral cover in West Hawai'i and is only expected to worsen, with annual bleaching that could begin as early as 2030 and which will result in the loss of 70% of Hawai'i's reefs. This loss of White List habitat virtually assures that a depleted population will not be able to rebound to the same extent, or at all, in the future, though it may have in the past.

Further evidence is found throughout this document and all combined point to significant adverse impacts to fish populations as a result of all proposed Alternatives with the exception of the No Action alternative, which would have a beneficial impact in the WHRFMA.

Reef Habitat: The DEIS wrongly claims that “the pressures from commercial aquarium collection under the Preferred Alternative are anticipated to be lower than rates seen prior to the October 2017 ban on commercial aquarium collection; therefore, it is not anticipated that a significant impact on reef habitat as a result of the Preferred Alternative would occur.” Damage to reef habitat from commercial aquarium collection is well documented. See “Damage to Reef Habitat” later in this document and also Appendix 3 where photographs of these practices and their effects can be found.

The DEIS cites a 2003 study (Tissot and Hallacher) in an attempt to conclude that no significant impact on aquatic invasive algae control is anticipated as a result of the Preferred Alternative, noting that the authors “found no increases in the abundance of macroalgae where the abundance of herbivores was reduced by aquarium collecting.” However, the DEIS omits the author's subsequent conclusion that the study may not be a good test of that hypothesis for several reasons, including that herbivores taken by aquarium collectors primarily consume filamentous algae (i.e. turf), not macroalgae, and that further investigation is warranted.⁷⁸ Additionally, macroalgae accounts for <2% of algal cover in West Hawai'i – the majority is turf algae, further underscoring the irrelevance of the 2003 study.⁷⁹

Evidence throughout this comment document points to significant adverse impacts to reef habitat as a result of all proposed Alternatives with the exception of the No Action alternative, which would have a beneficial impact in the WHRFMA.

Cultural Resources: The DEIS wrongly claims that “White List Species are not anticipated to significantly decline under the Preferred Alternative. Therefore, it is not anticipated that a significant impact on cultural resources would occur as a result of the Preferred Alternative.” This follows the conclusion in the CIA that “cultural impacts would occur if issuance of Aquarium Permits under an alternative would cause a significant decline in the population of a White List Species considered to be a cultural resource, either directly through the collection of fish or indirectly through habitat impacts.” As described in detail in this comment document, White List species are currently in decline as a direct result of aquarium collecting and will

⁷⁸ Tissot and Hallacher (2003).

⁷⁹ Gove 2019.

continue to decline as such as long as aquarium collecting occurs on Hawai'i Island. Therefore, cultural resources are in fact impacted.

Further evidence is found in the CIA which includes descriptions of significant adverse impacts to cultural resources as a result of all proposed Alternatives with the exception of the No Action alternative, which would have a beneficial impact in the WHRFMA.

HEPA Significance Criteria #2: To the question of whether “the take of aquarium fish curtails the uses of the environment, including aquatic invasive algae control, the tourism industry, and the overall integrity of diverse aquatic ecosystems,” the DEIS wrongly concludes “the Preferred Alternative does not curtail the range of beneficial uses of the environment.”

Aquatic invasive algae control: The DEIS wrongly claims that “the pressures from commercial aquarium collection under the Preferred Alternative are anticipated to be lower than rates seen prior to the October 2017 ban on commercial aquarium collection; therefore, it is not anticipated that a significant impact on aquatic invasive algae control as a result of the Preferred Alternative would occur. The DEIS cites a 2003 study (Tissot and Hallacher) to attempt to conclude that no significant impact on aquatic invasive algae control is anticipated as a result of the Preferred Alternative, noting that the authors “found no increases in the abundance of macroalgae where the abundance of herbivores was reduced by aquarium collecting.” However, the DEIS omits the authors subsequent conclusion that the study may not be a good test of that hypothesis for several reasons, including that herbivores taken by aquarium collectors primarily consume filamentous algae (i.e. turf), not macroalgae, and that further investigation is warranted.⁸⁰ Additionally, macroalgae accounts for <2% of algal cover in West Hawai'i – the majority is turf algae, further underscoring the irrelevance of the 2003 study.⁸¹

Reductions in herbivore biomass drive an increase of algae abundance. In West Hawai'i, herbivore biomass is as much as 2 times higher in the baseline MPAs than in the open areas and FRAs.⁸² Historically, 26.5% of the total biomass removed from West Hawai'i reefs in fishing and other extractive uses has been aquarium take, 98% of which are herbivores.⁸³ Logically, it follows that algae control is being significantly curtailed by aquarium take in the open areas.

Evidence throughout this comment document points to significant adverse impacts to aquatic invasive algae control as a result of all proposed Alternatives with the exception of the No Action alternative, which would have a beneficial impact in the WHRFMA.

Tourism: The DEIS wrongly claims that “populations of the White List Species are not anticipated to significantly decline, therefore not significantly impacting viewing opportunities. Consequently, continued commercial aquarium collection under the Preferred Alternative, which would limit the number of Aquarium Permits and decrease collection, is not anticipated

⁸⁰ Tissot and Hallacher (2003).

⁸¹ Gove 2019.

⁸² Gove 2019.

⁸³ DLNR 2019; DEIS at 97.

to significantly impact tourism.” As described below, viewing opportunities and marine tourism revenue losses resulting from depleted populations of beautiful, charismatic and iconic fishes are captured in studies documenting willingness to pay and consumer surplus losses.

Therefore, there are significant adverse impacts to marine tourism as a result of all proposed Alternatives with the exception of the No Action alternative, which would have a beneficial impact in the WHRFMA.

Integrity of Diverse Aquatic Ecosystems: The DEIS wrongly claims that “The pressures from commercial aquarium collection under the Preferred Alternative are anticipated to be lower than rates seen prior to the October 2017 ban on commercial aquarium collection; therefore, it is not anticipated that a significant impact on the integrity of diverse aquatic ecosystems as a result of the Preferred Alternative would occur.” As described throughout this document, White List species are currently in decline as a direct result of aquarium collecting and will continue as such as long as aquarium collecting occurs on Hawai‘i Island. Additionally, local extirpation has already been identified for some aquarium targeted species, which have been described by DAR and former aquarium collectors as “once common, now rare”, a condition that likely exists for other species, as well.⁸⁴

Therefore, there are significant adverse impacts to the integrity of diverse aquatic ecosystems as a result of all proposed Alternatives with the exception of the No Action alternative, which would have a beneficial impact in the WHRFMA.

- B. HEPA Significance Criteria #3: To the question regarding the extent to which the take of aquarium fish conflicts with the state’s long-term environmental goals, the DEIS wrongly concludes that “the Preferred Alternative does not conflict with the State’s long-term environmental policies, goals, or guidelines as expressed in chapter 344 HRS.”

As described throughout this document, significant adverse impacts to natural resources would occur as a result of all proposed Alternatives with the exception of the No Action alternative, which would have a beneficial impact in the WHRFMA.

- C. HEPA Significance Criteria #4: To the question of the impact of the take of aquarium fish on cultural practices in the state, the DEIS wrongly claims that “White List Species are not anticipated to significantly decline under the Preferred Alternative. Therefore, it is not anticipated that a significant impact on cultural resources would occur as a result of the Preferred Alternative.” This follows the conclusion in the CIA that “cultural impacts would occur if issuance of Aquarium Permits under an alternative would cause a significant decline in the population of a White List Species considered to be a cultural resource, either directly through the collection of fish or indirectly through habitat impacts.” As described in detail in this comment document, White List species are currently in decline as a direct result of aquarium

⁸⁴ Williams & Walsh (2008); Former aquarium collectors personal communications to R. Umberger (Dec. 16, 2019).

collecting and will continue as such as long as aquarium collecting occurs on Hawai'i Island. Therefore, cultural resources are in fact impacted.

Further evidence is found in the CIA which includes descriptions of significant adverse impacts to cultural resources as a result of all proposed Alternatives with the exception of the No Action alternative, which would have a beneficial impact.

- D. HEPA Significance Criteria #8: to the question regarding the cumulative effect of the commercial take of aquarium fish using fine mesh nets when combined with the effects of: the commercial take of aquarium fish by other legal methods; the take of aquarium fish for recreational purposes; and, the commercial and non-commercial take of aquarium fish species for consumption as food, particularly including Achilles Tang and kole, the DEIS wrongly concludes "the Preferred Alternative does not involve a commitment for larger actions. When the full range of impacts to White List Species are considered (e.g., recreational aquarium collection, non-aquarium commercial fishing, recreational fishing, tourism, climate change), there is a significant cumulative impact to some White List Species. However, the Preferred Alternative is not a significant contributor to the cumulative effect upon the environment."

As described throughout this document, fundamental errors in the DEIS's impact analysis resulted in patently false findings of no significant impacts and improper evaluations of these HEPA significance criteria. By failing to properly identify the varied and significant effects of commercial aquarium collection, the DEIS fails to accurately assess the cumulative effects when combined with other extractive activities.

The evidence is clear that all proposed Alternatives would significantly contribute to the cumulative effect upon the environment, with the exception of the No Action alternative, which would have a beneficial effect.

- E. Additional Areas Requiring Further Analysis as Described in the DLNR NOD:

- 1) *"It is also necessary to analyze the potential impacts under the no action alternative resulting from non-issuance of aquarium permits, including the increased take of larger, reproductively mature aquarium fish in East Hawai'i using legal mesh nets."*

Since aquarium collecting was prohibited in the WHRFMA, aquarium take in East Hawai'i has grown to be 5X the historic average catch for that entire coastline.⁸⁵ Most of that catch has been reported from zones 107 and 108, which share a boundary with Punalu'u, a known source area for juvenile yellow tangs in West Hawai'i (see DLNR map of aquarium fish zones at Appendix 6).⁸⁶ As previously stated, understanding and factoring larval dispersal and connectivity patterns is critically important for determining impact. It is through the identification of larval source and sink areas that

⁸⁵ DLNR Catch Reports.

⁸⁶ Christie et al. (2010).

appropriate direct, indirect and cumulative impacts, whether past, present or future, can be assessed and proper levels of take determined in order to prevent harm to populations of targeted species.

Both DLNR and the DEIS assert that under the no action alternative, aquarium take outside the WHRFMA is performed by using purportedly legal nets with larger than 2 inch mesh, and therefore, small fish will not be captured at the same rates as they would be with small (less than 2 inch) mesh, because “the smaller fish would escape the larger mesh.”⁸⁷ The DEIS concludes that the impact of this scenario cannot be quantified at this time.

We understand that because catch reports do not require information on fish sizes other than for yellow tangs, it impossible to determine size-related volumes of catch in the states commercial data. However, information gleaned from the retail market provides ample evidence that fish under 2” (i.e. small enough to escape purportedly legal mesh nets) continue to be captured in very high numbers despite the prohibition on small mesh nets (see Appendix 7 for examples). Further, and as noted in Appendix A, there was no response to our questions as to the specific methods or net sizes used for ongoing collection outside of the WHRFMA.

Therefore, the DEIS wrongly concludes that in East Hawai’i, the “no action alternative would have a less than significant direct impact on reef fish populations and the reefs in which they occur.” As with the WHRFMA, a proper and thorough analysis of the impacts has not been conducted for East Hawai’i.

- 2) *“The FEA identifies the scope of the analysis as one year and states that an EA with updated data and analysis would need to be completed on an annual basis. This improperly segments the analysis which must include the long-term and cumulative impacts over time of aquarium collection.”*

The DEIS expands the scope of the analysis to 5 years. However, this time frame is too short to adequately analyze long-term and cumulative impacts over time. For example, though collection pressure has been removed from the White List species in the FRAs, populations of once heavily targeted species in those areas, such as yellow tangs, have yet to return to natural levels of abundance, as reflected in the baseline MPAs, even after 20 years of protections. For very long-lived species such as the yellow tang and other surgeonfishes heavily targeted by aquarium collection, which have lifespans measuring decades, and which may not reproduce until they are at least 5 years old, a 5-year analysis period is far too short.

⁸⁷ DEIS at 96 and 329.

- 3) *“There is no statistical analysis of population growth compared to the life span of each fish and the number of years to and size of first reproduction against which this annual proposed take can be measured for purposes of estimating sustainable take.”*

The DEIS fails to address this issue entirely, providing zero of the statistical analyses that were requested and zero reasons for not doing so. Notably those statistical analyses form the foundation of determining estimations for sustainable in the Ochavillo and Hodgson (2006) work, which is referenced throughout the DEIS concerning what constitutes “sustainable reef fish harvest”. Instead, the DEIS relies solely upon analysis of catch as % of population, which as described here, is far too flawed to be used to legitimately justify the levels of take proposed in the DEIS.

- 4) *“With regard to proposed levels of sustainable catch, using “5% to 25% annual take of estimated populations as proposed in several research papers, we note that 5% to 25% is a wide range, and the precautionary principle calls for applying the lowest estimated percentage of sustainable take in the absence of scientific certainty.”*

Here again, using the fatally flawed analysis described earlier, the DEIS summarizes that “under the Preferred Alternative, collection of any of the 40 White List species is anticipated to be below 5% of the island-wide populations.” It is to be expected that inaccurate and under-reported catch levels applied to areas far beyond the directly impacted environment will result in a greatly reduced level of impact.

The 5% to 25% annual take of estimated populations, as proposed by Ochavillo and Hodgson (2006) pertains to small finite areas, called “collection areas” where the collection activity occurs. For example, two of the Philippine collection areas that form the basis for Ochavillo and Hodgson’s work, Batasan Island and Clarin, are part of Bohol, an island with a coastline that’s 390 km long and comparable to, though smaller than, Hawai’i Island’s 428 km long coastline.⁸⁸

One area is Batasan Island, a minor island of less than 120,000 m² that lies about 6.4 km off the Bohol coast, and is part of the municipality of Tubigon, itself just 81.87 km². The other collection area is the neighboring municipality of Clarin, which has a total municipal land area of 62.79 sq. km and a coastline of approximately 6 linear km.

The Ochavillo and Hodgson total allowable catch (TAC) as % of population is based on estimated natural mortality rates for certain reef fishes in those specific areas. Furthermore, their TAC relates to fish populations in those specific small areas, not the entire island of Bohol. The DEIS erroneously takes their 5% to 25% range, applies it to species that are not included in their work, to an area that extends far beyond the

⁸⁸ Spalding and Vosseler.

proposed collection area (i.e. the WHRFMA) to encompass the entire island of Hawai‘i, an area which is orders of magnitude larger than those used by Ochavillo and Hodgson.

- 5) *“We also note that there are no bag limits for most species, and that the fishery as currently regulated does not limit the number of permits, so that the annual take as a percentage of estimated population could rise significantly. Alternatives of overall annual take limits, a limited entry aquarium fishery program, and restrictions including full moratoria on the take of herbivores, species of special concern, and species evidencing severe population declines have not been proposed or analyzed.”*

The DEIS does not address this issue. The Preferred Alternative includes limited issuance of permits in this instance, but nothing prevents others from pursuing additional permits for themselves. Other than a reduced bag limit for Achilles tang, nothing more is proposed or analyzed.

- 6) *“The FEA asserts that certain types of fish such as Psychedelic Wrasse, Tinker’s Butterflyfish, and Fisher’s Angelfish inhabit waters deeper than the CREP monitoring studied, resulting in populations being underestimated and thus the annual take as a percentage of estimated population being overestimated.”*

The inclusion of these species on the state’s species of concern list indicates a heightened need for an accurate and thorough assessment of their populations.⁸⁹ As noted earlier, the annual take as a percentage of estimated population should factor under and non-reporting and should apply to the areas where direct impacts occur. Reporting sub-zones would represent the largest area that might be considered appropriate, however more specific areas would be the most appropriate (e.g. bays, reefs, and depth ranges). Allowing limitless take under the Preferred Alternative is contrary to DLNRs conservation actions identified for these species which includes protecting current populations and establishing further populations to reduce the risk of extinction.⁹⁰

- 7) *“In addition, we note the proposed alternatives for reduction in bag limits for Achilles Tang, but do not see a scientific basis for concluding that the proposed reduction would be sufficient to sustain the population.”*

The DEIS fails to address this issue entirely. Reducing the Achilles tang daily bag limit from 10 to 5 would do nothing to prevent further depletion, and extirpation of these important species. In 2014 a bag limit of 10 Achilles Tang per day was imposed on the aquarium trade in an attempt to address declining populations in West Hawai‘i. Since 2014, the Achilles tang market price has increased, while populations have decreased.

⁸⁹ DLNR, SWAP (2018).

⁹⁰ DLNR, SWAP (2018).

The outer possibilities of what the permits would allow must be considered. A cursory analysis of the Preferred Alternative and the data presented in the DEIS shows that 14 permittees taking 5 Achilles tang per day equates to 25,550 fish. This amount exceeds to total population estimate in the WHAP surveys in the 30'-60' range and is 11% of the island-wide population under the CREP estimates. Combined with the limitless take allowed by aquarium collectors in East Hawai'i, and the pressure from food fishers, the cumulative impact on this important species is extreme.

- 8) *“Cultural impacts of aquarium fishing need significantly more analysis than provided in the FEA. The OEQC guidelines should be followed for assessing cultural impacts, including consulting with traditional cultural practitioners and other knowledgeable informants and sources about cultural resources, cultural practices, and the proposed action’s potential impacts. Traditional Hawaiian practices and subsistence uses, local place-based and life-cycle knowledge, and traditional Hawaiian cultural significance of each type of aquarium fish taken should be reviewed. The indirect impact of modern technologies for highly efficient catch methods on traditional harvest capabilities should be included in the analysis.”*

As extensively noted herein, the DEIS’ Cultural Impact Assessment (CIA) is extremely flawed and inadequate, with its inherent purpose-- to identify cultural impacts and propose mitigations measures to limit such impacts, not being met.

- 9) *“Enforcement and compliance needs and challenges are key factors in the effectiveness of fisheries management, and should be analyzed as part of the environmental impact statement.”*

The DEIS fails to address this issue, citing only an unreliable claim regarding so-called “catch report validation” that did not indicate substantial underreporting of catch by aquarium collectors. DLNR is well aware of the major gaps and flaws in their reporting system that facilitates any amount of under and non-reporting. Additionally, an important avenue for validation, tallies of the species and their numbers leaving the state via air cargo, which are required by federal law, are not being provided, exposing both aquarium trade members and air cargo carriers to violations of the federal Lacey Act.⁹¹

Furthermore, the DEIS fails to analyze other significant gaps in enforcement and compliance, as we, too, spelled out in our comments to the Applicant/Stantec, responding with a single sentence, “enforcement is within the purview of the State of Hawai’i.”⁹²

⁹¹ U.S. Fish and Wildlife Service (2019).

⁹² DEIS at 474 and 483.

10) *“We appreciate that as an applicant action, the applicant can propose but not ensure regulations aimed at protecting and restoring populations of aquarium fish. We are interested in proposals for self-regulation by aquarium permit holders which could be incorporated into permit conditions even in the absence of or prior to establishing other regulations to accomplish the same purposes.”*

The DEIS fails to address this issue, providing no proposals for self-regulation that could be incorporated into permit conditions.

11) *“Overall, we appreciate that certain alternatives have been proposed, but believe they are more appropriately proposed as mitigation measures in an environmental impact statement to mitigate potential environmental impacts, rather than as alternatives in an environmental assessment, which, if implemented, might result in a finding of no significant impact. The Department of Land and Natural Resources is obligated to ensure full analysis under HRS Chapter 343 of potential environmental impacts of its actions in issuing aquarium permits. We believe this is most appropriate in an environmental impact statement.”*

The DEIS fails to address this issue and proposes no mitigation measures because their flawed analysis concludes there are no significant impacts to mitigate.

IV. Further Impacts Inadequately Analyzed

Environmental impacts from aquarium trade activities have been documented for over forty years. Under the Preferred Alternatives, every fish and marine creature, other than corals and those associated with live rock, could be removed from one, or all, of the State of Hawai‘i’s reefs—with catastrophic effects. This is not speculation: there is currently no law, regulation or enforcement capability that would prevent this from occurring. The potential for unlimited collection is a fact that encompasses the outer limits of what the aquarium permits allow, as was explained earlier.

Collecting individual species in high numbers poses a significant threat to coral reef health. As explained herein, herbivorous species, such as Yellow Tangs and Goldring Surgeonfishes, are the most heavily targeted.⁹³ Herbivorous fish are essential to avoid algal overgrowth of corals and concomitant degradation of the reef. Other important functional groups include: planktivores (e.g. Hawaiian Dascyllus), corallivores (e.g. Fourspot Butterflyfish, Multiband Butterflyfish), fish predators (e.g. Hawkfishes, Hawaiian Lionfish) and cleaner fishes (e.g. Hawaiian Cleaner Wrasse).

The reduction of natural populations of species taken by the aquarium trade in any area (e.g. specific site, zone, coastline, island or statewide), and by any amount, whether one or one hundred percent, indicates an irrevocable commitment and loss of a natural and cultural resource.⁹⁴ This

⁹³ DLNR Catch Reports.

⁹⁴ Haw. Rev. Stat. § 11-200-12(b)(1).

very loss curtails the range of beneficial uses that would otherwise be provided by the natural abundance of these populations.⁹⁵

We disagree with the DEIS response to our comment above that “this is not an irrevocable action, as commercial aquarium permits may be suspended pursuant to HAR 13-74-3(1) if the department determines that it is necessary for the protection and conservation of aquatic life. In addition, fish will continue to reproduce.” As previously stated, any and all substantial reductions in natural abundance of White List species in West Hawai‘i indicate lost natural and cultural resources. While it may be true that a potential *revocable* loss may be indicated by increasing populations of some White List species when aquarium collecting is halted, such as occurred for yellow tangs in the FRAs after their establishment in 2000 and in the open areas after collection was prohibited in 2018, there is no evidence that natural abundance will ever return. The reduced populations of yellow tangs in the FRAs, compared to baseline, natural populations found in the MPAs, even after 20 years of no aquarium collecting, is further evidence of an irrevocable loss that has occurred.

As has been long recognized,

The impact of commercial aquarium fish collecting is a complicated issue. The fish community members are highly dependent on one another. There is a constant interaction between predators and competitors, as well as other members of the food web. There is a lot of variability in the system, even when it is not disturbed by man. Reefs seem to undergo natural cycles. At times they may be very abundant. There is also natural variation in the fish community at different locations.⁹⁶

The DEIS fails to assess the high aesthetic value of this beautiful marine life as well as impacts to the complex relationships inherent in coral reef ecosystems and impacts to overall coral reef health. “Animal communities” are included in the rule definition for “environment,” however the EIS excludes any mention of the impact to fish and invertebrate communities, or the impact to the animals themselves.

The Hawai‘i State Wildlife Action Plan (SWAP) states that “Excessive extractive use constitutes a threat to wildlife. Certain reef fishes are harvested for sale in the aquarium trade . . . These activities are not sustainable on a large scale and impact native wildlife.”⁹⁷

A. General Impacts on Targeted Species

The list of species of greatest conservation need includes at least 18 native fish species that are threatened by the aquarium trade and in need of conservation actions to reduce the risk of extinction (depicted in Fig. 3).

