WRPP	Water Resource Protection Plan

PREFACE

As part of the update of the Water Resource Protection Plan (WRPP), the Commission on Water Resource Management (CWRM) identified the need for a standardized coding system to delineate and codify Hawaii's surface-water resources. The coding system is an important first-step towards improving the organization and management of surface-water information that CWRM collects and maintains. Key objectives of the CWRM Surface-Water Hydrologic Units include the following:

- 1) Define and delineate unique units that can accommodate the relational requirements in a database environment, while providing a system that can be easily understood by the general public.
- 2) Develop an information management system which utilizes a coding system to relate surface-water permits and other resource information to a given unit.
- 3) Define hydrologic units to be considered in the analysis and development of instream flow standards.
- 4) Provide a reference system that promotes better information management of other resource inventories.
- 5) Promote the sharing and collection of surface-water resource data between government agencies, the public, private entities, and community organizations.
- 6) Improve the overall coordination of monitoring, data collection, and field investigation efforts.

The CWRM Surface-Water Hydrologic Units provides a practical approach to managing surface-water information maintained by the CWRM, thereby allowing additional efforts to easily build upon or refer to this system. Through this effort, Commission staff will be able to better coordinate and improve surface water data collection and utilization between agencies and stakeholders, leading to better statewide resource management measures.

1.0 SURFACE-WATER HYDROLOGIC UNIT CODING SYSTEM

The State Water Code (Code), Chapter 174C, Hawaii Revised Statutes (HRS), mandates that the Water Resource Protection Plan shall include, but not be limited to:

“Hydrologic units and their characteristics, including the quantity and quality of available resource, requirements for beneficial instream uses and environmental protection, desirable uses worthy of preservation by permit, and undesirable uses for which permits may be denied.”

The Code defines a hydrologic unit as follows:

“A surface drainage area or a ground water basin or a combination of the two.”

Ground-water hydrologic units were established by the CWRM under the 1990 WRPP, however the Plan only suggested a complex surface-water classification scheme. The Plan established Aquifer Sectors and Systems, with a code and name assigned to each. Under this coding system, each Aquifer System was described and an estimated sustainable was calculated.

As part of the update of the WRPP, the CWRM sought to establish a coding system that would serve as the first step towards establishing instream flow standards, similar to the system developed for ground-water hydrologic units, or aquifers. However, staff recognized that surface-water hydrologic units may not represent strict drainage basin delineations, primarily based on the means by which instream flow standards are prescribed under the Code. Chapter 174C-71, HRS, states:

“In formulating the proposed standards, the commission shall weigh the importance of the present or potential uses of water from the stream for noninstream purposes, including the economic impact of restriction of such uses.”

While instream uses may generally fall within a true surface drainage area, noninstream uses tend to be land-based and therefore may not always fall within the same drainage area.

In developing the CWRM Surface-Water Hydrologic Units, it was necessary to review the *Hawaii Stream Assessment* (1990), *State Definition and Delineation of Watersheds* (1994), and *Refinement of Hawaii Watershed Delineations* (1999) reports to arrive at a coding system that could meet the requirements for organizing and managing surface-water information in a database environment. An equally important objective was to provide a coding system that could be easily administered and understood by the general public and other agencies.

Through the review of the reports identified above, the strengths and weaknesses of each were identified and are outlined in Table 1.1 below. It is important to note that each of the reports conducted extensive research into the development of their respective systems, however, each coding system was created with a specific purpose or a specific agency in mind (Refer to these reports for more detailed analysis and discussion). The primary objective of the CWRM Surface-Water Hydrologic Units is to establish a system that is appropriate for the informational requirements of CWRM.

Table 1.1. Summary of strengths and weaknesses of the various watershed/stream coding systems reviewed by the CWRM.

Hawaii Stream Assessment	
Strengths	Weaknesses
<ul style="list-style-type: none"> The first attempt to code streams and attribute stream-related information in a database structure. Includes all perennial streams statewide. Uses a 1-digit island code (e.g., '3' for Oahu). 	<ul style="list-style-type: none"> Does not include intermittent streams. Includes a hydrographic unit code that is unnecessary. Codes are assigned to a stream, as opposed to the entire watershed (where much of the data was derived from watershed attributes). Includes dashes (-) in the code (e.g., 3-2-04 for Waiahole Stream) that may be problematic in a database structure.
State Definition and Delineation of Watersheds	
Strengths	Weaknesses
<ul style="list-style-type: none"> The first attempt to delineate watershed areas statewide (especially important, as watershed conditions contribute to the overall stream condition). Delineates all watersheds statewide, including those containing intermittent streams. Applies new codes to watersheds containing intermittent streams. Maintains the stream mouth code from the <i>Hawaii Stream Assessment</i>. 	<ul style="list-style-type: none"> Uses an 8-digit island code based on USGS Hydrologic Units (e.g., '20060000' for Oahu). Maintains the hydrographic unit code from the <i>Hawaii Stream Assessment</i>. Coding of intermittent streams applies a 2-digit hydrologic unit code starting from 99 and working backwards. Includes dashes (-) in the code (e.g., 3-2-04) that may be problematic in a database structure.
Refinement of Hawaii Watershed Delineations	
Strengths	Weaknesses
<ul style="list-style-type: none"> Revised watershed delineations based upon revised 1:24,000 USGS DRG quadrangle maps. Removed the dashes (-) in the code (e.g., 20060000204000 for Waiahole watershed) 	<ul style="list-style-type: none"> Continued the coding format for islands and intermittent streams used in the <i>State Definition and Delineation of Watersheds</i>.