⁹⁵ Haw. Rev. Stat. § 11-200-12(b)(2).

⁹⁶ Noland (1978).

⁹⁷ DLNR, SWAP (2018).

Fig. 3. Native fish species threatened by the aquarium trade.⁹⁸

Butterflyfishes are among the most beautiful of coral reef fishes (see Fig. 4). Their bright yellow, white and black markings are especially striking against pale corals and deep blue waters. When encountered by snorkelers/divers the beauty of these species is often breath-taking. They are heavily targeted by the aquarium trade in Hawai'i. In 1976 five of the top ten most collected species were butterflyfish (see Fig. 5).⁹⁹

Fig. 4. Most heavily targeted butterflyfishes on Hawai'i reefs, statewide: Fourspot Butterflyfish, Longnose Butterflyfish, Teardrop Butterflyfish, Forcepsfish, Multiband/Copperband Butterflyfish.¹⁰⁰

Fig. 5. Five butterflyfish species were among the top ten marine aquarium fishes collected in 1976, statewide.¹⁰¹

Reported aquarium harvest of those same five species has since plummeted (see Fig. 6). The same is true for other heavily targeted butterflyfish species that have been among the top twenty aquarium fishes collected by the trade since 1976.¹⁰²

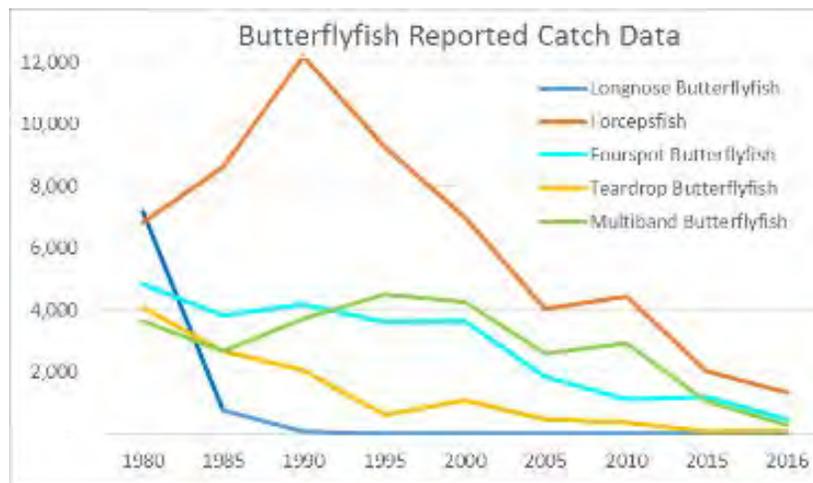

Fig. 6. DLNR reported harvests of the five most heavily targeted butterflyfish species since 1976. Data represents statewide annual average catch over five-year periods.¹⁰³

¹⁰¹ Katekaru (1978).

¹⁰² DLNR Aquarium Catch Reports.

¹⁰³ DLNR Aquarium Catch Reports.

This sharp decline in reported catch is not an indicator that these species are no longer in demand. Continuing demand is confirmed by several examples:

- These species' inclusion in the West Hawai'i White List.
- Their exclusion from the O'ahu rules.
 - The O'ahu aquarium rule prohibits take of three butterflyfishes, citing their "coral diets" as the need for the restriction.¹⁰⁴ Since 1999 total reported take of those three species was 50 fish.¹⁰⁵
 - Zero restrictions were provided for three additional coral eating butterflyfishes, with total reported take of over 51,000 individuals since 1999.¹⁰⁶
- The Fourspot Butterflyfish catch increase that followed the 2014/2015 warming event and unprecedented fish bloom.¹⁰⁷ Subsequently, catch of the Fourspot Butterflyfish declined to an all-time low.¹⁰⁸

The EIS fails to use a temporal baseline that captures the impacts of the heavy collection pressure on these species over time, before their natural populations were depleted by this activity.

B. Damage to Reef Habitat

In nearly every encounter with commercial aquarium collectors on West Hawai'i reefs, snorkelers and divers have witnessed and documented destructive practices that harm corals, with the most damage coming from vessel anchors and chains. Sticks, buckets, nets, underwater propulsion devices (scooters) are laid in the corals and the fins, knees and legs of collectors often come in contact with the reef—in fact, they are typically described as "crawling across" or "standing" on the corals. The results of these actions include abrasion and coral breakage. Both FEAs refer to a study that determined there was no evidence to indicate the presence of destructive fishing practices (e.g. breaking apart corals to capture hiding fishes).¹⁰⁹ However, the abundance of photographic evidence documenting coral breakage from vessel anchoring and fish capture activities, these impacts cannot be dismissed and must be evaluated in the EISs. Photographs of these practices and their effects can be found at Appendix 3.

Abundant coral reefs—put at risk by the Preferred Alternative—have a range of beneficial uses. The DEIS fails to adequately assess the curtailment of "the range of beneficial uses of the environment."¹¹⁰

C. Examples of Impacts in Various Hawai'i Island Regions

Baseline fish population data from the 1970's at Honaunau in West Hawai'i were compared to data gathered in surveys conducted 1998 – 2001. The results indicated that nearly all small bodied surgeonfish, butterflyfish and angelfish (i.e. species targeted by the aquarium trade) declined in abundance. Commercial aquarium collecting was implicated in the decline (see Fig. 9).¹¹¹ Similar results were found at Ke'ei where the site had been intermittently surveyed since 1979.¹¹²

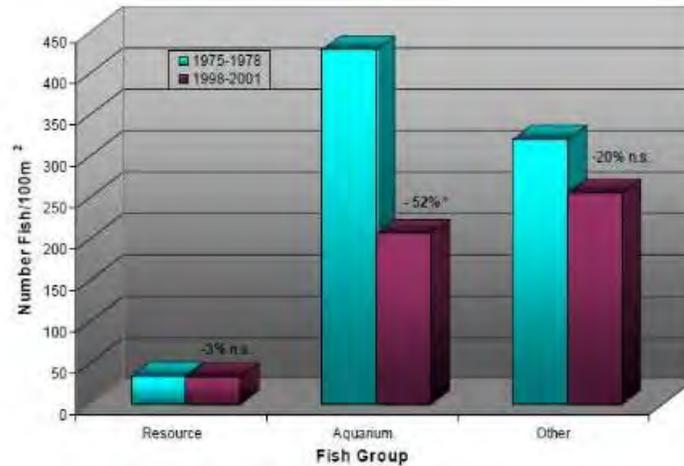

Fig. 9. Comparison of various fish functional groups at Honaunau over two survey periods.

***= $p < 0.05$, t-test. ¹¹³**

“Of the 20 most collected aquarium species, 18 declined in abundance with the species facing the heaviest fishing pressure typically showing the greatest declines.”¹¹⁴

In addition to documenting the impact of aquarium collecting in these areas, these studies also document baselines for abundance levels of aquarium targeted and other impacted species. Examinations of reported catch, as documented by DLNR, serve to further highlight the impacts of the trade.¹¹⁵ The documentation shows that the initial surveys were conducted during a time when the aquarium trade reported taking fewer than 50,000 fish annually from West Hawai'i reefs. In subsequent years, from 1987 to the final surveys in 2001, reported aquarium fish catch in West Hawai'i ranged between 150,000 and 300,000 individuals taken. Since then the annual West Hawai'i aquarium fish catch has ranged between 250,00 and >450,000 fish. Additionally, with the closure of approximately 32% of the reefs in West Hawai'i with the implementation of the FRAs in 2000, this increased fishing pressure was focused in smaller areas with likely intensified results.

¹¹¹ Williams & Walsh (2007).

¹¹² Williams & Walsh (2007).

¹¹³ Williams & Walsh (2007).

¹¹⁴ Williams & Walsh (2007).

¹¹⁵ DLNR (2014).

Another long-term study looked at reefs in South Kohala and determined that reef fish abundance was in “drastic decline” and reefs were in “dire straits”.¹¹⁶ Populations of all of the top five most abundant fish families had declined since the original surveys conducted in 1979-1981 (see Fig. 10). Thirty-one of the thirty-five most abundant fish species had declined, including 19 species targeted by the aquarium trade. Most of the aquarium targeted species had declined by more than 50% and many were down by more than 80%.¹¹⁷ The extent to which the massive increase in reported take has contributed to this decline was not studied in the DEIS.

As the Applicant noted in the FEAs’ responses to this comment, the “Dire Straits” report concluded that “the widespread declines in families of fish not typically targeted either for food use or for the aquarium fishery suggest that other, more widespread factors are *additionally* contributing to the overall long-term declines in fish abundance.”¹¹⁸[emphasis added] Rather than rebutting the argument that further analysis is needed, this statement only served to highlight why the DEIS needed to *also* evaluate the potential of cumulative impacts of other factors (e.g. pollution, and sedimentation) on targeted fish species, such as decline of coral coverage, which have been demonstrated to influence reef fish species diversity and abundance.¹¹⁹ Here, too, the flawed analyses failed to accurately identify impacts.

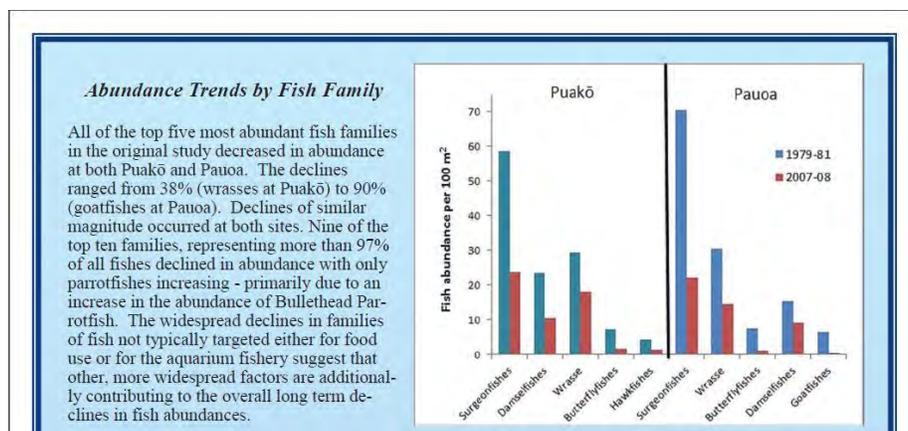

Fig. 10. Drastic declines of the most abundant fish families at two South Kohala Reefs.¹²⁰

The areas south of these reefs are subject to some of the most intense aquarium collecting pressure in the state. Aquarium take between Keahole Point and these reefs in South Kohala, in one year alone, exceeds the aquarium take from the entire Great Barrier Reef in Australia, which has a reef area that is 300 times larger than Hawai‘i’s. For example, in 2014 aquarium collectors reported

¹¹⁶ Walsh (2013).

¹²⁰ Walsh (2013).

taking 191,083 fish from this Hawai'i zone.¹²¹ By comparison, 2014 reported aquarium take from the Great Barrier Reef was 112,000.¹²²

Abundant populations of herbivorous fishes are critically important to coral reefs. They keep algae from overgrowing corals or preventing new corals from starting. Important families of herbivorous fishes in Hawai'i include surgeonfishes, damselfishes and parrotfishes. The vast majority of fishes taken by the aquarium trade are surgeonfishes. Yellow Tangs are the dominant herbivore in West Hawai'i.¹²³ They are also the most heavily collected species. The Dire Straits study documented a 90% decline in herbivorous surgeonfish and damselfish populations, while parrotfish populations had actually increased over time.¹²⁴

This aforementioned 90% decline in herbivores contributed to a 35% reduction in coral cover, a 64% reduction in coral building coralline algae, a 38% increase in algae at one site and a staggering 322% increase in algae at another. DLNR claims that parrotfishes are more important herbivores than surgeonfishes when it comes to keeping algae in check on coral reefs.¹²⁵ On these South Kohala reefs, the increased parrotfish populations were not enough to offset the loss of surgeonfishes and damselfishes, and the algae still outcompeted the corals. The notion that surgeonfishes taken by the aquarium trade are not an important component to coral reef health is challenged by this study.

The DEIS attempts to downplay the importance of surgeonfishes and other herbivorous fishes taken by the trade by citing a 2003 study by Tissot and Hallacher (described more in the next section) that found no evidence of increased macroalgal growth in areas of collection versus areas without collection, despite reduced fish abundance in the collected areas.¹²⁶ However, the authors concluded that the study may not be a good test of that hypothesis for several reasons, including that most surgeonfishes taken by aquarium collectors consume filamentous algae, not macroalgae, and that further investigation is warranted.¹²⁷

Further, a more recent assessment of ecosystem trends in West Hawai'i includes, among other data, the differences in herbivore biomass and coral cover between reefs on the northern portion of the West Hawai'i coast (which encompasses the South Kohala area described above and extends from Keahole Point, northward) and reefs on the southern portion (from Keahole Point, southward).¹²⁸ The data shows that herbivore biomass in the north is significantly lower than that found on the south.¹²⁹ Additionally, while the northern reefs are now dominated by algae, and coral cover has declined by ~30%, the same not true for the southern reefs.¹³⁰ Notably, though the northern area is

~33% smaller than the area to the south, catch reports do not indicate a corresponding reduction in take. In fact, in 2014 take was higher in the north than in the south.¹³¹ The extent to which heavy collection pressure in the north has contributed to this shift was not addressed in the DEIS.

The DEIS also attempts to downplay the importance of herbivores taken by the trade by claiming that they target the smaller fish which are “the least effective sizes for cropping algae.”¹³² However, research shows that these fish play key roles:

- “The degree of change that a herbivore or group of herbivores can impose on a system is determined by several factors, including the intensity of the bite size, the number of bites and the number and type of each grazer in the system.”¹³³
- Research on Maui shows that more herbivorous fishes on the reef, even those that are smaller bodied, equates to “more mouths on the algae.”¹³⁴
- In addition, a comparison of adult Yellow Tang densities in the West Hawai‘i long-term protected areas (i.e. MPAs) vs. the Open Areas, shows that collection pressure on small, juvenile, Yellow Tangs has reduced the natural abundance of sub-adult and adult yellow tangs, which are 2 – 4 times larger than juveniles, by an average of 60%.¹³⁵

The fact remains that algae now dominates many West Hawai‘i reefs, but the DEIS failed to accurately evaluate Applicant impacts that occur as a result of reduced herbivory.

D. Examples of Impacts to Species

Two peer reviewed studies documented the magnitude of the effect of aquarium collecting on natural populations of heavily targeted species by the aquarium trade. One, published in 2003 by Tissot and Hallacher, was conducted the two years prior to the establishment of the West Hawai‘i Fish Replenishment Areas (i.e. aquarium no-take zones).¹³⁶ The next study, by Tissot, et al., was conducted in 2000-2002, three years after those area closures.¹³⁷ The results of each study showed that aquarium collectors have a significant effect on the abundance of targeted aquarium fishes (see Fig. 11).

Mean estimates are compared with the study of Tissot and Hallacher (2003), which estimated the effects of aquarium collectors on these species in a previous study in West Hawai'i.

Fig. 11. Effects of aquarium collecting on nine heavily collected aquarium species. Significant declines, ranging from 14% - 97%, were seen in 7 of 9 species.¹³⁸

The U.S. Coral Reef Task Force described these results as follows: “Severe overfishing for aquarium trade occurs even in the United States: Aquarium fishes outside of reserves [in West Hawai'i] experience significant declines – from 14% to 97%.”¹³⁹

In a 2010 grant report to NOAA, DLNR documented that “a number of aquarium-targeted species have not responded to the increase in protected areas and have actually decreased in West Hawai'i since 1999” (see Fig. 12).¹⁴⁰ Per DLNR aquarium catch reports, these species are also among the top 20 most harvested fishes. Nonetheless, all but two species, the Moorish Idol and the Hawaiian Cleaner Wrasse, were included in the West Hawai'i 40 Species White List adopted in 2014. DLNR therefore calls for the continued harvesting of these species, despite knowing that their populations are in decline.

¹⁴⁰ Walsh et al. (2013).

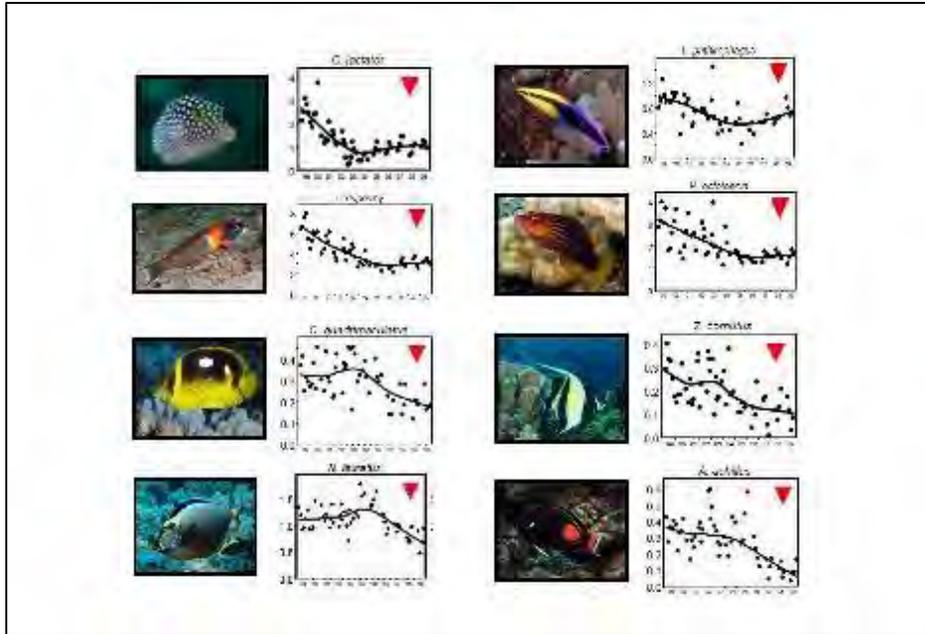

Fig. 12. Example of some targeted aquarium species that failed to respond to FRA's and had decreased along the West Hawai'i coastline from 1999 - 2010 (x-axis = year; y-axis = # 100 sq. meters).¹⁴¹

Three species identified in the SWAP, the Bandit Angelfish, Bluestripe Butterflyfish, and Hawaiian Turkeyfish Figure 4 (in gold outline) were included in a DLNR presentation on West Hawai'i Species of Special Concern (Fig. 3) where two were described as routinely seen in the 1970's and now very rare, and one was described as down by 99% in two different areas.¹⁴²

In West Hawai'i the decline of butterflyfishes has been well-documented in both population surveys and aquarium catch data. A 2008 presentation on West Hawai'i aquarium species of special concern reported declines in butterflyfish abundance and diversity.¹⁴³ Two species were particularly hard hit: the Bluestripe Butterflyfish and the Teardrop Butterflyfish, experienced population declines ranging from 89% - 100% in two West Hawai'i areas (see Fig. 13).

Fig. 13. Aquarium trade impacts to heavily targeted butterflyfishes and other species in West Hawai'i.

The Bluestripe Butterflyfish is a highly unique, endemic Hawaiian species that, having no sister species elsewhere in the Indo-Pacific, is also known as a relic (see Fig. 14).¹⁴⁴ Until 1980, this species was among the top twenty fishes collected in West Hawai'i, with an annual average harvest of 347.¹⁴⁵ By 2012, the last year this species appeared on West Hawai'i catch reports, reported harvest had dropped to a total of nine.¹⁴⁶ This species was excluded from the West Hawai'i forty species White List which went into effect in 2014.¹⁴⁷

Fig. 14. Relic species, Bluestripe Butterflyfish (Photo courtesy of Lynn Allen).

¹⁴⁵ DLNR Aquarium Catch Reports 1976 – 2005.

¹⁴⁶ DLNR Aquarium Catch Report for 2012.

¹⁴⁷ See HAR. § 13-60.4-7.

The 2015 Hawai'i SWAP lists the Bluestripe Butterflyfish among the species of greatest conservation need. Threatened by the aquarium trade, conservation actions include to “protect current populations, but also to establish further populations to reduce the risk of extinction.”¹⁴⁸

According to DLNR reef surveys and catch data, the Teardrop Butterflyfish has also experienced drastic declines on West Hawai'i reefs (see Fig. 13). This beautiful species is named for the striking upside-down black teardrop located mid-body (see Fig. 4).

Until 1980, the Teardrop Butterflyfish was among the top ten fishes collected in West Hawai'i with an average annual harvest of 1,454 individuals (see Fig. 15).¹⁴⁹ During the following five years, the harvest rate dropped, but it was still among the top twenty species collected (see Fig. 15).¹⁵⁰ Though collection continued until at least 2013, by the late 1990's DLNR considered Teardrop Butterflyfish as no longer targeted by the aquarium trade and excluded them a list of aquarium targeted species provided to researchers, Brian Tissot and Leon Hallacher, who were embarking on a project to document the magnitude of the effect of aquarium collecting on natural populations.¹⁵¹ They were, however, included in the surveys to test assumptions since they were similar to targeted species.¹⁵² The researchers encountered just one individual Teardrop Butterflyfish during the entire study and so they were excluded from further analysis.¹⁵³

Taxa	1980	1985	1990	1995	2000	2005
Bluestripe Butterflyfish	347	85	269	77	58	12
Teardrop Butterflyfish	1,454	185	508	158	204	185

Fig. 15. Adapted from DLNR Hawai'i Island reported catch data for top 20 aquarium species. Data represents statewide annual average catch over five-year periods.

In 2011 a group of divers encountered an aquarium collector at a popular North Kohala dive site. They watched in horror as the collector scooped up the first Teardrop Butterflyfish they had seen in that area in years along with a number of Yellow Tangs and other fishes (Fig. 16).¹⁵⁴ In 2013, the last year Teardrop Butterflyfish appeared on aquarium catch reports, reported take had dropped to a total of ninety, reflecting a 99% drop in annual catch since 1980.¹⁵⁵ This species was excluded from the West Hawai'i forty species White List which went into effect in 2014.

¹⁵⁵ DLNR Aquarium Catch Report for 2013.

Fig. 16. Teardrop Butterflyfish captured by an aquarium collector on a North Kohala Reef (photo courtesy of Brooke Everett).

The exclusion of any formerly collected species from the White List, such as the Bandit Angelfish, Bluestripe Butterflyfish, Hawaiian Turkeyfish, Teardrop Butterflyfish, or Thornback Cowfish, is not an exemption for a thorough analysis of their current status within the West Hawai'i Regional Fishery Management Area (WHRFMA) and elsewhere on Hawai'i Island, compared to the baseline (i.e. historic natural abundance)..

The aquarium fishery in West Hawai'i takes 1.8X more reef fish than recreational and other commercial fishing combined. Most of these fish are Yellow Tangs.¹⁵⁶

“Overall Yellow Tang abundance in 30'-60' hardbottom habitat in West Hawai'i increased by 355,758 individuals from 1999/2000 to 2010-2012 even though Yellow Tang abundance in the Open areas decreased by 21%. This decrease is attributable largely to an increase in the number of aquarium collectors and collected animals relative to the period when the FRAs were established.”¹⁵⁷

Over sixty percent of West Hawai'i reefs are open to the aquarium trade. On the reefs in those areas, the impact of the aquarium trade on natural populations of Yellow Tangs has been a significant reduction in the abundance.¹⁵⁸ For example, natural populations were reduced by over 75% in 2007-2009 and in recent years, by 60% (see Fig. 17). The increase in FRA Yellow Tang abundance that began in 2002, three years after establishment of these protected areas, is a clear example of the impact of the trade on natural populations: when collection pressure is removed, given enough time, populations may be able to rebound. As noted earlier, the overall increase in Yellow Tang abundance that has occurred since 2014 is due to an anomalous recruitment pulse that coincided

¹⁵⁶ DLNR (2014).

¹⁵⁷ Walsh et al. (2013).

¹⁵⁸ Tissot & Hallacher (2003); Tissot et al. (2004); DLNR (2014).

with warming waters in 2014.¹⁵⁹ Typical recruitment pulses, such as those that occurred in 2002 and 2009, have resulted in short-lived increases in fish populations that were followed by prolonged or short and steep population declines (see Fig. 17).

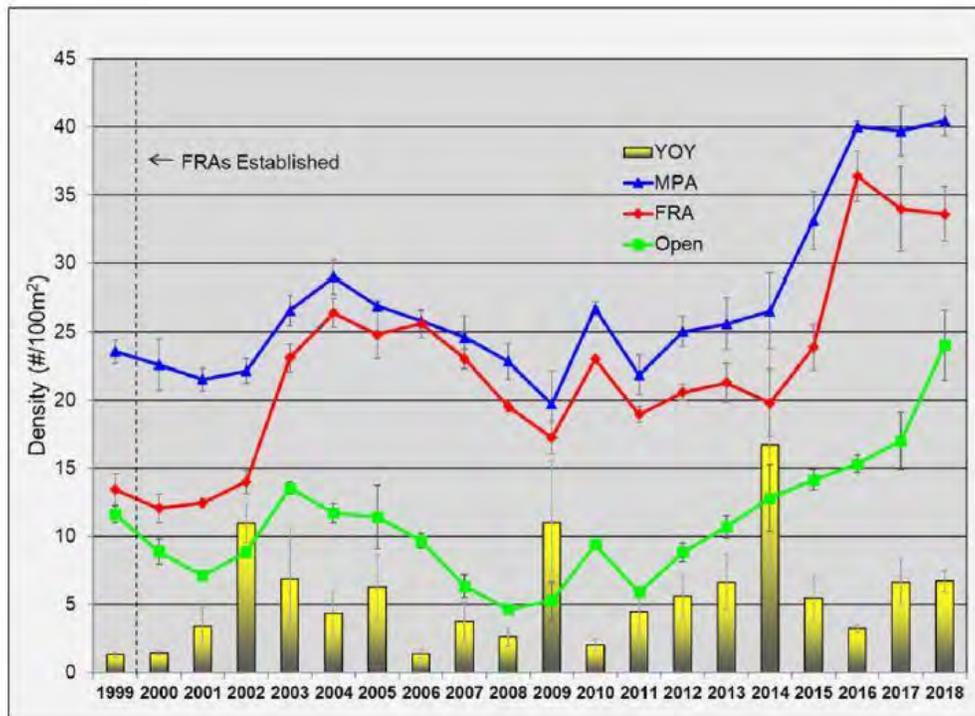

Fig. 17. Overall changes in Yellow Tang abundance 1999-2018. As shown by the large gap between the green line (areas open to the aquarium trade) and blue line (long term protected areas which serve as a proxy for natural abundance), millions of Yellow Tangs are missing from West Hawai'i reefs.¹⁶⁰

E. Failure to Assess Impacts to Aesthetic Value

In addition to the impacts to biodiversity, ecosystem function, and other fisheries, aesthetic and other social values are also heavily impacted.¹⁶¹ Species experiencing the heaviest collection pressure, with a corresponding reduction in natural abundance, are Hawai'i's most beautiful, charismatic and iconic fishes. The diminished aesthetic value from the cumulative and substantial reductions in species such as Yellow Tangs, butterflyfishes and Moorish Idols, which are dominated by vibrant yellows and oranges and striking white and black patterns, cannot be overestimated (see Fig. 7).

¹⁵⁹ Gove et al. (2016).

¹⁶⁰ DEIS at 101.

¹⁶¹ Walsh, Background on Proposed Hawai'i Administrative Rule 13-60.4 (2013).

Fig. 7. Reefs lacking yellow and orange fishes are greatly diminished in beauty.

These colors are more than aesthetically pleasing, as our eyes are physiologically attuned to them. The frequencies and wavelengths of yellows, oranges and reds allow them to strike our eyes much faster than the other colors.¹⁶²

By removing the species with prominent yellow, orange, red or white coloration and markings, the palette and very essence of what makes a coral reef beautiful to the human eye is diminished and degraded. It is impossible to decrease populations of a coral reef's beautiful wildlife without greatly decreasing the natural beauty of the place. Divers who have frequented these coral reefs, such as some of the Commenters, have noticed decreased abundance of colorful fish in recent years. The DEIS fails to address these cumulative losses and propose proper mitigation measures.

E. Failure to Assess Impacts to Property/Amenity Value

The DEIS fails to acknowledge and address the effects of the trade on the amenity/property values and propose proper mitigation measures. Houses that are within a block or 100 meters of beautiful, clean and healthy coastlines, beaches and coral reefs are more valuable and sell for significantly higher prices than comparable properties elsewhere. The same is true for condos and hotels/hotel rooms which generally command higher room and occupancy rates. Healthy coral reefs are also more likely to prevent beach erosion and, therefore, add value as a form of coastal protection. One and a half percent of the sale price of these properties is attributable to the marine ecosystem. Hawai'i's reef-related property value in 2001 was calculated at \$40 million.¹⁶³

G. Failure to Assess Impacts to Recreational Value

The DEIS fails to acknowledge and address the effects of the trade on the recreational value of this marine life and their coral reef homes and propose proper mitigation measures. The annual estimated expenditures related to marine life viewing (i.e. snorkeling and scuba) in Hawai'i is \$551 million. Reef-adjacent marine tourism expenditures (including hotel rooms) within 30 km of the coastline are an annual \$680 million.¹⁶⁴

¹⁶² Slembrouck (2011).

¹⁶³ Cesar et al. (2002).

¹⁶⁴ Spalding (2017).

These amounts exclude the lost value from declining fish abundance which is captured in willingness to pay surveys and summarized below:

- Healthier reefs lead to substantial economic gains.
 - Recreational users are willing to pay higher rates for a healthier marine environment.¹⁶⁵
 - Snorkel/dive businesses benefit when there are more fish for their clients to see.¹⁶⁶ One recent study showed divers were willing to pay \$93 to \$110 more to dive with abundant fish life.¹⁶⁷
- Without new regulations the potential for increasing losses is real.
 - Inability to stem declining reef fish numbers could cause significant losses to dive tourism industry (i.e. reductions in willingness to pay).¹⁶⁸
 - These consumer surplus losses could range from \$1.2 million to \$12.2 million annually.¹⁶⁹
 - Areas with degraded reefs and low fish populations could also see significant losses from a decrease in their share of the global dive market.¹⁷⁰
 - Anecdotal reports from long-time residents and visitors point to revenue loss already occurring from reduced abundance of beautiful fishes on Hawai'i reefs.

H. Failure to Assess Impacts to Passive Use Value

The DEIS fails to acknowledge and address the effects of the trade on the substantial non-use values of this marine life and their coral reef homes and propose proper mitigation measures. Intrinsic and social values associated with coral reefs are diminished by reduced fish populations. Concern for the marine environment has increased in recent years and people now place tremendous value on coral reef ecosystems. Many people value beautiful and healthy coral reef ecosystems as part of their legacy and responsibility to ensure future generations are able to experience them. A 2011 report for the National Oceanic and Atmospheric Administration (NOAA) estimated the passive use annual value of Hawai'i's coral reef ecosystems through a willingness to pay survey of U.S. households. The survey included a visual representation of an overfished and an abundant coral reef (see Fig. 8).

¹⁶⁵ Davidson et al. (eds.) (2003); FORCE Management Brief #4 for Caribbean Reef Management (P7/2007-2013).

¹⁶⁶ Davidson et al. (eds.) (2003).

¹⁶⁷ FORCE Management Brief #4 for Caribbean Reef Management (P7/2007-2013).

¹⁶⁹ FORCE Management Brief #4 for Caribbean Reef Management (P7/2007-2013).

¹⁷⁰ FORCE Management Brief #4 for Caribbean Reef Management (P7/2007-2013).

Fig. 8. Survey excerpt: NOAA Economic Value for Protecting and Restoring Hawaiian Coral Reef Ecosystems.¹⁷¹

The project determined that increased protections and restoration of degraded coral reefs in Hawai'i is worth about \$288 to the average U.S. household which aggregated over all U.S. households amounts to a \$34 billion annual passive use value for Hawai'i's coral reefs.¹⁷² This and other socio-economic values described here provide meaningful insights into the public's concerns and should be addressed in a comprehensive DEIS.

I. Failure to Assess Impacts to Aquatic Life Post Capture

A major factor that drives the rates of collection is premature mortality rates in captivity. According to a long-time industry insider, most Yellow Tangs die with the first month in a hobbyist tank and fewer than 1% of those captured survive one year in captivity.¹⁷³ A 2012 study determined that mistreatment in capture, handling, transport, and holding plays a larger factor in these premature deaths than hobbyist inexperience.¹⁷⁴ Hawai'i's Yellow Tang ranks among the top ten fish sold in the marine aquarium trade.¹⁷⁵ As such, it was prominently featured in the study, in both the consumer survey, as one of the nine fish species featured, and in the supply chain analysis, as one of the eighty-five species analyzed which included eleven other species that are captured both in Hawai'i and elsewhere in the Indo-Pacific.¹⁷⁶ The researchers also determined that each step in the supply chain significantly profits from customer purchases to replace fish that die prematurely, and

¹⁷¹ Bishop et al. (2011).

¹⁷² Bishop et al. (2011).

¹⁷³ Fenner, FAQs About Yellow Tangs 4; Fenner. Marine Life Use in the Aquarium Hobby.

¹⁷⁴ Cartwright et al. (2012).

¹⁷⁵ DLNR Aquarium Catch Reports; Rhyne et al. (2015).

¹⁷⁶ Cartwright et al. (2012).

that profits from replacement fish sales are so high, stores have no incentive to take action to reduce deaths.¹⁷⁷

A number of practices frequently utilized as cost saving measures by the aquarium trade in Hawai'i are inhumane and significantly contribute to the stressors that accumulate and ultimately lead to premature deaths of captive marine life. They include rapid surfacing and subsequent use of a technique known as "fizzing" to mitigate the resulting barotrauma injury to swim bladders; starving fish for 2 - 10 days prior to transport and spine cutting. Alternatives to these practices include slow surfacing, transport in larger volumes of water to dilute any waste produced by fishes during transport, and transport in hard plastic containers that cannot be punctured by fish spines.

Every fish that dies early puts extra pressure on natural resources because of the take of replacements. There is a general consensus in many countries that it is not ethical to trade in live animals, unless their health and welfare are ensured. These unnecessary and early deaths have given the trade a poor image. A \$20 million, multi-stakeholder reform effort failed, in part, because of trade reluctance to address, and take steps to reduce, mortality rates.

Fifty percent of species among Hawai'i's historical top 20 fish list are either not guaranteed to arrive alive or stay alive longer than 7 - 14 days when purchased from online or "brick and mortar" retailers. Examples are found in Appendix 4.

The DEIS erroneously excludes an analysis of impacts to fish and other aquatic life once they are taken, stating "because population effects have already occurred once an individual fish has been removed from the ocean, it is beyond the scope of this analysis to evaluate effects on individual fish once they are removed from the population." One of the core requirements of the aquarium collection statute, HRS § 188-31 is that aquatic life taken under the permit is maintained alive and in reasonable health. Aquarium catch reports capture presumed mortalities between capture and sale to marine dealers and indicate that an average of 3% of captured fishes die at this stage of the chain of custody. Self-reporting by a handful of wholesalers report that up to 2% more die while in their custody and an additional 1% - 2% die in air cargo transport. Wholesalers receiving fish from Hawaii report a similar "dead on arrival" rate, and note that the industry standard is to allow up to 5% to arrive dead with no charge-back to the shipper for losses.

Per Appendix A, the Applicants failed to respond to any questions regarding mortality rates. In order to fulfill its statutory duties to exercise discretion in granting permits, DLNR needs the average and maximum annual mortality rates for fish taken by the 14 fishers. Without this information the state has no way of assessing whether these permittees are responsible aquarium collectors that deserve these exclusive privileges. Furthermore, the public needs this information, as well, which is one of many reasons why withholding the identity of the 14 fishers is unacceptable.

V. Flawed Analysis of Cultural Impacts and Lack of Proposed Mitigation Measures

As set forth in HAR §§ 11-200-10 and -16 through -18, a complete analysis and discussion of impacts to cultural resources is required. The EIS must acknowledge and address the direct,

¹⁷⁷ Cartwright et al. (2012).

indirect, and cumulative impacts on cultural resources. The loss and harm caused by the irrevocable commitment of natural resources equally applies to impacts to cultural resources, as well. The EIS must also acknowledge and address the effects of the trade on Native Hawaiians traditional reliance on species targeted by the trade for subsistence, and most importantly, propose proper mitigation measures.

Decades of Applicant actions have directly impacted more than 200 species and indirectly impacted an unknown number of additional vertebrate and invertebrate species found in Hawai'i's coral reefs, one of the most complex ecosystems on Earth, where the fate of each species is determined by the existence, abundance and diverse actions of a multitude of other species that inhabit or otherwise rely upon these unique places.

While the CIA provided an extensive history of native Hawaiians and their symbiotic relationship with the ocean and its animal inhabitants, it completely dismissed the overwhelming oral testimonies in opposition to ¹⁷⁸both past and current trade practices and impacts.

More than 90 percent of those interviewed noted how the trade both directly and indirectly impacts their cultural resources, beliefs, practices and values, yet none of these concerns were included in the conclusion or proposed mitigation measures.

The CIA also failed to propose any substantive mitigation measures to address the biological and various socio-economic impacts to cultural resources and the ethical concerns and harm done to the animals, themselves.

The CIA initially acknowledges *“As stated in the OEQC Guidelines for Assessing Cultural Impacts, the goal of the oral interview process is to identify information ‘relating to the practices and beliefs of a particular cultural or ethnic group or groups’ (State of Hawai‘i, Office of Environmental Quality Control 2012:11). It is our contention that, in addition to assessing the significance of any identified traditional cultural properties, oral interviews should also be used to augment the process of identifying traditional cultural properties.”*

Thus, it is the researcher's responsibility to utilize the gathered cultural-historical background information, as well as the information collected through the consultation process, to identify and describe potential cultural impacts to resources, practices, and beliefs, **and to propose appropriate mitigative measures for those impacts as necessary.**

The DEIS further states: *“As discussed in Section 4.2 and detailed in the CIA, many of the 40 White List Species **have a cultural significance** in Hawai‘i, and **there are distinct differences between the traditional Native Hawaiian approach to fish harvest and management and the western model approach**”* (emphasis added).¹⁷⁹

¹⁷⁸ CIA at 104.

¹⁷⁹ DEIS at 91.

However, the above statements and subsequent lack of proposed mitigation measures, do not reflect these findings. Fifty-five individuals were consulted for the CIA, 50 of whom voiced strong concern with the trade.

The CIA further concludes that “***...if the issuance of commercial aquarium permits leads to a significant depletion of the populations of the above-mentioned species (either directly or indirectly through habitat disruption), then the result would be a cultural impact. Conversely, if the biological assessments (conducted by others) indicate that the issuance of the fourteen commercial aquarium permits will have no significant effect on either the fishes or their habitat, then the issuance of the permits would not result in a cultural impact***” (emphasis added).¹⁸⁰

As discussed earlier, the biological assessments used to analyze the impacts of the trade is extremely flawed, thus, the above conclusion, that the issuance of 14 permits will have no significant impact, is equally, inherently flawed.

We continue to agree with a number of concerns earlier raised by DLNR, and respectively, the Office of Hawaiian Affairs (OHA):¹⁸¹

*“Cultural impacts of aquarium fishing need significantly more analysis than provided in the FEA. The OEQC guidelines should be followed for assessing cultural impacts, including consulting with traditional cultural practitioners and other knowledgeable informants and sources about cultural resources, cultural practices, and the proposed action's potential impacts. Traditional Hawaiian practices and subsistence uses, local place-based and life-cycle knowledge, and traditional Hawaiian cultural significance of each type of aquarium fish taken should be reviewed. **The indirect impact of modern technologies for highly efficient catch methods on traditional harvest capabilities should be included in the analysis**”* (emphasis added).

The DEIS failed to respond to our questions regarding what type of gear/nets are currently being used to collect animals (outside of fine mesh nets). The CIA failed to include a discussion on gear types or recommend any regulations or prohibitions on the use of aquarium collection gear, that allows for the take of hundreds more animals per day, than if using traditional subsistence fishing methods. Further, there is no discussion about additional species take-prohibitions, bag limits (less reducing the daily bag limit of Achilles Tang from 10 to 5), “pono” fishing practices, the foundation of which is taking only what is needed, or a discussion on “resting” (closing) certain areas from commercial extraction.

OHA also states it “*anticipates that the DEIS will include a broader scope of analysis and **include a consideration of all consequences on the environment, including both direct and indirect effects**, in accordance with Hawai‘i Administrative Rules § 13-200-17(i)...*” yet the scope of the discussion of impacts is limited to 14 collectors who made up nearly 80 percent of the total catch even in years when not all 14 collectors were reporting take. The CIA also fails to include any legally

¹⁸⁰ CIA at 135.

¹⁸¹ CIA at 4; DEIS at 359.

required proposed mitigation measures, to address cumulative (past, present and reasonably foreseeable future) impacts to cultural resources.¹⁸²

In yet another gross contradiction, the CIA states that: “According to those guidelines: In scoping the cultural portion of an environmental assessment, the geographical extent of the inquiry should, in most instances, be greater than the area over which the proposed action will take place. This is to ensure that cultural practices which may not occur within the boundaries of the project area, but which may nonetheless be affected, are included in the assessment. (State of Hawai‘i, Office of Environmental Quality Control 2012:11) For this reason, for assessing the potential cultural impacts of the issuance of fourteen commercial aquarium permits within the WHRFMA, the entire fishery management area along the **western coast of Hawai‘i Island** is considered, not just those areas within which commercial aquarium fishing will be permitted. To Hawai‘i’s host culture, the ocean is viewed as an integrated whole, flowing unrestrained by politically imposed boundaries...” but fails to consider the impacts to the entire island of Hawaii, including the East side of the island which is seeing increased take rates from those seen in the past, with no disclosure or discussion of current gear-take methods, or the impacts of reducing species in one area impacting their health and abundance in other areas.¹⁸³

The CIA concludes with the following inadequate and/or unmeasurable recommendations, that in no way could be considered substantive mitigation measures, especially based on the numerous oral interviews and testimonies proposing a full closure of the trade or significant remedies to past and continuing conflict:

*“It is clear that the nearshore waters of West Hawai‘i Island, along with all of its contributing tangible and intangible elements and associations, could be considered a traditional cultural property significant under Criteria a, b, and e. Having a comprehension of the traditional cultural significance of nearshore waters of West Hawai‘i Island by all of its user constituencies, is a first step in ensuring that the activities of any one user group does not in any significant way conflict with the activities of another user group. As part of any future permitting processes associated with the WHRFMA, **it is recommended that DLNR-DAR provide to potential permit issues a document that provides a synopsis of the traditional cultural significance of the fishery**”* (emphasis added).¹⁸⁴

It is woefully inadequate to attempt to simplify this complex issue by only providing collectors with “a” document. There is no way to ensure that collectors even read the document let alone take any actions not to impact cultural resources, beliefs and practices.

The CIA then states: “... the authors recommend that PIJAC, and any commercial aquarium fishers who intend to conduct their operations within the WHRFMA, **consider developing or partnering with governmental and/or local organizations to help improve the management and**

¹⁸² DEIS at 359

¹⁸³ CIA at 4.

¹⁸⁴ CIA at 135.

sustainability of the nearshore fishery as a means to not only sustain, but actually improve reef-fish populations in the take areas... (emphasis added).¹⁸⁵

The CIA notes that aquarium collectors should “*consider developing or partnering with governmental and/or local organizations to help improve management and sustainability of the nearshore fishery...*” yet fails to provide even the most basic information, timeline or explanation as to how any partnership would proceed. The CIA further states the hope of improving reef-fish populations in the take areas, yet goes on to support the status quo, “*it is recommended that the existing bag limits and no-take areas within the WHRFMA remain in-place...*”.¹⁸⁶

The CIA adds “*Furthermore, it is recommended that the applicant (PIJAC) continue to work with the approving agency (DLNR), and the various other user groups within the WHRFMA, to **help improve the transparency of the accounting methods for fish takes, and the enforcement of the existing rules and regulations that govern those takes.** With respect to limiting the potential for cultural impacts, DLNR-DAR plays a significant role in managing and enforcing the rules and regulations that are intended to support the sustainability, viability, and fecundity of the WHRFMA . . .*” yet provides no information or guidance on actually improving the transparency of catch/accounting records and enforcement. This approach removes any all responsibility and accountability from the collectors and offers no solutions to the issues of enforcement, compliance and oversight.¹⁸⁷

The CIA continues, “*As voiced by many of the consulted parties, the lack of support and funding have hampered DNLR DAR’s ability to fulfill its fiduciary responsibility, namely to enhance, protect, conserve, and manage Hawai’i’s unique and limited resources, which are supposed to be held in public trust for the current and future generations of the people of Hawai’i nei, and visitors alike. While achieving this goal is not an easy task, and it certainly cannot be achieved by any single means, **DLNR-DAR should be proactive in seeking additional funding sources, and work with the various user groups who are most familiar with the WHRFMA, including the commercial aquarium fishers, to improve its enforcement capacity***” (emphasis added).¹⁸⁸

Again, this empty statement provides no information on mitigation measures, including proposed regulations, or funding sources, that could encourage better compliance or enforcement.

Finally, the CIA notes “*As expressed by multiple community members, the lack of enforcement by DLNR-DAR has resulted in community members feeling the need to police their respective areas themselves, which ultimately diverts time and energy from their desire to educate the next generation of Hawai’i and to perpetuate their own cultural practices. As part of improving enforcement, as expressed by some of the consulted parties, the **DLNR-DAR should consider incorporating more traditional Hawaiian fishery resource management practices (as detailed above) into the management of the WHRFMA, and representatives from the aquarium fishing industry should continue to work with the other user constituencies (i.e., Native Hawaiian organizations) that maintain an interest in the WHRFMA***” yet fails to include any discussion on what, if any, traditional

¹⁸⁵ CIA at 135

¹⁸⁶ CIA at 135

¹⁸⁷ CIA at 135

¹⁸⁸ CIA at 135

Hawaiian fishery resource management practices should be considered, when they might be considered or how.¹⁸⁹

In summary, the CIA remains extremely flawed and inadequate, with its inherent purpose-- to identify cultural impacts and propose mitigations measures to limit such impacts, not being met.