HYDROLOGIC UNIT CODE: 0000

The hydrologic unit code is a unique combination of four digits. Rather than replicate or build from previous coding efforts, the Commission opted to reassign new sequential codes that could be efficiently implemented in a database environment and be easily understood. Borrowing from the *State Definition and Delineation of Watersheds* report, a watershed unit is defined as follows:

“A watershed unit is comprised of a drainage basin (or basins) which include both stream and overland flow, whose runoff either enters the ocean along an identified segment of coastline (coastal segment) or enters an internal, landlocked drainage basin. The watershed units for an island are defined so that all segments of coastline are assigned to a unique watershed unit and so that all areas of an island are assigned to one, and only one, watershed unit.”

Hydrologic units with perennial streams are of primary importance, however, it is also essential to consider those units with intermittent or ephemeral streams as well as those with no clearly

defined watercourses. Outlined below are the individual components of the hydrologic unit coding system.

ISLAND CODE: 000

The first digit represents the eight main Hawaiian Islands using an unique number assigned by the CWRM. The Island Code is the same 1-digit number used in the HSA. The islands of Niihau, Kahoolawe and Lanai did not appear in the HSA database because these islands do not have perennial streams, however they have been included in this report as part of a more comprehensive surface water management scheme.

Island Code	Island Name
1	Niihau
2	Kauai
3	Oahu
4	Molokai
5	Lanai
6	Maui
7	Kahoolawe
8	Hawaii

SYSTEM CODE: 000

The last three digits are sequentially assigned, generally beginning in the northern portion of each island and continuing in a clockwise manner. This method is similar to previous coding efforts.

The CWRM Surface-Water Hydrologic Unit coding system does not include hydrologic sector units. Previous coding system efforts included a hydrologic sector code that represented regional drainage areas for each island. For example, Oahu was subdivided into Koolauloa, Koolaupoko, Honolulu, Ewa, Waianae, and Waialua. These sector designations can be incorporated at a later time if necessary and managed within the CWRM's surface-water database environment.

2.0 WATERSHED/STREAM CODING SYSTEM REFERENCE

The prior reports and coding systems served as a foundation for the CWRM Surface-Water Hydrologic Units. Using the results of these multiple watershed and stream coding systems, the CWRM has initiated a relational database of coding systems to facilitate the sharing of information between government agencies. The current compilation of coding systems is provided in Appendix C: Watershed/Stream Coding System Reference. However, it should be emphasized that this database is expected to change, as information sources are refined and other sources added. Therefore, the most current version of this database should be accessed through CWRM when needed. The following table outlines each coding system and their respective reports.

Coding System	Report Title
HSA Coding System	<i>Hawaii Stream Assessment (1990)</i>
CZM Coding System	<i>State Definition and Delineation of Watersheds (1994)</i>
NRCS Coding System	<i>Refinement of Hawaii Watershed Delineations (1999)</i>

3.0 SURFACE-WATER HYDROLOGIC UNIT MAPS

The *Refinement of Hawaii Watershed Delineations* report, and accompanying GIS layer, were obtained from Ms. Patricia Shade of NRCS, which provided the bulk of information used in developing the GIS layer and hydrologic unit maps for the CWRM Surface-Water Hydrologic Units. Delineated drainage basin layers for all islands, obtained from Dr. James Parham and developed using the RiverTools software, were also included in this analysis and refinement. These drainage basin layers were derived from 10-meter USGS digital elevation models.

For the majority of hydrologic units, unit boundaries closely matched the drainage basins. In these cases, individual stream systems were contained entirely within the hydrologic unit boundaries (from the headwater to the mouth). However, in a few instances, streams were found to go across hydrologic unit boundaries and in these cases drainage basins further were examined to more accurately determine the natural flow of water based on elevation gradients. In these instances, the hydrologic unit boundaries were evaluated together with the drainage basin layer and redrawn through on-screen digitizing using ArcGIS software.

The GIS layer representing the CWRM Surface-Water Hydrologic Units is available from the CWRM and maps of all hydrologic units statewide are provided in Appendix D. This hydrologic unit layer will be integrated as part of the ongoing analysis and eventual establishment of instream flow standards. The hydrologic unit database and GIS layer will be continually revised as new and improved information becomes available, or further analysis is conducted.