VI. Additional Deficiencies

A. Lack of Meaningful Alternatives Analyses

The DEIS does not propose or consider adequate alternatives. The Limited Permit Issuance Preferred Alternative is not reasonable, as is required by HEPA.¹⁹⁰ The Preferred Alternative ignores the vast majority of comments submitted on the DEA, FEA and by the consulted parties. Instead, it focuses on just one species, the Achilles Tangs and ignores the many comments naming locations where the impacts of collecting pressure are of concern. The conclusion that no significant adverse effects would occur as a result of the Preferred Alternative is erroneous and unsupportable,

The Agency's letter of determination stated that "because the applicant can propose but not ensure regulations aimed at protecting and restoring populations of aquarium fish, [the Agency] is interested in proposals for self-regulation by aquarium permit holders which could be incorporated into permit conditions even in the absence of or prior to establishing other regulations to accomplish the same purposes."¹⁹¹ We dispute the value of any self-regulation measure. Meaningful change must be binding on the industry, and a meaningful alternatives analysis requires the Applicant to propose binding measures. Here, the Applicant proposed neither self-regulation nor binding measures.

A reasonable alternative would require the Agency to first determine:

- 1) the life history, spawning grounds and offspring/recruitment patterns for each species to be collected for aquarium purposes (see DLNR list of aquarium species at Appendix 5);¹⁹²
- 2) natural abundance (i.e. unfished) levels and complete stock assessments, for each collection zone, for those same species (see DLNR map of aquarium fish zones at Appendix 6);¹⁹³
- 3) a definition for "sustainable" as it relates to the natural abundance of coral reef species taken in Hawai'i for aquarium purposes; and
- 4) annual total allowable catch, by species, designed to restore and then sustain natural abundance levels, with negligible impacts as defined in the Queensland Ecological Risk Assessment of the Marine Aquarium Fish Fishery, for each species to be taken for aquarium purposes, in each zone.¹⁹⁴

¹⁸⁹ CIA at 136

¹⁹⁰ See HAR. § 11-200-10(7).

¹⁹¹ DLNR HRS Chapter 343, Final Environmental Assessment, Notice of Determination for Hawai'i at 3 and for O'ahu at 3.

¹⁹² See DLNR Aquarium Fish Trip Report

¹⁹³ See DLNR Aquarium Fish Trip Report

¹⁹⁴ See Roelofs (2008) for a useful guide for describing the range of impacts to populations of target species in marine aquarium fisheries.

After making these necessary threshold determinations, the Agency should issue limited numbers of Aquarium Permits, by zone and by species with corresponding total allowable catch limits, per the above parameters. Additionally, the Agency should require Aquarium Collection Permits, for all take for aquarium purposes, regardless of the method of collection.

B. Lack of Mitigation Measures

HEPA also requires an EIS to consider mitigation measures.¹⁹⁵ With minor exceptions, such a discussion is plainly absent from the DEIS. Decades of Applicant actions have directly impacted more than 200 species and indirectly impacted an unknown number of additional vertebrate and invertebrate species found in Hawai'i's coral reefs, one of the most complex ecosystems on Earth, where the fate of each species is determined by the existence, abundance and diverse actions of a multitude of other species that inhabit or otherwise rely upon these unique places. Yet, the DEIS claims there are no significant impacts whatsoever, and therefore, proposes no mitigation measures outside of the bag limit for Achilles tang found in the Preferred Alternative.¹⁹⁶ The DEIS also fails to propose mitigation measures to address biological and related impacts to the various socio-economic values described herein, and also fails to propose mitigation for impacts to cultural resources, and for the ethical concerns and harm done to the animals, themselves, also described herein.

VII. Conclusion

For the reasons explained above, the DEIS is patently insufficient in its analysis of the impacts of commercial aquarium collection permits.

A serious overhaul of aquarium fish permitting in Hawai'i is needed.

Because currently there are not restrictions on the number of collection permits or the amount of take per species under a fine mesh net (i.e. aquarium) permit or commercial marine license, the impact that collection may have on target species must be evaluated before issuing permits. As such, each aquarium collection permit or commercial marine license issued for aquarium collecting must show the total allowable catch, per species and ideally per zone that permit holders must follow to prevent unsustainable fishing. Catch limits per species and per zone should be calculated in conjunction with input from all stakeholders and based on the stock assessment for each target species in the specific areas where they will be allowed to be taken under a permit.

The legislature has decreed it the "policy of the State" that DNL and other agencies must "[c]onserve natural resources . . . by preserving or augmenting natural resources, and by safeguarding the State's unique natural environmental characteristics . . ." ¹⁹⁷ The Agency must also "[e]ncourage management practices which conserve . . . all natural resources," and encourage all individuals "to fulfill the responsibility as trustees of the environment for the present and succeeding generations."¹⁹⁸ In enacting HEPA, the State legislature found "that the quality of

humanity's environment is critical to humanity's well-being, [and] that humanity's activities have broad and profound effects upon the interrelations of all components of the environment . . .”¹⁹⁹
The Agency simply cannot meet these mandates by continuing to allow unlimited aquarium collection, in light of the serious environmental consequences of those permits.

Appendix 1

Outstanding Questions from Consultation

APPENDIX A

Outstanding Questions

The below questions were prompted after we were made aware of the limited geographic scope of the forthcoming DEIS, to include only West Hawaii, as well as the DEIS's intent to provide exclusive aquarium collection privileges to 14 individuals, which was contrary to the earlier Draft Environmental Assessments (DEAs). Stantec's failure to provide this crucial information to all Consulted Parties limited some of the Consulted Parties' ability to meaningfully comment, and undermined HEPA's notice requirements.

Despite our objections to this flawed process, we submitted the below comments and questions to Stantec in an effort to inform and improve the DEIS and ensure that they were thoroughly evaluating the environmental impacts of this proposed action pursuant to HEPA. Stantec's response to our concerns with compliance with the HEPA process simply stated "*Comment noted. The commenters were included in the consultation process for the DEIS.*"

Therefore, below are our **outstanding questions** and in red, those questions that were inadequate in their response, or were not answered, and thus await DLNR's response. Stantec's responses are italicized:

1. What are the **environmental benefits** of removing tens to hundreds of thousands of animals annually for the West Hawaii aquarium trade?

Response: Comment noted.

No environmental benefits were provided by Stantec.

2. Why is the proposed DEIS limited to West Hawaii? Collection continues in East Hawaii and at even greater rates since the Supreme Court of Hawaii's September 2017 opinion. Why would other areas of collection be excluded? Do the 14 collectors propose to collect only in West Hawaii, or is this due to the need for an additional West Hawaii permit to take in this area?

Response: Comment noted. The DEIS evaluates the impact of commercial aquarium collection on the entire island of Hawai'i. However, the Applicant is not requesting any permits to be issued for East Hawai'i...

Aquarium Collection permits issued under HRS 188-31 are issued statewide and necessary in order to have a West Hawaii aquarium fishing permit thus, it is not accurate/incorrect to state that the applicants are not requesting any permit to be issued for East Hawaii. Further, Stantec fails to state if the applicants have or will be fishing in East Hawaii or other areas, as we explicitly asked.

Under the Preferred Alternative, 14 individuals would be provided exclusive access to take aquarium fish in the WHRFMA and use fine mesh nets, privileges that no other person would otherwise have. Given these 14 applicants are requesting special permission to access and remove constitutionally protected public trust resources, the below information is needed to explain how

and why these 14 applicants should be granted this exclusive access, that would otherwise be denied to others.

Inadequate response. Awaiting response from DLNR.

3. Please identify the 14 applicants by name and business name (DBA).

Response: Comment noted. The applicant information is provided in the DEIS.

Stantec claims the information on the 14 applicants is provided in the DEIS however, they only list PIJAC as the applicant. We repeatedly requested this information from Stantec and they never responded. We await this critical information. PIJAC is not an individual/collector nor are they a/the person who would potentially apply for, possess the necessary permits and engage in the activity (aquarium collecting) that is subject to HEPA. Again, given these 14 individuals/collectors are requesting exclusive access to natural resources, otherwise denied to all others, we need the name and business name of the collectors.

This information is not privileged and is routinely disclosed any time an individual is requesting permission to potentially alter or degrade the environment, or access a resource held in the public trust.

Further, as defined under HEPA, an Applicant is “Any person who, pursuant to statute, ordinance, or rule, officially requests approval for a proposed action. Under HEPA, an applicant cannot be an agency, nor can an agency be an applicant. This mutual exclusivity establishes an important boundary in HEPA and serves to divide the universe of actions in one of two different areas: applicant actions (see Section 343-5(c), HRS) or agency.

Inadequate/no response. Awaiting response from DLNR.

4. How many reef animals have been taken by the 14 applicants in the past decade (list per year, per species and method of collection) and in what area, and how many are the applicants proposing to take each year for the next decade (list per species and method)?

Response: Comment noted. The average and maximum collection by species of the 14 fishers has been added to Table 5-11. It should be noted that these fishers waived their right to confidentiality, and as such, this includes all their collected numbers from 2000 through 2017 (no data are excluded due to Hawai'i confidentiality laws). The collection numbers are limited to the WHRFMA for the analysis. It is assumed for the environmental consequences that the collection rates seen over the past 18 years will remain relatively the same over the 5-year analysis period, though the maximum collection is also included in the analysis. Collection would occur via fine mesh nets or other legal methods.

This is not correct nor accurate. As discussed in more detail in our comments, all 14 fishers either did not fish or did not disclose their catch in the data provided. In some years as few as 3 collectors reported taking in the WHRFMA. This grossly underestimates the impacts of 14 collectors in the WHRFMA. Moreover, the DEIS assumes that aquarium collection without the use of fine-mesh gear will continue “legally” in East Hawai‘i; however, as indicated in a letter dated January 7, 2020, from Earthjustice to DLNR (attached as Appendix 8), such collection also requires HEPA review, which currently is not being conducted. If this purportedly “legal” collection were halted pending

environmental review, then the 14 collectors would have even greater incentive to increase collection levels in West Hawai'i in the meantime. The DEIS fails to consider this effect.

5. Have any of the applicants been charged with any offense related to the aquarium trade or occurring during the course of aquarium trade activities, or county or state natural resource related offenses? If so, include date, offense and outcome of each offense.

Response: Comment noted. We do not possess this information. Enforcement and information occurring during the course of aquarium trade activities, or county or state natural resource concerning it is within the purview of the State of Hawaii.

Stantec could have asked the 14 applicants for this information. Given they chose not to provide this information we are requesting this information from DLNR. Again, given the 14 collectors are requesting exclusive privileges and access that no other person would have, it is in the interest of the public and the state, if these 14 collectors have been charged with any criminal or natural resource violation (i.e. at least 1 collector was criminally charged with attacking a diver in the WHRFMA in the past).

Inadequate response. Awaiting response from DLNR.

6. What steps will be taken by the 14 applicants to reduce the impacts of climate change, specifically, coral bleaching and ocean temperature rise, which is predicted to occur more frequently and more severely over the next decade, given they will be removing thousands of herbivorous species?

The environmental review must fully disclose the changing baseline from climate change and the effects of the proposed activities on the reef in light of climate change. The [Fourth National Climate Assessment](#), released in late 2018, projects that by 2040 Hawaii's coral reefs will bleach annually which will result in the loss of 71% of the state's current coral reef cover by mid-century, and 99% by 2100. Unprecedented coral bleaching across Hawaii and especially in West Hawaii has already occurred: back-to-back years of increased sea temperatures in 2014 and 2015 caused 50% of bleached corals to die in West Hawaii.

Further, on August 23, 2019, the Hawaii Dept. of Land and Natural Resources (DLNR) warned of possible severe and widespread coral bleaching across the state within the next two months as the result of sea temperatures that are currently 3 degrees above normal. Because temperatures are expected to rise even further, this bleaching event will likely be even worse than the one that damaged so many of Hawaii's reefs 4 – 5 years ago. Reefs in West Hawaii are already showing signs of stress such as bleaching and both DLNR and the National Oceanic and Atmospheric Administration (NOAA) have asked the public to take actions to minimize any additional stress to Hawaii's reefs. Notably, among the actions to be avoided are many that are widespread and/or inherent to the aquarium trade, referenced below.

Response: Comment noted. There is no evidence that suggests that commercial aquarium collection is a major contributor to climate change, including coral bleaching or ocean temperature rise...

Our question did not suggest that aquarium collection *causes* climate change but that collection exacerbates the impacts of climate change, which include coral bleaching and ocean temperature rise and the removal of herbivores, which is discussed further in our comments.

7. How will the 14 applicants 1) specifically comply with the following recommended actions, and, given the extremely limited enforcement resources and capabilities of DLNR, 2) how do they propose to show compliance with these recommended actions?
 - Reduce or stop taking herbivorous fishes such as surgeonfish which are needed to keep algae growth under control so as not to smother and kill corals stressed from bleaching
 - Avoid touching, standing in corals
 - Keep vessel anchors and chains off corals

Inadequate response. Stantec failed to provide any information on how the 14 collectors would comply or show compliance with DLNR's recommended actions.

Inadequate response. Awaiting response from DLNR.

8. How do the 14 applicants propose to prevent population reductions of reef species when, outside of the current court order, there are **no limits on**:
 - the issuance of West Hawaii aquarium collection permits
 - the issuance of State aquarium collection permits
 - the issuance of Commercial Marine Licenses
 - caps on the issuance of the above permits or a limited entry program
 - the use of certain types of gear that may be detrimental to the environment
 - overall take (Total Allowable Catch)
 - area/geographical limitations outside of "no take" areas
 - collection of species outside of the "white list"
 - number of "white list" species that may be taken

Aside from reducing the bag limit of Achilles Tang, Stantec failed to respond to any of the above questions. Further, they premise their Preferred Alternative on rules, regulations or legislative changes that the Applicants are not in a legal or policy position to change. Only DLNR, with public input, could make the changes necessary to amend or create a new permitting process to limit statewide issued aquarium collection permits (issued under HRS 188-31) to a specific geographic area and change the West Hawaii aquarium permit process to limit issuance to only 14 individuals. No other case is known where a proposed alternative subject to HEPA is contingent upon a state action(s) that has yet to be undertaken. A proposed action or alternative must be described in its entirety and cannot be broken up into component parts, as suggested in the preferred alternative that has yet to be initiated if at all. Per HEPA this could be considered a phased project (involving a later phase that cannot be fully described) or "segmenting", which is generally forbidden under HEPA.

This proposal further exemplifies the flawed process as the Applicants are proposing policy and legal changes that have yet to be implemented and are subject to the public input process and other approvals (BLNR, DLNR, state legislature). On pages 17-18 of the DEIS Stantec states *"The Applicant has no legislative or regulatory authority and cannot create, eliminate, or alter conservation areas*

(e.g., MPAs, FRAs, MLCs); create, eliminate, or alter current regulations (e.g., bag and size limits, season length, permit term); or change reporting requirements. Despite this, during the public comment period on the Draft EA Draft Environmental Impact Statement Alternatives 18 that was published on April 8, 2018, in response to DLNR concerns and in coordination with the DLNR, the Applicant developed an alternative that required regulation creation by DLNR (i.e., implementation of bag limits)."

Please clarify if DLNR-DAR coordinated with and made any commitments to the Applicants about undertaking such regulatory/statutory changes, without notifying the public about such proposed actions, that must be disclosed immediately.

Inadequate/no response. Awaiting response from DLNR.

9. The Hawaii Department of Land and Natural Resources (DLNR), specifically the Division of Aquatic Resources (DAR) and their enforcement arm, the Division of Conservation and Resource Enforcement (DOCARE) has severely restricted resources, such as inadequate staff and funding for enforcement, and there are current statutory restrictions on searches of certain containers carrying marine life and certain vessels.

How do the 14 applicants propose that enforcement will be achieved on any proposed limits to their activities, including verifiable compliance with current administrative rules, and state and federal laws, including those listed below. How are the 14 applicants currently complying?

- Federal Lacey Act requirements USC Title 16
- Hawaii Misdemeanor Cruelty to Animals statute HRS 711-1109

Response: Comment noted. Enforcement is within the purview of the State of Hawaii.

Stantec fails to respond to our questions or provide any information as to their required compliance with the federal Lacey Act, specifically how they are complying with labeling and documentation laws when shipping live animals, or HRS 711-1109 which prohibits the starvation or abuse of animals. Animals are defined in HRS 711-1100 as "any non-human animal."

They also failed to provide any information on what they will do to assist with enforcement given DOCARE's limited resources, staff and restrictions on inspections. The applicants/collectors fail to show any earnest interest in proposing any actions to assist with their complying and cooperating with law enforcement.

Inadequate/no response. Awaiting response from DLNR.

10. The commercial aquarium trade has long operated with fewer regulations, oversight and compliance-verification mechanisms than those that commercial food fisheries must adhere to. Further, while the issuance of aquarium collection permits is discretionary, and subjects the permit holder to certain legal obligations, including inspection of facilities holding marine life, many of these regulations have not been actively enforced. For clarification, do the 14 applicants cooperate and comply with the following:

- provide open and immediate access to coolers, containers, vessels and other aquarium related gear, equipment and holding facilities upon request of a DLNR-DOCARE Officer, as per the conditions of their permits?
- allow observers on their vessels with/without notice?

Response: Comment noted. Permit holders must comply with law. Enforcement is within the purview of applicants cooperate and comply with the following: the State of Hawaii.

Again, Stantec fails to respond to the questions or propose any applicant actions to mitigate potential violations, or to encourage or assist law enforcement. This same issue was raised in DLNR's rejection of the EA and was not addressed by the applicants.

Inadequate response. Awaiting response from DLNR.

11. The earlier DEAs for the aquarium trade failed to include data and records which are not readily accessible to the public and other interested parties. Please provide the necessary data and response to the following to address our outstanding concerns with enforceability of the above-referenced laws specifically as it relates to animal health, welfare and mortality rates:

- a) Thousands of fish have been taken since the Supreme Court opinion and subsequent District Court orders were issued in September and October of 2017 which prohibited the use of fine mesh nets (nets with a mesh less than 2 inch). Ninety plus percent of catch prior to the court ruling involved the use of fine mesh nets.

Please explain in detail the gear and method(s) of collection **currently** (October 2017 to present) used by each of the 14 applicants and for what species. If the 14 collectors did NOT collect during this period please provide that information as well.

Response: Comment noted. Within the WHRFMA, collection of aquarium fish is not occurring under any method. In East Hawai'i, collection can occur without fine mesh nets...

Stantec again fails to answer the questions, including providing info as to if and who is collecting in East Hawaii, and what methods of catch are currently being used by the applicants if collecting in East Hawaii, given the use of fine mesh nets are prohibited and 90+ percent of collection prior to the court ruling was performed with fine mesh nets.

Inadequate/no response. Awaiting response from DLNR.

- b) Per HDOA intrastate shipment records, thousands of fish have been shipped since the above-referenced court order took effect. For the 14 applicants please provide:
 - how many fish/animals were shipped by each applicant per month since October 2017 to the present and;
 - specifically where these fish/animals were shipped to (e.g., intrastate to Honolulu, interstate or international) and;
 - the mortality rates for each shipment (a) upon arrival and (b) at 14 days post-shipment;
 - what percentage of animals remain in Hawaii (for resale) versus those who are shipped 1) to the US mainland and 2) international;

Inadequate/no response. Awaiting response from DLNR.

- c) For each of the 14 applicants please note whether the collector is also a dealer. If the collector is not a dealer, provide who the collector sells their catch to;

Inadequate/no response. Awaiting response from DLNR.

- d) For each of the 14 applicants, please note which collectors engage in the following practices in contradiction to HRS 711-1109:

- withholding of food (starvation) and for what period of time;
- flogging or puncturing of the swim bladder;
- cutting of spines or dorsal fins;
- body compression (squeezing animal to force out ejection of fecal matter).

Inadequate/no response. Awaiting response from DLNR.

Appendix 2

This is in response to the UIPA request dated 12/19/2019 that asks DLNR to provide actual numbers of the 14 collectors represented in DEIS Tables 5-2 and 5-11.

DEIS Table 5-2

Information on the actual count of the 14 collectors who fished annually in East Hawaii cannot be disclosed due to data confidentiality, as only a few of the collectors harvested in this area. The count of the 14 collectors who fished in West Hawaii and the combined areas are posted in the table below.

<u>Year</u>	<u>WHRFMA</u>	<u>Combined</u>
2000	4	4
2001	3	3
2002	5	5
2003	7	7
2004	7	7
2005	8	8
2006	8	8
2007	7	8
2008	8	9
2009	7	9
2010	9	9
2011	9	9
2012	9	9
2013	8	8
2014	8	8
2015	9	9
2016	10	10
2017	11	11
2018	Closed	n.a.

DEIS Table 5-11

Information on the actual count of the 14 collectors who fished annually in East Hawaii, West Hawaii and combined areas by the 40 white species cannot be disclosed because of data confidentiality, because for some species, fewer than three collectors harvested it annually.

Appendix 3

Bandit Angelfish

QUICK FACTS

Scientific Name	Apolectichthys aruatus
Reef Compatible	With Caution
Care Level	Expert-only
Disposition	Semi-aggressive
Minimum Tank Size	100 gallons
Mature Size	7 inches
Diet	Omnivore
Range	Hawaii
Size Class	9

Curator's Note
The Bandit Angelfish is best kept in marine aquariums using live rock for filtration or decoration. They are natural sponge eaters and will graze on the rock work until they can weaned onto prepared foods.

*Due to availability and individuality of each species, colors and sizes may vary.

Guarantee Restriction:

All of our livestock has a guarantee to arrive alive. However for this species we cannot offer a guarantee beyond arrival for one or more reasons outlined below.

Some species do not handle stress from environmental conditions well. These stresses can include poor water quality, harassment from tank mates or confined aquarium conditions. When stressed, these species can lose the ability to ward off infection and disease. Other species have such specialized feeding requirements that is difficult to recreate in a aquarium and may succumb to mal nutrition.

Overview

The Yellow Hawaiian Tang is for many aquarists, the definitive fish of home saltwater aquariums. With its oval-shaped, vibrant yellow body, *Zebrasoma flavescens* brightens any marine system. The Yellow Hawaiian Tang is an active swimmer that will glide throughout your aquarium in near constant motion, acting as an aquarium tour guide of sorts to any onlooker who follows its meandering swim path.

Though iconic to the reefs of Hawaii, the Yellow Hawaiian Tang's natural habitat is actually widespread throughout the Pacific Ocean as far as Indonesia and the Great Barrier Reef. The Yellow Hawaiian Tang is also known as the Yellow Sailfin Tang or Yellow Surgeonfish. For best care, it should be housed in an aquarium of at least 100 gallons with ample room to swim. Like other Tangs, this member of the Acanthuridae family demonstrates territorial aggression towards its own species, or Tangs in general. Therefore, it is best to keep just one Yellow Hawaiian Tang per aquarium, unless multiple Yellow Hawaiian Tangs are introduced into the system simultaneously.

Although the Yellow Hawaiian Tang will eat meaty foods along with the other fish in the aquarium, it is important the Yellow Hawaiian Tang is offered plenty of marine based seaweed and algae. This will strengthen its immune system, reduce aggression and improve overall health. Offer dried seaweed tied to a rock or use a veggie clip, and feed at least three times per week. Sea Veggies, Seaweed Salad and Ocean Nutrition are all ideal products and are very easy to use.

The Yellow Hawaiian Tang is a very common, extremely popular, and hardy addition to any fish-only or reef aquarium system.

Approximate Purchase Size: Small: 1-1/2" to 2-1/4"; Small/Medium: 2-1/4" to 3-1/4"; Medium: 3-1/4" to 4-1/4"; Medium/Large: 4-1/4" - 5-1/4" Large: 5-1/4" to 6"

Re: Ongoing Illegal Aquarium Collection Under Commercial Marine Licenses and Request for Meeting

Dear Chair Case, Administrator Neilson, and Mr. Sakoda:

By this letter, Earthjustice, For the Fishes, Willie and Ka'imi Kaupiko, Mike Nakachi, and Center for Biological Diversity wish to raise for your immediate attention and corrective action the Hawai'i State Department of Land and Natural Resources' (DLNR's) ongoing unlawful practice of allowing commercial aquarium collection to continue without compliance with the environmental review requirements under the Hawai'i Environmental Policy Act (HEPA), Haw. Rev. Stat. (HRS) ch. 343. This practice flouts the Hawai'i Supreme Court's ruling in *Umberger v. Department of Land & Natural Resources*, 140 Hawai'i 500, 403 P.3d 277 (2017), that commercial aquarium collection requires HEPA review to address the impacts of the industrial-scale extraction of marine organisms for the aquarium trade on the marine environment.¹ DLNR, nonetheless, has chosen to disregard and circumvent the supreme court's ruling and the circuit court's subsequent injunction, allowing commercial aquarium collection to continue illegally under Commercial Marine Licenses (CMLs) issued pursuant to HRS § 189-2, without HEPA review or aquarium collection permits under HRS § 188-31.

Before the *Umberger* ruling, commercial aquarium collectors routinely obtained from DLNR both an aquarium permit under § 188-31, and a CML under § 189-2, regardless of the types of gear used. Despite the court injunction halting issuance of new commercial aquarium permits until the HEPA review process is complete, DLNR has since logged a statewide industry-reported commercial take of at least 372,769 fish and 203,972 aquatic invertebrates for

¹ *Umberger v. Dep't of Land & Natural Res.*, 140 Hawai'i 500, 506-10, 403 P.3d 277, 283-87 (2017).

aquarium purposes—totaling at minimum 576,741 individual animals.² DLNR has sought to justify this outcome by asserting that the court rulings only applied to the use of fine-meshed gear, and that any and all aquarium collection without the use of fine-meshed gear may continue without any aquarium permits or HEPA review.³

This ongoing end-run around the courts' rulings in *Umberger* violates state law and must immediately cease, for the following reasons:

- Aquarium collection under § 189-2 meets the exact same criteria triggering HEPA review as aquarium collection under § 188-31 and is equally subject to HEPA's legal requirements regardless of DLNR's chosen permitting methods;
- HRS § 188-31 regulates all aquarium collection regardless of the types of gear used, as confirmed by the statutory scheme and legislative history; therefore, all aquarium collection requires an aquarium permit and is subject to HEPA; and
- DLNR is failing to satisfy its public trust duties to reasonably monitor aquarium collection to ensure compliance with state laws and protection of public rights and resources.⁴

We also request a meeting with you as soon as possible to address this issue, and hopefully, reach a cooperative and productive resolution in the public interest and consistent with DLNR's public trust duties.

² Commercial aquarium catch data is self-reported by the collectors themselves, and thus may not accurately reflect the full amount of marine life taken. These numbers represent commercial aquarium catch data for October 2017 through October 2019. Extraction has presumably continued apace since then.

³ DLNR, Frequently Asked Questions – Aquarium Permit (HRS §188-31), https://dlnr.hawaii.gov/dar/files/2018/12/aquarium_permit_faq_rev6.pdf (last visited Jan. 5, 2020). DLNR recognizes West Hawai'i as a single exception to this loophole, since DLNR regulations require § 188-31 aquarium permits for all aquarium collection, regardless of the types of gear used.

⁴ In this context, DLNR has failed to monitor or enforce against poaching in express violation of the court's rulings. DLNR has also failed to take affirmative steps to ensure that collectors are, in fact, not using fine-meshed equipment, since extraction at the large scales being reported is likely infeasible or extraordinarily difficult with non-fine-meshed equipment.

Aquarium Collection Under Commercial Marine Licenses Requires HEPA Review.

In *Umberger*, the Hawai'i Supreme Court described commercial aquarium collection under HRS § 188-31 as the “systematic and deliberate extraction of aquatic life using procedures, equipment, facilities, and techniques authorized or required by [statute] and related administrative rules for the specific purpose of holding captive such aquatic life for aquarium purposes in order to earn profit” and determined that environmental review was required for such activity.⁵ Aquarium collection under a CML and HRS § 189-2 is indistinguishable in principle and result: aquarium collection gear⁶ is being used to systematically extract hundreds of thousands of fishes and marine organisms for profit, and there would be little point in collecting aquarium fish without facilities and equipment to keep specimens alive pending sale on the aquarium market.⁷ Further, the court described in detail why aquarium collection constitutes a “use” of “state land,” the analysis of which applies regardless of which statute purportedly authorizes it.⁸ Finally, the court’s analysis of “discretionary consent” under § 188-31 equally applies to collection under § 189-2 CMLs because DLNR likewise has discretion to issue them.⁹

Simply put, if commercial aquarium collection under HRS § 188-31 is subject to HEPA, that *same conduct* occurring under CMLs cannot evade environmental review. Indeed, it was the proposition of unlimited and unexamined commercial aquarium species extraction that

⁵ See *Umberger*, 140 Hawai'i at 514, 403 P.3d at 291.

⁶ Pursuant to its authority to administer CMLs under HRS § 189-2, DLNR authorizes non-fine-meshed gear for commercial aquarium purposes by offering “Aquarium” as an option on the “Gear Preferences” drop-down menu found on DLNR’s CML application/renewal webpage.

⁷ In addition to conforming with the *Umberger* court’s analysis of HEPA “action,” commercial aquarium collection under a CML would also constitute a HEPA “project” and “program” under the new HEPA definitions that went into effect in August 2019. See Haw. Admin. R. (HAR) § 11-200.1-2 (defining a HEPA “project” as a “discrete, planned undertaking that is site and time specific, has a specific goal or purpose, and has potential impact to the environment” and defining “program” generally as multiple projects with similar impacts).

⁸ See *Umberger*, 140 Hawai'i at 520-23, 403 P.3d at 297.

⁹ *Id.* at 525-27, 403 P.3d at 302-04; HRS § 189-2; HAR §§ 13-74-2(4), 13-74-3, 13-74-20.

spurred the court to require HEPA review—not the specific methods by which such collection was accomplished.¹⁰

HRS § 188-31 Applies Broadly to All Aquarium Collection, Regardless of the Types of Gear Used.

In response to *Umberger* and the circuit court's subsequent injunction against commercial aquarium permits until HEPA review is complete, DLNR has construed HRS § 188-31 to apply only to collection using fine-meshed equipment, and, based on this reasoning, has allowed commercial collection to continue under CMLs, purportedly using non-fine-meshed equipment. This cramped reading of the aquarium collection law is fundamentally flawed because it contradicts the statutory framework and legislative history and produces absurd results.

The underlying purpose for the enactment of the aquarium collection statute (which dates back to the 1950s) was threefold: (1) allowing inroads into the national aquarium fish trade for local fishers, by (2) carving out an exemption for the use of otherwise prohibited fine-meshed equipment, while (3) providing safeguards for the health and vitality of collected organisms.¹¹ This last requirement is unique to HRS § 188-31: while other statutes or administrative rules exempt uses like 'ōpae fishing from the fine-mesh prohibition, § 188-31

¹⁰ See *Umberger*, 140 Hawai'i at 506-09, 140 P.3d at 283-87 (reciting the factual bases for Petitioners' claim that aquarium collection should be reviewed under HEPA, including "disrupt[ion] of ecosystems," "marked difference[s] in the condition between those reefs that are open to collection and those that are not," "noticeable difference[s] in aquarium fish species' populations and coral damage" in areas open to collection, and impairment of overall reef ecosystem health due to removal of fish species "that serve a larger role in reef ecosystems"); *id.* at 516, 430 P.3d at 293 ("Given the nature, magnitude, and scale of aquarium collection . . . any environmental effects that aquarium collection may have falls squarely within the ambit of what HEPA's environmental review framework intends to integrate into governmental decision making"); *id.* at 523, 403 P.3d at 300 (holding that aquarium collection is a HEPA "use" of state lands and conservation districts because it entails the "*unlimited collection* of fishes and other aquatic life") (emphasis added); *id.* at 524-25, 140 P.3d at 301-02 (holding that commercial aquarium collection cannot be exempted from HEPA, in part because "*extraction of an unlimited number* of fish and other aquatic life annually" is not a "minor alteration" of public resources) (emphasis added).

¹¹ See H. Stand. Comm. Rep. No. 586, in 1953 House Journal, at 675.

alone includes the express requirement that collected animals be kept “alive and in reasonable health.” The statute was clearly intended to permit and regulate commercial aquarium collection, providing both a means to accomplish it efficiently and a caveat to control and prevent waste of aquatic resources.

Since its original enactment, § 188-31 has been amended to encompass aquarium collection comprehensively, and not just fine-meshed equipment. Most notably, legislative amendments in 1992 confirmed the broad scope of permitting authority, by adding the broad catch-all term “other aquatic life” to the operative permitting provision, which had previously referred to “marine or fresh water nongame fish.”¹² Along the same lines, the 1992 amendment clarified the title of the statute from “[n]ets and traps for aquarium purposes” to the more broadly expressed “[p]ermits to take aquatic life for aquarium purposes.”¹³ The inclusion of “other aquatic life” in the permitting section acknowledged the breadth of aquarium collection to include, for example, invertebrates like sea cucumbers, while the title amendment evinced legislative acknowledgement of the purpose and practice of regulating the take of aquatic life generally, and not the equipment in particular.¹⁴

Notwithstanding that the aquarium collection permitting statute has been in effect since the mid-1950s, DLNR now claims that an aquarium permit is unnecessary for any and all collection that does not use fine-meshed gear. This turns the statute on its head: instead of recognizing § 188-31’s original, fundamental purpose to permit and regulate aquarium collection activity and commercial industry, DLNR distorts the statute to allow widespread aquarium collection free from any regulation, including the requirement to keep collected fish alive and in reasonable health.

DLNR’s current reading of § 188-31, moreover, contradicts DLNR’s established interpretations via formal rulemaking, as well as its practice over decades, to regulate aquarium collection more broadly. For example, Haw. Admin. R. (HAR) ch. 13-86.1 regulates take of sea cucumbers, and requires a § 188-31 permit to collect sea cucumbers for aquarium purposes, even though such collection does not require traps or nets of any kind. HAR ch. 13-60.4 regulates take in the West Hawai‘i Regional Fishery Management Area (WHRFMA) and defines “aquarium gear” as “*any* equipment or gear adapted, designed, or commonly used to collect, capture, or maintain aquatic life alive in a state of captivity”; thus, collection in the WHRFMA

¹² 1992 Haw. Sess. Laws Act 96, § 2 at 146. Previously, the term “other aquatic life” had been included only in the statute’s definitional sections. RLH § 21-64 (1955).

¹³ 1992 Haw. Sess. Laws Act 96, § 2 at 146.

¹⁴ *See id.*

requires both an aquarium permit and a WHRFMA permit.¹⁵ In sum, DLNR has consistently issued aquarium permits for collection with gear other than fine-meshed traps and nets. To now claim that aquarium collection permitting applies only to fine-meshed gear is disingenuous at best.

Finally, DLNR's restrictive interpretation of § 188-31 has led to the absurd and unjust result of large-scale extraction persisting without any environmental review under HEPA, despite the court's rulings and the agency's duties to conserve and protect public trust resources. This contravenes the fundamental rule that a statute should not be construed "to create an absurdity, or worse yet, to circumvent [an agency's] constitutional and statutory obligations."¹⁶

DLNR Must Proactively Monitor and Regulate Commercial Aquarium Collection to Fulfill Its Public Trust Duties.

As DLNR is well aware, conservation lands, which include all state marine areas, are public resources held in trust for the people of Hawai'i pursuant to article XI, § 1 of the Hawai'i Constitution.¹⁷ Conservation districts exist in part to conserve "indigenous or endemic plants, fish, and wildlife."¹⁸ Submerged lands and associated resources also are part of the public trust *res*.¹⁹ DLNR must ensure that these public natural resources are responsibly managed and conserved. DLNR's public trust duty to manage public resources extends beyond simply issuing licenses and permits, and includes a responsibility to reasonably monitor uses of public trust assets to ensure that measures prescribed by law to conserve and protect such resources

¹⁵ HAR § 13-60.4-3 (emphasis added).

¹⁶ *Morgan v. Planning Dep't, Cnty. of Kaua'i*, 104 Hawai'i 173, 185-86, 86 P.3d 982, 994-95 (2004).

¹⁷ *See In re Thirty Meter Telescope*, 143 Hawai'i 379, 400, 431 P.3d 752, 773 (2018); *see also* Haw. Const. art. XI § 6 (specifically granting the state power to manage "marine, seabed, and other resources within the boundaries of the State").

¹⁸ HRS § 205-2(e).

¹⁹ *See Umberger*, 140 Hawai'i at 521, 403 P.3d at 298.

are “actually being implemented.”²⁰ DLNR cannot “turn a blind eye to imminent damage, leaving beneficiaries powerless to prevent damage before it occurs.”²¹

The courts have already determined that the large-scale removal of marine life by commercial aquarium collectors threatens impacts to public trust marine resources.²² Yet, DLNR has allowed commercial extraction to continue at an alarming rate, without any oversight beyond administration of CML applications and renewals, and logging of catch reports. Commercial collection should only be allowed to resume if and when the long-term impacts have been fully vetted and a final determination is made that some level of continued take will not adversely affect public resources. Absent such an informed determination, DLNR should take the precautionary measure of declaring an immediate moratorium on all commercial aquarium collection, regardless of the types of gear used, rather than evade HEPA by allowing continued industrial-scale extraction.

In any event, the law requires DLNR, at minimum, to proactively monitor ongoing commercial collection to ensure that such extraction is, in fact, being conducted via the claimed methods. Fish extraction at the levels seen since *Umberger* would be likely infeasible or extraordinarily difficult without fine-meshed gear. In this context, particularly given the public resources at stake, DLNR cannot simply sit on its hands and assume compliance, but must instead take diligent action to monitor and enforce the fine-mesh ban.

Similarly, since the *Umberger* ruling, there have been multiple reports of poaching and illegal activity in the WHRFMA, where all aquarium collection is undisputedly prohibited until environmental review under HEPA is complete. Yet, DLNR has failed to meaningfully monitor, investigate, and take enforcement action against illegal collection in the WHRFMA.

We hope that DLNR will embrace its role as the public's trustee and responsibly manage our precious marine resources in compliance with the law and court rulings, rather than choose an oppositional course that may lead to needless legal action. We would welcome the opportunity to discuss and resolve this cooperatively with DLNR, and we request a meeting for this purpose as soon as possible, particularly before DLNR proceeds with issuing any further CMLs for aquarium collection purposes. Mahalo nui for your attention to and consideration of our request.

Subject: Ban Aquarium Collection
Date: Wednesday, December 11, 2019 10:57:56 AM

As an proactive, lifetime member of The Sierra Club, I am advocating for Hawaii's Coral Reef health. Years upon years of cyanide poisoning our inshore waters, decades of juvenile reef fish extraction, globally broken swim fin damaged coral colonies due to careless divers/snorkelers, overfishing due to rising human population and demand and, now, ocean warming and acidification has most definitely had major negative impacts of reef vibrancy and species numbers and diversity. All marine creatures are victims of human impact. Lifetimes are cut short by disease and death due to aquatic plastic contamination. { As a certified diver, I have seen drastic **deleterious** changes in Hawaii, Fiji, Indonesia, Cook Islands, Mexico, Jamaica and California. } Any collection that may be allowed should be licensed educational aquariums such as the Monterey Bay Aquarium and the Waikiki Aquarium. And captive breed programs should be encouraged. That will take pressure off taking directly from our ocean environment. Extremely strict EIS should be drafted. I appreciate you three, David, Terry and Brian taking my testimony to heart.

Aloha.

Please note my strong disapproval of any commercial reef fish collection in Hawaii. There is no justification in satisfying a very small minority (collectors) at the expense of the remaining residents of Hawaii, not to mention the ecological damage the collectors have done.

Thank you.

January 7, 2020

Dear David Sakoda, Terry VanDeWalle, Brian Neilson:

Thank you for the opportunity to comment on the Pet Industry Joint Advisory Council Draft Environmental Impact Statement (DEIS) for the issuance of commercial aquarium permits for the West Hawaii Regional Fishery Management Area.

I am a West Hawaii, South Kona, Papa Bay resident and after review of the DEIS I would like to comment on the environmental, the cultural, and financial impact of the aquarium collecting industry with photo documentation as I have been a primary witness to aquarium collecting in West Hawaii and AQ collectors are personally known to me including individuals of the 14 permit applications to which this DEIS pertains, some represented in the following photos.

Moving to South Kona as a retiree with no prejudices or knowledge that aquarium collecting took place in the wild, while swimming recreationally near my home in Papa Bay I observed collecting of ornamental fish. I thought it odd and wrong that an apparent variance on coral damage was inherent with an aquarium collecting permit. After being advised by a Honokohau DOCARE officer via phone that coral damage certainly was an offense but that they would have to witness the coral damage and response time would prohibit that, I took up underwater photography.

Logistics ruled DANE's Conservation and Resources Enforcement out of the equation as Papa Bay is over an hour away from the Honokohau DOCARE office. Being aware that the breaking and damaging, with dive fins, leaded nets, and stick implements, of stony coral was occurring (HAR 13-95-70) I felt ethically obligated to assist, especially considering that I was one of very few non-collectors who have ever witnessed AQ collecting.

Although not familiar with Hawaii's standards and training, as a retired California Peace Officer I intended to contribute professionally and positively. My first actions were to swim to collectors that came into Papa Bay, introduce myself and tell them I intended to photo document when I observed the reef being busted up. Four out of six sets of collectors never came back to Papa.

Photos attached are small for the sake of a manageable email file. Full-size photos are available at this dropbox link: <https://www.dropbox.com/sh/1j1vq8773hw/AAAATpHfEjpsCv6mDpW1458-g>

DEIS 2.0 Purpose and need

2.1 "The purpose of the Applicant's action is to ensure that commercial aquarium fish collection allows for the lawful, responsible, and sustainable commercial collection of various fish species from nearshore habitats."

2.2 "The need for the Applicant's action is to continue commercial aquarium fishers' livelihoods in compliance with all applicable laws, rules, and regulations pertaining to the industry."

Photos #1 & 2, anchor damage, Papa Bay, February 25, 2014

I filed anchor damage to coral report with DOCARE and it was referred to the Hawaii county prosecutors office. I was never interviewed. Months later I was told by an office assistant at the Hawaii County Prosecutors office that my case number was not in the system. The reporting DOCARE officer that took my report said that although it is clear that the AQ collectors are anchored in a healthy coral area it is not clear that any damage occurred therefore the case was dropped.

In photo #1, the collector is aware that they have anchored into a rich coral area but made no effort to move and set the anchor into a sandy or rubble area. When this collector returned to Papa Bay a few weeks later, he was angry and stated that I should have understood that the wind came up after he was in the water causing the coral damage.

In photo #2, I would like to point out that the majority of AQ collectors do not use buoyancy control device (BCD) vests, also note that knee pads are worn over the wetsuit. As with this photo, my observations of collectors confirm that contact with the reef is an inevitable part of the collecting process.

Photos #3 & 4, Poaching, incomplete vessel hull number and no AQ permit number on equipment, Papa Bay, March 18, 2014.

I filed a poaching report with photos to DOCARE and this was also passed to the Hawaii County Prosecutors office. I was never interviewed and my subsequent phone inquiry produced the same result from the prosecutors' office, my case number was not in the system. The reporting DOCARE officer never returned my calls.

Photo #3, This photo illustrates contact with the reef. In the DEIS executive summary, page ii, the statement "the aquarium industry has no significant impact on the reef ecosystem" and "the targeted collection of smaller, less fecund individuals, commercial aquarium collection likely has minimal impacts on populations in general".

Hawaii's endemic finger coral makes the perfect sanctuary for the targeted juvenile herbivores, a maze to foil predators. For collectors to herd the fish into the apex of the collection net the collector must use an aggressive technique, the use of sticks to penetrate the finger coral depths and the collectors themselves crawling along the reef floor. In this photo, a rough count reveals 75 Yellow Tang and 80 Kole, this was one of four stings on the first of two dives by these collectors. One thousand fish may have been taken that day. This day most certainly had a significant impact on the reef ecosystem.

Photo #4, the white broken tips of finger coral visible mostly to the right of the nets, this is a photo taken while the collectors were packing up gear upon completion of the dive.

Photo #5 & 6, poaching, Collecting inside the boundaries of the Miloli'i Fish replenishment area (FRA), June 4, 2015

DEIS 1.2.3.2 HAR 13-60.4

"Aquarium collection is prohibited within FRAs, FMAs, and MLCs."

I sent photo documentation and a report to DOCARE on the responding DOCARE officer was unable to respond before these three AQ collectors on this Miloli'i, South Kona based collectors' boat left the area. A follow-up call to Honokohau DOCARE revealed that the collectors in the photos had reported to the DOCARE office and apologized for unintentionally collecting AQ fish inside the FRA and no charges were filed. Would the collectors have reported to the DOCARE office if they hadn't known I photographed the violation? and should that matter as this Miloli'i based collector has been cited twice before for collecting inside the Miloli'i FRA?

Again, the DEIS pledge in the Purpose and need section 2.0, mainly that "The purpose of the Applicant's action is to ensure that commercial aquarium fish collection allows for the lawful, responsible, and sustainable commercial collection of various fish species from nearshore habitats." On February 17, 2015, a Miloli'i fish collector was told by the Hawaii county planning department to stop packaging and shipping fish in a noncompliant ag zoned residential area, Miloli'i Beach Club Association II, South Kona.

This collector appealed the decision, one of his points was that he was not an aquarium collector but a fish breeder.

Quote: "The Petitioners' use of the property consists of gathering aquarium fish, holding such fish in tanks, breeding and propagating fish using wild stock, and packaging of some of the fish gathered and bred on the Property for shipment to customers."

The Planning Department Administrator agreed and closed the case before any neighbors could respond or submit evidence at the hearing.

**SUBJECT: Closure Letter
Complaint – Operating an Unpermitted Non-Agricultural Business
in an Agricultural Zone
Reference: Notice of Violation & Order dated February 17, 2015
File No. 2014-078W
TMK: 8-8-010:093 Papa 2nd, South Kona, HI, Milolii Beach Lots Sub'n**

Thank you for your letter dated April 16, 2015 which you say you are operating an aquaculture production facility consisting of gathering aquarium/ornamental fish, holding of such fish in tanks, breeding and propagating the fish using wild stock, packaging of some of the stocked and propagated fish for commercial shipment to customers from the subject property.

After consultation with County of Hawaii Corporation Counsel, the Planning Department has decided to close the complaint file without prejudice as to future determinations in this matter.

If you have any questions come in and see us or call us at 323-4770. We are here to assist you.

Sincerely,

(copy)

Hawai'i County is an Equal Opportunity Provider and Employer

planning@co.hawaii.hi.us

Photo #7. A fish breeding and propagating facility at Milolii Beach Club Association, Ag zoned residential lots on the day that the planning department interviewed for possible zoning violation, January 5, 2015. The packaging of 19 subs full of "breed and propagated" fish. This individual is one of the 14 commercial aquarium fishers of which the DEIS pertains, therefore, is the DEIS incomplete? Should the breeding and propagating of aquarium fish be included in the DEIS?

Last one! Photo #8, Anchor Chain in Coral

On the Memorial Day holiday, May 29, 2017, an AQ vessel with three collectors was working in Papa Bay. I photographed the AQ vessels anchor, Photo #8, then continued on swimming with four other neighbors. Moments later the AQ vessel buzzed us at full 200hp throttle missing my wife by 15 feet, they knew we were there as one of the collectors was waving at us with her middle finger. A conflict between recreational use of a neighborhoods swimming and snorkeling area and AQ collectors on a holiday weekend, I am thankful no injuries occurred.

Whats important to note in this photo is the 20 plus feet of the 9mm chain and the small claw anchor. Most AQ collectors, as most west side boaters in general use the chain to anchor not the actual anchor itself, enabling easy pull-up but damaging more square meters of coral as a result. A system of day-use mooring buoys has not been established in AQ collecting areas.

DEIS 2.5 Scope of Analysis. "The proposed action and resulting commercial collection does not include any activities different from or in addition to those that have occurred in the past."

The preceding sentence with my observations, that the collection of the targeted juvenile fish, in profitable amounts, can not be accomplished without aggravating actions to stoney coral, is disquieting. And the inability to monitor and enforce rules will result in continued reef damage by the careless time and cost saving actions of the AQ collectors such as improper anchoring.

Peoples observation skills are honed by their experiences. I worked for some years in the logging industry and so an analogy between timber harvesting and aquarium collecting and the management system contrasts between these two natural resources are in my thoughts as I observe AQ collectors at work. The Forest Service offers timber to logging contractors in a bid process were the opening bid is set to insure that infrastructure for the sale is not a cost liability to the public trust, the taxpayers. Road construction, environmental study and the resulting protections to plant and wildlife, and monitoring personnel, these costs are covered before a tree drops. If an endangered or threatened species or a historical/cultural site is discovered the timber sale does not happen. During and after the timber harvest forest service monitoring persons are on site to document that environmental safeguards such as erosion control are satisfactory.

For the most part the people in the logging industry love the woods and understand the importance of sustainability of our forests. But I can affirm that when profit is a factor shortcuts will be taken if the monitoring is not in place. More than one big Sugar Pine has made it to the mill with no evidence that it ever existed. Humans can justify actions and when something is gone it is often forgot.

DNR Mission

"Enhance, protect, conserve and manage Hawaii's unique and limited natural, cultural and historic resources held in public trust for current and future generations of the people of Hawaii nei, and its visitors, in partnership with others from the public and private sectors."

Public trust does not owe fourteen or four hundred individuals our natural resources. Until the removal of reef life can happen with assurances that such removal will enhance, protect and conserve the reef for future generations and the cost of those assurances, such as effective law enforcement, be paid for by the individuals removing that reef life, the moratorium needs to remain in place.

Mahalo Nui Loa for your service,

Paul Cox

Comments of William Graham of Hawi, January 2, 2020

Regarding the Draft EIS for the Issuance of Aquarium Permits

Introduction

This draft EIS is clearly intended to assess the environmental impacts of resuming the aquarium fishery business in West Hawaii using fine mesh nets. The applicant is not a fisherman but a mainland based trade industry group. The DEIS describes its scope in this manner: "Regarding biological resources, this DEIS focuses primarily on the effects of aquarium fishing on wild populations of White List species." That is understandable but the DEIS is extremely deficient when it comes to looking at anything beyond those particular populations. The bulk of my comments will speak specifically to this deficiency.

We also need to better understand the aquarium fishing permitting rules in order to evaluate the reasonableness of future oriented assumptions employed in the DEIS. In particular, the permitting rules appear silent on issues of scale that seem very important. Must the permittee be an individual or could it be a corporation? May the permittee employ multiple boats for collecting the fish? Is there any limit on the number of divers that may deploy from a single collection boat? Above all, there is no present limit on the number of fish that can be taken with a single permit. I attach a copy of the aquarium fishing permit form used by the DLNR.

Finally, the underlying structure behind this HRS 343 related program undertaken by the applicant is very confusing. This makes it difficult for myself and for the community to participate in a properly focused manner. The Pet Industry Joint Advisory Council was not initially applying for any permit. Rather, according to its environmental assessment, it was engaging in a "program" which is intended to facilitate the permitting process (for the apparent benefit of itself and others.) The activity of the Pet Industry group within this program was ostensibly to prepare this EIS. Was there a discretionary approval being sought? However the draft EIS now takes a different stance, and the discretionary approval sought is for "Commercial Aquarium Fishing Permits." That is a very consequential change. It would seem that the Pet Industry group now plans further actions beyond this

EIS? Any forthcoming EIS or revised DEIS must prominently explain these matters in a thorough manner.

My best guess is that the PIJAC recruited these 14 individuals to add on the ground substance to its decision to fund an EIS so that the aquarium trade worldwide could benefit. The 14 agreed provided that they remain anonymous. Of course I cannot substantiate this guess. But it surely fits the process we now see, which is a mess.

1. Impacts on our coral reefs

Today the primary ocean related concern in Hawaii should be the survival of our coral reefs. It is well-known that the ongoing and increasing threat is the warming and rising acidity of the oceans. Therefore coral survival is a worldwide problem but it's especially acute here in Hawaii where we depend so much on our ocean environment. When we discuss the populations of the inshore fishes our focus must turn to their role in maintaining the health of our coral reefs. The DEIS tells us that the overwhelming majority of aquarium fish collection in Hawaii has been of fishes in the surgeon fish family, about 90% of the total take. We know that these fish are herbivores which graze on algae. And without sufficient grazing, algae will overtake coral colonies that have been killed or weakened by adverse ocean conditions. This unwelcome algae growth then eliminates the chance for coral polyps to recover or repopulate when ocean conditions improve. Plus, once getting a foothold in one location, algae and seaweeds tend to spread. The bottom line is that we must do whatever we can to maintain strong populations of all the herbivores on our reefs. How can removing large numbers of surgeonfish align with that goal? The DEIS must address this squarely.

It is certainly not my conjecture that without aquarium fish collection the reefs would be able to maintain good health in the future. But the additional negative impact stemming from aquarium fish collecting will accelerate the loss of healthy reef. This is common sense reasoning. The Draft EIS presents no forward looking analysis of future reef health or herbivore populations. The herbivore populations will in turn be impacted by the prevailing condition of the reefs. Here is part of the DEIS response when the Humane Society asks for a more lengthy look into

future effects: "While it is correct that individuals are removed from the population annually, it is also true that new individuals are added during that period, and therefore it is not certain that losses will accumulate over time." That is hardly reassuring. The DLNR needs to be certain that losses will NOT accumulate. The DEIS keeps its focus on population levels, whereas EIS law requires reporting on indirect and cumulative impacts, such as the coral reefs where the fish reside.

Prior to the massive 2015 bleaching event our most notable coral reef bleaching had occurred back in 1998. That was the time when the world truly became aware of the fragility of the coral reef ecosystem. More recently during the latter half of 2015, and again during September and October of 2019 we have sustained major damage to our reefs here in Hawaii. The draft EIS only briefly mentions this situation and does not address it in any depth. Addressed on pages 116-117 it simply states that overall mean coral cover in West Hawaii declined 19.6% in closed areas and 17.6% in the open areas between 2014 and 2016. On page 133 the draft EIS indicates that after the bleaching event of 2015 there was an average coral cover loss of 49.7% in the leeward reefs of Hawaii Island. I won't try to reconcile the divergent numbers offered, but the magnitude of the problem is most apparent. Since the 2019 bleaching is too recent to be reflected in the DEIS I refer readers to the website hawaiicoral.org to visualize the magnitude of this most recent setback.

It is commonly acknowledged within the research community and the general public that coral bleaching events will occur more frequently in the future, and with increasingly stressful water conditions. The impact of aquarium fishing on future reef health must be examined in full. A look at other reefs in other countries should also be included for developing a better understanding of forward looking prospects in Hawaii. On page 133 the DEIS does say that Great Barrier Reef studies conclude that fishing pressure had minimal effect on bleaching. First off there is very little fishing pressure on that reef which has lots of protections. Furthermore, any pressure specifically due to aquarium fishing would be next to nothing compared to the intensity of aquarium fishing that we have had in West Hawaii. For reading on impacts to the Great Barrier Reef I

suggest Reef Life, chapter 13 by researcher Callum Roberts, published in 2019.

I think it also should be acknowledged that numerous individuals have been involved for many years since 1998 in establishing and protecting the sizeable Fish Replenishment Areas in West Hawaii where aquarium fishing with fine mesh nets has been prohibited. This effort has been extremely valuable in my opinion. But we are now in a new era when the survivability of our coral reefs is clearly in dire jeopardy.

2. From the ocean to the pet shop

With its narrow focus on population levels the DEIS shows minimal attention to the fishing activity itself or the handling of the fish which follows. Others have brought attention to the direct effects of the collection process on the reef, coming from both the anchoring and the actions of the divers. I'd like to look at the effects on the fish while in the ocean and thereafter.

To begin with, the most common fish collected is the yellow tang, and they run in tight schools of perhaps 20 to 40 fish as a rule. I dive and photograph in leeward North Kohala where yellow tang are still common. Once I closely watched an aquarium collector doing his job on a school of yellow tang off Mahukona. I don't have any particular criticism of how he comported himself, he seemed careful to me. The boat anchored further offshore where it could find a sandy bottom. But I want to put attention on the fish and how things went for them. The DEIS on page 32 describes succinctly and accurately the usual process for collection in just three paragraphs. Much more information must be provided, including the collection methods used with species that do not readily school and also with any invertebrates that are collected. To that last point, is the collection of invertebrates so negligible as not to be included in the DEIS? Otherwise we expect to find data on the quantity and types of invertebrates collected along with the environmental consequences. I have no sense that there is a problem here, but it should be addressed in the DEIS.

Regarding the yellow tang collection which I witnessed, not all the fish in the school got trapped in the net. Some broke away and were free, and scattered. But

not enough to form a new school, apparently. What happens to all those fish, who by nature want to be in a school? There were no other schools nearby to join and I have no idea if they would be accepted in a new school anyway. Are they out of luck, will they become easy prey? Or will little groups form and eventually join to make a new school? And how about those fish that were captured. The rules say that no more than 5 individuals longer than 4.5 inches can be taken in a single day. From my experience, only looking, I'd say adult yellow tang are generally maybe 6 inches long. And the schools do appear to contain fish that are of similar size. Does the collector make off-the-cuff judgments as to which to keep and which to release right away, due to size? Probably one develops a rather accurate eye with experience. Still I wonder about those that are perhaps too large. Do they get released after netted? Or do they arrive back at the boat and perhaps get released on the surface at that point? How do they fare thereafter? These are all issues that I think do not get addressed in the EIS. Specifically, is there loss of life of fish while in the collection activity that does not show up in any reporting?

And then, how about the treatment of the fish once they arrive at the boat, come to the dock, go into storage, get prepared for shipping, get shipped. On page 16 in the scoping analysis the DEIS informs us: "Therefore, because population effects have already occurred once an individual fish has been removed from the ocean, it is beyond the scope of this analysis to evaluate effects on individual fish once they are removed from the population." I would disagree, and I strongly believe the DEIS should not be so constrained. As evidence, consider state law in the matter of granting permits, HRS 188-31. Paragraph b reads: "Except as prohibited by law, the permits shall be issued only to persons who can satisfy the department that they possess facilities to and can maintain fish and other aquatic life alive and in reasonable health." Although the DLNR may not even be able to properly enforce this provision, clearly the welfare of the fish is important to the department. Furthermore, the Pet Industry Joint Advisory Council (which is the applicant) has expressed their Mission Statement on their website, pijac.org/who-we-are. The first mission is to "PROMOTE animal well-being and responsible pet ownership." In this DEIS, by choosing to neglect any consideration of the well-being of the

animals caught, PIJAC doesn't conform to their professed mission.

3. Absence of meaningful alternatives

My understanding is that the role of alternatives within the EIS process is one which pertains to possible courses of action by the applicant. Alternatives are not proposals for possible changes in agency rules, although they can be useful towards that end. I believe this is an accurate understanding.

In the DEIS I found there to be no alternatives of any consequence under consideration. It is also notable that the DLNR chairperson explicitly called out this failure in her letter of July 26, 2018 to the OEQC. That letter was referring to the alternatives considered in the Environmental Assessment, and it specifically suggested three consequential alternatives that might be analyzed. None of those three alternatives are examined in this DEIS. A look at the subject matter of the 5 alternatives that are considered in the DEIS should reinforce my conclusion.

First, reducing the Achilles Tang daily take limit down from 10 to 5 is a very modest change to just one of the forty species open to aquarium fishers. A second minimal alteration would limit collection by permit to just the West Hawaii area, designated as WHRFMA. It is already understood that the WHRFMA is where most aquarium fishing now occurs and is the primary area of environmental concern. Probably this is where the 14 proposed permittees have fished in the past. So that potential offering is of minor importance. Finally, limiting requested permits to just 14 individuals is not representing an alternative, it's just the scope of action related to the current application. That plus the alternative of no action essentially completes the alternatives considered.

The applicant could easily present and evaluate meaningful alternatives that might lessen the environmental impact of the proposed issuance of permits to the 14 seeking to use fine mesh netting for fish collection. The applicants might agree to conditions like the following: A sizeable subset of the 40 species could be considered off limits to their collection activity. They could abide by a closed season of some duration. They could offer further cooperation to ensure accurate reporting of fishes collected as well as survival statistics. They could constrain

themselves to annual limits on the total take of any one licensee. The presentation of such alternatives is not detrimental to the interests of the potential licensees, it merely looks more broadly before recommending the preferred alternative. This also gives the DLNR valuable information towards determining how it might handle its licensing task in the future.

Hawaii's EIS rules suggest the range of alternatives which are sought in a Draft EIS. Referring to 11-200-17, after citing the no action alternative the rule goes on to suggest: "Alternatives requiring actions of a significantly different nature which would provide similar benefits with different environmental impacts." I find the DEIS unacceptable since no significantly different alternatives for the proposed activities of the 14 are presented or evaluated.

4. Underlying structure of this application

It is important to keep in mind the process by which this DEIS has arisen. First Hawaii's court system ruled in early 2018 that current aquarium permits are invalid and new permit issuance must await a full study of the environmental impacts of collecting for aquariums. Obviously it is too expensive for a single fisherman to bankroll the preparation of an environmental impact statement. However, worldwide the aquarium industry is sizeable, with retailers and wholesalers and shippers all involved. So a trade group, the Pet Industry Joint Advisory Council located in Alexandria, Virginia has chosen to proceed with the environmental impact statement. Keeping things in perspective, it would be a net positive for Hawaii residents to get a comprehensive, fair minded environmental impact study of aquarium fishing and our reef life without spending taxpayer dollars. Let us hope that is forthcoming.

However there are striking oddities involved in the current process. The draft EIS (DEIS) lists the Pet Industry Council as the applicant who has initiated the EIS process. But the "applicant" hasn't applied for any aquarium permits yet, although I believe that the DLNR is not currently accepting applications. It's not clear that the Council has officially applied for anything. But within this DEIS the Project Summary section reads: "Proposed Action: issuance of 14 Commercial Aquarium Permits" Note that HRS343-2 defines applicant thus: "Applicant

means any person who, pursuant to statute, ordinance, or rule, officially requests approval for a proposed action." Clearly there is a mismatch here, the proposed action cited by the applicant is not being officially requested by the applicant. Furthermore, this DEIS action is a big change from the original "program" as described in the EA of March 13, 2018 under the section entitled "Project Summary". These are not mere housekeeping issues. Perhaps the HRS 343 process should be restarted with a clearly defined action maintained throughout.

There are 14 specific individuals who form the basis for significant parts of the data cited in the DEIS. Yet those 14 individuals have not been identified publicly nor have they applied for new permits. The Humane Society asked the DEIS authors for identification of the 14 applicants by name and business name after the issuance of the Environmental Assessment. Here is the response they received: "Comment noted. The applicant information is provided in the DEIS." This is a clear example of how the irregular situation here has brought about unnecessary confusion. We should hear in a forthright manner why the 14 are not identified. I can imagine reasons why those individuals might not want to be publicly singled out and I can respect their decision. But the DEIS itself suffers without full disclosure. In fact the permit application form used by the DLNR specifically asks for the name of the applicant and much more. See attached AquariumPermit.pdf. Furthermore one finds that some of the data within the EIS is purportedly based upon the historical records of those 14 specific individuals. Examples would include tables 5.2 and 5.11 in the DEIS. Absent specific disclosure of the 14, why should the public have confidence in the accuracy of that data when commenting on the DEIS? No verification is possible.

Also, the DEIS attempts to make use of the ambiguity that revolves around the 14 individuals and their role in the current application for which the DEIS has been prepared. On one hand, page 19 in section 3.5 Limited Permit Issuance (Preferred) Alternative, one reads: "Under the Limited Permit Issuance Alternative, the DLNR would issue Aquarium Permits to 14 aquarium fishers in the WHRFMA,"). Note that it does not say anything about any constraint on the DLNR from also issuing permits to other applicants. Then on page 135 in section 5.44, Mitigation, the second paragraph reads as follows: "Nevertheless, the

Preferred Alternative includes mitigative measures (see section 5.0) such as a reduction in the number of Aquarium Permits that would be issued, ..." So here the ambiguity is clearly exposed. Nowhere is the DLNR asked to limit its overall issuance of permits to only 14, since that is clearly not the proper role for the applicant. (Why would these 14 qualify as preferred over others, anyway?) The EIS must either explain how their proposal constrains the DLNR from further issuance of permits or else discontinue using the 14 number as a valid alternative to unlimited issuance.

With this EIS, if the PIJAC plans to get an approval of some nature which allows it to act as an agent of the DLNR insofar as issuing permits, that would be unusual. There is no indication that these 14 individuals are current applicants for permits. If this so-called application for 14 permits constrains the DLNR in any manner from deciding to whom it will choose to issue permits (such as to these 14) if and when the DLNR resumes issuance of permits, the public should be made aware of that right now, in this document.

GENERAL COMMENTS

Sierra Club comments in this document are indicated in italics. We concur and uphold DLNR's mission to 'Enhance, protect, conserve and manage Hawai'i's unique and limited natural, cultural, and historic resources held in public trust for current and future generations of the people of Hawai'i nei, and its visitors, in partnership with others from the public and private sectors.'

The legislature has decreed it the "policy of the State" that DNLN and other agencies must "[c]onserve natural resources . . . by preserving or augmenting natural resources, and by safeguarding the State's unique natural environmental characteristics . . ."1 The Agency must also "[e]ncourage management practices which conserve . . . all natural resources," and encourage all individuals "to fulfill the responsibility as trustees of the environment for the present and succeeding generations."2 In enacting HEPA, the State legislature found "that the quality of humanity's environment is critical to humanity's well-being, [and] that humanity's activities have broad and profound effects upon the interrelations of all components of the environment . .

¹ Haw. Rev. Stat. § 344-3(1).

² Haw. Rev. Stat. § 344-4(2)(A), (10)(A).

Sierra Club concurs with the DEIS analysis submitted collectively by For the Fishes, The Humane Society of the United States, Moana Ohana, and the Center for Biological Diversity. We ask that their response be incorporated into our comments and responded to in the succeeding draft of the EIS.

We find that this DEIS fails to provide adequate baseline data from which to analyze the risks posed by cumulative factors, such as unregulated collecting, under-reporting of catch, failure to monitor and take enforcement actions when violations occur, changes to habitat from natural and human perturbations historically, and the effect proposed alternative(s) would have on traditional fishing practice and diminishment of our clean and healthful environment. The DEIS fails to offer appropriate mitigation for anticipated impacts, regulation and reporting of all collection, sales records and export data, and it fails to address the cruelty to which the collected animals are exposed. The compiler of this DEIS failed to consult with citizen groups and communities who are affected, and dismissed the significant input provided by those with whom it did consult. The DEIS did not address our specific issues and concerns raised in the earlier environmental assessments, nor did it appropriately disclose adverse effects to the biological and cultural resources that are part of the public trust the State of Hawaii has the responsibility to protect. Future serious impacts to the coastal near-shore habitat due to climate change are ignored in this document, and the proposed action alternatives do not address mitigation for the anticipated loss of coastal habitat. The DEIS preferred alternative proposes to exploit a public resource for the economic benefit of a few, (who have been non-compliant with past rules and regulations), at the expense of the subsistence communities, the resident public, the visitors, and the health of the state as a whole. Absent the documentation needed for a complete and accurate analysis, we ask that at the very least, a No Action Alternative be implemented.

SPECIFIC COMMENTS

Executive Summary

p. ii

Even if the collection rates of the 40 White List Species were closer to the maximum collection by the 14 fishers from 2000-2017, the annual collection of all species would be less than 3.5% of the island-wide population. Research suggests collection of between 5%-25% is sustainable for various reef species similar to those on the White List (e.g., tang, wrasse, butterflyfish, angelfish, triggerfish). Based on the low percentage of the overall populations collected annually by commercial aquarium fishers, which is spread throughout the year and across multiple areas, as well as the targeted collection of smaller, less fecund individuals, commercial aquarium collection likely has minimal impacts on populations in general.

Explain why the research is reliable if it is only based on similar species, not actual species.

Calculations and evaluation of impacts should include catch of food fish which are also caught for aquarium collecting.

p.iii

Loss of the fishery would result in the loss of income, tax revenue, and jobs.

Recommendation by cultural practitioner Pelika Andrade was that the aquarium industry should invest in aquaculture, which would teach them how to grow and spawn their own supply and make contributions to replenishing the fish removed from our waters.

Income tax revenue, and jobs from sustainable aquaculture could replace that of aquarium fish collecting from the ocean.

2.0 PURPOSE AND NEED

p. 15 The need for the Applicant's action is to continue commercial aquarium fishers' livelihoods...

The resources of the ocean and the nearshore waters are a component of the Public Trust held for the benefit of Native Hawaiians and the general public. When the public trust resources are "mined" for the benefit of a few commercial collectors to enhance the pleasure of a few aquarists keeping open ocean animals in a closed and artificial environment, the sustainability of the habitat on which traditional practitioners depend is altered. The livelihoods of local fishers (and their families) for subsistence is a need that outweighs the needs of the applicant.

2.2 NEED FOR APPLICANT'S ACTION

Using fish for food meets a basic human need. Using fish for aquariums only provides pleasure, but there are many other options which do not involve animal cruelty and are more environmentally friendly.

p. 16

2.5 SCOPE OF ANALYSIS

p. 16

Regarding biological resources, this DEIS focuses primarily on the effects of aquarium fishing on wild populations of White List Species, as it is at the population level that DAR measures changes in White List Species and makes management decisions (e.g., issuance of harvest permits, implementation of bag limits). Therefore, because population effects have already occurred once an individual fish has been removed from the ocean, it is beyond the scope of this analysis to evaluate effects on individual fish once they are removed from the population.

The focus should be on impacts on specific West Hawai'i locations, not on the entire population around the island of Hawai'i.

2.5.1 Resources Evaluated and Dismissed from Further Consideration

pp. 16 - 17

This DEIS evaluates the impacts of five commercial aquarium fish collection alternatives on the nearshore habitat (0-600 feet; 0-100 fathoms) in which commercial aquarium fishing (or lack thereof) would take place over a 5-year period. During the evaluation process, it was determined that some resources typically evaluated in an EIS would not be impacted by any of the alternatives under consideration. The evaluation includes past use and potential impacts by the commercial aquarium fishery because it has been a part of the baseline condition of these resources since the late 1940s. Because a significant increase in commercial aquarium fishing is not anticipated during the 5-year assessment period evaluated in this DEIS, and in fact a decrease when compared to historic conditions is anticipated due to the issuance of only Aquarium Permits, this DEIS does not anticipate a significant change in the current baseline condition of these resources.

It is not clear that the DEIS examines the condition set forth by DLNR to examine "The adequacy of the analysis presented in the DEA, including but not limited to removal and replenishment rates for vulnerable species; specifically, how is the estimated sustainable range of 5% to 25% annual take of the estimated total population arrived at, and should the threshold be 5% or 25%."

The DLNR's issuance of 14 Aquarium Permits is not anticipated to result in significant beneficial or adverse impacts to water and air quality, geology and soil resources, aesthetics, noise, vegetation, terrestrial wildlife and avian species, threatened and endangered species, land use, public health and safety, communications, transportation, utilities, or population and demographics from the current baseline condition, therefore, these resources will not be evaluated further.

In light of Judge Wilson's dissenting opinion on the Thirty Meter Telescope, which is incorporated by the reference below, identify any Federal and State laws which state that if resources are degraded, it's acceptable to degrade them further.

<https://www.courts.state.hi.us/wp-content/uploads/2018/11/SCOT-17-0000777disam.pdf>

The DEIS states...it is beyond the scope of this analysis to evaluate effects on individual fish once they are removed from the population.

The trade as proposed in DEIS violates Hawaii's Cruelty to Animals statute. The disclaimer on the scope to exclude what happens to these creatures after caught is inappropriate and omits critical information needed to evaluate alternatives. If all of the captured individuals died, under this analysis, it would not be considered, because it would be outside the scope.

Fish may be brought up from reefs so quickly they suffer immediately. If their swim bladders are not punctured they can die. In several instances, fish have been found dead in trash cans (note the 500 dead at the harbor). Several Hawaiians interviewed complain that they see bags of dead reef fish and this is not pono. What measures are taken to ensure fish are treated humanely? We understand they are deprived of food at warehouses before shipping. Their fins are trimmed. What agency is charged with DOH and DLNR regulating care of fish?

The effects on individual fish removed from the population matter. The manner of capture and care should be included in the analysis! These fish are not used for subsistence, they are used for ornamentation and fleeting pleasure. The impacts of trapping, finning, starving, enclosure in confined packaging, transporting and eventual placement of remaining live "specimens" in artificial conditions must be considered in the DEIS analysis.

Hawaii Cruelty to Animals Statute

§711-1109 Cruelty to animals in the second degree. (1) A person commits the offense of cruelty to animals in the second degree if the person intentionally, knowingly, or recklessly:

(a) Overdrives, overloads, tortures, torments, beats, causes substantial bodily injury to, or starves any animal, or causes the overdriving, overloading, torture, torment, beating, or starving of any animal;

(b) Deprives a pet animal of necessary sustenance or causes such deprivation;

(c) Mutilates, poisons, or kills without need any animal other than insects, vermin, or other pests; provided that the handling or extermination of any insect, vermin, or other pest is conducted in accordance with standard and acceptable pest control practices and all applicable laws and regulations.

3.0 ALTERNATIVES

3.1 NO ACTION ALTERNATIVE

No Action Alternative does not meet the Applicant's purpose and need to continue fishers' livelihoods participating in lawful, responsible, and sustainable commercial collection of approved fish species from nearshore habitats

*Include the fact that collectors can pursue **alternate** livelihoods raising aquarium fish in captivity, working in commercial aquariums, fishing for food fish, and running boat and dive tours.*

In order to protect and ensure the sustained health of the reef and subsistence fishing practices of native communities, the Sierra Club requests that the DLNR accept the No Action Alternative.

3.5 LIMITED PERMIT ISSUANCE (PREFERRED) ALTERNATIVE

This Alternative is based on the best available science, supports the DLNR's purpose to ensure Applicant's Actions do not lead to degradation of fish populations and the habitats in which they occur in the context of commercial aquarium collection.

The problem continues to be that DLNR/DOCARE do not demonstrate the capacity, funding or commitment to enforce the regulations as proposed. This statement is corroborated by the numerous interviews conducted in the cultural impact statement appended as Appendix A.

Quotes from the Cultural Impact Assessment include the following:

(WILFRED KAUPIKO, KA'IMI KAUPIKO, AND GREG ASNER) When asked about their thoughts on the proposed action, they explained some of the reasons why they were not in support of the proposed action. The four individuals explained that while aquarium collection is not permitted within Miloli'i Bay, they noted that aquarium collectors often launch their boats and utilize water at the Miloli'i dock to fill their tanks. Ka'imi and Uncle Willy described several instances when they have caught aquarium collectors illegally harvesting fish within the FRA which they reported to DLNR. Uncle Willy (Kaupiko) stated that for the past ten years and because the State cannot fulfill its duties, the Miloli'i community has been implementing Makai Watch, a community- based watch and outreach program promoted by DLNR. Despite numerous complaints and reports to DLNR about the illegal taking of fish by collectors, Ka'imi and Uncle Willy opined that DLNR has failed in their responsibility as they do not follow up or issue citations to violators. For these reasons and many others, Uncle Willy feels that the "State cannot take care of our resources." (CIA P 127)

Shane Palacat-Nelson, In referencing Kealakekua Bay, Shane stated that the current state of the bay is unknown because there is not enough fish count, water quality, or reef health data to provide feedback on the potential impacts to the area. He further related that schools of fish can be depleted in one season, but if there is no data to detect these depletions then communities witnessing the depletion of their own resources are left with no support or evidence to resolve these on-going problems. He believes that restricted areas "are not working properly" and therefore declined to comment until there is a thorough study done within these areas. With the lack of data, he is unable to accept the commercialization of aquatic fisheries until these issues are addressed. (CIA P 128)

Joe (Balismo) also spoke about the lack of DOCARE enforcement officers because of their limited resources and stated that ensuring compliance with all laws pertaining to the aquarium industry is a difficult thing to enforce. He added that the lack of enforcement means that the state relies on the "trust system," which for him is unacceptable. (CIA p 132)

(Summary) As voiced by many of the consulted parties, the lack of support and funding have hampered DNLN-DAR's ability to fulfill its fiduciary responsibility, namely to enhance, protect, conserve, and manage Hawai'i's unique and limited resources, which are supposed to be held in public trust for the current and future generations of the people of Hawai'i nei, and visitors alike. (CIA P 135-6)

1.2.3.2 HAR 13-60.4 (p 13) In addition to applying any other penalties provided by law, the DLNR may revoke any West Hawai'i Aquarium Permit for any infraction of these rules or the terms and conditions of the permit, and any person whose permit has been revoked shall not be eligible to apply for another West Hawai'i Aquarium Permit (commercial or recreational) until one year from the date of revocation.

How has DLNR implemented enforcement to date? Have permits been revoked?

If, under the preferred alternative, each of 14 permittees were assessed at least \$50,000 annual fee to cover the cost of a dozen enforcement officers, the boats and equipment to monitor the commercial collection activities, and staff to conduct population assessments in the collection areas, such a system might be within reason, but the institutional will and funding are not evident. For this and many other reasons, this is not a practical or sustainable alternative.

4.1.1 Socioeconomic Aspects of the Commercial Aquarium Fishery

- In 2017, the commercial aquarium fishery on the island of Hawai'i reported landings near \$1.4 million, with more than \$1.29 million coming from the WHRFMA (DAR 2018a). **For the 14 fishers requesting commercial Aquarium Permits under the Proposed Action, 3 to 11 fishers reported catch in any given year between 2000 and 2017**, contributing from 22.3% to 69.1% to the total overall WHRFMA fishery value (Table 4-1). (Emphasis added)
-
- In addition to incorporating Act 306 into the Hawai'i Administrative Rules, HAR 13-60.4 identified West Hawai'i Aquarium Permit Terms and Conditions by implementing the following provisions:
- **Aquarium collectors must submit each month's daily aquarium fishing trip reports before every 10th day of the following month.** (Emphasis added)

According to table 4.1, barely 47 percent of permittees provided required reports, and of the 14 proposed permittees in the Preferred Alternative, only 3 to 11 provided reports during 2000-2017, so how does the DLNR expect to collect meaningful data, if those with permits are historically non-compliant?

4.2 CULTURAL RESOURCES

P 29 Commercial aquarium fish collection is not a part of Native Hawaiian culture; however, Native Hawaiians do participate in and support the fishery and Hawaiian culture has been a significant aspect of the fishery's management since the 1970's. Although the process has been contentious at times, the WHFC has been successful.

This section fails to acknowledge the significant impact of aquarium collecting on lawei`a (fishing and gathering) and its effect on Hawaiian traditional culture, contemporary practice and way of life.

Quoting a few passages from the Cultural Impact Statement:

P of 111-112 CIA quoting Pelika Andrade

When asked if the proposed project would lend to any potential cultural impacts, Pelika (Andrade) compared the practice of lawai'a to aquarium fish collection as it is practiced in Hawai'i today. She evaluated that lawai'a—the reciprocal relationship between man and the environment—and aquarium collection, which focuses on the act of lawei'a, removing fish from the ocean does not align with the Hawaiian worldview of caring for the ocean and its resources. She stated that aquarium fishing is not about feeding those at your table, but a business that impacts that

larger community. She feels that there is no accountability to the communities that are impacted by this industry, which was a fundamental aspect of traditional fishing practices. Based on this, Pelika believes that the proposed project would lend to adverse impacts to the community and is not aligned with traditional fishing practices. She went on to explain that with aquarium collection, "there's no tending process, only lawe i'a." She argued that modern aquarium collection practices negatively impact fisheries and disrupts traditional knowledge systems, because there is no input or contribution to maintaining the very resource that the industry is dependent upon. She emphasized that the practice of kupuna (Hawaiian elders) was not based exclusively on lawe i'a (taking fish), rather the act of lawe i'a was carried out after a fisher understood all of the other components that allowed for healthy marine resources. She argued that identifying oneself to the act of lawe i'a (taking fish) with no forms self-management, severely limits the individual from fully embracing the traditional practice of lawai'a, which emphasized caring for the resources. Pelika opined that the act and the sense of entitlement associated with lawe i'a (taking fish) can be applied to other fishing industries, from commercial to subsistence fishing. She explained that this mindset shift from caring for our resources, to entitlement to our resources, is a result of a lifestyle change. For these reasons, Pelika does not support aquarium fishing and other fishing practices or industries that make no effort towards contributing to maintaining the resources or encourages self-management.

P115 of CIA

The Kailapa Community members and those from the Kohala Estates spoke openly against the collection of reef fish to supply the aquarium industry. Many stated that the practice of catching fish without intending to consume it goes against traditional belief and that this act is not pono (proper, morally fitting, beneficial). They expressed that all fish are part of the public trust and that removing fish to supply a "lucrative" industry undermines traditional practices and beliefs associated with the ocean.

P 131 of CIA

Damien (Kenison) shared that for him, he feels that the take of fish for aquarium purposes is a "wasteful practice" and expressed that it is a cultural value not to waste fish. He opined that this practice from a Hawaiian perspective is maha'oi (rude and impudent). He feels that "tropical fish collectors have no respect for the resource and the communities" and described instances when coolers of dead tropical fish were found. He stated that the aquarium industry does not have a stake in the local communities. He expressed that dealing with this growing conflict has been stressful for the community.

4.4 BIOLOGICAL RESOURCES

The cultural significance of White list species are under-reported throughout the DEIS; for example, the DEIS section on Cultural Significance of the Achilles Tang states (p 36)

The yellow tang, called *lāī pala* or *lauī pala* in Hawai'i, although small was considered a delicacy and also involved in healing rituals.

It fails to provide this significant information:

P117 of CIA, Kehau Springer stated that "Through her interactions with various communities in West Hawai'i, and in speaking with kama'āina of the areas, certain harvesting and fishing practices have changed due to a decrease in fish population and environmental changes as exemplified by the pākuikui (Achilles tang). Kehau shared that this is a favorite delicacy in South Kona. Elders of the area shared that this fish was highly favored for parties and gatherings. However, according to oral interviews with various community members, in the last decade, there has been a major population decline. As a researcher, she confirmed that she has observed a very small population of pākuikui in these areas and in comparing scientific monitoring data, statistics, and literature reviews, their numbers have decreased significantly over the years. She does contend that there are other factors that may affect the population, such as their monogamous behavior, urbanization, pollution, and overharvesting."

While a decline in the abundance of Achilles Tang is described in the DEIS on p 76, the loss of the cultural resource is not addressed:

- Commercial aquarium landings of Achilles Tang have declined in West Hawai'i over the past two decades in association with a recent dramatic increase in its value (192% since 2008). This is strongly suggestive of declining availability (i.e., abundance). (Addressed in Section 5.4.1.2 – Achilles Tang).
- Achilles Tang have declined significantly in FRAs and Open Areas over the last 20 years. Open Area populations have usually been higher than FRA populations in the past decade. Achilles Tang has had low levels of recruitment over the past two decades, and because of its popularity as a food fish as well as an aquarium fish, this species is harvested both as juveniles and adults.

4.4.2.1 Red Pond Shrimp

Opae`ula, referred to in the DEIS as Red Pond Shrimp, are in a group known to be endemic to the Hawaiian Islands. The Center for Biological Diversity(CBD) has sued the US Fish and Wildlife Service(USFWS) for not designating critical habitat for all endangered species recently designated for Hawai'i and this Red pond shrimp is one. The suit claims that by not designating critical habitat, USFWS is violating the Endangered Species Act because 14 of 15 of species recently designated are not protected. Max Phillips of CBD says "These special species are found nowhere else...so if they disappear from here they'll be lost forever. Anchialine pool shrimp and the rest of the group needed habitat protection years ago but there not getting it from the anti-wildlife Trump administration. Species with habitat protections are twice as likely to be in recovery as those without".

4.4.3 Hawai'i Species of Greatest Conservation Need

pp. 67-68

...three White List Species occur on Hawai'i's SGCN list:

1. Psychedelic Wrasse
2. Tinker's Butterflyfish
3. Fisher's Angelfish

Since there is cause for concern about these species, they should not be collected.

p. 69 Ecosystem indicators related to benthic reef community integrity indicate a shift in West Hawai'i towards lowered reef accretion and reduced structural complexity.

Given the observations of cultural practitioners, over-fishing, pollution, damaged habitat, coral bleaching and climate change have all led to significant changes in the habitat for reef fish. There is no discussion in this section to address the significant degradation of the habitat both historically and contemporaneously.

P123 of CIA

Megan (Lamson) pointed to the 2015 coral bleaching event that resulted in the loss of close to fifty percent of live coral covers in West Hawai'i. She added that the drastic reduction in coral has severely altered the very foundation upon which reef fish and other marine life need to survive. She emphasized that although some fish listed on the "white-list" are highly valued in Hawaiian culture, she explained that all fish have a role in maintaining the necessary balance of the ecosystem. She stressed that we don't fully understand the ecological relationships that exist between the different species.

4.4.5 Reef Habitat

Due to Hawai'i's extreme isolation, an estimated 25% of the coral reef species are found nowhere else...The ratio between the cover of calcifying to non-calcifying organisms – an indicator of coral reef community dynamics and the extent to which a given system is dominated by organisms that contribute to coral reef development and persistence – declined across West Hawai'i since 2003...

Removing herbivorous aquarium fish will not help in mitigating the decline of coral reef health. Reef fish from larval through juvenile stages have an extremely high natural mortality rate, this natural order is important to the life on the reef as well as the mid water feeders and even the pelagic predators. An abundance of invasive algae will occur in a un-healthy ecosystem.

*A recent DAR announcement appealed to subsistence and recreational reef fishers to **refrain from taking herbivorous fish off the reefs**. This tacit recognition of the vital symbiotic service they perform in this delicate ecosystem is overdue and yet completely absent in the DEIS.*

The 'preferred alternative' in the document would allow (with one exception) for unlimited takes of many of these same important organisms.

4.4.7.1 West Hawai'i Aquarium Project (WHAP) Surveys

The 2010 and 2014 Hawai'i Island aquarium catch report validation did not indicate substantial underreporting of catch by aquarium collectors.

This statement is not consistent with tables 4-1 and 4-2 that detail significant underreporting by permittees and proposed permittees over a multi-year period.

Table 4-5. West Hawai'i Open Area population estimates...

Some catches as a percent of population seem high (30' -60' open area) This may indicate past mismanagement by DLNR. So perhaps DEIS assumptions that DLNR will enforce regulations are unfounded.

Achilles Tang

32.70% in 2013 – 2014

39.67% in 2017 – 2018

Yellow Tang

17.26% in 2013 – 2014

Black Surgeonfish

11.66% in 2013 – 2014

Shortnose wrasse

18.07% in 2017 – 2018

Psychedelic wrasse

55.78% in 2017-2018

p. 76

Achilles Tang have declined significantly in FRAs and Open Areas over the last 20 years. Open Area populations have usually been higher than FRA populations in the past decade. Achilles Tang has had low levels of recruitment over the past two decades, and because of its popularity as a food fish as well as an aquarium fish, this species is harvested both as juveniles and adults.

Pressure on food fish that are declining in numbers should not be increased by aquarium collecting.

p. 77

The Psychedelic Wrasse, Tinker's Butterflyfish, and Fisher's Angelfish are all listed as SGCN in Hawai'i...Adequate population estimates based on WHAP data (30-60 feet depth) are not available to assess the impact of continued aquarium collection on these three species due to their deeper water habitats. However, based on deep diver observations, Tinker's Butterflyfish and Psychedelic Wrasse are substantially more common in the long term protected areas (MPAs). Commercial aquarium fishers generally do not fish in the deeper waters in which these species occur. In 2017, there were 599 Psychedelic Wrasse, approximately 290 Tinker's Butterflyfish (n.d. in East Hawai'i), and 288 Fisher's Angelfish collected by aquarium fishers on the island of Hawai'i

See comments re. 4.4.3. Since two of the species seem to thrive when protected, they should not be collected.

In particular, the wide range (5% -25%) of claimed 'sustainable' takes for a range of 'white list' species is never fully backed up with studies of the subject areas. Nor does this gross margin of 'sustainability' cohere with statements elsewhere such as,

"The DAR (2019a) has noted significantly declining populations in one or more management area for 12 of the White List Species. However, as noted above and in Section 5.4.3, these declines are occurring in both areas open and closed to commercial aquarium fishing for all but one species, indicating that aquarium collection is not driving the decline (DAR 2019a). Because these declines are occurring in FRAs and/or MPAs as well (i.e., areas not open to commercial aquarium collection) it is reasonable to assume that banning commercial aquarium collection would not halt the declines.."

We observe that any declines whether driven by or contributed to by the trade are simply not justified by the logic and necessity of sustainability. It is the larger abiding responsibility of DLNR, as specified in the State constitution, to preserve in abundance this resource.

4.4.7.3 WHAP and CREP Survey Comparison

p. 81

...due to the larger spatial coverage and greater range of depths surveyed by the CREP, CREP data were considered to be a better estimator of island-wide fish populations, and therefore serve as the primary basis for the impact analysis found in Section 5.0.

See comments re. 2.5. WHAP should be used because it is specific to West Hawai'i.

5.2 SOCIOECONOMIC RESOURCES

5.2.1 Direct Impacts

p. 84

Total ex-vessel value (i.e., price received by a fisher for the catch) for the 14 fishers in the WHRFMA ranged from a low of \$164,040 in 2001 to a high of \$1,162,964 in 2016, with an average of \$793,352 (inflation- adjusted 2019 dollars...)...The 2017 ex-vessel inflation-adjusted value for the 14 fishers within the WHRFMA was \$932,735...It should be noted that the dollar value of these fisheries represents only the ex-vessel value, what the fishers are paid for their catch, and does not include the value which would be generated by additional dealer and retail sales.

p. 21

In 2001, Cesar et al. documented the annual recreational value of the coral reefs of the Hawaiian reefs for snorkelers and divers was estimated to be \$281 million and \$44 million, respectively. Although the direct expenditure per diver is much larger than the direct expenditures of snorkelers, the overall value related to the latter group is much larger due to their large numbers.

The value of the coral reef ecosystem for tourism (snorkeling) appears to be is several orders of magnitude greater than the value of the reef-sustaining fish for "esthetically pleasing" aquaria on the continent. In addition, the process of collecting and transporting reef fish for sale on the continent constitutes animal cruelty and a waste of resources (fish die in transport or within a year many die in tanks. This) is detrimental to society in the long term.

p. 85

Analysis by the DAR (2019a) has shown that actual underreporting of catch is small, with a 3.5% difference between the number of animals reported caught and sold in 2010 and a 0.4% difference in 2014, which likely represent live releases and mortality.

How reliable are reports of numbers caught and reports of numbers sold? The reporting process should be more fully described to back up the statement that "underreporting of catch is small".

p. 85

The number of non-reporting permit holders is actually an indicator of industry growth and direct socioeconomic benefits.

The DEIS should explain this incongruous assertion. More information should be provided to explain and back up this statement.

5.2.1.1 No Action Alternative

p. 85

An increase in the East Hawai'i commercial aquarium fishery value may offset some of the loss from the WHRFMA fishery under the No Action Alternative, but the fishery as a whole would still add approximately \$6.3 million less to the economy over the 5-year analysis period than under the Pre-Aquarium Collection Ban Alternative, or \$1,250,611 less per year (on average).

The EIS should evaluate how much of this would be offset by an increase in populations of aquarium fish that are also caught for food, and by collectors changing to jobs catching food fish, doing boat and dive tours, working at public aquariums, and other employment.

5.2.1.5 Limited Permit Issuance (Preferred) Alternative

p. 87

The analysis should factor in costs to collectors for boats, equipment, gas, insurance, maintenance, etc.

p. 88

The Limited Permit Issuance (Preferred) Alternative would have a minimal, but **beneficial direct impact** on Hawai'i's overall and ocean socioeconomic resources...

Explain how removing fish from the ocean has beneficial direct impact on ocean socioeconomic resources.

5.2.2 Indirect Impacts

p. 88

Indirect socioeconomic impacts of the commercial aquarium fishery would primarily involve the additional profits from the aquarium fish market (including freight and packaging), as well as other tourist businesses such as snorkel and dive operations that rely on seeing and interacting with a healthy reef ecosystem. The presence of a healthy reef ecosystem may also impact overall land/home values on the island of Hawai'i.

Explain how removing beautiful fish helps snorkel and dive operations.

Explain how taking herbivores off the reef makes the reef healthy.

See comment re. "scientific data" in 5.2.2.1

5.2.2.1 No Action Alternative

p. 88

...approximately \$31 million in indirect economic benefits of this fishery would not occur over the 5-year analysis period...

See comment re. p. 87.

p. 88

No scientific data exist to suggest that in the absence of aquarium fishers an increase in other tourist operations would occur.

The EIS does not rely on scientific data to make assumptions about tourist businesses in 5.2.2 (see above)

p. 88

The loss of funding for reef fish conservation likely would impact the ability of the DAR to monitor and protect reef fish.

The DEIS does not explain how the No Action Alternative would lead to a loss of funding. What mechanisms are in place to currently to provide funding for monitoring and enforcement? How are reef fish protected currently? How much of this would be offset by the reduced need for monitoring with no collecting allowed in West Hawai'i?

5.2.2.5 Limited Permit Issuance (Preferred) Alternative

p. 91

The Limited Permit Issuance (Preferred) Alternative would have a **less than significant impact** on Hawai'i's tourist industry, and a minimal, but **beneficial indirect impact** on Hawai'i's overall economy through re-investment efforts in terms of equipment, maintenance, supplies, and personnel.

The DEIS does not explain how the Preferred Alternative would impact funding for equipment, maintenance, supplies, and personnel. What mechanisms are in place to currently to provide funding for monitoring and enforcement? How are reef fish protected currently?

P 125 of CIA

Both Greg (Asner) and Gail confirmed fish population crashes at Pāpā Bay and have recorded collectors walking on and damaging coral, which they expressed is key to maintaining a healthy marine ecosystem. The group stated that they have seen aquarium collectors day after day collecting fish from the same areas and feels that this intensive harvesting does not give the fish and the ecosystem a chance to recuperate from previous biological removals. Greg believes that the destructive methods used by certain aquarium collectors are dismantling this integrated system.

Describe the economic impacts from reef degradation from loss of herbivores and collectors damaging coral.

5.3 CULTURAL RESOURCES

5.3.1 Direct and Indirect Impacts

p. 92

As concluded in the CIA, cultural impacts would occur if issuance of Aquarium Permits under an alternative would cause a significant decline in the population of a White List Species considered to be a cultural resource, either directly through the collection of fish or indirectly through habitat impacts.

P115 of CIA

The Kailapa Community members and those from the Kohala Estates spoke openly against the collection of reef fish to supply the aquarium industry. Many stated that the practice of catching fish without intending to consume it goes against traditional belief and that this act is not pono (proper, morally fitting, beneficial). They expressed that all fish are part of the public trust and that removing fish to supply a "lucrative" industry undermines traditional practices and beliefs associated with the ocean. They urged people to view fish in their natural environment where their colors are bright and brilliant. Several community members expressed concern for the high mortality rates of aquarium fish. They believe that removing any part of the ecosystem alters the natural balance and that removing small fish disrupts the natural food chain.

Even if collecting does not cause a decline, cultural impacts occur because of aquarium industry practices and attitudes towards natural resources. Removing beautiful fish that consume algae threatens coral reefs that support many forms of aquatic life and protect the islands from storms...inflicting suffering for the animals and the people that love them for the convenience of the industry (fizzing, finning, starving, confining in tiny bags).

Missing from the DEIS is an analysis of species are considered 'Aumakua (family guardians) the Native Hawaiian religious significance of each and every species collected must also be included in the EIS analysis and impact statement.

Missing from the DEIS is graphical and other analysis of the socio-economic impact on native Hawaiian communities with high incidence of commercial aquarium trade and trafficking in their area, nor is there an Ahupua'a or place-based analysis. For example, and analysis of the impact this industry has on traditional Hawaiian communities such as Miloli'i.

5.3.3 Mitigation

Significant cumulative [cultural resource] impacts are anticipated; however, commercial aquarium collection is a less than significant factor in the cumulative impact. Therefore, no mitigation is required or proposed.

This statement is not substantiated, and every incremental impact is additive to cumulative impact. See comments re. pp. 16 – 17.

p 134

Several White List and non-White List Species are endemic to the Hawaiian Archipelago (including Johnston Atoll) and therefore may be impacted when faced with changes in climate over time (e.g., warming temperatures, habitat loss due coral bleaching, etc.). The extent and severity of impacts to White List Species from climate change have been ongoing for decades and are expected to increase in the foreseeable future. If environmental fluctuations resulting from climate change (e.g., tropical storms, coral bleaching episodes, acidification, etc.), or other natural or human factors, change habitat conditions, fishing mortality may present a higher risk to some White List and non-White List Species and SGCN."

Cumulative impact is, by definition, caused by numerous factors; if the impact of climate change affects reef and fish mortality, then mitigation of fish mortality through collection and removal from the reef must be proposed and required.

5.4 BIOLOGICAL RESOURCES

5.4.1 Direct Impacts

p. 94

According to data presented in DAR (2019a), the number of collected fish in the WHRFMA has increased by 29% between 2000 and 2017, growing from a collection of 252,290 in 2000 to a collection of 324,565 in 2017 (DAR 2019a)⁸, representing an annual growth rate of 1.49%⁹.

Informants to the Cultural Impact Assessment (CIA) reported significant reductions in fish traditionally used for subsistence.

P102 of CIA Throughout the early part of the 20th century, the participation of Japanese in Hawai'i's commercial fishing continued to increase, while Kānaka Maoli participation gradually waned (Glazier 2007). As the commercial fishing industry continually expanded to meet the demands of the growing consumer population in the islands, the fish and other marine resources became more scarce. With the shift to a market economy and a commercial fishery these marine resources were valued mostly for their economic potential, and little to no regard was paid to the myriad of traditional values and more that emphasized the spiritual, cultural, familial, and ecological importance of the fish and other marine species. Maly and Maly (2003:ix) contend that "this trend has continued through the present-day and fostered the decline in health and well-being of the broad range and diversity of Hawaiian fisheries."

5.4.1.1 No Action Alternative

p. 95

*Explain why it is not harmful to remove herbivorous aquarium fish, even though DLNR recently urged fishers to refrain from taking herbivorous food fish.
"Avoid fishing for parrotfish, surgeonfish, and other herbivores."
coral_card.pdf dated November 2019*

Consider impacts on larger predator fish, commonly of high-value, when prey fish numbers are reduced by collecting.

5.4.1.5 Limited Permit Issuance (Preferred) Alternative

p. 124

The 14 fishers requesting Aquarium Permits collected up to a maximum of 293,845 fish in the WHRFMA in a single year during the period from 2000-2017 (see Table 5-2). Conservatively assuming collection in the first year of the 5-year analysis period started at this maximum, and then grew at 1.49% per year, a total of 1,513,665 fish would be collected over the 5-year analysis period, or an average of 302,733 per year.

Impacts to individual species in the WHRFMA are shown in Table 5-11, using both the average and maximum number of each of the White List Species collected in the WHRFMA by the 14 fishers annually between 2000 and 2017, and what percent of the CREP population estimates those values represent. The impacts on individual species' populations is less than 2% for all species when looking at average collection rates, and less than 3% when looking at maximum rates.

As noted in Tables 4-1 and 4-2, permittees failed to report catches 47% of the time.

Instead of only using averages, state what would happen for each species in the 5th year--how many fish would be collected at maximum rates, what percentage of the population would be collected, and whether this appears sustainable. How would the 5 year analysis be conducted?

p. 124

...the bag limit for Achilles Tang would be implemented...

See comments re. Table 4-5, p. 74. The statement regarding impacts to individual species populations does not seem to correlate with the data presented.

5.4.2 Indirect Effects

5.4.2.1 No Action Alternative

p. 125

...data do not exist that would allow for a thorough analysis of such effects ...

Interviews should be done with people who frequent specific areas to help research changes in abundance of fish in these areas.

5.4.2.5 Limited Permit Issuance (Preferred) Alternative

p. 127

It is anticipated that collection of approximately 1.5 million fish would occur in the WHRFMA...

For all numbers in this section—do they cover one year, or the 5-year analysis period?

5.4.3 Cumulative Impacts

5.4.3.1 Recreational Aquarium Fish Collection

p. 128

The DAR collected recreational aquarium fish catch information from 1975 until 1985, after which, data collection was discontinued, and currently no reporting of catch is required for recreational aquarium permit holders. Historic recreational catch data were not digitized or processed into a database, and therefore, are not available for analysis (DAR 2018a).

Can DLNR do adequate enforcement without the ability to collect and store data?

p. 129

...studies conducted by Tissot and Hallacher (2003) found that aquarium collecting had no significant impact (beneficial nor detrimental) on reef habitat. In addition, 15 years of coral reef data collected and analyzed by the DAR (2018b) found no significant difference in coral cover in areas open to commercial aquarium fish collection.

Photo documentation and careful observation by community members indicate that coral damage is occurring regularly on the reef. More collecting photos at: <https://www.atdarock.photography/Big-Island-Aquarium-collecting>

5.4.3.2 Non-Aquarium Commercial and Non-Commercial Fishing (Non-Aquarium Fish)

p. 130

...unlike the aquarium fishery which targets mostly immature fish, the commercial and recreational fisheries selectively target the larger breeding portion of the population which has profound implications for the sustainable usage of the resource (DAR 2019a).

Little fish taken by collectors cannot grow up to become the big fish sought by fishers. The ideal time to take fish sustainably may vary among species. With this in mind, review studies analyzing the impacts of taking each of the species collected in West Hawai'i at various points in their life cycle.

p. 130

...on the island of Hawai'i, commercial aquarium fish collection constitutes 25% of the total catch and 11% of the biomass (when excluding Yellow Tang...)

For West Hawai'i, how many fish, and how many pounds of fish, are taken on average per year, based on the last five years, by

- *One commercial aquarium collector*
- *One commercial non-aquarium fisher*
- *One recreational non-aquarium fisher*

5.4.3.5 Climate Change

p. 134

The extent and severity of impacts to White List Species from climate change have been ongoing for decades and are expected to increase in the foreseeable future. If environmental fluctuations resulting from climate change (e.g., tropical storms, coral bleaching episodes, acidification, etc.), or other natural or human factors, change habitat conditions, fishing mortality may present a higher risk to some White List and non-White List Species and SGCN.

Cite evidence that climate change will NOT put White List species at risk by changing habitat conditions.

This DEIS is significantly deficient regarding impacts of climate change in coral systems and reef wildlife, as well as climate change impacts on run off, water diversion for development or and impacts when added to pollution and contamination for all run off sources; including golf courses, hotels, housing development and other projects that contribute to the destruction and or contamination of the reef and near shore ecosystems. All of these perturbations will have a cumulative impact on coral reef habitat and fish populations.

5.4.3.6 Cumulative Impact Conclusion

pp. 134 - 135

The DAR (2019a) has noted significantly declining populations in one or more of the management areas for 12 of the White List Species, and cumulatively, all of the factors discussed above likely contribute to

the declines...while commercial aquarium collection does contribute to the cumulative impact, it is a **less than significant** factor in the observed declines.

Since aquarium fish are only used for pleasure, relaxation and entertainment, not for food, and the economic benefits of aquarium collecting amount to less than 0.01% of the economic benefits of commercial marine activities, why add to the impacts?

The DEIS fails to adequately address the interviews/testimony of Hawaiians and therefore dismisses the wisdom and observations of the culture. The DEIS claims there will be no significant loss of fish numbers with unlimited catch. Baseline should be before trade began, not 2018. Why should Hawaiians be denied the abundance their grandparents experienced? This is continued discrimination against indigenous people in order to profit from marine resources, and is evidence of a Western colonial mindset, and does not address social justice.

5.5 SUMMARY OF IMPACTS

Table 5-13. Summary of direct and indirect impacts by alternative over the 5-year analysis period.

p. 136

Limited Permit Issuance (Preferred)...Collection of 1.5 million White List Species fish from the WHRFMA

How would the removal of 1.5 million juvenile eherbivorous fish from the ecosystem result in no loss of abundance?

5.6 EVALUATION OF HEPA SIGNIFICANCE CRITERIA

Significance Criteria #1: The Preferred Alternative (i.e., Limited Permit Issuance Alternative) does not involve an irrevocable commitment or loss or destruction of any natural or cultural resource.

Reef Habitat

p. 139

...the DAR (2019a) reported that herbivore biomass has not changed since 2003 in the open areas or FRAs and has increased by 30.8% in the MPAs. While there has been no significant change in Open Areas or FRAs, there has still been an increasing trend, with a 14.4% increase in herbivore biomass in FRAs and a 26.0% increase in herbivore biomass in Open Areas between 2003 and 2017 (DAR 2019a, Gove et al. 2019). This occurred even with the pressures from commercial aquarium collection, which was occurring during this time .

The use of an improper baseline, the minimization of potential collection rates under the proposed alternatives, and an expanded area to which the impacts would apply provide inaccurate and unverifiable data from which to make proposed actions and mitigations.

*Paul Cox took this photo of two aquarium fish collectors right out front of the Miloli'i subdivision in Papa Bay, South Kona March 18, 2014. The primary targeted fish are the juvenile fish that use the finger coral as protection from predation. By the way, finger coral (*Porites Compressa*) is endemic to Hawaii, found nowhere else in the world. The collectors set a fine mesh net in the shape of a V onto the coral. He has seen anywhere from 15' to 200' of net for this process. As you can see in this photo the net is acting as a wall due to the floats on its upper ridge, what you don't see is the net it is anchored to the reef with an equal amount of lead sinkers. Some collectors do not use lead instead they tie or pin the net to the reef. The next step is to herd the fish from out of their sanctuary that is in the depths of the finger corals towards the apex of the V in the net. This is accomplished by the use of the white sticks that you can see lying under the collector's feet. The sticks are poked into the corals aggressively as the collectors push and crawl on the coral themselves. The idea is to make this fish sanctuary a place for the fright-or-flight response. Why don't the fish just swim over the top of the net? these little guys have a hard time ascending rapidly due to their internal air bladders (the fish do use buoyancy control). The collectors do not use a buoyancy control vest, to keep themselves negatively buoyant which helps to stabilize themselves onto the reef itself while they work.*

P 141

Significance Criteria #4

The Preferred Alternative does not substantially affect the economic welfare, social welfare, and cultural practices of the community or State...

MLG Sierra Club members have supported the Hawaii County Council resolution passed in 2008 to asking for a ban on the aquarium trade. We have been active since leading West coast hikes, snorkeling and kayak outings, and talking to residents about fish numbers. We had successful program "Where have all the Fishes Gone?" with attendance over 70. Speakers included Mike Nakachi, legislator Rep. Nicole Lowen, and Paul Cox. Members and leaders report seeing more reef fish on the West side decades ago.

Members met with several Pebble Beach residents who reported more fish since Ka'ohe bay protected after prolonged fight. Some are divers and photographers. A small kayaking group going south from pebble beach about 2003 remarked how few fish could be seen under water. A friend, local to the area, said angrily that they were being taken by AQ collectors. This was during the time Pebble Beach community was fighting to stop collection in their area. They did get some protection but only about 1,000' right in front of their bay. They asked for 1 mile or so.

We met with Kaimi Kaupiko in Miloli'i who is from subsistence fishing family. They oppose the trade and succeeded in getting the area designated FRA. They are teaching keiki cultural practices. A few were in the trade but they are trying to work that out. The culture is corrupted by money system but they want to preserve culture. I see mention of community involvement in DEIS but not since 1999. We also have met with Paul Cox, underwater photographer who presented at the program with photographs of many instances of violations of collectors damaging reef, unmarked buckets and equipment and using illegal nets as they walk on coral and rocks. We snorkeled with him at Papa Bay. He has made complaints that were ignored by DLNR or summarily dismissed.

Democratic Party resolution drafted on 4/5/2018 states "The taking of reef wildlife purely for commercial purposes cannot be reconciled with the 'precautionary principle' nor the 'hierarchy of priorities' policy guidelines of Hawai'i State Department of Land and Natural Resources". They also affirm the resolution based on Public Trust doctrine as stated in Article XI, Section I of constitution. Furthermore "the Democratic Party calls for State legislation to end commercial harvesting of coral reef wildlife".

The DEIS fails to address the concerns of the communities that are impacted by the actions of the aquarium collectors.

p. 142

Significance Criteria #8:

The Preferred Alternative does not involve a commitment for larger actions. When the full range of impacts to White List Species are considered (e.g., recreational aquarium collection, non-aquarium commercial fishing, recreational fishing, tourism, climate change), there is a significant cumulative impact to some White List Species...commercial aquarium collection does contribute to the cumulative impact...

See comment re. pp. 134 – 135.

p. 143

Significance Criteria #9

The Preferred Alternative does not affect threatened or endangered species or their habitats nor does it have a significant impact on rare species.

p. 77

The Psychedelic Wrasse, Tinker's Butterflyfish, and Fisher's Angelfish are all listed as SGCN in Hawai'i...Adequate population estimates based on WHAP data (30-60 feet depth) are not available to assess the impact of continued aquarium collection on these three species due to their deeper water habitats. However, based on deep diver observations, Tinker's Butterflyfish and Psychedelic Wrasse are substantially more common in the long term protected areas (MPAs). Commercial aquarium fishers generally do not fish in the deeper waters in which these species occur. In 2017, there were 599 Psychedelic Wrasse, approximately 290 Tinker's Butterflyfish (n.d. in East Hawai'i), and 288 Fisher's Angelfish collected by aquarium fishers on the island of Hawai'i

See comments re. 4.4.3. Since two of the species seem to thrive when protected, they should not be collected.

P 143

No significant adverse effects would occur as a result of the Preferred Alternative. Therefore, mitigation for impacts is not warranted and no mitigation measures would be implemented.

The document states, "The Preferred Alternative does not substantially affect the economy but plays an important role as a nearshore fishery in the state." What role? We maintain the role is largely negative as evidenced by the history of conflicts, dissension and general retreat of the trade throughout the state.

*Elsewhere it states, "No scientific data exist to suggest that in the absence of aquarium fishers an increase in other tourist operations would occur." We say, although you can't prove a negative, the outspoken claims and concerns of recreational competitors such as **Snorkel Bob** would certainly beg to differ! And the disappointment registered by recreational users we regularly interact with on our Sierra Club snorkel outings is something we have noted as well.*

Sierra Club Conclusion: *Under the **No Action Alternative** issuance of Aquarium Permits would not occur and commercial aquarium fishing would not be permitted in the WHRFMA. Therefore, collection of all White List Species in the WHRFMA would be zero and reef habitat would not be affected.*

In the WHRFMA, where no fish would be collected, a minor, although unquantifiable, increase in number of White List Species, non-White List Species, and SGCN may occur over the 5-year analysis period, which may provide additional viewing opportunities for tourists, an increase in the prey base, additional individual herbivores to maintain the reef, and increased competition between species for available resources."

Our constituency finds the 'No Action Alternative' to be logically and integrally the most compelling. This is clearly the superior plan!

We urge decision making authorities to adopt this alternative.

Thank you for the opportunity to comment.

Sincerely,

*Deborah Ward, Chair
Cory Harden, Conservation Chair

I strongly urge you NOT to allow the collecting and selling of West Hawaii's reef fish.

The reef is in dire need of protection.

A healthy reef is a huge money-maker in Hawaii as many tourists come to snorkel and view the coral and fish.

However the reef is very unhealthy presently due to the recent high temperatures of the sea (climate change), pollution, sunscreens and other damaging aspects of human disrespect and lack of education and knowledge. Taking the reef fish will hurt the reef even more.

A healthy reef is extremely important. The fish are an important part of the eco-system.

The reef fish must be protected.

Please malama

our beautiful reefs!

Blessings,

Darby L. Partner, CPM

Subject: No more commercial aquarium fishing in Hawai`i
Date: Wednesday, November 27, 2019 10:54:13 AM

I am a Native Hawaiian Cultural Practitioner. I also come from a line of fishermen on both sides of my family. I have noticed the fish population depleting. I have notice a surge in invasive fish such as the Toao and Roy. Take more efforts into eradicating those first.

Put more efforts into restoring our reefs, rather than depleting our marine life.

No more. Stop and Deny this request to resume commercial aquarium fishing not only in West Hawai`i, but in Hawai`i shores... from Lo`ihi to Papahanaumokuakea.

Dear Terry Vandewalle,

Please re-open this sustainable fishery.

I also request that any additional applicants, should there be any, conduct another EIS and CIA to measure additional impact beyond the 14 permits in the Proposed Action, further ensuring the sustainability while complying with the Supreme Court ruling.

Sincerely,
Dawn Wallis

Dear Terry Vandewalle,

To Whom It May Concern,

On behalf of Segrest Inc, I am emailing you to express our support for DLNR's adoption of the draft Environmental Impact Statement which analyzes the issuing of Commercial Aquarium Permits for the West Hawaii Regional Fishery Management Area. We believe that the draft EIS has fully and completely analyzed all of the potential impacts of the Hawaii aquarium fishery. In the draft EIS, measures are proposed that would further help avoid and minimize what are already insignificant impacts on fish species and the environment in the West Hawaii Regional Fishery Management Area. Researchers and scientists have consistently determined that the Hawaii aquarium fishery is one the best managed near shore fisheries in the world. This conclusion has been backed by data from the DLNR. In order to develop a management strategy for the West Hawaii Regional Fishery Management Area, input from native Hawaiians and the environmental community has been used. We fully support the DLNR resuming the issuance of permits for aquarium fishing in the West Hawaii Regional Fishery Management Area.

Sincerely,
Alan Luken

Dear Terry Vandewalle,

I feel that Aquarium hobby both professionally and at the hobby level is important way to learn about our earth. Through the use of conservation I think that Hawaiian fish can be enjoyed my many around the world without effecting the natural state of things on a reef. Often times aquariums are the only way for some to truly understand how beautiful the ocean world can be because of the cost it takes to visit Hawaii.

Sincerely,
Grant Rakowski

January 6, 2020

Dear Terry Vandewalle,

I support DLNR's adoption of the Draft Environmental Impact Statement analyzing Issuance of Commercial Aquarium Permits for the West Hawai'i Regional Fishery Management Area (WHRFMA). This draft EIS fully analyzes all of the potential impacts the Hawaii aquarium fishery may have on the environment under each of the alternatives. The DEIS proposes measures to avoid and minimize already insignificant impacts on fish species and the environment in the WHRFMA. Scientists have consistently characterized the Hawaiian aquarium fishery as one of the best managed near-shore fisheries in the world. This is back by DLNR data. Native Hawaiians and the environmental community input has been used to develop the management strategy for the WHRFMA. I support DLNR resuming the issuance of permits for aquarium fishing in the WHRFMA.

Sincerely,
Arthur Parola
